For areas specified as "Sand Based Lawn", provide the following machinery and tools for both planting and establishment operation as specified in this Specification:

1. Mowing Machine

   Reel / cylinder or rotary type of mowing machine with height of cut adjustable between 25mm to 75mm in maximum 12.5mm increments; width of cut between 400mm to 600mm.

2. Aerator

   Aerator with coring / spiking width tines 75mm to 100mm apart; coring / spiking depth between 75mm to 150mm; coring / spiking with adjustable solid / hollow tines between 10mm to 20mm in diameter or otherwise specified.

3. Turf Roller

   Pull-behind or ride-on turf rolling machine designed specific for turf with minimum 750mm rolling width; minimum 450kg in full weight. Heavier roller with vibration shall be needed when instructed by the CM.

4. Verticutting Machine

   Walk behind verticutting machine or verticutting unit attached on reel type mowing machine with minimum 25mm working width; adjustable cutting depth between 10 to 50mm.

5. Spiker

   Walk behind or hand Spiker designed specific for turf with minimum 350-400mm working width and tines 75-100mm apart.

6. Spreader

   Rotary broadcast spreader designed specific for turf with minimum 350mm working width.

WORKMANSHIP

GENERAL

SLW7.W010.9 PROGRAMME

Where trees or shrubs are planted in grass areas, carry out all tree or shrub planting prior to any grassing operations.

PREPARATION

SLW7.W110.9 CULTIVATION

1. Prior to cultivation, remove all pernicious and perennial weeds, including complete root system;
2. When instructed by the CM, apply weed-killer in accordance with the manufacturer's recommendation;
3. Cultivate areas less steep than 1:2 to a depth of 150mm and bring to a 25mm deep fine tilth by hand ranking or Approved mechanical means;
4. If necessary, carry out regrading of the surface to conform to the prescribed finished levels and create free flowing contours free from humps and water collecting hollows;
5. Final level: 25 mm above any adjacent hard surfaces.

SLW7.W120.9 CULTIVATION ON EMBANKMENTS

On embankments with slopes of 1:2 or steeper, do not cultivate the existing soil, so that the slope remains stable and erosion is prevented.

SLW7.W130.9 STONE PICKING

Remove all stones larger than 30 mm in any dimension, except on embankments of a gradient of 1:2 or greater.

SLW7.W140.9 FINISHED LEVELS

Finish levels to those indicated on the Drawings, creating free flowing contours, free from water collecting hollows and level with (+25 mm, -0 mm) adjoining hard surfaces.

SPRIGGING

SLW7.W210.9 PROGRAMME

Plant sprigs in their final positions within 48 hours of lifting.

SLW7.W220.9 CULTIVATION

Cultivate all areas, as SLW7.W110 and SLW7.W120, as appropriate. Scarify embankments, with a gradient of 1:2 or greater, to a depth of 5 mm with a hand rake to break up the surface.

SLW7.W230.9 APPLYING PRE-SPRIGGING FERTILIZER

Four to seven days prior to sprigging apply quick release fertilizer, as SLW1.M130, evenly at a rate of 40 g/m² and lightly rake into the soil.

SLW7.W240.9 WATERING

Thoroughly moisten the previously prepared soil immediately prior to sprigging using a fine spray hose attachment to avoid soil erosion and run off.

SLW7.W250.9 SPRIGGING

1. Lay the sprigs evenly at rates of not less than 15 bushels/100m² (approx. 27kg/100m²) on the surface until the entire area is covered;
2. Sprigs shall be laid flat on the surface and avoid protruding out;
3. Apply thin layer of top-dressing, as SLW7.M330 to cover the sprigged area; alternatively, use a disc-roller (cutting blade interval of 100mm) to roll over and press the sprigs down to the rootzone at 50-75mm deep;
4. Roll the top-dressed or roll-planted area with a flat rollers, as SLW7.M350;
5. Apply a compound fertilizer, as SLW1.M110 evenly at a rate of 20g/m²;
6. Water the sprigged area thoroughly and then cover with protective fabric as, EXT14.M240; the protective cover should be made of bio-degradable materials;
7. All sprigs delivered on Site shall be kept moist before sprigging.

SLW7.W260.9 POST-SPRIGGING OPERATION

1. Water the sprigged area three times per day or more depending on weather condition;
2. Remove protective fabric when new leaf blades were found emerging from the surface;
3. Fence off the sprigged area until further instruction by the CM.

SLW7.W270.9 RE-SPRIGGING

Where grassed areas do not show a 90% coverage 28 days after sprigging, immediately recultivate and re-sprig the areas, whether this date occurs in the Planting Period or Establishment Period.

TURFING

SLW7.W310.9 PROGRAMME

Lay turves in their final positions within 48 hours of lifting.

SLW7.W320.9 CULTIVATION

Cultivate all areas for turfing as SLW7.W110 and SLW7.W120 as appropriate. Scarify embankments, with a gradient of 1:2 or greater, to a depth of 5 mm with a hand rake to break up the surface.

SLW7.W330.9 APPLYING PRE-TURFING FERTILIZER

Four to seven days prior to turfing, apply quick-release fertilizer, as SLW1.M130 evenly at a rate of 40g/m² and lightly rake into the soil.

SLW7.W340.9 WATERING

Thoroughly moisten the previously prepared soil immediately prior to turfing using a fine spray hose attachment to avoid erosion and run off.

SLW7.W350.9 DELIVERY AND STACKING

Carefully unload turves and:

1. Store on cleared ground;
2. Stack not more than 1000 mm high unless palletted;
3. Do not allow turves to dry out.

SLW7.W360.9 PLANKED SUPPORTS

Transport turves from stacks to laying areas along planks laid closely side by side. Provide sufficient planks and always use to support workmen and barrows, and for access and laying.

SLW7.W370.9 TURF LAYING

Lay turves:

1. Working off planks;
2. In consecutive rows in stretcher bond to correct levels starting at near side of the area so that work proceeds over turf already laid;
3. Where necessary, lightly and evenly firm turves with approved wooden beaters, the bottom of the beaters being frequently scraped clean of accumulated soil or mud;
4. After laying, fill any gaps with top dressing, as SLW7.M330 well brush in to fill all joints;
5. Use rollers, as SLW7.M350 to roll the surface immediately after laying;
6. Water the grassed area thoroughly;
7. All turves delivered on Site shall be laid within 48 hours and keep moist before laying.

SLW7.W380.9 SLOPES EXCEEDING 1:2

1. Provide sufficient planks and ladders to ensure safe and efficient working;
2. Lay turves to the areas shown on the Drawings in consecutive rows either diagonally or horizontally, in stretcher bond with closely butted joints;
3. Firm as previously specified and secure each turf with one turf peg or turf pin, as appropriate, to provide a firm fixing, properly driven home, just below the surface.

SLW7.W390.9 UNEVENNESS OF FINISHED LEVEL

Adjust any unevenness in the finished level of turf as the work proceeds by lifting, raking out or infilling with graded sand as per EXT12.M330 and replacing and refirming the turf.

SLW7.W400.9 ROLLERS

When instructed by the CM, use rollers as per SLW7.M350 to roll the surface again until it reach an even surface to the satisfaction of the CM.

SLW7.W410.9 PERIMETERS

Use whole turves only and trim to clean, straight lines or regular curves as shown on Drawings.

SLW7.W420.9 TURF JOINTS

When instructed by the CM, refill the gaps with top dressing, as SLW7.M330 well brush in to level the surface to the satisfaction of the CM and water in carefully with a fine spray hose.

SLW7.W430.9 SHRINKAGE

Should shrinkage occur, fill the open joints with graded sand, as EXT12.M330 brush in and well water.

SLW7.W440.9 APPLYING POST-TURFING FERTILIZER

30 days after turfing apply slow release fertilizer, as SLW1.M110 evenly at a rate of 20 g/m².

SLW7.W450.9 TURFING TAKE

Where bare patches still occur 21 days after laying, remove the whole turf, recultivate the soil and returf the patch.

SLW7.W460.9 LAYING TURF IN GRASS PAVING SYSTEM

In the locations as shown on Drawings, lay turf to grass paving system as follows:

1. Apply soil filling mix, as EXT12.M330 to the openings of the grass paving system and water lightly prior to laying turf;
2. Prepare turf for use by cutting to an appropriate size and shape to fit the openings in the grass paving system in use;
3. Lay the cut turf in each of the openings of the grass paving system with closely butted joints and firm the turf by lightly and evenly beating with approved wooden beaters. The bottom of the beaters being frequently scraped clean of accumulated soil or mud;
4. After laying, fill any gaps with top dressing, as SLW7.M330 and brush in well to fill all joints and water carefully using a fine spray hose attachment;
5. Should shrinkage occur, refer to SLW7.W430;
6. Apply post-turfing fertilizers, as SLW7.W440;
7. Where bare patches within the turfed portions of the grass paving system still occur 21 days after laying, carry out turfing take, as SLW7.W450.

SEEDING

SLW7.W510.9 STORING SEED

Store seed on boards off the ground, in a clean dry place, free from vermin.

SLW7.W520.9 APPLYING PRE-SEEDING FERTILIZER

Four to seven days prior to broadcast sowing apply quick release fertilizer, as SLW1.M130, evenly at a rate of 40 g/m² (±5%) and lightly rake into the soil.

SLW7.W530.9 BROADCAST SOWING

1. Evenly broadcast grass seed mix, SLW7.M210, over areas shown on the Drawings by sowing at half the rate specified below in two equal sowings at right angles to each other, either by hand or by an Approved mechanical drill;
2. Rate of sowing: 30 g/m².

SLW7.W540.9 RAKING, HARROWING AND ROLLING

1. Lightly rake or harrow in the seed;
2. Roll and cross-roll with a lightweight roller.

SLW7.W550.9 APPLYING WEED-KILLER

Apply weed-killer evenly to newly seeded areas, as SLW1.W720.

SLW7.W560.9 TURF EDGING TO SEEDED AREAS

Edge seeded areas with turf 300 mm wide where shown on the Drawings. Adjust soil level to receive turf and marry-in surface of seed bed to surface of turf.

SLW7.W570.9 EDGE TRIMMING TO SEEDED AREAS

Trim edges of seeded areas which have not been edged with turf when sufficiently established to clean, straight lines or regular curves as shown on Drawings.

SLW7.W580.9 APPLYING POST-SEEDING FERTILIZER

Ten days after broadcast sowing, apply slow release fertilizer, as SLW1.M110 evenly at a rate of 20g/m².

SLW7.W590.9 GERMINATION OF BROADCAST SOWN SEED

Where grass areas do not show 90% cover over any 10 m² area, 28 days after sowing immediately re-cultivate and re-sow the area, whether this date occurs in the Planting Period or the Establishment Period.

SLW7.W592.9 APPLICATION OF GRASS SEED AND SOIL FILLING MIXTURE IN GRASS PAVING SYSTEM

In the locations as shown on Drawings, apply grass seed and soil filling mixture to grass paving system as follows:

1. Thoroughly mix grass seed, as SLW7.M270 and soil filling, as EXT12.M330 to form grass seed and soil filling mixture;
2. Apply grass seed and soil filling mixture to the openings of the grass paving system;
3. Lightly compact, and finish flush with the adjoining surfaces;
4. Water immediately and continue to water, as SLW1.W520 using a fine spray hose attachment to avoid erosion and run off;
5. Apply weed-killer evenly to newly seeded areas in accordance with the manufacturer's recommendation;
6. Apply post-seeding fertilizer, as SLW7.W580;
7. Re-sow, as SLW7.W590;
8. Carry out post-planting cutting, as SLW7.W630;
9. After germination and throughout the Planting Period and Establishment Period, ensure that the soil surface within the seeded areas of the grass paving system remain flush with the surrounding surfaces by supplementing top dressing, as SLW7.M330 and seed mixture, as SLW7.M270. Water in carefully using a fine spray hose attachment.

POST PLANTING OPERATIONS

SLW7.W610.9 WATERING

Water immediately after laying and continue to water, as SLW1.W520 using a fine spray hose attachment to avoid erosion and run off.

SLW7.W620.9 ROLLING OF GRASSED AREAS

When instructed by the CM, roll the grassed area with rollers, as SLW7.M350 to increase contact between the turves or sprigs and the rootzone medium.

SLW7.W630.9 CUTTING

1. Make the first cut when the grass sward is 75 mm high and reduce the sward to 25 mm high;
2. Make subsequent cuts as soon as the grass sward is 50 mm high and reduce the sward to 25 mm high;
3. Trim edges after cutting.

SLW7.W640.9 MOWING

1. Use mowing machine, as SLW7.M350;
2. Make the first mowing when the turf is at 50mm high and reduce the turf to 35mm high;
3. Make subsequent mowing as soon as the turf is at 40mm high and reduce the turf to 32 - 37mm high, depends on the season, as SLW9.W640;
4. Trim edges after cutting;
5. Rake up and remove all cuttings from Site within 24 hours after mowing;
6. Do not remove more than one-third of the height of the turf at each time.

SLW8 TREE SURGERY WORKS

MATERIALS

GENERAL

SLW8.M010.9 SCOPE OF WORK

The scope of the Works comprises the removal of dead, dying and diseased branches and stumps, cleaning out cavities, raising and thinning the crown, for transplanting purposes as Worksection EXT11 and generally improving the shape of existing trees, as scheduled and shown on the Drawings or as Instructed.

1. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to PRE.B2.010 for relevance.

WORKMANSHIP

TREE SURGERY

SLW8.W010.9 STANDARD

Carry out works in accordance with BS 3998:2010 "Recommendations for Tree Work" and “General Guidelines on Tree Pruning” posted as website:

http://www.trees.gov.hk.

SLW8.W020.9 PRUNING TECHNIQUES

1. Cut back dead branches to living tissue/growing point;
2. Where removal of a whole lateral branch is required, do not cut flush to the main trunk or leaving a stub. Apply under cut technique to prevent tearing the bark and cut limbs in two operations. Cut initially from the underside close to the trunk or parent limb, without cutting into the branch bark ridge or collar. Make the second cut from above at a point 25 mm further away from the trunk;
3. Cut all limbs sloping away from the main trunk at an angle of approximately 60° from the horizontal on a line above the branch bark ridge and the branch collar without leaving a stub, in accordance with BS 3998:1989; figure 1;
4. Long and heavy branches should be cut in sequence of section by section. Carefully lower all cut branches to the ground to prevent any damage to limbs being retained;
5. Keep the crown in a well-balanced form and natural shape after pruning. Do not remove more than one quarter of the original crown coverage in each pruning operation.

SLW8.W030.9 CUTTING BACK BARK

Cleanly cut back loose, dead or damaged bark to firm healthy bark, and trim to leave rounded edges.

SLW8.W040.9 TIMING OF PRUNING

Carry out pruning of evergreen trees just before spring. For deciduous trees, pruning after shedding leaves in winter when trees are dormant is preferred. Avoid pruning prior to flowering seasons of the trees.

SLW8.W050.9 CAVITY TREATMENT

Cut out rotten wood from cavities, without exposing clean healthy wood.

SLW8.W060.9 ADDITIONAL DAMAGE

Repair any additional damage to existing trees, caused by tree surgery operations or any other cause during the Contract Period, as Instructed.

SLW8.W070.9 TOOLS AND EQUIPMENT

Use the tools and equipment recommended by and in accordance with BS 3998: 2010.

SLW9 ESTABLISHMENT WORKS

WORKMANSHIP

DEFINITIONS

SLW9.W010.9 ESTABLISHMENT WORKS

Establishment Works (EW) is the works as defined in the Preliminaries Worksection to be carried out during the Establishment Period (EP) to establish the soft landscaping.

1. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to PRE.B2.010 for relevance.

SLW9.W020.9 ESTABLISHMENT PERIOD

Establishment Period (EP) is the 24 month period, commencing the day after the certified date for Completion of Section A - Planting Works, during which the EW are to be carried out.

GENERAL

SLW9.W100.9 TREE INVENTORY REPORT

1. No later than three(3) months from the certified date of completion of Section A, provide written Tree Inventory Report with information of all existing and newly planted trees, palms and conifers as indicated on Drawings and Plant Schedules for preparation of record plan of soft landscape works. In particular, attention is drawn to the following requirements:
    a. To provide tree information including location with Geographic Information System (GIS) technology, dimensions including trunk girth at 1.3m above ground level, crown spread, overall height, current conditions of tree such as form and health, and tree identification number to trees of size of light-standard and above, palms and conifers;
    b. To install tag to individual tree, palm or conifer with the tree identification (ID) number based on the tree layout plan. Format of the tree tag and the numbering system to be approved by the CM;
    c. To take and complete the tree inventory record for each tree, palm or conifer with a photo showing the whole tree, palm or conifer.
2. No later than two (2) months before the date for completion of Section B, replace missing tree tag(s), update and submit the Tree Inventory Report to the CM.

SLW9.W110.9 VANDALISM DAMAGE TO PLANTING

The Authority will accept responsibility for replacing dead or damaged stock resulting from vandalism only when the Contractor

1. Proves that such death or damage was caused by circumstances outside his control; and
2. Submits written claims to the CM within three working days of the event happening.

SLW9.W120.9 TYPHOON DAMAGE

1. Within 48 hours of Typhoon Signal No. 8 or above being lowered:
   a. Make a photographic record and detailed report of all plant damage;
   b. Replant all plants blown over and firm up all other plants.
2. Within five days of Typhoon Signal No. 8 or above being lowered:
   a. Remove dead plants and clear the Site of all debris;
   b. Provide the above photographic record and report to the CM.
3. The Authority will accept responsibility for plants recorded as dead or dying after, and as a result of, the typhoon only when:
   a. The CM is notified within one month of the end of the typhoon; and
   b. Replanting works are carried out satisfactorily as specified and thorough watering is carried out each day.

SLW9.W130.9 REPLACEMENT PLANTING

Replace any plant during the EP which is, in the opinion of the CM, dead, dying, ailing or no longer conforming to this Specification within two weeks of identification. Carry out replacement planting in accordance with this Specification. Bear all costs of replacement unless due to extreme weather conditions, vandalism, or typhoons as SLW9.W110 and SLW9.W120.

1. Those trees and palms transplanted to the Site by the Employer's Direct contractor are excepted, as refer to PRE.B2.010 for relevance.

SLW9.W140.9 PLANT DIVISION

Where the CM considers ground cover and herbaceous planting to be overcrowded, divide and transplant as Instructed and in accordance with the following:

1. Dig up at an appropriate season;
2. Divide by teasing the roots apart by hand or using two forks back to back taking care to maintain an adequate root system with each divided part;
3. Replant one part in the original location and carry the other parts to another part of the estate as Instructed;
4. Replant in agreed positions, fertilize and water, all in accordance with this Specification.

SLW9.W150.9 THINNING

Where Instructed reduce the number of plants due to overcrowding as

1. Dig up plants, transport and replant in locations as directed; or
2. Dig up plants, transport and replant in locations within a 20 km round trip of the original location as directed; or
3. Remove from site;
4. Fertilize and water all in accordance with this Specification.

SLW9.W160.9 PARASITIC PLANTS

Parasitic plants, as defined as SLW1.M070, which become evident during the first four months of the EP are deemed to have been brought in on plants or soil delivered to the Site. Treat these parasitic plants as SLW1.W610 to SLW1.W650.

SLW9.W170.9 RECORDS

1. Ensure that the Approved Foreman reports to the Estate's Housing Manager's office before and after carrying out each day's establishment work and makes a signed record each day:
   a. Stating the work carried out;
   b. Indicating the percentage completed for each day's operation on the standard form (DLAP-F005) provided for the purpose.
2. Obtain countersignatures from the CM's site staff and keep the records available for inspection in the Estate Housing Manager's office.

SLW9.W180.9 WATER SUPPLY

See clauses PRE.B10.1210 and PRE.B10.1220.

SCHEDULES OF ESTABLISHMENT WORKS OPERATIONS

SLW9.W210.9 GENERAL

In the event of the scheduled operations requiring amendment due to the site and weather conditions prevailing during the EP, seek Approval, at least four weeks before the operation on site, with full justification to exceed the numbers specified.

SLW9.W220.9 FIRST TWELVE MONTHS OF ESTABLISHMENT PERIOD

During the first twelve months of EP, carry out the operations as scheduled below as applicable to the Soft Landscaping Works in accordance with this Specification and shown or scheduled on the Drawings:

Operation	Anticipated No.	Timing
Watering (in open air) (under cover)	300 350	As specified. As specified.
Weeding	12	As specified.
Fertilizing	1	Early Summer, or otherwise Instructed.
Soil aeration	1	Immediately after fertilizer application.
Mulch application	1	Immediately after aeration operation.
Firming up	Min. 3	Immediately after strong wind and/or every four months.
Checking and adjusting tree ties	6	Check every two months; adjust/replace as necessary.
Tying climbers to supports and climber wires	As required	Check monthly, tie as necessary.
Climber wires	6	Check every two months; adjust/replace as necessary.
Pruning	Varies according to species	As scheduled in clause SLW9.W240.
Grass cutting	12	As specified.

Pesticide	As required	Check monthly; treat immediately.
Fungicide	As required	Check monthly; treat immediately.
Cleaning indoor plants	12	1 per month.
Checking and making good artificial plants	12	1 per month.
Checking and repairing protective fencing	Continuous	Check weekly: repair immediately.
Typhoon damage; assessment and repair	As required	As specified.
Gravel mulch topping up to tree grilles	4	Three monthly intervals.
Clearance of existing vegetated areas	Min. 2	Check every three months and treat as necessary.
Hessian binding removal		Remove from transplanted trees when instructed

SLW9.W230.9 SECOND TWELVE MONTHS OF ESTABLISHMENT PERIOD

During the second twelve months of EP, carry out the operations as scheduled below as applicable to the Soft Landscaping Works in accordance with this Specification and shown or scheduled on the Drawings:

Operation	Anticipated No.	Timing
Watering (in open air) (under cover)	280 350	As specified. As specified.
Weeding	9	As specified.
Fertilizing	2	Early Spring and Late Summer, or otherwise Instructed.
Soil aeration	2	a. Immediately after first fertilizer application; b. Immediately after second fertilizer application.
Mulch application	2	a. Immediately after first aeration operation; b. Immediately after second aeration operation.
Firming up	Min. 3	Immediately after strong wind and/or every four months.
Checking and adjusting tree ties	6	Check every two months; adjust/replace as necessary.
Tying climbers to supports and climber wires	As required	Check monthly; tie as necessary.
Climber wires	6	Check every 2 months; adjust/replace as necessary.

Pruning	Varies according to species	As scheduled in clause SLW9.W240.
Grass cutting	12	As specified.
Pesticide	As required	Check monthly; treat immediately.
Fungicide	As required	Check monthly; treat immediately.
Cleaning indoor plants	12	1 per month.
Checking and making good artificial plants	12	1 per month.
Checking and repairing protective fencing	Continuous	Check weekly: repair immediately.
Stakes	1	Remove as necessary.
Typhoon damage; assessment and repair	As required	As specified.
Gravel mulch topping up to tree grilles	4	Three monthly intervals.
Clearance of existing vegetated areas	Min. 2	Check every three months and treat as necessary.

SLW9.W240.9 PRUNING SCHEDULE

Carry out pruning operations as schedule below as applicable to the Soft Landscaping Works:

Timing	Plant Species	Pruning Requirement
January	Palms:	
	All	Remove dead fronds.
	Small Shrub:	
	Nandina spp.	Remove dead leaves.
	Climbers:	
	Antigonon leptopus	Moderate pruning after flowering.
	Pyrostegia ignea	Moderate pruning after flowering.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
February	Conifers:	
	Casuarina spp.	As hedge: heavy pruning to shape as specified.
	Palms:	
	All	Remove dead fronds.
	Ground Cover:	
	Tradescantia fluminensis	Prune hard back to 100 mm.

	Zebrina pendula	Prune hard back to 100 mm.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
End of February	Large Shrubs:	
	Acalypha spp. (except A.hispida)	Prune hard back to 300 mm to remove previous year's growth.
	Barleria cristata	Prune hard back to 300 mm.
	Lagerstroemia spp.	Prune to 900 mm.
	Manihot spp.	Prune back to 300 mm.
	Mussaenda spp.	Prune to 600 mm.
	Tecoma stans	As mass planting: prune 900 mm. As feature plant: no pruning.
	Thunbergia erecta	Light pruning to remove dense overcrowded crossing branches. Shorten branches by one half. Prune as necessary to encourage even, natural free form habit.
	Small Shrubs:	
	Allamanda nerifolia	Prune hard back to 300 mm.
	Jasminum sambac	Prune hard back to 300 mm.
	Jasminum mesnyi	Thin out stems.
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	Catharanthus roseus	Prune hard back to 300 mm.

Timing	Plant Species	Pruning Requirement
March	Trees:	
	All	Remove dead wood and crossing branches. Clear trunks of adventitious budding.
	Conifers:	
	All	Remove dead branches.
	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	All	Remove dead wood
	Ervatamia divaricata	Prune to 750 mm to encourage dense bushy growth of a natural form.
	Rhodomyrtus spp.	Prune to 900 mm maintaining a natural free branching form.

	Tecomaria spp.	As hedge: prune to shape as specified. As shrub: prune to 600 mm.
	Small Shrubs:	
	All	Remove dead wood.
	Cuphea hyssopifolia	Prune to 200 mm.
	Eranthemum spp.	Prune to 450 mm to encourage dense, basal branching.
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	All	Remove dead shoots and wood.
	Lantana montevidensis	After flowering prune back as necessary to maintain a tight cushion form or tight overhanging form if planted in balcony planters.
	Climbers:	
	All	Remove dead wood and withered leaves. Thin out when overcrowded.
	Allamanda cathartica	Prune hard back to 600 mm
	Bougainvillea spp.	Moderate pruning to remove old wood.
	Malvaviscus arboreus	Prune hard back to 900 mm.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
April	Trees:	
	Callistemon spp.	Light pruning.
	Eucalyptus spp.	Light pruning.
	Palms:	
	All	Remove dead fronds.
	Bamboos:	
	All	Remove dead wood.
	Large Shrubs:	
	Agave spp.	Remove lower dead leaves.
	Cordyline spp.	Remove dead leaves.
	Duranta spp.	As hedge: prune to shape as specified. As shrub: remove dead wood.
	Hibiscus spp.	Prune hard back to 900 mm.
	Ligustrum sinense	As hedge: prune to shape as specified.
	Malvaviscus spp.	As hedge: prune to shape as specified. As shrub: prune to 900 mm.

	Schefflera arboricola	Shorten leggy branched by ½ to ⅓. Light pruning to encourage dense, balanced, bushy, natural growth form.
	Thevetia spp.	Prune to 900 mm.
	Small Shrubs:	
	Eranthemum spp.	Prune to 450 mm to encourage dense, basal branching.
	Nandina spp.	Remove dead leaves
	Ground Cover:	
	Wedelia trilobata	Prune hard back to prevent Wedelia from climbing over other plants. At edge of planter, cut back to 100 mm overhang.
	Aquatic:	
	All	Remove dead leaves and stems

Timing	Plant Species	Pruning Requirement
May	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Brunfelsia calycina	Prune hard back to 300 mm, after flowering.
	Melastoma spp.	Light pruning.
	Murraya spp.	Light pruning to remove rough foliage.
	Nerium spp.	Prune to 900 mm.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	Lantana montevidensis	Light pruning to maintain tight balanced form.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
June	Palms:	
	All	Remove dead fronds.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	Wedelia trilobata	Prune hard back to prevent Wedelia from climbing over other plants. At edge of planter, cut back to 100 mm overhang.
	Aquatic:	

	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
July	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Agave spp.	Remove lower dead leaves.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
August	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Acalypha spp. (except A.hispida)	Prune to reduce height to 500 mm.
	Cordyline spp.	Remove dead leaves.
	Small Shrubs:	
	Allamanda nerifolia	Prune hard back to 300 mm.
	Nandina spp.	Remove dead leaves.
	Ground Cover:	
	Gerbera jamesonii	Prune hard back to soil level
	Lantana montevidensis	Moderate pruning to maintain tight balanced form.
	Liriope spicata	Remove dead foliage.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
September	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Dichroa febrifuga	Prune to 500 mm to encourage dense basal branching but maintain a natural free branching form.
	Schefflera arboricola	Shorten leggy branches by 1/2 or 1/3.
	Small Shrubs:	

	Nandina spp.	Light pruning to encourage dense, balanced, bushy, natural growth form. Remove dead leaves.
	Ground Cover:	
	Wedelia trilobata	Prune hard back to prevent Wedelia from climbing over other plants. At edge of planter, cut back to 100 mm overhang.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
October	Trees:	
	All	Remove dead wood and crossing branches. Clear trunks of adventitious budding.
	Conifers:	
	All	Remove dead branches.
	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	All	Remove dead wood.
	Agave spp.	Remove lower dead leaves.
	Small Shrubs:	
	All	Remove dead wood.
	Nandina spp.	Remove dead leaves
	Ground Cover:	
	All	Remove dead shoots and wood.
	Climbers:	
	All	Remove dead wood, and withered leaves. Thin out when overcrowded.

Timing	Plant Species	Pruning Requirement
November	Palms:	
	All	Remove dead fronds.
	Large Shrubs:	
	Calliandra spp.	Prune to 750 mm after flowering.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
December	Palms:	
	All	Remove dead fronds.
	Livistona spp.	Remove old fruit branches.
	Phoenix spp.	Remove old fruit branches.
	Large Shrubs:	
	Cordyline spp.	Remove dead leaves.
	Small Shrubs:	
	Nandina spp.	Remove dead leaves.
	Aquatic:	
	All	Remove dead leaves and stems.

Timing	Plant Species	Pruning Requirement
As and when required	Herbaceous:	
	All	Cut back to ground level immediately after plant dies back for dormant period.

ESTABLISHMENT OPERATIONS

SLW9.W300.9 MAKING GOOD ERODED SEEDED AREAS

Make good any erosion of seeded, or hydroseeded, areas by broadcast sowing as SLW7.W530 or hydroseeding as EXT14.W310 as appropriate and carry out post application operations as specified.

SLW9.W310.9 WATERING

Water all planted areas so as to maintain a moist soil through the depth of the fabricated soil profile adequate to ensure satisfactory establishment and as a minimum:

1. For plants exposed to natural rainfall:
    a. Water during the first 12 months of EP, on every day that the rainfall is less than 5 mm per day except on the day following a day that rainfall exceeded 20 mm per day or when the fabricated soil profile is saturated;
    b. Water during the second 12 months of EP on every day that the rainfall is less than 2 mm per day except on the day following a day that rainfall exceeded 15 mm per day or when the fabricated soil profile is moist.
2. For plants NOT exposed to natural rainfall:

    Water every two to three days irrespective of the weather conditions during the whole EP.

Carry out watering either early mornings or late afternoon or both.

SLW9.W320.9 WEEDING

Keep all planted areas weed-free and:

1. During the first twelve months of EP, undertake a weeding operation at least once every three weeks during the wet season, and at least once every two months during the dry season;
2. During the second twelve months of EP, undertake a weeding operation at least once every month during the wet season, and at least once every two months during the dry season;
3. Replace any mulch or soil disturbed or removed during this process;
4. Maintain a circle of bare soil, 200 mm diameter greater than that of the tree trunk or plant stem, around all plant bases in grassed areas;
5. Collect all arisings resulting from these operations and remove from the Site to a properly designated tip.

SLW9.W330.9 FERTILIZING

1. During the first twelve months of the EP, carry out one applications of fertilizer during early summer, as SLW1.M110, at the following rates (±5%):
   a. 200 gm per semi-mature tree;
   b. 150 gm per heavy standard tree, large palm and large conifer;
   c. 100 gm per standard tree, light standard tree, medium size palm and medium size conifer;
   d. 50 gm per seedling tree, whip, small palm (up to 2000 mm high), small conifer;
   e. 30 gm for shrub, climbing plant and bamboo;
   f. 5 gm per ground cover and herbaceous plant;
   g. 25 gm/m² for grass area.
2. During the second twelve months of the EP, carry out two applications of fertilizer, one during early spring as SLW1.M110, and one during later summer as SLW1.M120, at the following rates (±5%):
   a. 200 gm per semi-mature tree;
   b. 150 gm per heavy standard tree, large palm and large conifer;
   c. 100 gm per standard and light standard tree, medium size palm and medium size conifer;
   d. 50 gm per seedling tree, whip, small palm, small conifer;
   e. 10 gm for shrub, climbing plant and bamboo;
   f. 5 gm per ground cover and herbaceous plant;
   g. 25 gm/m² for grass areas.
3. For the purpose of this clause the following definitions apply:

	Conifer height (mm)	Palm height (mm)
Large:	Above 3000	Above 4000
Medium:	Above 1200 but not above 3000	Above 2000 but not above 4000
Small:	Not above 1200	Not above 2000

4. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to PRE.B2.010 where relevant.

Option

1. Fertilizing with spent mushroom compost (SMC)

a. During the EP, carry out one application of SMC fertilizer every 6 months, as SLW1.M135, at the following dosage: Add SMC at a dose of 2% by volume by layering on the top soil;

b. These works shall include those trees and palms transplanted to the Site by the Employer's Direct Contractor, as refer to PRE.B2.010 where relevant.

SLW9.W340.9 TOP DRESSING TO GRASSED AREAS

Immediately after fertilizing, top dress all grass areas with top dressing, as specified at SLW7.M330, to smooth out minor depressions.

SLW9.W350.9 AERATION

1. Shrub areas, including bamboos, climbers and herbaceous plants: immediately after fertilizing, cultivate the soil by hand using a fork to a depth of 100 mm;
2. Ground cover areas: immediately after fertilizing lightly break up the soil by hand using a fork to a depth of 75 mm;
3. Grass areas: immediately before fertilizing aerate the soil by inserting a tine or fork to a depth of 100 mm at 200 mm centres.

SLW9.W360.9 MULCHING

Immediately after aeration, top up all shrub and ground cover areas, by adding mulch to match existing to the following minimum depths:

1. Shrubs, bamboo, climber and herbaceous plants: 25 mm;
2. Ground cover plants: restore to the original depth;
3. Plants in grassed areas: 25 mm in mulched circle.

SLW9.W370.9 AERATION AND MULCHING

Do not undertake aeration or mulching to ground cover areas once ground cover plants have successfully established and there are not visible bare areas of soil.

SLW9.W380.9 TOPPING UP GRAVEL MULCH TO TREE GRILLES

At three monthly intervals top-up gravel to match existing to fill the interstices of the tree grilles.

SLW9.W390.9 FIRMING UP

Firm up plants and tree stakes from time to time during the EP and particularly after heavy rain or wind.

SLW9.W400.9 TREE SUPPORTS

1. Tighten, slacken or replace tree ties, as SLW2.M330, as necessary for the healthy growth of the tree, and adjust or replace the trunk protection, as SLW2.M370 as necessary to prevent chafing of the bark;
2. Adjust guying turnbuckles as necessary to ensure guys are taut.

SLW9.W410.9 GRASS CUTTING

Cut grass by hand or machine, as SLW7.W630 and EXT14.W350 or otherwise instructed. These works shall include those existing grassed / hydroseeded area on Site:

1. During the main growing period (April to October): at least once per month at 100mm height;
2. During the dry season (November to March): at least twice at equal intervals at 100mm height;
3. Rake up and remove all cuttings from site to a properly designated tip within 24 hours after cut.

SLW9.W420.9 PRUNING PROGRAMME

Carry out pruning:

1. At the appropriate time of year for each species as scheduled in SLW9.W240;
2. Once each year of the EP, except when otherwise specified.

SLW9.W430.9 PRUNING PROCEDURES

Carry out pruning using sharp tools to give a clean cut, free from ragged edges and:

1. Ensure cuts are immediately above buds or branches and slope away from an outward facing bud;
2. Prune back branches, to the main stem to encourage bushy growth and improve flowering;
3. Remove dead, damaged or crossing branches and dead flower heads;
4. Retain the individual habit and shape of the plant, unless otherwise directed or the intention of the design is to form a clipped hedge;
5. Prune flowering shrubs by removing the shoots bearing the dead flower heads and/or the new growth dependant on species.

SLW9.W440.9 TREATMENT OF PESTS AND FUNGAL GROWTH

1. Regularly check all plant and grass areas for signs of insect attack or fungal infestation, whether or not the insects or fungi are injurious to the plants or only cause a nuisance. Pay particularly attention during known periods of activity;
2. Report immediately to the CM any signs of insect attack or fungal infestation, and carry on to identify, monitor, and assess the insect attack or fungal infestation and propose remedial measures according to prevailing guidelines on pest control laid down by AFCD and Guidelines on Occupational Safety and Health for Pest Control Operators laid down by Food and Environmental Hygiene Department (FEHD);
3. Post warning notices (e.g. poison, no-entry, name of pesticide, date and time of application, re-entry time etc.) at conspicuous locations to avoid the public from entering the area under treatment before and after spraying of pesticide. Inform Estate Management to notify residents on the application and on spray drift risks;
4. Effect remedial measures by applying pesticides approved by the CM in strict accordance with the manufacturer's recommendations and labelling instructions, and carry out associated arboriculture works to the infected and/or infested areas in the manner as stated in PRE.B8.1260 sub-clauses (5)(a) and (5)(c) to (g);
5. Take due care and have regard to the safety and convenience of the general public and carefully control the spraying of the chemical pesticide to avoid unnecessary dispersion;
6. Plant parts pruned from diseased plants shall not be stockpiled anywhere on the Site and shall be disposed of from the Site.

SLW9.W445.9 CLEARANCE OF EXISTING VEGETATED AREAS

Keep existing vegetated areas clear as EXT11.W110.

SLW9.W450.9 CARE OF INDOOR PLANTS

Clean the leaves of all indoor plants at least once a month, and fertilize as SLW9.W330.

SLW9.W460.9 CARE OF ARTIFICIAL PLANTS

Maintain artificial plants as follows:

1. Clean each leaf and keep tidy once per month;
2. Replace leaves when they are loose or missing.

SLW9.W470.9 MAINTENANCE OF PROTECTIVE FENCING

Regularly check protective fencing and immediately carry out all necessary repairs to ensure that fencing is maintained in good condition at all times.

SLW9.W480.9 REMOVAL OF PROTECTIVE FENCING

Remove temporary protective fencing during or at the end of the EP as Instructed.

SLW9.W490.9 REMOVAL OF STAKES

Remove stakes when the plant root system is sufficiently developed to support the plant at the end of the EP unless otherwise instructed.

SLW9.W500.9 REMOVAL OF HESSIAN BINDING TO TRANSPLANTED TREES

Remove hessian binding from trunk and large branches of transplanted trees as soon as satisfactory growth has occurred as Instructed.

SLW9.W510.9 FINAL INSPECTION

1. In the presence of the CM carry out an inspection and formal check of the Works at the end of the EP;
2. Carry out the last of the operations scheduled immediately prior to the final handover inspection;
3. On satisfactory completion of any outstanding defective and replacement work, a completion Certificate will be issued in accordance with Clause 53 of the "said Conditions"

MAINTENANCE FOR SAND BASED LAWN

SLW9.W610.9 GENERAL

Maintenance operations listed in SLW9.W620 to SLW9.W680 only apply to areas specified as “Sand Based Lawn”.

SLW9.W620.9 CONTROL USAGE

Control the usage with fence for turf establishment or recovery when instructed by the CM.

SLW9.W630.9 OVERSEED DURING DRY SEASON

Overseed with dry season grass seeds by hand / overseeding machine during onset of cooler months when instructed by the CM.

SLW9.W640.9 TURF MOWING

Mow the turf by machine, as SLW7.M350:

1. During the main growing period: mow at 32 mm once per week;
2. During the dry season: mow at 37 mm once per week;
3. Rake up and remove all cuttings from site within 24 hours after cut.

SLW9.W650.9 TOPDRESSING

Apply 6mm thick topdressing by spreader as per SLW7.M350 2 times per year and any additional operation when instructed by the CM with graded sand as per EXT12.M235.

SLW9.W660.9 DETHATCHING

Remove the thatch layer by following operation:

1. Verti-cutting: 1-2 times per year and any additional operation when instructed by the CM by machine as per SLW7.M350. The depth of the cutting should be set at about 25mm below the thatch layer;
2. Hollow-tine coring: once per year with aerator installed with 12mm diameter hallow tine;
3. Solid-tine coring: once every 2 months with aerator installed with 6mm diameter solid tine.

SLW9.W670.9 SPIKING

Spike the grassed area with hand spiker, as SLW7.M350 once every 2 months and any additional operation when instructed by the CM.

SLW9.W680.9 FERTILIZATION

Apply compound fertilizer as per SLW1.M110 monthly.

ELE1.1 APPLICATION OF SPECIFICATION

ELE1.1.010.9 PRELIMINARIES

This Specification and this Worksection ELE1 in particular should be read in conjunction with Preliminaries for Building Services Sub-contracts.

ELE1.1.020.9 APPLICATION TO SYSTEMS

1. This Worksection ELE1 of this Specification is applicable to the whole of the Sub-contract Works while the other Worksections are applicable to the Systems described in the respective Worksection;
2. Worksection ELE2, which specifies general system requirements should be read in conjunction with subsequent Worksections of this Specification which are reference Worksections and define details of installations.

ELE1.2 THE WORKS

ELE1.2.010.9 SITE OF THE WORKS

The site of the Works is given in the Project Specific Specification.

ELE1.2.020.9 SCOPE OF THE WORKS

The scope of the works is given in the Project Specific Specification.

ELE1.3 CONTRACT DOCUMENTATION

ELE1.3.010.9 DRAWINGS AND DOCUMENTS

1. A Schedule of the Sub-contract Drawings is included in Appendix 'P';
2. The tenderer's attention is also drawn to the latest revision of the Standard Lighting Fitting Schedule issued by the Housing Department;
3. The Schedule is available for inspection at the Building Services Section, Housing Department during normal office hours upon application to the Contract Manager;
4. The Sub-contract Drawings and the Schedule shall hereinafter be referred to as the Drawings.

ELE1.3.020.9 TECHNICAL INFORMATION SUPPLIED WITH TENDER AND SUB-CONTRACTOR'S RESPONSIBILITY

1. All technical information supplied with the tender, including the tenderer's proposed design and the materials offered, is for tender assessment only;
2. Acceptance of the tender will not relieve the Sub-contractor of his responsibility for the proper working of the installation to meet the specified requirements in compliance with the Sub-contract documents to the entire satisfaction of the Contract Manager;
3. In the event of the installation being, in the opinion of the Contract Manager, not in compliance with the specified requirements, the Sub-contractor shall modify his design, replace any unsatisfactory materials and do everything necessary for compliance with the specified requirements at his own cost.

ELE1.3.030.9 DEFINITIONS AND ABBREVIATIONS

In this Specification the word "shall" is mandatory, the word "will" is informative, the word "should" is advisory and the word "provide" means supply and fix, or supply and install. In addition the following words shall have meanings herein assigned:

1. "Authority"

   means Hong Kong Housing Authority.

2. "Indicated"

   means indicated elsewhere in the Specification or on the Drawings.

3. "or Equal" or "or Similar"

   means having similar characteristics and Specification, as regards type of construction, performance, general appearance and standard of quality of manufacture.

4. "Drawing"

   means the drawings referred to in the Specification and any modification of such drawings Approved by the Contract Manager and such other drawings as may be, from time to time, furnished or Approved.

5. "Standard Drawings"

   means the drawings prepared by the Authority to show detailed arrangements of the common standard installations.

6. "EMSD"

   means the Electrical and Mechanical Services Department.

7. "WSD"

   means the Water Supplies Department.

8. "FSD"

   means the Fire Services Department.

9. "IET"

   means the Institution of Engineering and Technology UK.

10. "CSA"

    means the conductor cross-sectional area.

11. "BSI"

    means the British Standards Institution.

12. "BS"

    means British Standards, including British Standard Specifications and British Standard Codes of Practice published by the British Standards Institution.

13. "EN"

    means European Standard.

14. "ISO"

    means International Organization for Standardization Publications.

15. "IEC"

    means International Electrotechnical Commission Publications.

16. "BS EN"

    means European Standard adopted by the British Standards Institution to replace any relevant British Standard.

17. "ASTM"

    means American Society for Testing and Materials.

18. "ANSI"

    means American National Standards Institution.

19. "PASS"

    means Performance Assessment Scoring System.

20. "BSPASS"

    means Building Services Performance Assessment Scoring System.

ELE1.3.040.9 SINGULAR AND PLURAL

Words importing the singular only also include the plural vice versa where the context requires.

ELE1.4 COMPLIANCE WITH REGULATIONS AND STANDARDS

ELE1.4.010.A STATUTORY REGULATIONS

The Sub-contractor shall comply with the latest edition of all relevant Ordinances and Regulations together with any amendments made thereto, Laws of Hong Kong and shall be responsible for giving notifications to the appropriate authorities and paying all fees in accordance with the Sub-contract.

The following are particularly relevant:

1. Electricity Ordinance Chapter 406, and other subsidiary legislation made under the Ordinance;
2. Regulations of the Telecommunication Authority, Government of Hong Kong;
3. Buildings Energy Efficiency Ordinance (Cap. 610);
4. Energy Efficiency (Labelling of Products) Ordinance Chapter 598;
5. Fire Safety (Commercial Premises) Ordinance and Fire Safety (Buildings) Ordinance;
6. Dangerous Goods Ordinance and Dangerous Goods (General) Regulations;
7. Occupational Safety and Health Ordinance, Chapter 509, and other subsidiary legislation made under the Ordinance;
8. Factories and Industrial Undertakings Ordinance, Chapter 59, and other subsidiary legislation made under the Ordinance;
9. Construction Site (Safety) Regulations;
10. Construction Site Safety Manual issued by the Development Bureau, the Government of the HKSAR;
11. All regulations, code of practices and guidelines on safety issued by the Labour Department from time to time;
12. Other relevant Ordinances and Regulations, Laws of Hong Kong;
13. Code of Practice for the Electricity (Wiring) Regulations (hereinafter referred to as the Electrical CoP);
14. Guidance Notes for the Electrical Products (Safety) Regulation (hereinafter referred to as the Electrical Product Guidance Notes), which applies to all electrical products designed for household use and supplied in Hong Kong;
15. Codes of Practice for minimum Fire Service Installations and Equipment and Inspection, Testing and Maintenance of Installations and Equipment, and Circular Letters issued by the Fire Services Department (hereinafter referred to as Fire Services COP);
16. Code of Practice for Energy Efficiency of Building Services Installation, issued by the Electrical and Mechanical Services Department (hereinafter referred to as the BEC).

ELE1.4.020.9 STANDARDS

All materials and workmanship shall comply, where applicable, with all relevant sections, together with any revisions or amendments made thereto, of the following:

1. The Supply Rules issued by the respective Supply Company currently in operation in Hong Kong (hereinafter referred to as the Supply Rules);
2. 17th Edition of the Regulations for Electrical Installations, issued by the IET (hereinafter referred to as the 17th Edition IEE Wiring Regulations). The 17th Edition IEE Regulations was jointly published by the BSI and the IET as BS 7671(hereinafter referred to as BS 7671) and is the general standard now referred to in this Specification. Reference is also made to Guidance Notes published by the IET for use in conjunction with BS 7671;
3. Appropriate British Standards / International or National Standards / Code of Practice subject to clause ELE1.4.040. When a British Standard quoted in this Specification has been wholly or partially superseded by another equivalent or similar British Standard, the Sub-contractor is allowed to offer material in compliance with the latter in lieu for the Contract Manager's Approval;
4. Relevant parts of the HKHA Specification Library for Building Works (hereinafter referred to as the HKHA Building Works Specification) which may be viewed during normal office hours in the Authority's offices upon application to the Contract Manager;
5. General Technical Specifications for Monochrome and Colour Closed Circuit Television Systems (Specification No. ESG 14 March 2017 Edition) issued by the Electronic & Data Communication Division, Electrical and Mechanical Services Department, Hong Kong;
6. General Specification for Public Address System (Specification No. ESG11 Issue No. 5 October 2016 and Amendment 4 October 2016) issued by the Projects Division, Electrical and Mechanical Service Department, Hong Kong (hereinafter referred to as the General PA Specification);
7. Other International or National Standard Specifications as detailed in ELE1.4.050 (hereinafter referred to as Equivalent Standards).

ELE1.4.030.9 PRECEDENCE

In case of conflict between the requirements among the publications referred to in ELE1.4.010 and ELE1.4.020, interpretation shall be in accordance with the following order of preference unless otherwise specified or directed by the Contract Manager:

1. Ordinances and subsidiary legislations, Regulations, Laws of Hong Kong;
2. The Project Specific Specification and / or the contract documents for a particular project;
3. The Specification and/or the Drawings;
4. The Electrical CoP;
5. Electrical Product Guidance Notes;
6. Supply Rules;
7. BS 7671 when specified;
8. British Standard Specifications and Codes of Practice;
9. Equivalent standard;
10. HKHA Building Works Specification.

ELE1.4.040.9 APPLICATION OF BRITISH STANDARDS/INTERNATIONAL OR NATIONAL STANDARDS / CODE OF PRACTICE

1. The date/year of British Standards (BS)/International or National Standards / Codes of Practice (CP) shall be referred to Appendix 1 of the Specification. Where it is not specified in the Specification, it shall be deemed to refer to any valid or latest version, and any applicable amendments to that version;
2. Where the date/year is specified, due to intended purposes, the specified version and any amendments to that version shall be compiled with unless otherwise approved by Contract Manager;
3. "Head standards" (HS) are not dated because they do not contain any technical content. However reference to a head standard invokes all relevant extant "parts" of that standard which are themselves dated. Reference to head standards is a practicable method of using a general BS reference in situations where detailed reference to each part would be cumbersome.

ELE1.4.050.9 OTHER INTERNATIONAL OR NATIONAL STANDARD SPECIFICATIONS

Materials or equipment manufactured to other International or National Standard Specifications (Equivalent Standard) may be considered for acceptance provided that:

1. The Equivalent Standard shall be no less stringent than the corresponding BS; and
2. The materials or equipment shall be compatible, in all respects, with and comply with the corresponding BS; and
3. The following documents shall be produced when required:
    a. An English translation of the Equivalent Standard, certified true by the Equivalent Standard issuing organization or an acceptable authority;
    b. A comparison table highlighting the differences between the Equivalent Standard and the corresponding BS.

ELE1.4.060.9 TESTING AND CERTIFICATION

1. Unless otherwise specified, equipment shall be type-tested in accordance with the testing requirements as stipulated in the appropriate recognised standard as stipulated in the Electrical CoP;
2. Test certificates for each type test complete with reports and drawings, where applicable, shall be produced when required, to prove to the satisfaction of the Contract Manager of the compliance with the recognised standard. If the original documents are not produced in English, an English translation of the documents, certified true by the issuing organisation or an acceptable authority, shall be produced when required;
3. For the purpose of product testing and certification, the following interpretation shall apply:
    a. "Independent" shall mean not owned, managed or operated, either in whole or in part, by the manufacturer or its agents;
    b. "Accredited Laboratory" shall mean a laboratory accredited to carry out the specified tests by:
        i. IECEE (IEC System for Conformity Testing to Standards for Safety of Electrical Equipment) CB Scheme; or
        ii. Hong Kong Accreditation Service (HKAS) or Hong Kong Laboratory Accreditation Scheme (HOKLAS); or

iii. Other equivalent national laboratory accreditation schemes which have mutual recognition agreements with HKAS/HOKLAS as stipulated in the Electrical CoP.

c. "Short Circuit Testing Organisation" shall mean:

i. The Association of Short Circuit Testing Authorities (ASTA); or

ii. NV tot Keuring van Elektrotechnische Materialen (KEMA); or

iii. Association des Stations d'Essais Francaises d'Appareillage (ASEFA); or

iv. An Accredited Laboratory; or

v. Other short-circuit testing authorities internationally recognized as having equal standing as ASTA.

d. "Equivalent Quality Surveillance Scheme" shall mean equivalent quality surveillance schemes internationally recognized as having equal standing as the specified scheme(s).

ELE1.4.085.9 CODE OF PRACTICE FOR ENERGY EFFICIENCY OF BUILDING SERVICES INSTALLATION

1. All materials and workmanship, where specified, shall comply with the BEC;
2. The Sub-contractor shall provide all necessary information and document to the CM for Registered Energy Assessor’s preparation of all relevant submission as required under the Buildings Energy Efficiency Ordinance (Cap. 610);
3. Attend and provide necessary equipment for random check and site check upon requested by the CM.

ELE1.5 CONDITIONS OF SUPPLY

ELE1.5.010.9 ELECTRICITY SUPPLY

Unless otherwise specified, the complete electrical installation shall be suitable for operation under the supply system with a nominal frequency of 50 Hz and nominal voltage of 380V, 3-phase and 220V, single phase within the variation limits as declared by the local Supply Companies.

ELE1.5.020.9 SERVICE CONDITIONS

The complete electrical installation shall be suitable for use under Hong Kong climatic conditions with relative humidity and ambient temperature as shown below:

1. Relative Humidity: up to 0.99 saturation;
2. Ambient Temperature: peak from minus 5℃ to plus 40℃ for 4 hours continuously with an average from 0℃ to plus 35℃ over only 24 hours period.

ELE1.6 MATERIALS AND EQUIPMENT

ELE1.6.010.9 METRIC UNITS

Materials shall be of metric unit.

ELE1.6.020.9 SUBMISSIONS FOR APPROVAL

1. The Sub-contractor shall submit catalogues, technical information, certificate of safety compliance and samples of the materials proposed for Approval as required by the Contract Manager. The Sub-contractor shall also read in conjunction with the associated requirements stipulated at Preliminaries for Building Services Sub-contracts;
2. The Sub-contractor shall ensure the availability of the certificate of safety compliance for all proposed household products, prior to the submission for approval;
3. Approval of equipment will not be considered until and unless proper rating/type of sample complete with detailed information/technical data such as equipment catalogue, manufacturer's specification and certificates, when required are submitted for examination.

ELE1.6.030.9 SELECTION OF EQUIPMENT

1. Selection of equipment shall be based on this Specification and technical data contained on the Drawings for a particular installation;
2. Where items of equipment are interconnected to form an integral part of the complete electrical installation, their characteristics of performance and capacities shall be so matched as to give efficient, economical, safe and reliable operation of the complete electrical installation.

ELE1.6.040.9 EQUIPMENT CATALOGUES AND MANUFACTURER'S SPECIFICATIONS

1. Equipment Catalogues and manufacturers' Specification related to the proposed equipment shall be in the English language, specific and shall include all information necessary for the Contract Manager to ascertain that the equipment complies with this Specification and Drawings. Data and sales catalogue of a general nature will not normally be accepted;
2. Equipment catalogues and manufacturers' specifications must be submitted for the examination by and Approval of the Contract Manager before any equipment is to be ordered.

ELE1.6.050.9 CONSISTENCY

All equipment of the same category shall be the product of the same manufacturer and shall preferably be of the same colour scheme throughout.

ELE1.6.060.9 RESTRICTED USE OF ASBESTOS PRODUCTS

Asbestos or products containing asbestos shall not be used without prior Approval.

ELE1.7 WORKMANSHIP

ELE1.7.010.9 TRADESMEN

All tradesmen must be experienced in the trade and the works carried out shall be consistent with good practice in Hong Kong and to the satisfaction of the Contract Manager.

ELE1.7.020.9 TOOLS AND INSTRUMENTS

1. Proper tools shall be used to carry out the electrical installations;
2. Adequate and accurate testing/measuring instruments shall also be used to demonstrate compliance of the electrical installations with the relevant specifications and regulations;
3. The Contract Manager has the right to stop any work on which the correct tools and/or instruments are not being used;
4. Instruments used for acceptance test shall be calibrated at appropriate intervals and/or as specified in Project Specific Specification.

ELE1.7.030.9 SAFETY ON SITE

All works shall be carried out in such a manner as to comply with all regulations together with any amendments made thereto on safety aspects. These include but are not limited to the following:

1. Construction Sites (Safety) Regulations;
2. Factories & Industries Undertakings Electricity Regulations;
3. Electricity Ordinance, Chapter 406;
4. IEC 60364-7-704: Construction and Demolition Site Installation.

ELE1.7.040.9 GUARD AND RAILING FOR MOVING OR ROTATING PARTS OF EQUIPMENT

1. All moving or rotating parts of equipment shall be provided with an Approved guard and railing complying with the Factories & Industrial Undertakings (Guarding and Operation of Machinery) Regulations, published by the Labour Department, together with any amendments made thereto;
2. Guards shall be rigid and of substantial construction and shall consist of heavy mild steel angle frames, hinged and latched with either heavy galvanized mild steel wire crimped mesh securely fastened to frames or galvanised sheet metal of 1.2 mm minimum thickness;
3. All apertures shall be such that finger access to dangerous parts is not possible.
4. All sections shall be bolted or riveted;
5. Railings shall be 32 mm galvanized mild steel pipe and rail fittings.

ELE1.7.050.9 IDENTIFICATION OF CABLES AND CONDUITS

1. Cables for control circuits, inter-communication circuits, signalling circuits, and bell wiring shall be identified as required for each particular circumstance. Cables for power and lighting circuits shall be identified in accordance with the Electrical CoP Code 13D;

2. Electrical conduits, where required to be distinguished from pipelines of other services, shall use orange as the basic identification colour in compliance with BS 1710.

ELE1.7.060.9 SAMPLE FLATS AND SAMPLE WING

During the construction for domestic building blocks, a specified sample flats and wing located on a typical floor and construction mock-up will be required to be completed by the Main Contractor including the flats, the corridor, the flights of common staircase leading to the floors immediately above and below the sample wing and the lift lobby etc. If necessary, flats at the adjacent wing may also be selected. The Sub-contractor shall complete the electrical installations in the specified sample flats, sample wing and construction mock-up in coordination with the Main Contractor to cope with the construction programme. The proposed samples and details of electrical installations in the sample flats and the sample wing shall be submitted to the CM for approval prior to commencement of works. The Sub-contractor shall be responsible to replace any electrical installations which are found damaged or deformed and to carry out the necessary adjustments to restore to as-new condition before building completion.

ELE1.8 SITE MANAGEMENT

ELE1.8.010.9 APPOINTMENT OF SUPERVISING ENGINEERS, SITE SUPERVISORS AND BLOCK FOREMEN

1. Immediately upon the award of the Sub-contract, the Sub-contractor shall appoint Supervising Engineer(s) and Site Supervisor(s) specified in ELE1.8.020 and ELE1.8.030 who shall be both English and Cantonese speaking and in the Sub-contractor's full-time employment for the supervision of the Sub-contract Works to the satisfaction of the Contract Manager;
2. The Sub-contractor shall also identify Block Foremen as in ELE1.8.035;
3. Immediately after the award of the Sub-contract, the name, qualifications and curriculum vitae of the Supervising Engineer(s) and Site Supervisor(s) shall be submitted for Approval to the satisfaction of the Contract Manager;
4. None of the Supervising Engineer(s) and Site Supervisor(s) shall be removed from their respective duties without prior Approval;
5. In the event of any of them being unsatisfactory, in the opinion of the Contract Manager, or misconducting themselves, they shall be removed forthwith and be replaced by suitable substitutes to the Contract Manager's satisfaction within seven days from the Contract Manager's instruction in writing.

ELE1.8.020.9 SUPERVISING ENGINEERS

1. Unless otherwise specified, the Sub-contractor is to employ for the supervision of all works on Site, at least one qualified Supervising Engineer. The Supervising Engineer shall generally represent the Sub-contractor in all respects of the Sub-contract and assume the following duties:
    a. Coordinate and supervise the work in the Sub-contractor's office and the Site;
    b. Develop, in conjunction with the Main Contractor, schedules of installation drawings, builder's work drawings, material submission and delivery, statutory submissions, the programme of works and testing and commissioning programme, for approval by the CM;
    c. Liaison with the CM and other parties;
    d. Attend at the office of the CM for the finalisation of drawings and equipment selection;
    e. Attend progress meetings and coordination meetings;
    f. Monitor and supervise installation drawings submission, builder's work drawings submission, material submission and delivery, statutory submissions in accordance with the respective submission schedules. Submit progress reports to the CM monthly or at shorter intervals when such requested by the CM;
    g. Check and confirm the installation drawings, builder's work drawings and material submissions are suitable for the installation works and in compliance with the requirements of the Sub-contract;
    h. Examine, verify and confirm in writing to the CM on a monthly basis that the material delivered to the Site under the Sub-contract has been approved by the CM;
    i. Certify all material delivery vouchers in accordance with PRE.B12.280 of the Main Contract;

j. Prepare, in conjunction with the Main contractor, the delivery method statements for delivery of plant and equipment;

k. Undertake all site test and commissioning of the Sub-contract Works and endorse the test and commissioning reports to confirm that he is satisfied with the completeness, workmanship and performance of the installations which comply fully with the Sub-contract requirements, prior to submission to the CM.

2. Qualification requirements:

At least one year of proven post qualification at supervisory level on electrical installations in buildings with the following qualification:

a. Registered Professional Engineer (Electrical or BS Discipline) under the Engineers Registration Ordinance; or

b. Member of the Hong Kong Institution of Engineers (Electrical or BS Discipline) elected after 5 December 1975; or

c. Member (Electrical or BS Discipline) of an overseas engineering institution which has signed agreements for the mutual recognition of qualifications with the Hong Kong Institution of Engineers.

3. The Supervising Engineer(s) shall be highly competent and experienced, and shall be given a high level of delegated authority such that they can take decisions, including those involving expenditure.

ELE1.8.030.9 SITE SUPERVISORS

1. Unless otherwise specified, the Sub-contractor is to employ at least one qualified Site Supervisor. The Site Supervisor(s) shall be stationed on site;

2. Qualifications requirements:

Registered Electrical Worker Grade B(2) or above registered under the Electricity Ordinance.

ELE1.8.035.9 BLOCK FOREMEN

The Sub-contractor is to identify from time to time one Block Foreman per block who shall be answerable to the Contract Manager for the quality and progress of works for the block. The Block Foreman shall be stationed on Site. This Block Foreman and the Site Supervisor shall not be the same person.

ELE1.8.040.9 BUILDING SERVICES PERFORMANCE ASSESSMENT SCORING SYSTEM

1. The Housing Authority has adopted a Building Services Performance Assessment Scoring System (BSPASS) to assess the performance of building services Nominated Sub-contractors undertaking works for the Authority;

2. BSPASS will be operated in this Sub-contract and assessments by Building Services PASS Assessment Team (BSPAT) or other staff of the HA will be conducted at quarterly intervals or other intervals as required by the Contract Manager;

3. Upon the Contract Manager's notification, the Sub-contractor's authorised representative shall attend all such assessments;

4. The Sub-contractor shall provide all necessary attendance, and all necessary measuring instruments, in addition to those specified in PRE.BS1.630, etc. to facilitate the BSPASS assessment as stipulated in the relevant BSPASS manuals;

5. In addition, the Sub-contractor shall also provide labours for the opening up and re-fixing of the works, the operation of the equipment and the testing, etc. as required by the assessment.

ELE1.8.050.9 COORDINATION WITH MAIN CONTRACTOR ON INTENDED CONSTRUCTION METHOD FOR INTERNAL PARTITION WALLS (PANEL WALLS) IN DOMESTIC FLATS, PRECAST CONCRETE WALL & PRECAST FACADE PANEL

The internal partition walls (panel walls) in the domestic flats, precast concrete walls and the precast facade panel are of prefabricated panel wall construction. The Sub-contractor shall coordinate with the Main Contractor on their intended panel wall construction method and makes necessary allowance for the conduit installation work. The provision and installation of GI / PVC conduits and conduit fittings on internal partition walls (panel walls), precast concrete walls and precast facade panel should be carried out by Main Contractor and the proposed installation details are shown on Drawings. The Sub-contractor should ensure that all the conduit systems are in compliance with the Specification & Drawings.

ELE1.8.060.9 MODIFICATION WORKS IN NON-DOMESTIC PREMISES DURING MAINTENANCE PERIOD

1. During the Maintenance Period, the Employer may employ other workmen or contractors to carry out modification works pertaining to the installation to suit the fitting out works of the tenants;
2. The Sub-contractor shall provide the necessary attendance, including operation of the installation, as instructed by the Contract Manager to facilitate such modification works;
3. The costs of the attendance will be determined by a fair valuation made by the Contract Manager in conjunction with the Sub-contractor and paid for separately;
4. The employment of other workmen or contractors by the Employer for the modification of the installation shall not in any way relieve the Sub-contractor of his responsibilities for the maintenance and defects of the Works, other than those parts which have been modified by others, in accordance with the Contract.

ELE1.8.070.9 NOTICES AND FEES

The Sub-contractor shall comply with the regulations and requirements of all relevant Authorities such as Fire Services Department, the Building Authority, the Telecommunications Authority, the Electrical and Mechanical Services Department, Utility Companies, etc and shall be responsible for giving notifications to the appropriate Authorities and for paying all fees levied; such fees shall be included in the Tender Price, and also for collecting all necessary certificates and licenses for the installation.

ELE1.9 SITE SECURITY

ELE1.9.010.9 SUB-CONTRACTOR'S STORE ROOMS

1. In addition to the storage shed to be constructed by the Main Contractor as required under PRE.BS1.380 of the Preliminaries for Building Services Sub-contracts, the Main Contractor will also hand over to the Sub-contractor the switchroom of each building six months after the concreting of the structural frame and ceiling slab of the respective main switchroom, or four months before the completion of each building, whichever is the earlier;
2. The Sub-contractor may make use of the rooms for storage of materials, subject to the progress of the Works not being affected. The Sub-contractor shall make available to the Contractor the builder's work drawings and programme in good time to enable the Contractor to complete his works necessary for the handover of the rooms;
3. Immediately after the handover of the rooms, the Sub-contractor shall lock the doors with a good quality padlock. The padlock shall have proven reliability and in-service records for the Housing Authority projects. The Sub-contractor shall also provide and maintain in good operating conditions a burglar alarm system as specified in ELE1.9.020;
4. The Sub-contractor shall remove the padlocks and burglar alarm system upon completion of the respective building and upon Approval by the Contract Manager.

ELE1.9.020.9 BURGLAR ALARM SYSTEM FOR SUB-CONTRACTOR'S STORE ROOMS

The Sub-contractor shall provide the following whole burglar alarm system for each Electrical Sub-contractor's store room during the period as specified in ELE1.9.010:

1. System description

   The system shall consist of:

   a. Volumetric motion detector;

   b. Magnetic door contacts;

   c. Burglar alarm panel;

   d. Self activated bell;

   e. Dedicated-line remote alarm transmission circuit.

2. Volumetric motion detector

   a. Volumetric detectors used shall make use of dual technology, including passive infra red and microwave/ultrasonic wave, such that the possibility of false alarm will be reduced to the minimum;

   b. There shall be at least one detector installed facing each cable trench or any other weak points or openings.

3. Magnetic door contact

   Surface-mounted magnetic door contacts shall be installed on the inner door frame. It will be used to detect door open.

4. Control panel

The control panel shall be installed inside the protected room. It shall be powered by AC mains and backed up by stand-by battery sufficient for 8 hours. The control panel shall have real time clock display and alarm latching display. The panel shall be able to be armed or disarmed by mechanical key or by keying in secret code via the panel keypad. The panel shall also be built-in with entry and exit delay timer, such that the timer will be triggered by the entry, exit route sensors.

5. Alarm annunciator

   a. Self-activated alarm bell shall be installed on outstanding location on the outer wall of the protected room. The bell shall be housed in strong steel housing with anti-corrosion finishing and are tamper protect against removal of the lid, the bolt or attempted removal of the housing from the wall. The bell shall be self-powered by rechargeable battery. If input circuit is cut off, it shall give out annunciation. Upon activation it shall give out alarm sound level not less than 100 db at 1 metre distance. There shall also be a strobe light on the bell to provide visual warning;

   b. A cut off timer adjustable from 1 minute to 15 minutes shall be provided. Should the bell ring for the pre-set period, it shall be cut off by the timer. However, the strobe light shall remain flashing. Should the built-in battery voltage goes below the threshold limit, the bell shall give intermittent audio and visual warning to signify the need for battery replacement.

6. Dedicated line remote alarm transmission

   a. Alarm signal shall be transmitted to a remote central station. The signal shall be transmitted through dedicated lease-line. The alarm transmission line shall also be supervised, such that communication failure can be detected from the central station;

   b. The transmitter used shall have identity signals sent back to the central station such that compromising by direct swapping of transmitter shall not be possible. Communication data shall also be encrypted to deter compromising;

   c. The alarm signal shall be terminated in the central station which shall be manned by at least 2 persons any time. The central station shall enforce stringent security measures and meeting BS 5979 is preferred. The central station shall be operated by a well established and reputable security service company, the name of which shall be submitted to the Contract Manager for Approval;

   d. In the central station, there shall be records of telephone numbers of site guard post and keyholders. Should there by any alarm received by the central station, its operator shall call site guard and the keyholder. Upon notification, the keyholder shall return to the protected premises to investigate and reset the control panel. Should there be any suspected theft or burglary, the operator shall call the police. All telephone conversations with central station must be recorded and kept for at least 30 days for later reference.

7. Operating cost

   All operating costs for the burglar alarm system, including the rental charges for the lease-line, the charges for the remote central station etc. shall be borne by the Sub-contractor.

ELE1.9.030.9 MARKING OF RESIDUAL CURRENT CIRCUIT BREAKERS (RCCB)

The name of the estate and the phase number (e.g. LOK FU 5), or the suitable description of the contract, shall be indelibly marked on an external surface of the enclosure of the RCCB in capital letters of not less than 3 mm high. The marking shall not affect the appearance and performance of the RCCB. A sample of the marked RCCB shall be submitted to the Contract Manager for Approval prior to installation.

ELE1.10 RECORD DOCUMENTATION

ELE1.10.010.9 REQUIREMENTS FOR SUB-CONTRACTOR'S DRAWINGS

1. Size of drawings

   Drawings submitted by the Sub-contractor shall be of a standard size from A0 to A4 in accordance with BS EN ISO 5457. "As-fitted" drawings shall be of A0 or A1 size only.

2. Installation drawings

   The Installation Drawings shall detail and dimension the following, where relevant and also read in conjunction with Preliminaries for Building Services Sub-contracts:

   a. Site distribution, cable and busduct routes;

   b. General layout drawings giving accurate and dimensioned locations of all plant and equipment included in the Sub-contract;

   c. Schematic diagrams for main and sub-main distribution;

   d. Main switchboard details, including schematic diagram, component layout, busbar arrangement, compartmentation, conductor sizes, cabling arrangement, termination details, control diagram;

   e. Details of distribution boards and consumer units, including types and rating of protective devices, sizes and types of incoming and outgoing cables, circuit description;

   f. Busduct installation details showing connections, mounting details and setting out of all components including straight runs elbows, offsets, tap-off units, etc.;

   g. Prefabricated Branch Cables installation details showing connections, mounting details and setting out of all components including straight runs elbows, offsets, tap-off units, etc.;

   h. Lighting layouts for normal and emergency fittings, detailing positions, mounting methods, types of luminaires, switch positions and wiring connections;

   i. Conduit routes with conduit sizes, showing adaptable boxes, details of cables and circuit references (see ELE1.10.020);

   j. Trunking and cable tray routes with details of sizes, fixings, cables carried;

   k. Generator installation details, showing plant layout and sections, exhaust pipe details, fuel system details, acoustic treatment, control equipment;

   l. Earthing and equipotential bonding system with details of conductor sizes and routing, bonding arrangement;

   m. Lightning protection system with details of air terminations, down conductors and bonding;

   n. CABD, Security, CCTV, EAS, PA and carpark control systems, whichever included in the Sub-contract, with schematics, equipment details, cable routes, termination details, fixing details, etc.;

   o. Label schedules, showing wording and formats for the labelling of equipment and distribution board circuits;

   Operating and maintenance clearances for the equipment and their static and dynamic structural loading shall be shown on the installation drawings wherever necessary.

3. "As-fitted" drawings

   The "as-fitted" drawings shall be based on the full set of Approved Installation Drawings updated to show the actual positions and arrangement of all items installed. Any additional drawings which are considered necessary by the Contract Manager for showing the complete installation shall be included. The Drawings shall be drawn in black-ink lines on transparent linen or other Approved materials, suitable for reproduction of prints.

ELE1.10.020.9 CONDUIT RUN DRAWINGS

The Sub-contractor shall submit detailed conduit layout drawings for Approval prior to commencement of the installation. The Sub-contractor shall supply to the Contract Manager eight (8) sets of conduit run drawings after Approval.

ELE1.10.030.9 WORKING DRAWINGS AND AS-FITTED DRAWINGS

1. The Sub-contractor's attention is drawn to Preliminaries for Building Services Sub-contracts for installation drawings and ELE1.10.020 above;
2. Schematic wiring diagrams for the electrical installation of each building shall be provided and fixed properly to the satisfaction of the Contract Manager, in the locations hereunder. The diagrams shall be of A1 size minimum and each diagram shall be treated with acrylic varnish to prevent deterioration and mounted in an anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness;

System	Location of diagram
Electrical power distribution and associated systems	Main switchroom and near other main switches as required in compliance with the Electrical CoP
Security system	Meter room accommodating the main control equipment
Public address system	Adjacent to the main system amplifier

3. The complete set of as-fitted drawings shall consist of each of the drawings, which shall include but not be limited to the following:
   a. Site plan and underground cable route of telecommunication lines, supply company cables, road lighting layout plan;
   b. Schematic wiring diagrams;
   c. Electrical floor layout plans;
   d. Typical domestic flat layout plans;
   e. Schematic wiring diagram of public lighting;
   f. Public lighting layout plans;
   g. External lighting layout plans;
   h. Transformer room, main switch room and meter room layout plans;
   i. Installation details - lateral main, trunking and mounting methods;
   j. Lightning protection system;
   k. Schematic diagram for doorphone system;
   l. Control block diagram for doorphone system;

m. Security system – schematic diagram for all sub-systems (showing the type of integrated circuits transistors, diodes and other semiconductor devices, voltage rating and values of all passive components etc), one to one scale printed board layout and the arrangement of components on the circuit boards;

n. CCTV installation layout plan;

o. Security alarm installation;

p. Public address system;

q. CABD system - site layout plan (showing antenna position and direction) and signal field strength.

ELE1.10.040.9 DOCUMENTS AND TECHNICAL LITERATURE TO BE SUBMITTED AFTER COMPLETION

The Sub-contractor shall submit the following documents and technical literature to the Contract Manager for the whole installation and equipment provided under this Sub-contract which shall include, but not be limited to the following:

1. User manual consisting of:

   a. Information (catalogue, manual, instruction etc.) on special precautions/procedures/methods required on the use, operation, cleaning, servicing, maintenance, repair and replacement of all proprietary material and equipment installed such as air circuit breaker(s)/moulded case circuit breaker(s) including protection and instrumentation devices, lighting fittings, amplifiers and cameras. Requirements on proper use and operation for durability, safety and statutory consideration shall be clearly stated;

   b. A list of recommended spare parts;

   c. Testing and commissioning reports on the system and equipment installed (electronic copy in PDF format stored on recordable compact disc shall be provided in addition to hard copies).

2. Original certificate of warranty for any material, equipment and installation with warranty period last beyond Maintenance Period; and

3. Other items as required by the Contract Manager.

For public address system, apart from the documents stipulated above, three sets of operation and maintenance manuals with detailed circuit diagrams and descriptions shall be submitted to the Contract Manager one month before the commissioning of the installation.

ELE2.1 DOMESTIC BLOCKS

ELE2.1.1 APPLICATION

ELE2.1.1.010.9 BLOCKS

ELE2.1 applies to the domestic blocks covered by this Sub-contract unless otherwise specified in Project Specific Specification or Drawings.

ELE2.1.1.020.9 REFERENCE DOCUMENTS

The Sub-contractor shall provide the whole of the electrical installation in each of the blocks/buildings as detailed on the Drawings and in this Specification including Project Specific Specification. This section of the Specification should be read in conjunction with other Worksections.

ELE2.1.2 MAINS SUPPLY

ELE2.1.2.010.9 PROVISION BY SUPPLY COMPANY

1. The Supply Company will provide an independent 380V, 3-phase, 4-wire, TT system supply to each block/building;
2. The Sub-contractor shall provide durable labels at the main incoming circuit breakers and along the risers at all floor levels to indicate the source transformers as per the power supply company's requirements and as otherwise specified in Project Specific Specification.

ELE2.1.2.020.9 ATTENDANCE BY SUB-CONTRACTOR

The Sub-contractor shall provide all necessary attendance, complete with all necessary work, and enforce all safety measures required for the connection of supply.

ELE2.1.3 MAIN CUBICLE SWITCHBOARD

ELE2.1.3.010.9 PROVISION OF DETAILS

The main cubicle switchboard shall be provided as shown on the Drawings. The Sub-contractor shall submit a set of detailed installation drawings showing the proposed layout, positioning and construction of the cubicle switchboard for Approval prior to assembly. The proposal shall take into account the actual site conditions and Supply Company's requirements with regard to incoming supply termination, clearance space for installation, operation and maintenance, incoming cable/bars and outgoing cable routing, supporting framework, etc.

ELE2.1.3.020.9 INSTALLATION OF SUPPLY COMPANY'S ELECTRICITY METERS

The Sub-contractor shall apply, collect and install the Supply Company's electricity meters, and liaise with the Supply Company to ensure that the provisions for termination of the incoming supply cables/busbars and installation of the electricity meters are suitable and meet the Supply Company's requirements.

ELE2.1.3.030.9 OFF-SITE INSPECTION

Inspection of the cubicle switchboard may be carried out by the Contract Manager or his representative at the manufacturer's works during the construction stage.

ELE2.1.3.040.9 TESTS

Tests shall be carried out by the Sub-contractor upon completion in the presence of the Contract Manager or his representative prior to acceptance and delivery to Site.

ELE2.1.3.050.9 SUPPLY FEEDING FROM HEC

1. Unless otherwise specified on Drawings, the Sub-contractor shall supply and install the LV transit blocks and single cores XLPE/PVCI/PVCS power supply cables connecting to the incoming air circuit breakers;
2. For design using busbar trunking system, the Sub-contractor shall supply and install the LV transit blocks and busbar trunking system connecting to the incoming air circuit breakers;
3. The busbar trunking system shall comply with IEC 61439-1 and shall be assembled by the same manufacturer of the main cubicle switchboard;
4. The copper busbars shall be of 2500A TP and full neutral and housed in an enclosure of IP 31. The system and its installation details shall be submitted for Approval prior to installation.

ELE2.1.3.060.9 POWER FACTOR CORRECTION EQUIPMENT

1. When power factor correction equipment is required, a separate floor-standing cubicle housing the power factor correction capacitor bank and the associated equipment shall be provided within the main switch room as shown on the Drawings;
2. The power factor correction cubicle shall be manufactured/assembled by the same manufacturer of the main cubicle switchboard;
3. The Sub-contractor shall submit a set of detailed installation drawings showing the proposed layout, positioning and construction of the power factor correction cubicle for Approval prior to assembly.

ELE2.1.3.070.9 PAINTING SWITCHGEAR

All the switchgears fed from essential supply circuitry shall be painted in red.

ELE2.1.4 RISING MAINS AND SUB-MAINS DISTRIBUTION SYSTEMS

ELE2.1.4.010.9 SCOPE OF WORK

The Sub-contractor shall supply, install and connect rising mains and sub-mains distribution systems comprising cables, busbar/pre-fabricated branch cable risers, conduit and accessories, MCB distribution boards, busbar chambers, etc as shown on the Drawings and otherwise as specified in Project Specific Specification.

ELE2.1.4.020.9 BUSBAR/PRE-FABRICATED BRANCH CABLE RISING MAINS

The busbar/pre-fabricated branch cable rising mains shall be manufactured and designed for the particular job with all purpose-made fittings and accessories.

ELE2.1.4.030.9 BUSBAR/PRE-FABRICATED BRANCH CABLE RISERS

1. The Sub-contractor shall submit the manufacturer's drawings showing the details of the busbar/pre-fabricated branch cable risers to the Contract Manager or his representative for Approval prior to manufacture;
2. The busbar risers shall be securely fixed on the surface of the wall and shall be straight from the bottom to the top;
3. When the gap between a riser and wall is considerable due to uneven plastering or concrete at fixing point, the Sub-contractor shall install suitable packing or Approved galvanized steel brackets to which the trunking shall be fixed;
4. The minimum distance between the trunking case and the wall shall be 25 mm.

ELE2.1.4.040.9 FIXING ARMOURED CABLES

All armoured cables run on walls shall be fixed by cable cleats of the following types:

Cable Diameter (mm)	Type of Cable Cleat
dia. ≤ 50	1-bolt Fixing Type
dia. > 50	2-bolt Fixing Type

Also, the cables shall be fixed on wall by means of angle iron support or metal framework depending on actual site conditions.

ELE2.1.4.050.9 PAINTING SWITCHGEAR

All the switchgears fed from essential supply circuitry shall be painted in red.

ELE2.1.5 BRANCH-OFF CIRCUITS FROM RISING MAINS

ELE2.1.5.010.9 SCOPE OF WORK

The Sub-contractor shall supply, install and connect the TP & N branch-off circuits from the busbar/pre-fabricated branch cable rising mains comprising cables, TP & N fuse combination unit and MCB distribution board etc. in the meter rooms of each domestic floor and at other locations as shown on the Drawings and otherwise as specified in Project Specific Specification.

ELE2.1.6 RADIAL MAINS TO DOMESTIC UNITS

ELE2.1.6.010.9 THE INSTALLATION

1. The mains supply to each domestic unit on one floor shall be fed from the appropriate MCB distribution board in the meter room on the same floor or the other floor as shown on the Drawings;
2. Each circuit commencing from the respective double pole MCB shall be fed via the Supply Company's electricity meter to each individual domestic unit by PVC insulated cable in a cable containment system such as surface steel conduit/PVC conduit/trunking system as shown on the Drawings inside the meter room(s), and in concealed PVC conduit system from the meter room(s) to the consumer unit in each domestic unit;
3. The meter board for the installation of Supply Company's meter shall be provided and installed by the Sub-contractor;

4. The Supply Company's meters will be supplied and installed on the meter board in Meter Rooms at each floor by the Supply Company as shown on the Drawings. The Sub-contractor shall be responsible for providing connection and fixing facilities, at the position and ready for installing Supply Company's meter. The Sub-contractor shall check and ensure everything of the circuit is in an orderly manner before meter connection by the Supply Company.

ELE2.1.6.020.9 METER CONNECTION AND ENERGISATION FOR DOMESTIC FLATS

1. Before the installation and connection of the meters by Supply Company for the flats, the Sub-contractor shall switch off all the control switches i.e. the DP MCBs in the meter rooms and shall insulate properly any exposed conductors of the meter tails to the satisfaction of the Contract Manager;

2. The Sub-contractor shall also switch off all the main switches of consumer units in the flats and provide, next to each main switch, a temporary label/notice, in English and Chinese, as follows

   "Danger : Do not switch on the main switch unless the meter is connected and the electricity supply to this flat is ready. (Please check with the Management Office for the readiness of supply)."

   危險 : 在本單位電錶安裝和電源接駁妥當前切勿閉合(開)電源總掣 (有關電錶 / 電源接駁時間，請與管理處聯絡)

   The label/notice shall be legible and reasonably durable. Sample shall be submitted for Approval.

3. The Supply Company, before connecting the meters, will inspect and test the installation of the flats. The Sub-contractor shall provide all necessary attendance for such inspection and testing carried out within the Maintenance Period and shall pay all fees levied on retesting;

4. The Sub-contractor shall be responsible for switching on the supply circuits to individual flats subsequent to the installation of meters by the Supply Company. Immediately before switching on the supply to each flat, the Sub-contractor shall check to ensure that the switching will not cause any danger to other persons and the installation;

5. The Sub-contractor shall liaise with the Supply Co. and the Management Office for programming the meter connection and the switching operation before and within the Maintenance Period. The Sub-contractor shall complete the switching operation within 12 hours after collecting the daily return from the Management Office for those flats with the meter connected or upon notification by the Management Office. After the switching, the Sub-contractor shall return the record of flats energised to the Management Office immediately.

ELE2.1.7 INSTALLATION FOR DOMESTIC UNITS IN RENTAL BLOCKS

ELE2.1.7.010.9 SCOPE OF INSTALLATION

Each installation shall comprise a door bell and push, 13A 3-pin single and twin sockets, 20A DP switches, connection units, lampholders, lighting switches etc, to complete as shown on the Drawings and otherwise as specified in Project Specific Specification.

ELE2.1.7.020.9 WIRING SYSTEM

The Sub-contractor shall supply, install and connect a concealed PVC conduit wiring system for lighting and power points in each domestic unit, commencing from the surface mounted consumer unit as shown on the Drawings.

ELE2.1.7.050.9 ACCESSORIES

1. All electrical accessories shall be of flush type;
2. Inscription is not required on front plate of control switches feeding fixed electrical appliances in domestic blocks;
3. The door bell shall operate at extra-low voltage, comprising double wound transformer, bell and push etc. Sample of the door bell shall be submitted for Approval prior to ordering of material.

ELE2.1.7.060.9 CONSUMER UNIT

1. A plastic label to indicate the on and off of the main switch and the function of each MCB and spare way shall be provided in accordance with Worksection ELE28.1;
2. The range of instantaneous tripping current for MCB for the A/C unit shall be in accordance with IEC 60898-1 or BS EN 60898-1 - type C tripping characteristics;
3. The range of instantaneous tripping current for MCB for lighting and power shall be in accordance with IEC 60898-1 or BS EN 60898-1 – type B tripping characteristics;
4. The earthing terminal of the consumer unit shall be connected by protective conductor of adequate size PVC insulated cable as shown on the Drawings to the proper earthing terminal of the incoming supply system.

ELE2.1.7.070.9 CONDUIT FOR COMMUNICATIONS INSTALLATIONS

1. A concealed PVC conduit system complete with draw wire and accessories shall be provided by the Sub-contractor for the Fixed Telecommunication Network Services (FTNS), Communal Aerial Broadcasting Distribution (CABD) installation, Subscription Television Distribution Network (STDN) installation, Towngas Automatic Meter Reading (AMR) system and security system installation as shown on the Drawings;
2. The Sub-contractor shall take the roles of coordinating other neighbouring services and determine the exact concealed conduit routes for communications installations while those given on the Drawings are for indicative and tendering purposes.

ELE2.1.7.080.9 EQUIPOTENTIAL BONDING - GENERAL

1. The Sub-contractor shall provide a system of main equipotential bonding and local supplementary bonding for all exposed and extraneous conductive parts for each domestic unit in accordance with the Electrical CoP, BS 7671, Supply Rules and ELE17;
2. The Sub-contractor shall ensure the bonding for extraneous conductive parts is sound and the result complies with the Electrical CoP and BS 7671 by proper measurement with records at good time. For those parts of equipotential bonding system found not electrical conductive, the Main Contractor and the Sub-contractor shall be responsible for rectification of their own works as early as possible.

ELE2.1.7.085.9 MAIN EQUIPOTENTIAL BONDING

The water and gas main incoming pipes inside the domestic flat shall be bonded at their point of entry to the flat to the earth terminal of the consumer unit by cables in concealed PVC conduit system and surface wires as shown on the Drawings.

ELE2.1.7.090.9 LOCAL SUPPLEMENTARY BONDING

1. Local supplementary bonding shall also be provided for the exposed metal cold/hot water pipes and/or gas pipes in the flats, when they are not connected to the main pipes by reliable metal-to-metal joints of negligible impedance. Local supplementary bonding for these pipes inside pipe duct, under sink, cooking bench or below bath tub may be by surface wiring;
2. The Sub-contractor shall provide, local supplementary bonding for the following extraneous conductive parts, which are not exhaustive in the domestic flat as shown on the Drawings:
    a. Sink/combined unit/cooking bench;
    b. Windows;
    c. Louvers;
    d. Bathroom fittings.
3. Supplementary Bonding
    a. For sink/combined unit/cooking bench
        i. The Main Contractor will provide a 1.5 mm thick stainless steel earthing lug with a 5 mm diameter hole welded to each sink/combined unit/cooking bench;
        ii. The Sub-contractor shall provide the supplementary bonding for the sink/combined unit/cooking bench by surface wiring to the earthing terminal of the nearby extraneous/exposed conductive parts or BS 4662 or IEC 60670-1 box or the nearby fused connection unit via concealed PVC conduit to the BS 4662 or IEC 60670-1 box. For the former case, the bonding conductor shall be fixed by a 4 mm diameter stainless steel screw, washer and nut to the earthing lug.
    b. For windows and louvers
        i. The Main Contractor will provide at each of the extraneous conductive parts, a 20 mm wide, 1.5 mm thick hot-dip galvanized steel earthing lug one end of which will be fixed to the extraneous conductive part by 2 nos. M4 self-tapping stainless steel screws at 60 mm c/c and the other end with a 5 mm diameter hole provided, for the termination of the bonding conductor, will be extended to the nearby BS 4662 or IEC 60670-1 box via a recess slot;
        ii. The Sub-contractor shall provide the bonding conductor which shall be fixed to the earthing lug by a 4 mm diameter stainless steel screw, washer and nut and to the earthing terminal of the nearby [BS 4662 or IEC 60670-1 box]/[lighting point or connection unit];
        iii. The recess slot will be provided and backfilled after the fixing of the earthing lug by the Main Contractor;
        iv. The Sub-contractor shall advise the Main Contractor of the location of the recess slot in conjunction with the layout of the BS 4662 or IEC 60670-1 box for equipotential bonding.

c. For bathroom fittings

i. The Main Contractor will provide a concealed 30 mm wide, 1.5 mm thick hot-dip galvanized steel metal strip for equipotential bonding of the extraneous conductive parts as shown on the Drawings;

ii. The Main Contractor will fix one end of the hot-dip galvanized steel metal strip to the extraneous conductive part and the other end with a 5 mm diameter hole provided, for the termination of the bonding conductor in the nearby BS 4662 or IEC 60670-1 box as shown on the Drawings;

iii. The Sub-contractor shall provide the bonding conductor which shall be fixed to the metal strip by a 4 mm diameter stainless steel screw, washer and nut and to the earthing terminal of the nearby [BS 4662 or IEC 60670-1 box]/[lighting point or connection unit];

The Sub-contractor shall advise the Main Contractor of the location of the BS 4662 or IEC 60670-1 box for equipotential bonding.

ELE2.1.12 PUBLIC LIGHTING AND POWER

ELE2.1.12.010.9 SCOPE OF INSTALLATION

The Sub-contractor shall supply, install and connect concealed PVC conduit wiring systems for the electrical installations at all public areas and plant rooms, comprising conduits and fittings, cables, lighting fittings, switches, MCB boards, sockets, etc to complete as shown on the Drawings.

ELE2.1.12.020.9 ESSENTIAL LIGHTING

Part of the public lighting is essential lighting fed from the essential supply board as shown on the Drawings.

ELE2.1.12.030.A LIGHTING CONTROLS

1. The public lighting shall be controlled by 24 hours time switches / photocells complete with metal box as shown on the Drawings;
2. A by-pass switch with “ON” and “OFF” indication shall be provided for each time switch to control the operation manually;
3. A notification label should be provided next to the by-pass switch and coloured in white with red lettering in both English and Chinese denoting,

   "ONLY AUTHORISED MAINTENANCE PERSONNEL IS PERMITTED TO OPERATE THE BYPASS SWITCH FOR EMERGENCY OPERATION.

   PLEASE ENSURE THAT THIS SWITCH IS RESUMED TO THE "OFF" POSITION AFTER USE.

   只允許授權維修人員操作此旁路掣以進行緊急操作

   請確保此掣在使用後恢復到“關閉”位置"
4. The time switch / photocell shall be submitted for Approval before installation;
5. The control of the lightings on roof is timer controlled and interconnected with the fire alarm installation and door contacts for operation as shown on the Drawings and as otherwise specified in Project Specific Specification;
6. The public lighting main switch and MCB distribution boards shall be installed in switch / meter rooms at various floors and blocks as shown on the Drawings.

ELE2.1.12.050.9 EXIT SIGNS

The Sub-contractor shall supply and install the exit signs as shown on the Drawings.

ELE2.1.12.060.9 MCB UNIT

Unless otherwise specified, the range of instantaneous tripping current for MCB unit for lighting and power circuitry shall be in accordance with IEC 60898 or BS EN 60898-1 type B tripping characteristics.

ELE2.1.13 LIFT SUPPLY

ELE2.1.13.010.9 SCOPE OF INSTALLATION

1. The Sub-contractor shall supply, install and connect lift power supply system consisting of multi-core fire resistant armoured cables, floor mounted L.V. cubicle switchboard, isolator, changeover contactor, fuse combination units, busbar chamber, MCB distribution boards, etc, as shown on the Drawings and otherwise as specified in Project Specific Specification;
2. The L.V. cubicle switchboard shall be provided as shown on the Drawings. The Sub-contractor shall submit a set of detailed installation drawings showing the proposed layout, position and construction of the cubicle switchboard for approval prior to assembly.

ELE2.1.13.020.9 INSTALLATION CABLES

The cables shall be installed with a minimum horizontal or vertical separation distance of 75 mm with other circuits.

ELE2.1.13.030.9 CONDUIT FOR LIFT ALARM BELLS

Except for surface mounted conduit which shall be of G. I. type, a system of concealed PVC conduit completed with draw wire and accessories reserved for lift alarm bells at ground floor and central lift alarm indication system shall be carried out by the Sub-contractor as shown on the Drawings.

ELE2.1.13.040.9 TRIPPING OF POWER CIRCUITS FOR AFTER HOMING

The Lift Sub-contractor shall provide a homing signal to the Sub-Contractor, in form of a pair of normally open dry contacts, for each non-fireman's lift after completion of homing. Upon receiving the homing signal, the power supply of the corresponding sub-distribution board serving the lighting and small power of that lift shall be tripped off automatically. The power supply shall resume normal after the homing signal is removed. The Sub-Contractor shall supply and install all necessary contactors and control circuits to perform the above function.

ELE2.1.14 PUMP SUPPLY

ELE2.1.14.010.9 SCOPE OF INSTALLATION

The Sub-contractor shall supply, install and connect the pump power supply system consisting of multi-core armoured cable, switchgears, busbar chambers, MCB distribution board, etc inside the fire services pump rooms, and water pump room, as shown on the Drawings and otherwise as specified in Project Specific Specification.

ELE2.1.14.020.9 FACILITIES PROVIDED BY OTHERS

All water pumps including fire pumps, starters, control panel, control wiring and accessories up to the roof tank will be provided by others.

ELE2.1.14.030.9 INSTALLATION OF CABLES

The circuit for fire pump supply shall be at a horizontal or vertical separation distance of 75 mm with other circuits.

ELE2.1.14.040.9 CONDUIT FOR PUMP SUPPLY

Except for surface mounted conduit which shall be of G. I. type, a system of concealed PVC conduits completed with draw wires and accessories, etc from the roof tanks down to the pump rooms for the pump control circuit, shall be carried out by the Sub-contractor as shown on the Drawings.

ELE2.1.15 PUMP, LIFT MACHINE, GENERATOR ROOMS, REFUSE STORAGE & MATERIAL RECOVERY CHAMBERS, REFUSE STORAGE & MATERIAL RECOVERY ROOMS AND REFUSE COLLECTION POINT/JUNK COLLECTION POINT

ELE2.1.15.010.9 SCOPE OF INSTALLATION

1. The Sub-contractor shall supply, install and connect in surface steel conduit wiring system for the electrical installation in all lift machine rooms, FS pump rooms, water pump rooms and generator rooms as shown on the Drawings and otherwise as specified in the Project Specific Specification, whereas for refuse storage & material recovery chambers, refuse storage & material recovery rooms and refuse collection point/junk collection point, concealed PVC conduit system shall be used;
2. The Sub-contractor shall supply and install mechanical ventilation systems for the refuse collection point/junk collection point, refuse storage & material recovery chambers, refuse storage & material recovery rooms, refuse chutes, pump rooms, lift machine rooms, generator rooms and other rooms all as shown on the Drawings and otherwise as specified in the Project Specific Specification and ELE31.

ELE2.1.15.025.9 SCOPE AND REQUIREMENTS OF MECHANICAL VENTILATION SYSTEM

1. The Sub-contractor shall supply, install, commission, test and maintain the mechanical ventilation systems all as shown on the Drawings and as specified in this Specification;
2. The sections in ELE31 stipulate the performance specification to be supplied and installed by the Sub-contractor and set out in general the design criteria, minimum requirements, types and standards of the relevant equipment and materials to be provided. The Sub-contractor shall be fully responsible for the comprehensive application design, manufacture, supply, installation, testing and commissioning to meet the project requirements, whether or not installation details are indicated in the Specification and / or on the Drawings;

3. The system installation shall comply with this Specification, latest edition of General Specification for Air conditioning, Refrigeration, Ventilation and Central Monitoring & Control System Installation in Government Buildings of the Hong Kong Special Administrative Region issued by Architectural Services Department, Hong Kong (hereinafter referred to as "General AC Specification") and latest edition of Code of Practice for Energy Efficiency of Building Services Installation issued by Electrical and Mechanical Services Department, Hong Kong.

ELE2.1.15.030.9 EXECUTION OF WORK FOR MECHANICAL VENTILATION SYSTEM

The Sub-contractor shall employ a registered ventilation contractor to supply, install, commission, test and maintain the complete systems and to issue ventilation certificates to the Contract Manager during the Maintenance Period where required by Building (Ventilating Systems) Regulations.

ELE2.1.15.040.9 EXTRACTION SYSTEM FOR VEHICLE EXHAUST

Extraction system for vehicle exhaust shall be provided for the refuse collection point when specified in the Project Specific Specification and shown on the Drawings.

ELE2.1.15.050.9 FILTERS FOR MECHANICAL VENTILATION SYSTEM

Outdoor air shall be filtered by washable panel filter when shown on the Drawings to improve indoor air quality and protect equipment before it enters the mechanical ventilation system.

ELE2.1.16 TRANSFORMER ROOMS/H.V. SWITCH ROOMS

ELE2.1.16.010.9 SCOPE OF INSTALLATION FOR POWER SUPPLY FROM CLP

The Sub-contractor shall supply, install and connect the electrical installation comprising surface steel conduits and accessories, cables, MCB distribution board, switches, socket-outlets, lighting fittings, cable tray, etc to complete as shown on the Drawings and otherwise as specified in the Project Specific Specification.

ELE2.1.16.015.9 SCOPE OF INSTALLATION FOR POWER SUPPLY FROM HEC

The Sub-contractor shall supply, install and connect the electrical installation comprising surface steel conduits and accessories, cable, MCB distribution board, switches, socket-outlets, lighting fittings, etc to complete as shown on the Drawings and otherwise as specified in the Project Specific Specification.

ELE2.1.16.020.9 SUPPLY

The supply to the MCB distribution board will be provided by the Supply Company.

ELE2.1.16.030.9 FANS FOR CLP TRANSFORMER ROOM

1. The exhaust fan and the temperature control panel will be provided by the Supply Company but shall be collected and installed by the Sub-contractor;
2. The mounting diaphragm and flexible connection for exhaust fan shall be supplied and installed by the Sub-contractor.

ELE2.1.16.035.9 FANS FOR HEC TRANSFORMER ROOM

1. The axial flow fan and silencer will be supplied by the Supply Company and will be installed by the Main Contractor;
2. The fan control cubicle will be supplied by the Supply Company and shall be installed by the Sub-contractor.

ELE2.1.16.040.9 AIR TRUNKING

The air trunking inside the transformer rooms/switch rooms will be provided and installed by the Main Contractor.

ELE2.1.16.050.9 EQUIPOTENTIAL BONDING

The Sub-contractor shall also provide the equipotential bonding for the air trunking, steel door, etc to the earthing terminal of the MCB distribution board as shown on the Drawings.

ELE2.1.17 PROVISION FOR FIXED TELECOMMUNICATION NETWORK SYSTEM (FTNS) INSTALLATION

ELE2.1.17.010.9 CONDUIT AND TRUNKING

Except for the surface mounted conduit which shall be of G. I. type, a system of concealed PVC conduit and steel trunking together with accessories only for fixed telecommunication network system (FTNS) installation shall be provided by the Sub-contractor as shown on the Drawings.

ELE2.1.17.020.9 EARTHING

An earthing terminal for the FTNS equipment shall be provided by the Sub-contractor at the location as shown on the Drawings.

ELE2.1.17.030.9 LIGHTING IN TBE ROOMS

The Sub-contractor shall supply and install lighting fittings and switches in TBE rooms in concealed PVC conduit system as shown on the Drawings.

ELE2.1.17.040.9 TBE ROOM SUPPLY

The Sub-contractor shall supply, install and connect power supply system for FTNS installation consisting of switchgear, MCB board, trunking and cables in TBE room as shown on the Drawings.

ELE2.1.18 PROVISION FOR SECURITY SYSTEM (SE) INSTALLATION

ELE2.1.18.010.9 PROVISION OF SYSTEM / INSTALLATION

The Sub-contractor shall supply, install and connect the SE installation as shown on the Drawings and otherwise as specified in the Project Specific Specification and ELE24.

The detail of the building to be provided with a separate security system is specified in the Project Specific Specification.

The provision of Security System, unless otherwise stated in the Project Specific Specification or the Drawings, shall consist of the following:

1. A complete doorphone system with doorphone panel in main entrance or other entrances as indicated on the Drawings for every domestic block;
2. A complete local CCTV monitoring system for lifts and entrances at every domestic block;
3. A complete local alarm and door monitoring system at every domestic block;
4. A complete central alarm and door monitoring system;
5. A complete central CCTV system for entrances and guard counter;
6. Telephone at guard counter and in Estate Office.

ELE2.1.18.020.9 PROVISION OF POWER SUPPLY AND CONDUIT

1. The Sub-contractor shall provide the power supply and surface steel conduit/trunking system inside the meter/service room for SE installation;
2. A system of concealed PVC conduit together with accessories from the meter/service rooms to the domestic units and roof shall be provided as shown on the Drawings and otherwise as specified in the Project Specific Specification.

ELE2.1.19 PROVISION FOR SUBSCRIPTION TELEVISISON DISTRIBUTION NETWORK (STDN) INSTALLATION

ELE2.1.19.010.9 CONDUIT AND TRUNKING

1. Except for surface mounted conduit which shall be of G.I. type, a system consisting of concealed PVC conduit and steel trunking together with accessories only for CABD & STDN installations shall be provided by the Sub-contractor as shown on the Drawings;
2. The Sub-contractor shall take the roles of coordinating other neighbouring services and determine the exact concealed conduit routes for communications installations while those given on the Drawings are for indicative and tendering purposes;
3. The Sub-contractor shall check and locate the exact location of the antenna in preparing the conduit run drawing from the meter/service room on the top floor to the roof and submit to the Contract Manager for Approval as this portion of conduit routing has not been shown on the Drawings;
4. The coordinated conduit layout for the entire CABD, STDN and any other television broadcasting distribution systems shall be submitted to the Contract Manager for approval prior to the commencement of works.

ELE2.1.19.020.9 COORDINATION

1. The Sub-contractor shall coordinate with the STDN operators and obtain a set of their exact technical requirements for installation. The Sub-contractor shall also install the CABD equipment in consideration of any space allocated for STDN installation;
2. The CABD equipment the Sub-contractor is installing shall not cause any interference that will impair the quality of to other neighbouring telecommunication services, including the STDN one.

ELE2.1.20 EARTHING AND FAULT PROTECTION

ELE2.1.20.010.9 GENERAL

This section should be read in conjunction with other Worksections relating to earthing and fault protection.

ELE2.1.20.020.9 EARTHING TERMINALS

1. An earthing terminal bonded to the reinforcement or steel piles of the building in each main switchroom will be provided by the Main Contractor as shown on the Drawings;
2. The Sub-contractor shall supervise the work and label the terminal and connect it up with copper tapes to the main earthing terminal in accordance with the Drawings;
3. The Sub-contractor shall follow Power Company Code of Practice 101 / Guide to Connection of Supply to provide bonding terminal and connection to the main earthing terminal as shown on the Drawings for bonding to the earthed point of transformer.

ELE2.1.20.030.9 EARTH ELECTRODE

The earth electrode shall be of rod electrode.

ELE2.1.20.040.9 EARTHING SYSTEM FOR TBE ROOM

In addition to earthing provided for exposed conductive parts of electrical installations in TBE room, a separate earthing system consisting of earth electrode(s), earthing conductor and earthing terminal shall be provided for telecommunication equipment as shown on the Drawings.

ELE2.1.20.050.9 CIRCUIT PROTECTIVE CONDUCTOR

1. For distribution boards supplying circuits for both sockets and fixed equipment, the Sub-contractor shall also check, in accordance with the offered equipment, and ensure that the impedance of the protective conductor between the exposed conductive parts and the point at which the protective conductor is connected to the main equipotential bonding of an installation does not exceed 50Zs/Uo ohms, where Zs is the earth fault loop impedance corresponding to a disconnection time of 5 sec. and Uo is the nominal voltage equivalent to 220V, failing which the Sub-contractor shall provide CPC with larger cross-sectional area wherever necessary;
2. For circuits supplying only fixed equipment within the equipotential zone, the earth fault loop impedance at every point of utilisation is such that disconnection occurs within 0.4 second or 5 seconds in accordance with Code 11B(b) (ii) of the Electrical CoP;
3. For circuits supplying fixed equipment outside the equipotential zone, the earth fault loop impedance at every point of utilisation is such that disconnection occurs within 0.2 second or 0.4 second in accordance with Code 11B(b) (iii) of the Electrical CoP.

ELE2.1.20.060.9 EQUIPOTENTIAL BONDING FOR EXTRANEOUS CONDUCTIVE PARTS IN COMMUNAL AREA OF BUILDING

1. Notwithstanding the provisions of the following specification on workmanship and materials for installation of cast iron piping system by Main Contractor, the Sub-contractor has the responsibility to verify that the resistance of installed cast iron pipes to main earth is not less than 45,000 Ohm even under the worst conditions (e.g. high moisture) in accordance with the Electrical CoP and if otherwise and necessary to provide the equipotential bonding in accordance with the requirements of the Electrical CoP:
    a. Use cold caulking compound for jointing of cast iron pipes and fittings in accordance with manufacturer's instruction;
    b. The pipe brackets for mounting cast iron pipe shall be lined with resilient plastic at pipe clamp;
    c. Paint cast iron pipes/fittings with at least 2 finish coats of bitumen to BS 3416 after installation.

ELE2.1.21 LIGHTNING PROTECTION SYSTEM

ELE2.1.21.010.9 STANDARD

The Sub-contractor shall supply, install and connect a lightning protection system at the roof top of Domestic Blocks as shown on the Drawings.

ELE2.1.21.020.9 CONSTRUCTION

The lightning protection system comprising aluminium tapes shall be complete with fixing saddles bonded to the structure as shown on the Drawings.

ELE2.1.21.030.9 EQUIPOTENTIAL BONDING

The Sub-contractor shall also provide equipotential bonding of the lightning protection system to the electrical system in accordance with the Electrical CoP.

ELE2.1.21.040.9 RESISTANCE

After the completion of the lightning protection system installation, the Sub-contractor shall measure the resistance of the down conductors between the air termination on roof and the structural earth terminal in the main switch room and report the measured results to the Contract Manager for checking purpose.

ELE2.1.22 STANDBY DIESEL GENERATING SET(S)

ELE2.1.22.010.9 APPLICATION

A standby diesel generating set shall be provided as an emergency supply to comply with the Fire Services Department requirements as shown on the Drawings.

ELE2.1.23 PROVISION FOR TOWNGAS AUTOMATIC METER READING (AMR) SYSTEM INSTALLATION

ELE2.1.23.010.9 CONDUIT AND TRUNKING

Except for surface mounted conduit which shall be of G.I. type, a system of consisting of concealed PVC conduit and steel trunking together with accessories for AMR system installation shall be provided as shown on the Drawings.

ELE2.1.24 COMMUNAL AERIAL BROADCAST DISTRIBUTION SYSTEM

ELE2.1.24.010.9 PROVISION OF SYSTEM / INSTALLATION

A complete communal aerial broadcast distribution system shall be provided as shown on the Drawings and otherwise as specified in the Project Specific Specification and ELE23.

ELE2.1.24.020.9 SPECIAL REQUIREMENTS

The special requirements are specified in the Project Specific Specification.

ELE2.1.25 PUBLIC ADDRESS SYSTEM

ELE2.1.25.010.9 PROVISION OF SYSTEM / INSTALLATION

Complete public address systems shall be provided as shown on the Drawings and otherwise as specified in the Project Specific Specification and ELE25.

ELE2.1.26 SMART METER MONITORING AND ENERGY INFORMATION DISPLAY SYSTEM

ELE2.1.26.010.9 SCOPE OF INSTALLATION

The Sub-contractor shall design, supply and install a smart meter monitoring and energy information display system as shown on the Drawings and as specified in ELE35. The Sub-contractor shall supply and install a central monitoring and management workstation in the security control room at the Estate Management Office for central data processing, and which shall be connected to the local energy information display system in each domestic block as specified and shown on the Drawings. The central monitoring and management workstation shall oversee the local systems in all domestic blocks.

The Sub-contractor shall supply and install local energy information display system at the ground floor main entrance lobby of each domestic block and the associated data gathering units and equipment for displaying the information as described in ELE35. The complete display system shall include a LED TV display panel, integrated stereo speakers, display interfacing units and all peripheral devices and connections as specified and shown on Drawings.

The Sub-contract shall supply and install the complete communication network and cabling system including all connection cables and all associated interfaces and accessories between the central monitoring and management station at the EMO and all associated domestic blocks.

ELE2.1.27 AUTOMATIC METER READING (AMR) OUTSTATION FOR WATER SUPPLIES

ELE2.1.27.010.9 PROVISION OF SYSTEM / INSTALLATION

The Sub-contractor shall design, supply and install AMR outstation for water supplies as shown on the Drawings and as Specification in ELE36.

ELE2.1.27.020.9 CONDUIT AND TRUNKING

Except for surface mounted conduit which shall be of G.I. type, a system consisting of concealed PVC conduit and steel trunking together with accessories for AMR outstation for water supplies shall be provided as shown on the Drawings.

ELE2.2 EXTERNAL PUBLIC LIGHTING

ELE2.2.010.9 SCOPE

The Sub-contractor shall supply, install and connect the complete external public lighting system as shown on the Drawings and otherwise as specified in the Project Specific Specification.

ELE2.2.020.9 INSTALLATION

1. Where the lighting fittings are mounted on the periphery of the block, they shall be wired in concealed conduits;
2. Power supply to each circuit of lighting fitting(s) shall be fed from MCB unit via individual residual current devices or RCBO unit;
3. The Sub-contractor shall provide all necessary fixing facilities and accessories as recommended by manufacturers for installation of external lighting fittings as shown on the Drawings;
4. Provision of ducts, excavation, concrete foundation necessary for installation of external lighting fittings and the cement/soil filling will be carried out by the Main Contractor;
5. The Sub-contractor shall coordinate with the Main Contractor and submit drawings showing details of all builder's works requirements necessary to complete installation of external public lighting to the Main Contractor for subsequent transmission to and Approval by Contract Manager.

ELE2.2.030.9 SWITCH CONTROL

The public lighting shall be controlled by 24 hours time switches/photocell as shown on the Drawings.

ELE2.2.040.9 FLOODLIGHTING FITTINGS

The Sub-contractor shall also be responsible for adjusting the mounting heights and aiming angles of the flood lighting fittings (if any) for the ball courts, playgrounds, etc. This may be carried out at night when required.

ELE3.20 FIREMAN'S EMERGENCY SWITCH 44
ELE3.20.010.9 GENERAL 44

ELE3.1 GENERAL

ELE3.1.010.9 SCOPE

1. This section specifies the general requirements of low voltage switchgear and associated equipments which are intended for assembly on site from individual items of components. Additional and specific requirements for factory built assemblies of switchgear and controlgear are given in ELE4, the Drawings, other documents issued by the Contract Manager or Project Specific Specification;
2. The component equipments covered in this Section shall include the following:
    a. Fuse combination units and switch disconnectors;
    b. Circuit-breakers comprising moulded case circuit-breakers (MCCBs), miniature circuit breakers (MCBs), residual current-operated circuit-breakers (RCCBs) and residual current-operated circuit-breakers with integral overcurrent protection (RCBOs);
    c. Double-pole switch disconnectors;
    d. Fuses;
    e. Distribution boards including consumer units;
    f. Starters and contactors;
    g. Time switches;
    h. Measuring instrument;
    i. Site built assemblies.
3. The general requirements specified in ELE3.1.020 to ELE3.1.080 both inclusive shall apply to all items of switchgear and associated equipment where applicable unless explicitly mentioned otherwise.

ELE3.1.020.9 SERVICE CONDITIONS

The following conditions shall apply:

1. Ambient temperature: peak from minus 5℃ to plus 40℃ for 4 hours continuously with an average from 0℃ to plus 35℃ over only 24 hour period;
2. Relative humidity: up to 0.99 saturation.

ELE3.1.030.9 SHORT-CIRCUIT RATING AND CONTINUOUS CURRENT RATING

1. Low voltage switchgear shall be suitably rated for the specified prospective short-circuit current which can occur at the point of its installation. It shall also be rated for uninterrupted duty when carrying continuously the specified full load current. For non-automatic switching devices the rated short-time withstanding current shall be at least 12 times the continuous current rating for 1 second;
2. Where equipment components are installed in enclosures, they shall be suitable for operation at the actual maximum temperatures which will be reached within the enclosures under normal loaded conditions when the ambient temperature is 40℃.

ELE3.1.040.9 VOLTAGE RATING

Low voltage switchgear and associated equipment shall be suitable for use on 220V (single phase) or 380V (3 phase) 50Hz supply.

ELE3.1.050.9 DEGREE OF PROTECTION FOR ENCLOSURE

Enclosures for low voltage switchgear and associated equipment shall have an index of protection, in accordance with IEC 60529 of at least IP 30 for indoor applications and of at least IP 54 for outdoor applications.

ELE3.1.060.9 MATERIALS

1. Unless otherwise specified, low voltage switchgear and associated equipment except MCCBs, MCBs and RCBOs shall be metalclad. All ferrous metal parts shall be galvanised or chrome plated unless the final finish has been painted or enamelled in the manufacturer's factory;
2. All extraneous conductive parts shall be electrically continuous.

ELE3.1.070.9 ON AND OFF INDICATION

1. The design of a switching device shall incorporate some positive means to indicate clearly and reliably the ON (or CLOSE) and the OFF (or OPEN) positions of the contacts. Indication of either position shall only occur when the ON or OFF position on every pole has been attained. Such indication shall be provided on the outside of the device and shall be prominently visible to an operator when the device is installed in the normal manner;
2. When the switching device is also used for isolation purpose, then an indication of the OFF position shall occur only when all contacts are also in the OFF position and the isolating distance between contacts in every pole has attained a clearance not less than those specified in the respective equipment standards.

ELE3.1.080.9 IDENTIFICATION OF CIRCUIT

1. Labels or other means of identification shall be provided for every item of switchgear and associated equipment to indicate the purpose of the item. The labels shall either be fixed at the front cover or at the inside surface of the hinged front cover;
2. For a split-busbar consumer unit, the labels shall identify all outgoing MCBs which are protected by an RCCB from those which are not.

ELE3.2 SURFACE MOUNTED FUSE COMBINATION UNITS AND SWITCH-DISCONNECTORS

ELE3.2.1 GENERAL

ELE3.2.1.010.9 TYPE AND STANDARD

Surface mounted switch-disconnector fuses, fuse-switch disconnectors and switch-disconnectors (hereinafter referred to as "switching device" or "switching devices") shall be air-break, metalclad type and shall comply with IEC 60947-3.

ELE3.2.1.020.9 ARRANGEMENT

The switch-disconnector fuses or fuse-switch disconnectors shall be a combination of a switch-disconnector and one or more fuses in a composite unit.

ELE3.2.1.030.9 CLASS AND RATING

	Class	Rating
1.	Rated operational voltage	380/220V (min.)
2.	Rated frequency	50Hz
3.	Rated insulation voltage	415V (min.)
4.	Rated impulse withstand voltage	6 kV (min.)
5.	Conventional enclosed thermal current and rated operational current/power for uninterrupted duty	As shown on the drawings
6.	Utilization category	AC22B unless otherwise specified.
7.	Rated short-time withstand current (for switch-disconnectors protected by air circuit breakers/moulded case circuit breakers)	At least twelve times the maximum rated operational current for one second.
8.	Rated short-circuit current (for switch-disconnectors protected by bolt-type fuses as specified in ELE3.13.010 and for switch-disconnector fuses / fuse-switch disconnectors)	40 kA

ELE3.2.1.040.9 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.2.2 TYPE-TEST

ELE3.2.2.010.9 TEST STANDARDS

Switch-disconnector fuses, fuse-switch disconnectors and switch-disconnectors shall be type-tested in accordance with Clause 8.2 and Clause 8.3 of IEC 60947-3. For switch-disconnectors to be used in circuits protected by fuses, test sequence III of Clause 8.3.5 is not required, but test sequence IV of Clause 8.3.6 shall be performed to such switch-disconnectors connected in series with bolt-type fuse links as specified in ELE3.13.010 of the corresponding rated maximum current.

ELE3.2.2.020.9 TYPE-TESTING

The following test sequences of IEC 60947-3 shall be carried out by a Short Circuit Testing Organisation.

1. For fuse combination units – test sequences I & IV;
2. For switch-disconnectors – test sequences I & III.

Switch disconnectors converted from type-tested switch-disconnector fuses/fuse-switch disconnectors by replacing the fuse links with copper short links for a rated operational current not greater than the maximum rated operational current for the original switch-disconnector fuses/fuse-switch disconnectors and are installed in circuits protected by bolt-type fuses as specified in ELE3.13.010 are also acceptable.

ELE3.2.3 CONSTRUCTION AND DESIGN

ELE3.2.3.010.9 TYPE

Switch-disconnector fuses, fuse-switch disconnectors and switch-disconnectors shall be triple or single pole as shown on the Drawings, with detachable fully rated front accessible neutral link, or 4-pole as shown on the Drawings.

ELE3.2.3.020.9 CURRENT RATINGS ABOVE 100A

For fuse combination units with current ratings above 100A, the switching devices shall make and break on both the incoming supply side and the outgoing load side.

ELE3.2.3.030.9 CURRENT RATINGS OF 100A AND BELOW

For fuse combination units with current ratings of 100A and below, fuse bases and carriers shall be provided for housing the fuse links if the switching device are not making and breaking on both the incoming supply side and the outgoing load side.

ELE3.2.3.040.9 CURRENT CARRYING MATERIAL

The current carrying parts shall be made of hard drawn, high conductivity copper to BS EN 13601.

ELE3.2.3.050.9 ENCLOSURE

The enclosure shall be made of sheet steel of thickness not less than 1.6 mm for current ratings above 32A and not less than 1.2 mm for 32A and below, complete with stoved epoxy powder paint, or equal and Approved finish of a gloss light colour.

ELE3.2.3.060.9 FRONT COVER

The front cover of switching devices shall be hinged or of an equal and Approved construction, to enable easy access to the interior for replacement of fuse links. Gland plates shall be provided for top and bottom cable entry for switching devices of current ratings above 32A.

ELE3.2.3.070.9 DEGREE OF PROTECTION

1. Under normal service conditions, the enclosure shall be of totally enclosed type with a degree of protection against ingress of foreign solid bodies and liquids of at least IP41 as per IEC 60529 for the top surface and IP31 for the other surfaces of the enclosures. With the front-hinged door open and in replacing fuse links, the degree of protection to the live parts shall be at least IP2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;
2. The switching devices shall be suitable for installation under environmental condition of pollution degree 3 unless otherwise specified.

ELE3.2.3.080.9 SPACE IN TERMINAL ENCLOSURE

1. Terminal connections shall be by means of screws so to ensure that the necessary contact pressure is maintained;
2. The terminal enclosure shall have sufficient space for accommodating cable lugs for the largest cables which the switching device is designed to receive, and also for proper cable termination with cable bending radius in accordance with the Electrical CoP otherwise proper extension cable terminals and/or cable boxes shall be provided. The palm width of the cable lugs shall comply with BS 91.

ELE3.2.3.090.9 FUSE COMBINATION UNITS

For switch-disconnector fuses or fuse-switch disconnectors, the fuse holders shall be capable of accepting any fuse links of physical dimension complying with the minimum and maximum limits of the respective fuse reference tabulated in the Specification for fuses (i.e. ELE3.13).

ELE3.2.3.100.9 EARTHING TERMINAL

An external accessible earthing terminal shall be provided at the side panel of the enclosure.

ELE3.2.4 OPERATION

ELE3.2.4.010.9 DESCRIPTION

The switching devices shall be independent manual operated and shall have mechanical interlock to prevent access to the interior except when the switching devices are in the OFF position, and to prevent the contacts from being switched to close when the door is open.

ELE3.2.4.020.9 PERFORMANCE

The latter interlock shall be able to be defeated by trained personnel for maintenance when necessary.

ELE3.2.4.030.9 SECURITY

A facility shall be provided for padlocking the switching devices in the OFF position.

ELE3.3 CIRCUIT BREAKER - GENERAL

ELE3.3.010.9 SCOPE OF CIRCUIT BREAKER

This Sub-section covers the general requirements of ACBs, MCCBs, MCBs, RCCBs and RCBOs. Additional requirements relevant to particular types of circuit-breakers shall be given in ELE3.4 to ELE3.7 both inclusive.

ELE3.3.020.9 NUMBER OF POLES

Circuit-breakers shall be of four-pole, three-pole, double-pole or single-pole, as specified and shall have air-break contacts.

ELE3.3.030.9 OPERATING MECHANISM

1. The operating mechanism of a circuit-breaker shall be trip-free;
2. When an MCCB or MCB or RCCB or RCBO trips and opens its contacts, the operating toggle shall automatically resume the OFF or TRIPPED position.

ELE3.3.040.9 CASING

The casing of an MCCB, an MCB, an RCCB, an RCBO shall be formed from an insulating material. The construction shall be capable of withstanding the appropriate rated short circuit current and reasonably rough use without fracture or distortion.

ELE3.3.050.9 CURRENT RATING

The rated current of a circuit-breaker shall be taken as that rated continuous current when the circuit-breaker is installed in the enclosure together with other equipment, if any, under normal operating conditions as shown on the Drawings.

ELE3.4 MOULDED CASE CIRCUIT BREAKERS (MCCB)

ELE3.4.1 GENERAL

ELE3.4.1.010.9 STANDARD

Moulded Case Circuit Breakers (MCCB) shall comply with IEC 60947-2.

ELE3.4.1.020.9 CLASS AND RATING

	Class	Rating
a.	Rated operation voltage:	220/380V
b.	Rated insulation voltage:	415V
c.	Rated frequency:	50Hz
d.	Rated ultimate short-circuit breaking capacity:	40 kA unless otherwise specified
e.	Rated uninterrupted current:	As shown on the Drawings

ELE3.4.1.030.9 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.4.2 CONSTRUCTION AND DESIGN

ELE3.4.2.010.9 MCCB

1. MCCB shall be triple, double or single pole complete with overcurrent and/or earth leakage tripping device as shown on the Drawings, and suitable for direct mounting inside a metal enclosure or a cubicle switchboard. Both triple and single pole MCCB shall be provided with detachable, fully rated, front accessible neutral copper link mounted inside the enclosure;
2.
    a. For surface mounted MCCB cable terminals shall be at the top and bottom with access from the front;
    b. For MCCB housed in switchboard cubicles, the cable terminals shall be suitable for busbar connection;
    c. Interphase barriers shall be provided when necessary to maintain safe electrical clearance.
3. MCCB shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE3.4.2.020.9 ENCLOSURES FOR SURFACE-MOUNTED MCCB

1.

a. The enclosure shall be of totally enclosed type with a degree of protection against ingress of foreign solid bodies and liquids of at least IP41 as per IEC 60529, for the top surface, and IP31 for the other surfaces of the enclosures;

b. The enclosure shall conform to the type-tested standard or as recommended by the manufacturer. The front cover of the enclosure shall be hinged or equal and approved. With the front-hinged cover opened, all live parts shall be protected to IP20. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;

c. The enclosure shall have sufficient space for accommodating cable lugs for the largest cables which the MCCB is designed to receive;

d. The palm width of the cable lugs shall comply with BS 91;

e. There shall also be sufficient space for proper cable termination with cable bending radius in accordance with the Electrical CoP, otherwise proper extension cable terminals and/or cable box shall be provided.

2. An external accessible earthing terminal shall be provided at the side panel of the enclosure. The enclosure shall be formed from sheet steel 1.6 mm thick;

3. All inside and outside surfaces of the enclosures shall be treated with either anti-rust protective coating followed by two stoved coats of gloss paint of contrasting colours, or an alternative acceptable finish such as phosphate treatment followed by epoxy powder paint. The finishing colour shall be approved by the Contract Manager.

ELE3.4.3 OPERATION

ELE3.4.3.010.9 OPERATING CHARACTERISTICS

1. MCCB shall have inverse time delay and instantaneous tripping time-current characteristic which cannot be inadvertently adjusted. The operating characteristic shall be such that:

   a. The time delay on overload tripping shall be inversely proportional to the overcurrent up to a threshold value of approximately 7 times the rated current or as otherwise specified;

   b. There shall be no intentional time-delay on overcurrent tripping due to short-circuit or heavy overcurrent exceeding the threshold value.

2. The operating characteristic shall be calibrated at 40°C. For earth leakage protection, the tripping current shall be as shown on the Drawings. The earth leakage relay and the zero-sequence current transformer, if any, shall comply with the relevant British Standard.

ELE3.4.3.020.9 OPERATING MECHANISM AND INDICATIONS

1. The operating mechanism shall be independent manual and trip-free. Indication of OFF position shall occur only when the specified isolation distance on each pole has been attained. Reliable visual indication of ON and OFF position and trip indication shall be provided;

2. MCCBs shall be equipped with lockable function such that they can be locked off and only be able to be unlocked by the use of keys or tools used to lock off these devices. Additional proprietary assistive devices shall be provided where necessary to facilitate the lockable function using padlocks. In case of no supply of proprietary assistive devices from the MCCB manufacturer or in case of provision of assistive devices for existing MCCBs in existing buildings, alternative made may be proposed and shall be demonstrated by the Sub-contractor that the proposed devices are suitable for the MCCBs to facilitate the lockable function using padlocks.

ELE3.4.3.030.9 TYPE-TEST

MCCB shall be type-tested to IEC 60947-2. Verification of short-circuit making and breaking capacity shall be carried out by a Short-Circuit Testing Organization.

ELE3.5 MINIATURE CIRCUIT BREAKERS (MCB)

ELE3.5.010.9 GENERAL

Miniature Circuit Breakers (MCBs) shall comply with IEC 60898-1 or BS EN 60898-1, suitable for 220/380V supply operation with rated current and number of poles as shown on the Drawings.

ELE3.5.020.9 CATEGORY OF DUTY

MCBs shall have a standard value of rated short-circuit capacity of not less than 4500A.

ELE3.5.030.9 TYPE

Unless otherwise specified or shown on the Drawings, MCBs shall have an instantaneous tripping operation of type B or type C in accordance with IEC 60898-1 or BS EN 60898-1.

ELE3.5.040.9 CABLE TERMINALS

Terminals suitable for terminating appropriate size of solid or stranded conductors shall be provided for the outgoing cables. The terminals shall be accessible from the front for easy cable termination.

ELE3.5.050.9 CONTACTS

Contacts shall be non-weld type.

ELE3.5.060.9 TRIPPING MECHANISM, ISOLATION AND SWITCHING

1. Tripping elements shall be thermal magnetic type with instantaneous tripping characteristic under short-circuit conditions and inverse time delay tripping characteristic under overload conditions;
2. For domestic buildings, the double pole MCBs providing supply to domestic units before the power company's meters shall be capable of both isolating and switching the full load current of the respective circuits;
3. MCBs shall be equipped with lockable function such that they can be locked off and only be able to be unlocked by the use of keys or tools used to lock off these devices. Additional proprietary assistive devices shall be provided where necessary to facilitate the lockable function using padlocks. In case of no supply of proprietary assistive devices from the MCB manufacturer or in case of provision of assistive devices for existing MCBs in existing buildings, alternative made may be proposed and shall be demonstrated by the Sub-contractor that the proposed devices are suitable for the MCBs to facilitate the lockable function using padlocks.

ELE3.5.070.9 OPERATING MECHANISM

Operating mechanism shall be quick break, trip free type. Where the handle is used to indicate the position of the contacts, the handle, when released, shall automatically take up the position corresponding to that of the moving contacts; in this case, the handle shall have two distinct rest positions corresponding to the position of the contacts but, for automatic opening, a third distinct position of the handle may be provided.

ELE3.5.080.9 TYPE-TEST

Full type-test certificates to Section 9 of BS EN 60898-1 or Section 9 of IEC 60898-1 shall be produced to the satisfaction of the Contract Manager. In addition, type-test to test sequences C, D and E of IEC 60898-1 or BS EN 60898-1 shall be carried out by a Short Circuit Testing Organization.

ELE3.6 RESIDUAL CURRENT OPERATED CIRCUIT BREAKERS (RCCB)

ELE3.6.010.9 PERFORMANCE

1. Residual current operated circuit breakers (RCCBs) shall comply with IEC 61008-1, and shall be suitable for 220/380V supply operation with rated current and number of poles as indicated on the Drawings. The rated residual operating current of RCCBs shall be 30 mA unless otherwise specified. RCCBs shall not require any auxiliary source for operation. However, 2-pole RCCB requiring an integral auxiliary source for operation will still be acceptable provided that in the event of failure of integral auxiliary source through the loss of neutral, it shall either still function as a RCCB or open automatically without delay;
2. The RCCBs shall be the following types for earth leakage protection:
    a. Circuits serving electric vehicles charging facilities: Type B;
    b. Other circuits: Type AC (General type).

ELE3.6.020.9 TYPE-TEST CERTIFICATES

Full type-test certificates to Section 9 of IEC 61008-1 shall be produced to the satisfaction of the Contract Manager.

ELE3.6.030.9 CIRCUIT FAULT CURRENT TEST

1. The short circuit tests as specified in Clause 9.11 of IEC 61008-1 shall be carried out by a Short-circuit Testing Organisation;
2. For RCCBs which form part of consumer units or miniature circuit breaker distribution boards which have been satisfactorily tested in accordance with ELE3.12.4 or ELE3.11.5 respectively, the short circuit tests as specified in Clause 9.11 of IEC 61008-1 will not be required.

ELE3.6.040.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences as PRE.BS1.205 to verify the country / place of manufacture and authenticity of RCCBs delivered to Site or installed.

ELE3.7 RESIDUAL CURRENT-OPERATED CIRCUIT BREAKERS WITH INTEGRAL OVERCURRENT PROTECTION (RCBO)

ELE3.7.010.9 GENERAL

Residual current operated circuit breaker with integral overcurrent protection (RCBO) shall comply with IEC 61009-1 or BS EN 61009-1, and shall be suitable for 220/380V supply operation with rated current and number of poles as indicated on the Drawings. The rated residual operating current of RCBOs shall be 30mA unless otherwise specified.

ELE3.7.020.9 CATEGORY OF DUTY

RCBOs shall have a standard value of rated short-circuit capacity of not less than 4500A.

ELE3.7.030.9 PERFORMANCE

1. RCBOs shall not require any auxiliary source for operation;
2. The RCBOs shall comply with the following types for earth leakage protection:
   a. Circuits serving electric vehicles charging facilities: Type B;
   b. Other circuits: Type AC (General type).
3. Unless otherwise specified or shown on the Drawings, RCBOs shall also have an overcurrent instantaneous tripping operation of type B or type C in accordance with IEC 61009-1 or BS EN 61009-1;
4. Cable Terminals and contacts shall be as specified in ELE3.5.040 and ELE3.5.050 respectively;
5. Tripping mechanism shall be as specified in ELE3.5.060 Sub-clause (1);
6. RCBOs shall be equipped with lockable function such that they can be locked off and only be able to be unlocked by the use of keys or tools used to lock off these devices. Additional proprietary assistive devices shall be provided where necessary to facilitate the lockable function using padlocks. In case of no supply of proprietary assistive devices from the RCBO manufacturer, alternative made may be proposed and shall be demonstrated by the Sub-contractor that the proposed devices are suitable for the RCBOs to facilitate the lockable function using padlocks;
7. Operating mechanism shall be as specified in ELE3.5.070.

ELE3.7.040.9 TYPE-TEST CERTIFICATES

Full type-test certificates to Section 9 of IEC 61009-1 or BS EN 61009-1 shall be produced to the satisfaction of the Contract Manager. In addition, type-test to test sequences C, E_1, F_0 and F_1 of IEC 61009-1 or BS EN 61009-1 shall be carried out by a Short-circuit Testing Organisation.

ELE3.7.050.9 CIRCUIT FAULT CURRENT TEST

1. The short circuit tests as specified in Clause 9.12 of IEC 61009-1 or BS EN 61009-1 shall be carried out by a Short-circuit Testing Organisation;

2. For RCBOs which form part of miniature circuit breaker distribution boards which have been satisfactorily tested in accordance with ELE3.11.5, the short circuit tests as specified in Clause 9.12 of IEC 61009-1 or BS EN 61009-1 will not be required.

ELE3.7.060.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences as PRE.BS1.205 to verify the country / place of manufacture and authenticity of RCBOs delivered to Site or installed.

ELE3.8 DOUBLE POLE SWITCH-DISCONNECTORS

ELE3.8.010.9 PERFORMANCE

1. Double Pole Switch-disconnectors shall comply with IEC 60947-3, suitable for 220V supply operation with rated current as indicated on the Drawings;
2. They shall have Utilization Category AC22A and shall be provided with facility for padlocking the switch disconnectors in the isolated position;
3. Incoming terminal shall be protected against direct contact to IP2X.

ELE3.8.020.9 TYPE-TEST REPORTS

Full type-test report to Clause 8.1.2 of IEC 60947-3 shall be produced to the satisfaction of the Contract Manager.

ELE3.9 DISTRIBUTION BOARDS - GENERAL

ELE3.9.010.9 SCOPE OF DISTRIBUTION BOARDS

This sub-section covers the general requirements of MCCB distribution boards. Additional requirements relevant to a particular type of MCCB distribution board shall be given in ELE3.10.

ELE3.9.020.9 CONSTRUCTION OF ENCLOSURE

1. The enclosure of a distribution board shall be constructed from sheet steel, rust proofed and baked enamelled or stove epoxy powder painted;
2. The construction shall be of robust design, capable of withstanding the mechanical, electrical and thermal stresses under all working conditions, including fault conditions.

ELE3.9.030.9 ARRANGEMENT OF COMPONENT PARTS

1. Distribution boards shall include all necessary components and accessories to form a complete assembly;
2. Components and accessories shall be firmly fixed in position in the distribution board, and shall be assembled in such a way that it shall be possible to remove or replace any component parts and to carry out cable connections from the front;
3. Ample space shall be allowed for cabling;
4. MCCBs shall be arranged neatly in a row or rows;
5. All components shall be totally concealed: only the toggles of the MCCBs shall protrude through the cover plate of the distribution board.

ELE3.9.040.9 BUSBARS

All busbars shall be of hard drawn copper having ratings as specified and shall be electro-tinned. Neutral busbars shall be of the same CSA as the phase busbars, and shall have adequate number of terminals for all outgoing circuits including spare ways.

ELE3.9.050.9 EARTHING TERMINALS

1. Every distribution board shall be provided with an external earthing terminal for connection to the main earthing terminal. In addition, a multi-terminal connector shall be provided within the distribution board for connection of protective conductors of all outgoing circuits including spare ways;
2. Both the external earthing terminal and the multi-terminal connector for protective conductor shall be of hard drawn electro-tinned copper and shall be labelled in accordance with the requirements of IEC 60439-1.

ELE3.9.060.9 PROVISION OF SPARE WAYS

Each distribution board shall be provided with spare ways for future expansion. For new installations, the number of spare ways shall not be less than 20% of the total number of outgoing ways in the distribution board. Each spare way shall be blanked off with a suitable blanking plate having a finish comparable to that of the distribution board.

ELE3.9.070.9 SHROUDING OF LIVE PARTS

1. All conductive parts shall be properly shrouded against accidental contact by means of rigid barriers, partitions of insulating materials such that accidental contact can be prevented during operation of component replacement or cable connection;
2. All conductive structural parts of the distribution boards shall comply with the protective circuit requirements of IEC 60439-1.

ELE3.10 MOULDED CASE CIRCUIT BREAKER (MCCB) DISTRIBUTION BOARDS

ELE3.10.010.9 GENERAL

1. The enclosure of an MCCB distribution board shall be constructed from sheet steel having a thickness of not less than 1.5 mm, and shall be designed for general commercial and light industrial applications;
2. The design, construction and testing specifications of the distribution boards shall comply with IEC 61439-1 and IEC 61439-2, or IEC 60439-1.

ELE3.10.020.9 TYPE OF MCCB DISTRIBUTION BOARD

1. MCCB distribution boards shall be of two types, viz. Type A and Type B. Type A MCCB distribution board shall be suitable for accommodating, in any combination, the double-pole and triple-pole MCCBs of 100A frame size. Type B MCCB distribution boards shall be suitable for accommodating triple-pole MCCBs of 225A framesize;
2. All MCCB distribution boards shall each be provided with a moulded-case isolating switch having a current rating not less than that of the supply side protective device. The moulded-case isolating switch shall meet the relevant requirements of ELE3.1 and ELE3.2.

ELE3.10.030.9 BUSBARS

1. MCCB distribution boards shall be provided with vertical triple-pole and neutral copper busbars of rating not less than that of the supply side protective device subject to a minimum of 250A;
2. The configuration of the busbars, busbar supports and busbar mounting arrangement shall be type-tested to a short-time withstanding current of not less than 14 kA in the case of type A boards or 22 kA in the case of type B boards for 0.2 seconds at a voltage of not less than 380V;
3. Outgoing MCCBs shall be mounted horizontally on both sides of the vertical busbars. The connection between the MCCBs and the phase busbars shall be by means of copper tapes and bolted joints. Plug-in type of current carrying contacts shall not be accepted.

ELE3.10.040.9 ASSISTIVE DEVICE FOR LOCKING OF MCCB UNIT USING PADLOCK

1. For the MCCB distribution board fitted with MCCBs that cannot be locked by directly application of padlocks, two (2) assistive devices shall be provided for each MCCB distribution board irrespective of the number of outgoing ways to facilitate the locking of MCCBs using padlocks for isolation purpose during maintenance;
2. The assistive devices for all MCCB distribution boards installed within the electrical meter room shall be collectively housed inside a cabinet suitably wall mounted at a location within the electrical meter room;
3. The cabinet shall be made of sheet steel with finishing in baked enamelled or stove epoxy powder painted. The cabinet shall be suitably sized, fitted with front-hinged door and equipped inside with suitable hooks of sufficient numbers for hanging of all assistive devices.

ELE3.11 MINIATURE CIRCUIT BREAKER (MCB) DISTRIBUTION BOARDS

ELE3.11.1 GENERAL

ELE3.11.1.010.9 TYPE

Miniature Circuit Breaker Distribution Boards (MCB boards) shall be of surface mounted and enclosed type, and shall comply with IEC 60439-3 or BS EN 60439-3.

ELE3.11.1.020.9 GUARANTEE OF TYPE TEST EQUIVALENCE

In cases where miniature circuit breaker distribution boards are manufactured under licence from a Principal Company, letters of guarantee for products manufactured by the licensee from the Principal Company shall be produced to prove that such products are equivalent, in every respect, to the type-tested products.

ELE3.11.1.030.9 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.11.2 PERFORMANCE

ELE3.11.2.010.9 CLASS AND RATING

Class	Rating
1. Rated operational voltage:	220/380V (min)
2. Rated frequency:	50Hz
3. Rated insulated voltage:	415V (min)
4. Rated current:	a. MCB boards without integral incoming switch-disconnector: 200A; b. MCB boards with integral incoming switch-disconnector: not less than the current rating of the integral incoming switch-disconnector, subject to a minimum of 100A.
5. Rated conditional short-circuit current:	24 kA when backed up by 160A fuse as specified in ELE3.13.010.

ELE3.11.3 ENCLOSURE

ELE3.11.3.010.9 CONSTRUCTION

MCB boards shall be fabricated from sheet steel with a thickness of not less than 1.2 mm. They shall be robustly constructed and rustproof.

ELE3.11.3.020.9 FINISH

All inside and outside surfaces of the enclosure shall be treated with either anti-rust protective coating followed by two stoved coats of gloss paint of contrasting colours or an alternative acceptable finish such as phosphate treatment followed by stove epoxy powder paint. The finishing coat shall be approved by the Contract Manager.

ELE3.11.3.030.9 KNOCKOUTS

Knockouts of appropriate size shall be provided on the top and bottom of the enclosure.

ELE3.11.3.040.9 FASTENING DEVICE

The fastening device (e.g. screws) for fixing the cover to the enclosure shall be captive and shall not cause damage to the enclosure during fastening and loosening.

ELE3.11.3.050.9 DEGREE OF PROTECTION

1. The degree of protection for the enclosure with all functional units and blanking plates fitted shall be at least IP41 and IP 31 for the top surface and other surfaces respectively;
2. If any cover or blanking plate can be removed without a tool, the degree of protection against direct contact with live parts shall be at least IP 2X with the cover or blanking plate removed;
3. Insulated tooth covers should be provided and inserted to cover the exposed live parts protruding from the main busbar reserved for future connection of MCB units and RCBO units;
4. With the front cover removed or in replacing the MCB unit or RCBO unit, any live parts which cannot be isolated by the MCB board's integral incoming switch-disconnector shall be provided with barrier or other means affording a degree of protection at least IP 2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label bearing "DANGER - 危險" in red legible letters and characters each not less than 10 mm high shall be provided next to the neutral conductor. And, if the MCB board is not provided with an integral incoming switch disconnector, a warning notice shall be placed in such a position that any person gaining access to live parts will be warned of the need to use the appropriate isolating device.

ELE3.11.3.060.9 DANGER LABEL

A label bearing "DANGER - 危險" in red legible letters and characters each not less than 10 mm high shall also be provided on the cover.

ELE3.11.4 COMPONENTS AND ARRANGEMENT

ELE3.11.4.010.9 SPECIFICATION

The functional units such as MCBs, RCCBs, RCBOs, switch-disconnectors etc. shall comply with the relevant BS EN/BS/IEC and the relevant sections in this Specification.

ELE3.11.4.020.9 MOUNTING ARRANGEMENT

All the MCBs, RCCB, RCBO (if provided) and switch-disconnectors (if provided) shall be mounted in a straight line manner and fixed firmly in position. The toggles of all devices shall be projected through the front panel of the MCB board. The on and off identifications for all these devices shall be clearly visible such that the close or open state of the devices shall be easily distinguished when they are mounted in the normal service position.

ELE3.11.4.030.9 MAIN BUSBARS

The main busbars shall be copper to BS EN 13601 and be completely tinned. Fixing of busbars shall not rely on any functional unit.

ELE3.11.4.040.9 NEUTRAL TERMINAL BLOCK

The neutral terminal block, where specified, shall allow the connection of copper conductors having current carrying capacity of the phase conductor. The number of outgoing terminals in the neutral blocks shall not be less than the maximum number of outgoing circuits.

ELE3.11.4.050.9 EARTHING TERMINAL BLOCK

The earthing terminal block shall be provided with sufficient terminals for the incoming and maximum number of outgoing circuits.

ELE3.11.4.060.9 SPACING

Sufficient space shall be provided for wiring and termination after all the functional units are fixed in position.

ELE3.11.4.070.9 MOUNTING

The functional units, terminal blocks, busbars, incoming switch-disconnector, etc. shall be mounted as skeleton units or on a backplate. The skeleton units shall not be disintegrated for the removal or replacement of any functional unit.

ELE3.11.4.080.9 REMOVAL

Removal of any skeleton unit or the backplate, replacement of MCB or RCBO, or termination of cable shall not disturb or loosen the other components or wiring.

ELE3.11.4.090.9 STEEL SCREWS

All steel screws shall be zinc plated or chromate coated. Self tapping screws are not acceptable.

ELE3.11.4.100.9 IDENTIFICATION

1. For MCB board designed to incorporate both multi-pole and single pole MCBs/RCBOs, phase and neutral colour identification shall be provided adjacent to each MCB/RCBO outgoing way and neutral connection;
2. Ferrules shall be provided for wires, including earthing, phase and neutral conductor, throughout the distribution board internally for circuit identification.

ELE3.11.4.110.9 CIRCUITRY

The circuitry of the MCB board shall be as shown on the Drawings.

ELE3.11.4.120.9 ASSISTIVE DEVICE FOR LOCKING OF MCB UNIT AND RCBO UNIT USING PADLOCK

1. Two (2) assistive devices shall be provided for each MCB board irrespective of the number of outgoing ways to facilitate the locking of MCBs and RCBOs using padlocks for isolation purpose during maintenance;
2. The assistive devices for all MCB boards installed within the electrical meter room shall be collectively housed inside a cabinet suitably wall mounted at a location within the electrical meter room;
3. The cabinet shall be made of sheet steel with finishing in baked enamelled or stove epoxy powder painted. The cabinet shall be suitably sized, fitted with front-hinged door and equipped inside with suitable hooks of sufficient numbers for hanging of all assistive devices.

ELE3.11.5 TYPE-TEST

ELE3.11.5.010.9 STANDARD

MCB boards shall be type-tested to Clause 8 of BS EN 60439-3 or IEC 60439-3. Partially type-tested assemblies (PTTA) will only be accepted provided that the non-type-tested arrangements are derived from and have been verified to comply with the standard of the type-tested ones and/or been tested to the satisfaction of the Contract Manager. PTTA shall be verified and substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the type-tested arrangement from which the PTTA is derived.

ELE3.11.5.020.9 VERIFICATION

The short-circuit strength of the MCB board shall be type-tested and verified by a Short Circuit Testing Organization with the conditional short-circuit current specified in ELE3.11.2.

ELE3.11.5.030.A SHORT-CIRCUIT

The short-circuit shall be made as follows:

1. For MCB boards designed to incorporate single pole MCBs/RCBOs only: across the phase and neutral;
2. For MCB boards designed to incorporate DP MCBs/DP RCBOs: across each phase and neutral. If the busbars in all phases are equally constructed and subject to the Approval of the Contract Manager, partially type tested assembly (PTTA) will be acceptable;
3. For MCB boards designed to incorporate TP and/or SP MCBs and SP RCBOs: across the three phases. Where a neutral bar exists, it shall be subjected to one test to prove its short-circuit withstand strength in relation to the nearest phase bar for the conditional short-circuit current specified in ELE3.11.2;
4. The bolted short-circuit connection shall be provided immediately at the terminals of the outgoing functional unit. The prospective short-circuit current shall pass through the integral incoming switch-disconnector (if provided), the main busbars, the neutral busbar (if provided), RCCB (if provided), SP, DP or TP MCBs, and SP or DP RCBOs, as appropriate, located at the farthest position from the incoming supply point.

ELE3.12 CONSUMER UNITS

ELE3.12.1 GENERAL

ELE3.12.1.010.9 STANDARD

Consumer units shall comply with IEC 60439-3 or BS EN 60439-3 and shall be tropicalised for use in Hong Kong.

ELE3.12.1.020.9 GUARANTEE OF TYPE-TEST EQUIVALENCE

In case where consumer units are manufactured under licence from a Principal Company, a letter of guarantee for products manufactured by the licencee from the Principal Company shall be produced to prove that such products are equivalent, in every respect, to the type-tested standard products.

ELE3.12.1.030.9 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.12.2 ENCLOSURE

ELE3.12.2.010.9 CONSTRUCTION

Consumer units shall be fabricated from sheet steel with a thickness of not less than 1.2 mm for the enclosures, cover plates and hinged covers. They shall be robustly constructed and rustproof. The hinged covers shall be capable of covering up all functional units including labels fitted on the consumer units. The hinged covers together with hinges shall be so designed and fixed to the enclosures to enable their easy removal when and where required without causing any damage to the finish or impairing the integrity and the specified IP of the cover plates and enclosures.

ELE3.12.2.020.9 FINISH

1. All inside and outside surfaces of the enclosure, cover plate and hinged cover shall be treated with, either anti-rust protective coating followed by two stoved coats of gloss paint of contrasting colours, or an alternative acceptable finish such as phosphate treatment, followed by two stoved coats of gloss paint of contrasting colours, or an alternative acceptable finish such as phosphate treatment followed by stoved epoxy powder paint;
2. The finishing colour shall be the manufacturer's standard colour or a standard alternative light gray colour RAL 9002 according to the Classic RAL System, subject to the approval of the Contract Manager.

ELE3.12.2.030.9 KNOCKOUTS

Knockouts of appropriate size on the top and rear of the enclosure shall be provided.

ELE3.12.2.040.9 FASTENING DEVICE

The fastening device (e.g. screws) for fixing the cover plate/cover to the enclosure shall not cause damage to the enclosure during fastening and loosening. Hinges and screwed connections shall be properly designed and fixed to ensure permanent good conductivity between the enclosure, cover plates and hinged covers.

ELE3.12.2.050.9 DEGREE OF PROTECTION

1. The degree of protection for the enclosure shall be at least IP 41 with all the functional units and blanking plates fitted;
2. If any cover or blanking plate can be removed without a tool, the degree of protection against direct contact with live parts shall be at least IP 2X with the cover or blanking plate removed;
3. Insulated tooth covers should be provided and inserted to cover the exposed live parts protruding from the main busbar reserved for future connection of MCB units.

ELE3.12.3 COMPONENTS AND ARRANGEMENT

ELE3.12.3.010.9 COMPONENTS

Each consumer unit shall comprise, but not be limited to, the following items:

1. Tinned main copper busbars to BS EN 13601;
2. A double pole switch-disconnector;
3. A residual current operated circuit breaker (RCCB);
4. An assembly of miniature circuit breakers (MCBs);
5. Multi-terminal bar(s) for neutral conductors with one hole and screw of suitable size for each way; the bar(s) shall be properly supported to and insulated from the backplate or enclosure;
6. A multi-terminal bar for circuit protective conductors with one hole and screw of suitable size for each way, earthing lead and two bonding conductors;
7. Rigidly fixed but removable metal backplate or mounting rail assembly;
8. Plastic labels for incoming and outgoing circuits and RCCB on the cover;
9. Rigid blanking plates; and
10. Interconnecting tinned copper bars of appropriate rating to BS EN 13601 or copper cables of appropriate rating to BS EN 50525-2-31.

ELE3.12.3.020.9 CIRCUITRY

The circuitry of the consumer unit shall be as shown on the Drawings.

ELE3.12.3.030.9 SPECIFICATION

The functional units such as MCBs, RCCB, switch-disconnector, etc. shall comply with the relevant BS/BS EN/IEC and the relevant sections in this Specification.

ELE3.12.3.040.9 MOUNTING ARRANGEMENTS

All the MCBs, RCCB and switch-disconnector shall be mounted in a straight line manner and fixed firmly in position so as not to allow any lateral movement. Except for rotary type, the toggles of all devices shall be operated in the same direction and projected through the front panel of the unit. The on and off identifications for all these devices shall be clearly visible such that the close or open state of the devices shall be easily distinguished when they are mounted in the normal service position.

ELE3.12.3.050.9 SPACING

Sufficient space shall be provided for wiring and termination after all the circuit breakers are mounted in position.

ELE3.12.3.060.9 MOUNTING

All the MCBs, RCCB, switch-disconnector, main busbars and the interconnecting copper bars or cables shall form an integral assembly on the metal backplate or mounting rail in such a way that it can be easily removed from the enclosure without disintegration.

ELE3.12.3.070.9 MULTI-TERMINAL BARS

The multi-terminal bars for neutral and circuit protective conductors shall be fixed securely and held captive so that they cannot be rotated. These bars shall be of copper to BS EN 13601.

ELE3.12.3.080.9 STEEL SCREWS

All steel screws within the unit shall be zinc plated or chromate coated.

ELE3.12.3.090.9 ASSISTIVE DEVICE FOR LOCKING OF MCB UNIT USING PADLOCK

1. For Public Rental Housing (PRH) development:

    a. A total of fifty (50) assistive devices shall be provided for each domestic block of any size to facilitate the locking of MCBs using padlocks for isolation purpose during maintenance;

    b. Twenty (20) assistive devices shall be collectively housed inside a cabinet suitably wall mounted at a location near guard counter of each domestic block. The cabinet shall be made of sheet steel with finishing in baked enamelled or stove epoxy powder painted or fabricated in other material as specified by the CM. The cabinet shall be suitably sized, fitted with front-hinged door with lock using key for access and equipped inside with suitable hooks of sufficient numbers for hanging of all assistive devices;

    c. The rest thirty (30) assistive devices shall be collectively housed inside a cabinet suitably wall mounted at a location within the main switch room. The cabinet shall be made of sheet steel with finishing in baked enamelled or stove epoxy powder painted. The cabinet shall be suitably sized, fitted with front-hinged door and equipped inside with suitable hooks of sufficient numbers for hanging of all assistive devices; and

    d. A label of durable material shall be provided with prominent red wordings on white ground with a size of not less than 100 x 50 mm inscribed in English and Chinese characters as follows:

REW MAY BORROW ASSISTIVE DEVICE(S)
FOR LOCKING OFF MCB UNITS FROM
GUARD COUNTER

電業工程人員可於大堂櫃位借取微型斷路器的
上鎖輔助器

Lettering shall be at least 5 mm high. The notice shall be securely affixed by adhesive means inside the cover of consumer unit.

2. For Subsidised Sale Flats (SSF) development:

   a. Two (2) assistive devices shall be provided for each consumer unit irrespective of the number of outgoing ways to facilitate the locking of MCBs using padlocks for isolation purpose during maintenance; and

   b. The assistive devices for all consumer units shall be handed over to the CM at contract completion.

ELE3.12.4 TYPE-TEST

ELE3.12.4.010.9 STANDARD

Consumer units shall be type-tested to Clause 8 of BS EN 60439-3 or IEC 60439-3. Partially type-tested assemblies (PTTA) will only be accepted provided that the non-type-tested arrangements are derived from and have been verified to comply with the standard of the type-tested ones and/or been tested to the satisfaction of the Contract Manager. PTTA shall be verified and substantiated by test certificates/reports and/or graphs, calculations, etc. together with the details of the type-tested arrangement from which the PTTA is derived.

ELE3.12.4.020.9 VERIFICATION

The short-circuit strength of the consumer unit shall be type-tested and verified by a Short Circuit Testing Organization in accordance with Annex ZA to BS EN 60439-3 or IEC 60439-3 at 16 kA minimum.

ELE3.13 FUSES

ELE3.13.010.9 GENERAL

1. Fuses shall comply with IEC 60269-1, IEC 60269-2 and BS 88:Section 2.2 or BS 88-2;
2. Fuses of compact dimensions to BS 88:Part 6 or BS 88-2 are only acceptable for metering circuits and/or control circuits provided that the rated breaking capacity of the fuse shall exceed the prospective short-circuit current at the point where the fuse is installed;
3. All fuses shall be of a.c. rating and their current ratings shall be as shown on the Drawings;
4. Fuse links shall be certified to use and shall bear the marking of "ASTA 20 CERT" or a similar and Approved Equivalent Quality Surveillance Scheme;
5. Unless otherwise specified, fuse links shall be of current limiting type with full-range breaking capacity for general application (i.e. Utilization Category "gG"). Fuse links shall have conventional fusing current not more than 1.45 times the rated current under the intended service conditions;
6. Fuse links other than those to be used in fuse combination units shall be provided with fuse holders. The maximum power dissipation of the fuse link shall not exceed the maximum rated power acceptance of the fuse holder under the intended service conditions;
7. When fuse holders are specified, the degree of protection against electric shock for the complete fuse shall be IP3X under normal service conditions. When replacing the fuse link or removing the fuse carrier, the degree of protection against electric shock shall be at least IP2X;
8. Type-test certificates and reports, time/current characteristics, cut-off characteristics, pre-arcing and operating $I^2 t$ characteristics and Letter of Authorisation to use "ASTA 20 CERT" endorsement or similar documents shall be submitted for reference and examination if required.

ELE3.13.020.9 FUSES TO BS 88:SECTION 2.2

1. Fuses shall comply with IEC 60269-1, IEC 60269-2 and BS 88:Section 2.2 or BS 88-2;
2. When the fuse link is to be used in a fuse combination unit, its rated power dissipating shall not exceed that of the fuse link used in carrying out the temperature-rise type test of the unit;
3. The physical dimensions of the fuse links shall be as shown in the following table:

Current rating of fuse link (I)	Dimension as fuse reference of BS 88:Section 2.2 or BS 88-2
32 > or = I	A2
32 < I < or = 63	A3
63 < I < or = 100	A4 or B1
100 < I < or = 200	B2
200 < I < or = 315	B3
315< I < or = 400	B4 or C1

400 < I < or = 630	C2
630< I < or = 800	C3

For fuse links rated at or below 100A mounted in cubicle switchboard, the physical dimensions of the fuse links as shown in Fig. 1 of BS 88:Section 2.2 or Figure 501 of BS 88-2 are also acceptable;

4. Fuses shall be type-tested to IEC, 60269-1, IEC 60269-2 and BS 88:Section 2.2 or BS 88-2. Type-test of 'Verification of Breaking Capacity' shall be carried out by a Short-Circuit Testing Organisation.

ELE3.13.030.9 FUSES TO BS 88:PART 6

1. Fuses of compact dimensions shall comply with IEC 60269-1 and BS 88:Part 6 or BS 88-2;
2. Fuses shall be type-tested to IEC 60269-1 and BS 88:Part 6 or BS 88-2. Type test of 'Verification of Breaking Capacity' shall be carried out by a Short-Circuit Testing Organisation.

ELE3.15 CONTACTORS

ELE3.15.1 GENERAL APPLICATION

ELE3.15.1.010.9 STANDARD

Contactors shall comply with IEC 60947-4-1.

ELE3.15.1.020.9 RATINGS

1.	Rated operational voltage:	380/220V
2.	Rated insulation voltage:	415V
3.	Rated frequency:	50Hz
4.	Pollution degree:	3
5.	Conventional enclosed thermal current:	As shown on the drawings
6.	Rated operational current/power and duty:	As shown on the drawings

ELE3.15.1.030.9 CONSTRUCTION AND DESIGN

1. Contactors shall be four-pole, triple-pole, double-pole or single-pole as shown on the Drawings;
2. The mechanical endurance of the contactors shall not be less than 3 million no-load operating cycles;
3. Unless otherwise specified, the number of on-load operating cycles for category AC-3 shall not be less than 1/20 of the number of no-load operating cycles corresponding to the mechanical endurance of the contactor;
4. Contactors shall be silver or silver-faced;
5. Insulation shall be of class B of IEC 60085.

ELE3.15.1.040.9 OPERATION

Contactors shall be electro-magnetically controlled, double air-break type. The rated control circuit voltage shall be the same as that of the main circuit; otherwise it shall be 24V, 30V or 110V d.c. as specified.

ELE3.15.1.050.9 UTILISATION CATEGORY

1. Unless otherwise specified, contactors shall be of utilisation category AC-2 for general application;
2. For special applications described in clause ELE3.15.2, the utilisation categories of the contactors used shall comply with the correspondent requirements accordingly. Contactors with utilisation category other than the stipulated categories are acceptable provided that the test currents, voltages, power factors or time constants, number of operating cycles, the on and off times given in the Tables 7 and 8 of IEC 60947-4-1 and the test circuit for the assigned utilisation categories are not more severe than those of the contactor has been tested and the temperature rise has been verified at a current not less than the highest assigned rated operational current in continuous duty.

ELE3.15.1.060.9 TYPE TESTS

Contactors shall be type-tested to IEC 60947-1 and IEC 60947-4-1. Full type-test certificates shall be produced to the satisfaction of the Contract Manager.

ELE3.15.2 SPECIAL APPLICATIONS

ELE3.15.2.010.9 CHANGEOVER CONTACTORS FOR CUBICLE TYPE SWITCHBOARD

1. Two identical contactors, mechanically and electrically interlocked such that only one of them can be closed at any one time, shall be used;
2. Each changeover contactor shall be enclosed in a separate and segregated compartment with a hinged front door as specified in ELE4.2.050. The contactor shall be provided with phase barriers and arcing chutes where applicable. At least one "a" contact and one "b" contact shall be provided for each contactor;
3. Contactors shall be rated for AC-3 utilisation category and intermittent duty of Class 30. When the main contacts of a contactor remain closed at either the main supply side or the essential supply side, the contactor shall be suitably rated for the specified current for uninterrupted duty;
4. Prior to the time of material submission for approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE3.15.2.020.9 CONTROL CONTACTORS FOR POWER FACTOR CORRECTION EQUIPMENT

1. The contacts shall be of quick break and have a high arc resistance during switching operation;
2. Contactors shall be of utilisation category AC-6b and specifically designed for switching direct connected capacitor banks with intermittent duty of Class 30.

ELE3.15.2.030.9 CONTACTORS FOR MOTOR STARTER

1. Contactors for star/delta starting or reversing contactors shall be fitted with the necessary mechanical and electrical interlocks;
2. Contactors shall be of utilisation category AC-3 for general motor circuits and AC-4 for motor circuits with plugging or inching facilities. Contactors for motor starters of AC-3 utilisation category shall be of uninterrupted duty and intermittent duty Class 12, 60% on-load factor; and contactors for AC-4 category shall be of intermittent duty Class 30, 60% on-load factor.

ELE3.15.2.040.9 CONTROL CONTACTORS FOR DISCHARGE LAMPS

Contactors shall be of utilisation category AC-5a for electric discharge lamps. Also it shall be specifically designed for switching operations of the lamps with intermittent duty of Class 30.

ELE3.15.2.050.9 CONTROL CONTACTORS FOR HERMETIC REFRIGERANT COMPRESSOR MOTORS

Contactors shall be of utilisation category AC-8a for hermetic refrigerant compressor motors with manual reset of overload releases and AC-8b for the one with automatic reset of overload releases. Also it shall be specifically designed for switching operations of these items with intermittent duty of Class 30.

ELE3.16 STARTERS

ELE3.16.010.9 GENERAL

Starters shall be air-break triple pole electromagnetic contractor type and shall comply with and be tested to IEC 60947-4-1 or EN 60947-4-1. Unless otherwise specified, each starter shall comprise an isolating device, a thermal overload protective device, main and auxiliary contacts, on/off controls and indications.

ELE3.16.020.9 UTILISATION CATEGORY

Starters shall be of utilisation categories AC-3 for general motor circuits and AC-4 for motor circuits with plugging or inching facilities. Motor starters for AC-3 utilisation category shall be of both uninterrupted duty and intermittent duty Class 0.1 60% on-load factor. Starters of category AC-4 shall be of intermittent duty Class 0.3 60% on-load factor.

ELE3.16.030.9 MECHANICAL AND ELECTRICAL ENDURANCE

1. The mechanical and electrical endurance of the starters shall be tested in accordance with IEC 60947-4-1 or EN 60947-4-1;
2. The mechanical endurance of the starters shall not be less than 0.1 million no-load operating cycles for category AC-3 starters and 0.3 million no-load operating cycles for AC-4 starters;
3. The number of on-load operating cycles for category AC-3 starters shall not be less than 1/20 of the number of no-load operating cycles corresponding to the mechanical endurance of the starters.

ELE3.16.040.9 THERMAL OVERLOAD RELAY

Thermal overload relay shall be Type B compensated for ambient temperature of 40°C and have a setting range of 50% - 150% rated operational current.

ELE3.16.050.9 AUXILIARIES

For assisted start starters, timers shall be solid state plug-in type with 0 - 15 seconds setting. For star/delta and reversing starters, mechanical and electrical interlocks shall be fitted with the contactors.

ELE3.17 TIME SWITCHES

ELE3.17.010.9 OPERATION

Time switches shall be self-starting and driven by synchronous motor or an electronic operated clock.

ELE3.17.020.9 MOUNTING/HOUSING

Time switches shall be suitable for either flush, surface or panel mounting as specified in ELE2 and shall be housed in metal or robust moulded plastic enclosure with a removable clear plastic front cover.

ELE3.17.030.9 RATING

The time switches shall be rated at 15A (Resistive load) unless otherwise specified. The time accuracy shall be within ±1 second per day.

ELE3.17.040.9 FEATURES

1. An automatic rewind spring reserve or lithium/NiMH battery backup, of not less than 72 hours, to drive the mechanism during power interruption;
2. A 24-hour dial with at least 2 "ON-OFF" operation cycles everyday;
3. An on/off or test switch to enable the circuit to be controlled at will without affecting the normal dial operation;
4. A minimum time setting period of 15 minutes shall be achievable.

ELE3.18 MEASURING INSTRUMENTS

ELE3.18.010.9 KILOWATT-HOUR METERS

1. Kilowatt-hour meters shall be of a digital display type suitable for small rating circuits and have rated current not less than the rating of the circuit protection MCBs at the upstream of the corresponding circuits, single-phase or three-phase, as shown on the Drawings;
2. The meters shall comply with IEC 62053-21 or BS EN 62053-21, with IP51 in protective enclosure for indoor meters;
3. The meters shall be of direct connection type or connection with external measuring current transformers (MCTs) as appropriate to suit the rating of measured circuits;
4. The meters shall be mounted on a DIN rail and housed inside a metal enclosure with the display exposed to view on the front cover;
5. The display of the meter shall show the accumulative reading in kilowatt-hour and have minimum 4 digits. The reading shall be maintained even under power interruption and be continued upon power resumption;
6. The accuracy of the meters shall not be less than Class 1 according to IEC 62053-21 or BS EN 62053-21. The manufacturer shall issue a calibration certificate for every batch of meters at time of production and the calibration certificate shall be submitted to the Contract Manager. Such calibration shall be conducted by the manufacturer within one year prior to delivery of the meter on site. The manufacturer shall also declare in writing that the meter shall require no re-calibration for a minimum of 10 years from the time of issue of calibration certificate. A label marking the manufacturer’s calibration date shall be fixed adjacent to the meter;
7. The meters shall comply with the Electromagnetic Compatibility (EMC) requirements in accordance with IEC 61000-4-2, IEC 61000-4-3, IEC 61000-4-4 and IEC 61000-4-5 standards.

ELE3.18.020.9 AMMETERS AND VOLTMETERS

1.
   a. Ammeters and voltmeters shall be of moving iron type or moving magnet type or moving coil with transducer type, complying with IEC 60051-1 and IEC 60051-2;
   b. The accuracy class shall be "2.5" or better in accordance with IEC 60051-1 and IEC 60051-2;
   c. The dial shall have a nominal diameter of approximate 75 mm and shall have a minimum scale deflection of 90°.
2.
   a. An ammeter for any circuit of rating up to 60A may be connected directly in series with the circuit, so that the full circuit current passes through the instrument;
   b. For a circuit of rating exceeding 60A, the ammeter shall be fed through the secondary winding of a current transformer, and shall give a scale deflection with a secondary current of 5A.

ELE3.18.030.9 CURRENT TRANSFORMERS

Current transformers for use with measuring instruments shall comply with IEC 61869-2 or BS EN 61869-2 having rated secondary current of 5A and rated output suitably matched with the burden of the measuring instrument.

ELE3.18.040.9 SELECTOR SWITCH FOR AMMETER

1. Where a single ammeter is used to measure the current in each phase, or the neutral of a three phase circuit, the ammeter shall be connected to a selector switch which shall enable the ammeter to be inserted in series with each phase and the neutral in turn;
2. When the ammeter is connected to the secondary windings of the measuring current transformers, the selector switch shall have facilities to prevent the current transformers from being open circuited during change-over and at OFF position.

ELE3.18.050.9 SELECTOR SWITCH FOR VOLTMETERS

1. In three phase circuits, in which a single voltmeter is used to measure the voltage, the voltmeter shall be provided with a selector switch to enable the following voltages to be measured:
    a. Voltage between each phase to neutral;
    b. Voltage between any two phases.
2. The selector switch shall also have an OFF position.

ELE3.18.060.9 MOUNTING POSITION OF SELECTOR SWITCHES

Selector switches for ammeters or voltmeters shall be mounted immediately below the meters with which they are associated.

ELE3.18.070.9 METER CHAMBERS

1. Construction:
    a. Meter chambers for housing kilowatt-hour meters shall be made of galvanised steel not less than 1.6 mm thick and shall be of ample size to accommodate the required number of kilowatt-hour meters and meter cables;
    b. Provision shall be made to enable the kilowatt-hour meters to be fixed inside the chamber without removing the chamber from the wall or other supports;
    c. Meter fixing screws shall not project through the back of the chamber.
2. Front covers:
    a. When a meter chamber is installed indoors, it shall be fitted with a hinged metal front cover;
    b. Meter chambers installed outdoors shall be weatherproof, with screw-on type front covers;
    c. The degree of protection in the latter case shall be of at least IP54 in accordance with IEC 60529.
3. Windows:
    a. Glass windows shall be provided in the front covers of meter chambers to enable the registers of the kilowatt-hour meters to be read easily;
    b. A window shall be provided for each meter, and the size of the window shall be large enough to enable the serial number of the meter and the register to be clearly visible.

ELE3.18.080.9 MOUNTING OF CURRENT TRANSFORMERS ASSOCIATED WITH A WATT-HOUR METER

1. Current transformers, if required in association with a watt-hour meter, may be mounted inside the meter chamber, or in a separate current transformer chamber, as dictated by the circumstances of each particular job;
2. When current transformers are mounted in the meter chamber, the front cover shall be arranged so that the opening or removal of the front cover to gain access to the meters will not expose the current transformers;
3. A separate cover giving access to the current transformers compartment shall be provided;
4. Suitable engraved labels shall be fixed on the covers to identify the installed equipment therein.

ELE3.18.090.9 IDENTIFICATION OF INSTRUMENTS

Each measuring instrument shall be identified by means of a label fitted under the associated instrument. This label shall denote the function of the circuit connected to the meter.

ELE3.19 SITE BUILT ASSEMBLIES

ELE3.19.010.9 SITE BUILT ASSEMBLIES

Site built assemblies of switchgear and controlgear shall be constructed, assembled and installed in accordance with ELE2 or the Drawings. They shall also comply with and be tested to the relevant BS EN/BS/IEC Specifications.

ELE3.20 FIREMAN'S EMERGENCY SWITCH

ELE3.20.010.9 GENERAL

1. The fireman's emergency switch shall comply with IEC 60947-3;
2. The fireman's emergency switch shall be coloured red with aluminium enclosure. The switch shall be weatherproof with ingress protection of at least IP65 to BS EN 60529 or IEC 60529;
3. The fireman's emergency switch shall have its 'ON' and 'OFF' positions clearly indicated by lettering legible to a person standing on the ground at the intended site, with the 'OFF position at the top;
4. The fireman's emergency switch shall be provided with a device with interlocking mechanism to prevent the switch being inadvertently returned to the 'ON' position;
5. The fireman's emergency switch shall be provided with an operating handle which is designed in such a way that a fireman-hook or axe can be used to switch off the switch.

ELE4.1 GENERAL

ELE4.1.005.9 STANDARDS

Switchboards shall be constructed to fully comply with IEC 61439-1 and IEC 61439-2 standards.

ELE4.1.015.A SWITCHBOARDS

1. Switchboards shall be low-voltage switchgear and controlgear assemblies (hereinafter referred to as "ASSEMBLY" or "ASSEMBLIES") in full compliance with IEC 61439-1 and IEC 61439-2. They shall be of the enclosed, stationary, floor-standing, multi-cubicle type ASSEMBLIES for indoor use;
2. The manufacturer shall operate quality management system including design, manufacture, installation and maintenance of the ASSEMBLIES conforming to ISO 9001 and be certified by a certification body which is accredited by one of the following accreditation bodies:
    a. Hong Kong Accreditation Services (HKAS);
    b. An accreditation body considered as having equivalent standard by the Development Bureau.
3. In the case where the ASSEMBLIES are manufactured under licence from a Principal Company, a letter of guarantee from the Principal Company shall be produced to prove that the products manufactured by the licences are equivalent, in every respect, to those verified standard products;
4. Prior to delivery to Site, the ASSEMBLIES shall have satisfactory proven record of reliability in local application for a minimum period of 12 months which shall be established after the satisfactory completion of the original design verification in compliance with IEC 61439-1 and IEC 61439-2;
5. All materials and components used in the ASSEMBLIES shall be of the same make and brand of the verified ones. Alternative materials or components will not be accepted without prior Approval;
6. The ASSEMBLIES shall adopt the full compliance of IEC 61439-1 and IEC 61439-2 as a whole.

ELE4.1.025.A DESIGN VERIFICATION

1. Three different but equivalent types of verification of requirements as stipulated in Annex D of IEC 61439-1 shall be made for the ASSEMBLIES:
    a. Verification testing (type testing);
    b. Verification comparison with a tested reference design;
    c. Verification assessment, i.e. confirmation of the correct application of calculations and design rules, including use of appropriate safety margins.
2. ASSEMBLIES, circuit breakers and fuse combination units shall be verified to comply with IEC 61439-1 and IEC 61439-2, IEC 60947-2 and IEC 60947-3 respectively. They shall be suitable for installation under environment condition of pollution degree 3 unless otherwise specified;

3. Certificates for verification complete with reports and drawings showing enclosures and partitions of the ASSEMBLIES to demonstrate the segregation of circuits, the type and thickness of insulation barriers, details of insulating supports and the clearances of equipment that passed the verification shall be submitted if required by the CM;

4. Verification shall be substantiated by test certificates / reports and / or graphs, calculations, etc. together with the details of the verified arrangement from which is derived.

ELE4.1.028.N MODIFICATIONS MADE TO A VERIFIED (TYPE TESTED) ASSEMBLY

1. If modifications are made to a verified ASSEMBLY, Clause 10 of IEC 61439-1 shall be used to check if these modifications will affect the performance of the ASSEMBLY. New verifications shall be carried out if an adverse effect is likely to occur. Certification bodies recognised by the electrical CoP as shown in Code 4A as Recognised Certification Bodies for testing of low voltage switchgear and control gear assemblies shall be considered eligible to be third party design checker for assessment and verification of ASSEMBLY design employing design calculation approach as allowed in IEC 61439-2;

2. A functional unit (ACB, MCCB, switchfuse, fuseswitch and changeover contactor / switch) in the verified ASSEMBLY may be substituted with a similar device from another series of the same manufacturer to that used in the original verification, provided that:

   a. The power loss and terminal temperature rise of the device, when tested in accordance with its product standard, is the same or lower;

   b. The physical arrangement within the functional unit and the rating of the functional unit shall be maintained;

   c. Other requirements are considered including the short-circuit requirements according to Table 13 of IEC 61439-1.

3. The configuration of the busbar and functional unit assembly contained in the ASSEMBLY shall be the same as shown on the verification test drawings. Modifications are only allowed if these modifications will not affect the performance of the ASSEMBLY. As far as temperature-rise matters are concerned, any change in the configuration shall not have any adverse thermal influences of the adjacent units and shall be substantiated in accordance with ELE4.1.028 (2a) and further verified by temperature rise limits test in accordance with ELE4.5.2.025 (1g). Any change of configurations which may introduce negative impact to the short-circuit performance of the ASSEMBLY will require separate test certificates issued by certification bodies unless verification in accordance with all the criteria specified in Table 13 of IEC 61439-1 is submitted by the Sub-contractor and approved by the CM.

ELE4.1.035.A SHORT-CIRCUIT WITHSTAND STRENGTH VERIFICATION

1. ASSEMBLIES:

   The following short-circuit withstand strength verification on the main circuits of ASSEMBLIES shall be carried out by a Short Circuit Testing Organization in compliance with IEC 61439-1 and IEC 61439-2 at the value of short circuit currents specified below:

Circuit	Test Current

a. Busbars connected to the outgoing terminals of the outgoing functional unit in accordance with Clause10.11.5.3.2 of IEC 61439-1	50kA for 1 second when outgoing functional unit is an air circuit breaker; Prospective short-circuit current of 50kA to flow until it is broken when the outgoing functional unit is a fuse combination unit or MCCB unit.
b. Main busbars including riser / droppers and the busbars connected to the outgoing terminals of the mains incoming circuit breaker in accordance with Clause 10.11.5.3.3 of IEC 61439-1	50kA for 1 second
c. Neutral busbars of the above circuits in accordance with Clause 10.11.5.3.5 of IEC 61439-1	30kA for 1 second
d. Separate protective conductors and the terminals for the outgoing protective conductor in accordance with Clause 10.11.5.6 of IEC 61439-1	30kA for 1 second at main earth bar; Prospective short-circuit current of 30kA to flow until it is broken at outgoing protective conductor in each modular section.

2. Circuit breakers and fuse combination units:

   The following short-circuit type-test on the circuit breakers and fuse combination units shall also be carried out by a Short Circuit Testing Organization in accordance with IEC 60947-2 and IEC 60947-3 respectively:

Switchgear	Test Current
a. Air Circuit Breakers:	
i. Rated service short-circuit breaking capacities:	50kA
ii. Rated short-circuit making capacity:	105kA at 0.25p.f.
iii. Rated short-time withstand current:	50kA for 1 second
b. MCCBs:	
Rated ultimate short-circuit breaking capacity:	50kA
c. Fuse Combination Units:	
Rated fused short-circuit current:	50kA

ELE4.2 ASSEMBLIES - DESIGN AND CONSTRUCTION

ELE4.2.015.9 GENERAL ARRANGEMENT

1. ASSEMBLIES shall be formed from one or more modular sections (vertical-panel), each with a maximum width not exceeding 1000 mm and shall not accommodate more than two fuse combination units or two MCCB units in the same row. They shall be fitted together to form a flush front continuous board of uniform height and depth front-to-back and be suitable for floor mounting without any mounting structure. ASSEMBLIES shall be pleasing in appearance and shall be extensible at both ends;
2. ASSEMBLIES shall be of totally enclosed type with openings only for ventilating purposes. Ventilating grills or louvres located on top of the board shall be protected against ingress of condensate water (see also ELE4.2.035). In no case shall ventilating louvres be located at the front of ASSEMBLIES;
3. No forced ventilation to any components of ASSEMBLIES is allowed.

ELE4.2.020.A MECHANICAL DESIGN

1. The construction of the ASSEMBLIES shall be structurally, mechanically and electrically sound and shall be of steel construction, self supporting, with the enclosures, covers, removable covers and cover plates made of sheet steel of not less than 2 mm thick. All removable covers and doors shall be notched and all joints shall be machined to give a rigid, robust and smooth appearance to the satisfaction of the CM;
2. Marks of welding shall not be visible from the external surface of panels;
3. Detachable hinges shall be provided for the doors. Exposed hinges shall be bright cadmium or nickel chromium plated;
4. Gaskets shall be fitted on doors and removable covers and shall be continuous, without joints around corners, and suitably arranged to minimize the transmission of vibration, and to prevent the entry of dust.

ELE4.2.035.A PROTECTION AGAINST ELECTRIC SHOCK AND EXTERNAL INFLUENCES

1. Basic protection (protection against direct contact) shall be by means of barriers of enclosures in accordance with IEC 61439-1 and IEC 61439-2;
2. All external surfaces of an ASSEMBLY shall have a degree of protection against ingress of solid foreign bodies and liquid of at least IP31 in the normal service condition in accordance with IEC 61439-1 and IEC 61439-2;
3. With the front-hinged door of the functional units open and in replacing the fuse links, the degree of protection to the live part shall be at least IP2X. If the degree of protection to the neutral conductor of the live part cannot comply with this requirement, a warning label shall be provided next to the neutral conductor;
4. The bottom of the ASSEMBLY shall be closed and made vermin-proof by means of barriers cut away, where required, to fit the cables passing through. The barriers in the cable compartment shall be made of phenolic resin bonded paper laminate sheet of a minimum thickness of 6 mm;

5. The construction of the enclosure shall be the same for ASSEMBLIES under all types of verification, and be checked by visual inspection and standard test finger, if necessary, as specified in IEC 60529;
6. Fault protection (protection against indirect contact) shall be by means of protective circuits in accordance with IEC 61439-1 and IEC 61439-2. The size and installation of the protective conductors in an ASSEMBLY shall be in accordance with ELE4.3.1.075.

ELE4.2.040.9 FINISH

1. Before untreated steel work is painted, it shall be thoroughly cleaned by an Approved method, such as grit-blasting or chemical pickling and an Approved rust inhibitive priming coat applied. Treated steelwork e.g. zintec, shall be suitably cleaned and degreased;
2. Surfaces shall then have not less than two coats of stoved finish paint of contrasting colours; the finishing colour, both interior and exterior shall be equivalent to colour code 00A01 of BS 4800 (light grey) or lighter;
3. Care shall be taken to ensure that edges of metalwork have an adequate dry film thickness of paint and that paint build-up does not occur at edges;
4. Alternative finishing processes such as phosphate treatment followed by stoved epoxy powder paint conforming to BS EN 12476 will also be accepted.

ELE4.2.055.A COMPARTMENTATION

1. Internal separation of an ASSEMBLY shall be provided by means of barriers or partitions made of sheet steel or non-hygroscopic and flame retardant insulating materials rigidly fixed;
2. The size and construction of the compartments shall be the same as the type-tested ones;
3. Openings necessary for interconnection, control or ventilation shall be at least IP2X for protection against contact with live parts in the adjacent compartments, and be such that exhaust outlets of functional units shall not discharge directly to the live parts in adjacent compartments;
4. The ASSEMBLY shall be capable of withstanding any external fault. In the event of any internal arcing fault on a functional unit, the damage shall be confined to that unit so that the busbar and all other functional units remain fit for further service;
5. The internal separation shall be of Form 3b in accordance with IEC 61439-2. Further compartmentation shall also be provided for each of the following equipment:
    a. Incoming power supply cables, conductors and connections to the incoming supply side terminals of each incoming circuit breakers;
    b. Protective relays and terminal blocks;
    c. Batteries and Battery Charger;
    d. Supply Company's meter;
    e. Supply Company's CT;
    f. Capacitor bank;
    g. Fuse combination unit for capacitor bank;
    h. Control gears and relays for capacitor bank;
    i. Each section (vertical-panel) except the horizontal busbar compartments;

j. Cable terminals for outgoing functional units.

6. Front doors shall be provided for items given in sub-clauses (5)(b), (5)(c), (5)(d), (5)(e), (5)(g) and (5)(h) above and each outgoing functional units;

7. Removal back covers shall be completed with pair of handles for easy fixing and removal and provided for items given in sub-clauses (5)(a), (5)(f) and (5)(i) above;

8. Voltmeters, ammeters, multi-function electronic meters together with associated switches and indication lamps are allowed to be mounted on the front cover/door of the respective functional unit, provided that they do not obstruct the operation of the unit, are suitably protected against direct contact of live parts of at least IP2X, even when the door is open and, are properly earthed.

ELE4.3 ASSEMBLIES - COMPONENTS AND AUXILIARIES

ELE4.3.1 BUSBARS AND BUSBAR CONNECTIONS

ELE4.3.1.015.9 STANDARD

Assembly: IEC 61439-1 and IEC 61439-2.

ELE4.3.1.025.A RATING

1. Rated insulation voltage:	415V minimum
2. Rated operational voltage:	380/220V
3. Rated current:	100A, 200A, 400A, 800A, 1200A, 1600A, 2500A, 3200A as shown on the drawings
4. Rated frequency:	50Hz
5. Rated short-time withstand current:	as specified in ELE4.1.035

ELE4.3.1.035.A BUSBARS

1. Busbars shall be three phase and full rating neutral busbar made of hard drawn, high conductivity, bare solid copper bars to BS EN 13601 with electrotinned finish. The temperature-rise verification with rated current on each busbar section shall be witnessed by an acceptable third-party;
2. Main busbars shall run horizontally and conform to the verification arrangement;
3. A vertical busbar riser / dropper shall be required for each section of the ASSEMBLY where switchgears are arranged in multi-tier, with a cross-section capable of carrying either the total rated current of all outgoing functional units including spare outgoing functional units connected to it or the current rating of the upstream protective device protecting it, whichever is the less, without undue temperature-rise in accordance with Clause 10.10 of IEC 61439-1 and IEC 61439-2;
4. Busbars connecting the riser / dropper to the supply side of outgoing functional unit shall be with adequate insulation or shrouding;
5. Busbars shall be provided to connect between functional units and to extend each outgoing terminal of the functional units to the cabling compartment;
6. Where connection by busbars from busbar riser / dropper to the supply terminals of those outgoing functional units of small rating are not possible, appropriate functional units with suitable frame size shall be selected instead such that the connection by busbars could be maintained throughout the entire ASSEMBLY.

ELE4.3.1.040.9 ARRANGEMENT OF BUSBARS AND CONNECTIONS

1. In the incoming terminal compartment, the busbars shall be arranged in a manner that the provision and arrangement for the cable/busbar terminations shall comply with the Supply Company's requirement;
2. Unless otherwise specified, busbars and main connections which are generally in one plane shall be arranged in the order of L1-L2-L3 phases as follows:

a. If the run of the conductors is horizontal, the L1 phase shall be the top, or the left or farthest away as viewed from the front of the ASSEMBLY;

b. If the run of the conductor is vertical, the L1 phase shall be the left or farthest away as viewed from the front of the ASSEMBLY.

3. The busbars from the incoming supply connections through the incomer circuit breaker to the nearest main horizontal busbars, which follow the phase notation of the Supply Company's incoming terminals, shall also be acceptable;

4. The neutral shall occupy the outer position and shall be clearly marked.

ELE4.3.1.055.9 BUSBAR IDENTIFICATION

Each busbar and protective conductor shall be identified by colours in accordance with the Electrical CoP. The terminals for external protective conductors shall be marked in accordance with IEC 61439-1 and IEC 61439-2.

ELE4.3.1.065.9 BUSBAR JOINTING AND SUPPORT

1. Jointing of sections of busbars shall be made by bolts and nuts or clamps. Soldered, welded or riveted joints shall not be used;

2. Bolts for jointing busbars shall be of steel, either hot-dip galvanized or heavily eletroplated with zinc or cadmium, to guard against corrosion;

3. Conductors shall be supported on insulators of non-hygroscopic and non-deteriorating materials as verification;

4. The method and materials used in jointing and support shall conform to the verification arrangement.

ELE4.3.1.075.9 PROTECTIVE CONDUCTORS

1. Protective conductors shall be of size in accordance with IEC 61439-1 and IEC 61439-2;

2. The cross sectional area and the installation of the protective conductor shall be so selected and designed to eliminate the possibility of the fault current in the protective conductor causing a temperature rise that may damage the conductor or impair its electrical continuity before the operation of the protective device, for a duration that may last up to 5 seconds;

3. A continuous tinned copper bar of size satisfying the above requirement and in any case not less than 150 mm^2 shall be fixed at the rear interior bottom portion throughout the length of the ASSEMBLY, bonding the frame-work of all modular sections, terminals for the outgoing protective conductor(s) of each circuit, the circuit breaker's earthing terminal and finally connected to the earthing terminals on the external surface at the extreme ends of the ASSEMBLY.

ELE4.3.1.080.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with PRE.BS1.205 to verify the country / place of manufacture and authenticity of busbars delivered to Site or installed.

ELE4.3.2 AUXILIARY CIRCUITS

ELE4.3.2.010.9 WIRING

1. All auxiliary circuits shall be wired in PVC insulated copper cables to type CK of BS 6231 of not less than 2.5 mm² conductor;
2. All wiring shall be clipped in a neat and tidy manner by nylon type cable ties or installed in plastic wiring channels;
3. Wiring from the fixed part of the ASSEMBLY to equipment mounted on the hinged door shall be enclosed by a flexible PVC tubing.

ELE4.3.2.020.9 MARKING

1. Sleeve type cable markers shall be fitted to both ends of each length of cable to denote its function; the function letter shall be followed by a number identifying the individual wire;
2. Each branch of any connection shall bear the same identification mark. Where it is necessary to identify branches which are common, different identification marks for the branches shall be employed only if they are common through links or are connected to separate terminals which are then common by removable connections;
3. Numbering shall read from the terminals outwards on all wires;
4. Circuit function letters and wire numbers shall be in accordance with the following table:

Circuit		Test Current
C	Current transformers for over-current protection (including combined earth-fault protection) and instruments	10 - 29 : L1 phase 30 - 49 : L2 phase 50 - 69 : L3 phase 70 - 89 : residual circuit and neutral current transformer
D	Current transformers for metering and voltage control	90 : circuit protective conductors directly connected to the earthing bar
J	D.C. and d.c. supply	1 - 69
H	A.C. and a.c. supply	1 - 69
K	Closing and tripping control circuit	any number from 1 upwards
L	Alarms and indications initiated by auxiliary switches and relay contacts	any number from 1 upwards

ELE4.3.2.030.9 TERMINATION

1. Wiring from one section to another section of an ASSEMBLY shall feed through terminal blocks;
2. Except for the Supply Company's metering, test/disconnect terminal blocks shall be provided for each measurement and protection current transformer. The terminal blocks shall be housed in the same relay compartment with hinged front door;
3. All terminal blocks shall be feed-through terminal blocks with screw clamp connections and conforming to the following requirements:
    a. Electrical and mechanical characteristics to be type tested to IEC 60947-7-1;

b. Voltage rating 750V;

c. Moulding material to be melamine with low flammability as certified to UL94-V0(5V);

d. Designed to be mounted directly on assembly rail to BS 5825;

e. All current carrying parts to be copper coated with tin lead alloy. Clamping yokes and screw to be zinc plated steel with additional protection by a chromate layer.

In addition, test/disconnect terminal blocks complete with plugs and test sockets for tapping off/disconnection shall be provided for test and measurement circuits.

4. The terminal blocks shall be provided with manufacturer's standard assembly rails, end section, partition, bracket, cross connection plug, jumper bar, warning sign, plastic screw, marking tags, disconnect plugs, test plug bolt, test plug, etc.;

5. Only one cable shall be terminated in each terminal, where necessary, jumper bars or cross connecting plugs shall be used;

6. Terminal blocks for the live conductor shall be indicated with a warning sign and separated from other terminal blocks by partitions.

ELE4.3.3 AIR CIRCUIT BREAKERS

ELE4.3.3.015.9 STANDARDS

1. Circuit Breaker: IEC 60947-2;
2. Assembly: IEC 61439-1 and IEC 61439-2.

ELE4.3.3.025.A RATING

1. Rated operational voltage:	380V
2. Rated insulation voltage:	415V minimum
3. Rated frequency:	50Hz
4. Rated service short-circuit breaking capacity:	as specified in ELE4.1.035
5. Rated short-time withstand current:	as specified in ELE4.1.035
6. Rated-uninterrupted current:	800A, 1200A, 1600A, 2500A and 3200A as shown on the drawings

ELE4.3.3.035.A CIRCUIT BREAKER

1. The circuit breaker shall be triple pole or four pole as specified on the Drawings, air break and of metalclad, horizontal withdrawable type, fitted with a shunt trip coil and / or overcurrent release, depending on the type of protection scheme used, as specified in ELE4.4.1 and shown on the Drawings;

2. The circuit breaker shall be housed in a separate and segregated circuit breaker compartment as specified in ELE4.2.055. Each circuit breaker of triple pole type shall be complete with an accessible bolted type neutral link in accordance with the type-tested designs;

3. The circuit breaker shall have independent manual closing with stored energy or spring assisted mechanism, unless otherwise specified. Neutral link / pole shall be easily accessible for inspection and maintenance even after cabling;

4. Unless otherwise specified, opening and closing of incoming and bus-section ACB shall be capable of being remote controlled repeatedly by the integrally mounted shunt trip coil and shunt close coil respectively and shall be provided with on and off or "1" and "0" mechanical indicators on the front panel of the circuit breaker. The closing operation of the ACB shall be operable either by a solenoid coil or by a motorized mechanism;
5. For circuit breaker with mechanism controlled by a solenoid coil, the closing mechanism shall be controlled by the solenoid coil which replaces the standard closing spring. The a.c. supply to the rectifier for the solenoid coil shall be taken from the "Live" side of the circuit breaker. The closing contactor, rectifier and anti-hunting relay shall all be integrally mounted on the circuit breaker;
6. For circuit breaker with motorized mechanism, the closing spring shall be capable of being released electrically or manually and shall automatically be recharged upon each release operation with indication showing the mechanism is fully charged;
7. A push button shall be mounted on the front door of the circuit breaker to enable local closing for normal operation;
8. The remote closing and tripping function shall be designed to be operated through a pair of voltage free contacts on a remote operating device. A female 3-pin receptacle without the remote operating device shall be provided inside the IDMT Relay / Fuse chamber of the cubicle. The receptacle shall be of rating 250V 10A, a.c. to IEC 60320 or equivalent and approved standard. One number remote operating device shall be provided with each ASSEMBLY. The connection of the receptacle shall be as follows:
    a. Earth: common;
    b. Live: for remote closing;
    c. Neutral: for remote tripping.
9. The circuit breaker shall be of horizontal withdrawable type with 'connected', 'test' and 'isolated' positions, fitted with mechanical position indicators and pad-locking facilities in each of the positions;
10. The circuit breaker shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE4.3.3.040.9 MECHANICAL INTERLOCKS

The circuit breaker shall be provided with the following mechanical interlocks:

1. Circuit breaker cannot be racked in or withdrawn when in closed position;
2. Circuit breaker can be closed only when the main circuit connection is fully connected. When circuit breaker is racked out to a position at test or completed isolated or a position in between the two, the breaker can also be closed for testing purpose as long as the main circuit connection is already fully opened;
3. With hand charged spring mechanism, initiation of the closing of the circuit breaker is not possible until the closing mechanism is fully charged;
4. Other mechanical interlocks if specified on the Drawings to facilitate sequential operation of circuit breakers/section switches of the ASSEMBLY incorporating more than one circuit breaker.

ELE4.3.3.050.9 CIRCUIT BREAKER COMPARTMENT/INTERLOCK

The circuit breaker compartment shall maintain a degree of protection against direct contact with live parts of at least IP 2X during normal operation without overriding the interlock. To ensure safety, the circuit breaker compartment shall be provided with the necessary mechanical interlock as follows, or other equal and Approved means of mechanical interlock, so that:

1. If a door is used to enclose the breaker, it can only be opened when the main circuit of the circuit breaker has opened and it shall not be possible to close the circuit breaker while the door is opened, except by overriding the interlock. The interlock shall be restored on reclosing the door; or
2. If a front panel is used to enclose the breaker, the panel shall be fitted to the withdrawable part of the breaker and carried in unity with it in the drawout/rack-in operation. It shall be possible to remove the panel with tools when the circuit breaker is in the 'isolated' position.

ELE4.3.3.060.9 SAFETY SHUTTERS

1. A set of safety shutters shall be provided to cover each three phase or three phase and neutral group of stationary isolating contacts for three pole or four pole circuit breaker respectively;
2. Shutters shall be opened automatically by a positive drive from the circuit breaker moving portion and, when closed, shall prevent access to stationary isolating contacts. When the circuit breaker is withdrawn, shutters shall be capable of being operated and padlocked in the closed position;
3. Each safety shutter shall bear a colour label with 15 mm minimum white lettering as follows:

a.	Incoming supply	:	red/incomer;
b.	Busbar	:	yellow/busbar;
c.	Bus section	:	red/bus section;
d.	Outgoing feeder	:	yellow/outgoing.

ELE4.3.3.070.A AUXILIARY CONTACTS, CONTROL CONTACTS AND AUXILIARY SWITCHES

1. All the control and instrumentation wiring between the fixing part of the ASSEMBLY and the withdrawable part of the breaker shall through the auxiliary and control contacts. Automatic safety shutters or screens with warning signs shall be provided if they are still live when the circuit breaker is withdrawn;
2. The auxiliary contacts shall engage when the breaker is in the "connected" and "test" positions and disengage when in the "isolated" position;
3. At least one spare a – contact (normally open contact) and one spare b – contact (normally closed contact) shall be provided.

ELE4.3.4 FUSE COMBINATION UNITS AND SWITCH-DISCONNECTORS

ELE4.3.4.010.9 COMPLIANCE WITH SPECIFICATION

Unless otherwise specified, cubicle mounted fuse combination units and switch-disconnectors shall comply with the relevant parts of Specification for surface mounted fuse combination units and switch-disconnector (i.e. ELE3.2).

ELE4.3.4.025.9 ASSEMBLY

The assembly of the switching devices in the ASSEMBLY shall also comply with IEC 61439-1 and IEC 61439-2.

ELE4.3.4.035.9 SWITCHING DEVICE

Each switching device shall be enclosed in a separate and segregated compartment with hinged front door as specified in ELE4.2.055 and flush mounted on the front of the ASSEMBLY.

ELE4.3.4.040.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with PRE.BS1.205 to verify the country / place of manufacture and authenticity of fuse combination units and switch-disconnectors delivered to Site or installed.

ELE4.3.5 CHANGEOVER CONTACTORS

ELE4.3.5.010.9 COMPLIANCE WITH SPECIFICATION

Unless otherwise specified, changeover contactors shall comply with the relevant parts of Specification for contactors. (i.e. ELE3.15).

ELE4.3.5.025.9 INSTALLATION

The installation of the changeover contactors in the ASSEMBLY shall also comply with IEC 61439-1 and IEC 61439-2. The installation such as the ways of mounting, the connection of incoming and outgoing conductors, the clearance and creepage distance, the enclosure, etc. shall be identical to the type-tested one or as recommended by the contactor manufacturers.

ELE4.3.5.030.9 SHORT-CIRCUIT WITHSTAND CAPACITY

For contactors protected by fuse, the short-circuit withstand capacity of the contactors shall be not less than the maximum let-through energy of the respective fuse and be verified by test.

ELE4.3.5.040.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with PRE.BS1.205 to verify the country / place of manufacture and authenticity of changeover contactors delivered to Site or installed.

ELE4.3.6 CABLE TERMINATION

ELE4.3.6.015.9 INCOMING/OUTGOING CABLES

All incoming/outgoing cables, unless otherwise specified, shall be of bottom-entry and incoming/outgoing busbar trunking of top entry and terminated in separate compartments as stated in ELE4.2.055. The cables shall be located at the rear of the ASSEMBLY complete with removable back covers.

ELE4.3.6.020.9 CABLE GLAND PLATES

Cable gland plates made of brass or steel of not less than 2 mm thick shall be provided below the lug termination at a distance not exceeding 600 mm. Adequate space shall be reserved for future cabling for the spare functional units.

ELE4.3.6.030.9 CABLE SUPPORTS

Cable and cable supports shall be suitably installed to prevent terminals or cables being subjected to stresses, which may reduce their normal life or performance.

ELE4.3.7 SUPPLY COMPANY'S METERING EQUIPMENT

ELE4.3.7.010.9 METERING COMPARTMENTS

1. Separate compartments shall be provided for accommodating the Supply Company's meter(s) on the front of the ASSEMBLY and for the corresponding current transformers;
2. The metering compartment shall be complete with a hinged glazed door for meter viewing and suitable support for mounting the meter.

ELE4.3.7.020.9 METERING EQUIPMENT

1. The metering equipment will be supplied and fixed by the Supply Company on site, but the ASSEMBLY shall be complete with fuses for the voltage coil, removable links for mounting the current transformers and the associated wiring to the meter;
2. The fuses shall be of rating according to the requirements of the Supply Company, with provision for sealing to prevent unauthorized removal and the incoming side of the fuseholders bolted to the incoming supply busbar.

ELE4.3.8 MOULDED CASE CIRCUIT BREAKERS (MCCB)

ELE4.3.8.010.9 COMPLIANCE WITH SPECIFICATION

Unless otherwise specified, MCCBs mounted in the ASSEMBLY shall comply with the relevant parts of Specification for MCCB (i.e. ELE3.4). MCCB shall be type-tested and comply with the additional requirements for circuit breakers suitable for isolation in accordance with Clause 7.1.2 of IEC 60947-2.

ELE4.3.8.025.9 INSTALLATION

The installation of MCCBs mounted in the ASSEMBLY shall also comply with IEC 61439-1 and IEC 61439-2. The installation details such as the ways of mounting, mounting plates, termination of incoming and outgoing conductors, clearance and creepage distances, dimensions of enclosure, etc. shall be submitted to verify them in full compliance with the type-tested arrangements and/or the MCCB manufacturers' recommendations.

ELE4.3.8.030.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with PRE.BS1.205 to verify the country / place of manufacture and authenticity of MCCBs delivered to Site or installed.

ELE4.3.9 POWER FACTOR CORRECTION EQUIPMENT

ELE4.3.9.010.9 COMPLIANCE WITH SPECIFICATION

Unless otherwise specified, power factor correction equipment mounted on/housed in the ASSEMBLY shall comply with the Specification for Power Factor Correction Equipment (i.e. ELE5).

ELE4.4 PROTECTION AND INSTRUMENTATION

ELE4.4.1 CIRCUIT BREAKER PROTECTION

ELE4.4.1.015.9 COMPLIANCE WITH SPECIFICATION

The protection scheme for circuit breakers shall be in accordance with ELE4.4.1.020 and ELE4.4.1.035 as indicated on the Drawings.

ELE4.4.1.020.9 PROTECTION SCHEME WITH EXTERNAL D.C. SOURCE FOR TRIPPING

For overcurrent or earth fault protection the circuit breaker shall trip by means of shunt trip release operated from the battery set and charger and controlled by protection relays. If electromechanical relays are used, three overcurrent relays, one for each phase, and one earth fault relay shall be provided.

ELE4.4.1.035.A BATTERY SET AND CHARGER

1. General:

   Battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions. Two sets of battery and charger system shall be separately provided for tripping circuit and changeover / control circuits.

2. Battery / Charger equipment:

   The battery / charger equipment shall be housed in a segregated front accessible compartment as defined in ELE4.2.055. The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be as follows:

   a. 30V d.c for tripping circuits;

   b. 24V d.c. for changeover / control circuits.

3. Batteries:

   a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Type test report shall be submitted if required by the CM. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;

   b. The rated capacity of the battery for switchgear tripping auxiliary supplies shall be sufficient for at least 20 operations without charging and for at least two air circuit breakers tripping simultaneously, and shall be of at least 4 Ampere-hour rating.

4. Battery charger:

   The battery charger shall be automatic trickle-charge type with two rates charging to suit the battery characteristics. The first rate of charging shall be capable of restoring full capacity and second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour.

5. Battery re-charging time:

The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged.

6. Battery charger indication / facilities:

   The battery charger shall be provided with the following indications / facilities which shall be extended and mounted on the front door of the compartment:

   a. Mains On;

   b. Charger Fail;

   c. Voltmeter;

   d. Ammeter;

   e. Test Facilities.

ELE4.4.1.040.9 ELECTROMECHANICAL TYPE PROTECTION RELAY

1. Overcurrent and earth fault protection relays shall be of induction type to BS EN 60255 or IEC 60255 with IDMT characteristics in accordance with the time setting specified below;

2. The relays shall be accommodated in draw-out cases and contacts shall be fitted which shall short-circuit the associated current transformers on withdrawal of the relay. For the overcurrent relays, the three single phase elements shall be arrayed in one horizontal plane and accommodated in a common draw-out case, which shall be flush mounted on the front hinged door of the ASSEMBLY;

3. Operation indicators shall be provided for each protective element and installed within the same relay. They shall have a common hand-reset device operable without opening the relay case. The overcurrent relay shall comprise the following features:

a. Current setting:	50% to 200% of 5A (CT rating), adjustable in 7 equal steps;
b. Time setting:	0.63 second at 10 times current setting (for HEC supply); 1.3 seconds at 10 times current setting (for CLP supply);
c. Burden:	3.5VA maximum at current setting.

4. The earth fault relay shall comprise the following features:

a. Current setting:	10% to 40% of 5A (CT Rating), adjustable in 7 equal steps;
b. Time setting:	1.3 seconds at 10 times current setting;
c. Burden:	3.5VA maximum at current setting.

ELE4.4.1.050.9 ELECTRONIC TYPE PROTECTION RELAYS

1. Electronic type protection relays shall comply with BS EN 60255 or IEC 60255 with choice of the following characteristic curves:

   a. Normal inverse IDMT curve;

   b. Very inverse IDMT curve;

   c. Extremely inverse IDMT curve.

2. The relay shall provide trip contact for overcurrent and earth fault protections, and separate signal contacts for time delayed phase fault, instantaneous high-set phase fault and time delayed earth fault operations;
3. Trip indicators shall be provided which will enable the type of fault condition to be identified. Each indicator shall be capable of being reset by hand without opening the relay case;
4. The relay shall comprise the following features:
   a. Current setting: 0.5 to 2 x In in step of 0.05 x In with instantaneous high-set of 5 to 10 x In for overcurrent protection; 0.1 to 0.4 x In in step of 0.05 x In for earth fault protection;
   b. Time multiplier setting: 0.1 to 1.0 in 0.05 step;
   c. AC burden: less than 0.5VA for 5A relay in any setting.
5. The relay shall be accommodated in a dust-proof case to IP51 and can be easily drawn out on front side in the event that the relay requires replacement. Facility shall be provided for short-circuiting the associated current transformers on withdrawal of the relay. The draw-out case shall be flush mounted on the front-hinged door of the ASSEMBLY. The relay shall be rated for an operating temperature up to 55℃;
6. The relay shall be type-tested for compliance with the following international standards by an Accredited Laboratory:

Standards	Description
BS EN 61000-6-4 or IEC 61000-6-4	Electromagnetic Emission
BS EN 61000-6-2 or IEC 61000-6-2	Electromagnetic Immunity
BS EN 60255-3 or BS EN 60255-151 or IEC 60255-151	Accuracy
BS EN 60255-21-1 or IEC 60255-21-1	Vibration Tests - Class 1
BS EN 60255-21-2 or IEC 60255-21-2	Shock & Bump Tests - Class 1
BS EN 60255-22-2 or IEC 60255-22-2	Electrostatic Discharge Tests - Class 2

7. The relay shall be suitable for operation at 30V d.c. auxiliary power supply and accepts current inputs from standard protection current transformers with rated secondary current of 5A. An exclusive battery set and charger shall be provided for relay operation.

ELE4.4.1.060.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY FOR ELECTROMECHANICAL AND ELECTRONIC TYPE PROTECTION RELAY

The Sub-contractor shall produce documentary evidences in accordance with PRE.BS1.205 to verify the country / place of manufacture and authenticity of electromechanical and electronic type protection relays delivered to Site or installed.

ELE4.4.3 FUSE PROTECTION

ELE4.4.3.010.9 METHOD OF PROTECTION

All potential auxiliary and control circuits shall be protected by fuses.

ELE4.4.3.020.9 COMPLIANCE WITH SPECIFICATION

All fuses used, including those used in fuse combination units, shall be in compliance with the Specification for Fuses (i.e. ELE3.13).

ELE4.4.4 CURRENT TRANSFORMERS

ELE4.4.4.010.A STANDARD AND TYPE

Current transformers shall comply with IEC 61869-2 and shall be of ring and encapsulated type.

ELE4.4.4.020.9 MEASURING CURRENT TRANSFORMERS

Measuring current transformers shall have a minimum accuracy class of 1. The C.T. ratio for measuring current transformer shall match the corresponding indicating/measuring device.

ELE4.4.4.030.A PROTECTION CURRENT TRANSFORMERS

Protection current transformers (PCT) shall have a minimum accuracy class of 10P. The rating of the current transformer shall match the total burden of the trip circuit including the relays, connection leads and overcurrent release where applicable, to which the current transformer is connected, such that, under the most severe fault conditions, the current transformer does not saturate and is still capable of maintaining its accuracy. The C.T. ratios of all PCTs used in conjunction with mains incoming circuit breakers shall meet the requirements of related power company.

ELE4.4.4.040.9 FITTING

Unless otherwise specified, the protection current transformers shall be fitted on the outgoing side of the respective circuit breaker, whereas for the measuring current transformer, on the outgoing side of the functional unit, removable short links for mounting the current transformer shall be provided to facilitate subsequent easy replacement/maintenance.

ELE4.4.5 INDICATING METERS

ELE4.4.5.010.9 STANDARD

Indicating meters of analogue type shall comply with class 2.5 of BS EN 60051 or IEC 60051. Multi-function electronic meters shall comply with BS EN 61557-12 or IEC 61557-12.

ELE4.4.5.020.9 MOUNTING

Meters of analogue type with approximate 75 mm dial and with an external zero adjustment, and multi-function electronic meters shall be flush mounted on the front cover of the ASSEMBLY.

ELE4.4.5.030.9 MONITORING

Multi-function electronic meters, analogue type ammeters and voltmeters etc. shall be provided as shown on the Drawings. The analogue type ammeters used for monitoring the total current carried by the incoming circuit breaker shall be of the combination type with the thermal demand and the instantaneous values shown. The thermal demand shall indicate the mean r.m.s. current over the past 15 minutes with a slave pointer showing the maximum value reached.

ELE4.4.5.040.A MULTI-FUNCTION ELECTRONIC METERS

1. Multi-function electronic meter shall be of a digital display type to measure the following electrical parameters by means of microprocessor technology:

Function of Measurement	Minimum Accuracy
True Root Mean Square (RMS) Current: per phase & neutral	±0.5%
True RMS Volts: all phase-to-phase & phase-to-neutral	±0.5%
Real Power (kW): per phase & three phase total	±1%
Apparent Power (kVA): per phase & three phase total	±1%
Reactive Power (kVAr): per phase & three phase total	±1%
Total Power Factor: per phase & three phase total	±1%
Frequency (Hz)	±1%
Maximum Demand Current (Id): per phase, present & peak	±1%
Real Power Demand (kWd): three phase total, present & peak	±1%
Apparent Power Demand (kVAd): three phase total, present & peak	±1%
Reactive Power Demand (kVArd): three phase total	±1%
Real Energy (kWh): three phase total	±1%
Total Harmonic Distortion (THD): per phase, voltage & current (at least up to 31st harmonic order)	±2%

2. The meter shall be suitable for operation at 380V/220V, 50Hz and accepts current inputs from standard measuring current transformers with rated secondary current of 5A. The meter shall be rated for an operating temperature up to 50℃ and have a minimum overcurrent withstand rating of 100A for 1 second;
3. The meter shall be capable to trend the required parameters as stipulated in the BEC Code at every 15 minutes and include hourly, daily, monthly and annual data. The meter shall be equipped with sufficient built-in memory capable of maintaining all data collected for a minimum of 36 months. The Sub-contractor shall retrieve the data files from all meters and submit to the CM on annual basis or as required by the CM during the Maintenance Period;
4. The meter shall be equipped with a communication port at front panel, using either RS232, RS485, RJ45 or similar socket and plug as Approved, for communication with portable personal computer for energy control and audit purpose. The connection cable with the appropriate plug and a copy of proprietary-made software for data retrieval shall be provided;
5. The meter shall be flush mounted with protection to not less than IP2X at front face. All wiring shall be connected via terminal blocks to allow easy removal of the cable connectors in the event that the meter requires replacement;
6. The meter shall comply with the general electrical safety requirements as specified in IEC 61010-1 and should be suitably suppressed to fall within the limits allowed by BS EN 61000-6-4 or IEC 61000-6-4 and BS EN 61000-6-2 or IEC 61000-6-2 for electromagnetic emission and immunity;

7. The manufacturer shall operate a quality management system conforming to ISO 9001 or other equivalent national / international quality system. The manufacturer shall issue a calibration certificate for every meter at the time of production and the calibration certificate shall be submitted to the CM. Such calibration shall be conducted by the manufacturer within one year prior to delivery of the meter on Site or prior to the date of factory acceptance test if the meter is installed in an ASSEMBLY that factory acceptance test is required. The manufacturer shall also declare in writing that the meter shall require no re-calibration for a minimum of 10 years from the time of issue of calibration certificate. A label marking the manufacturer's calibration date shall be fixed adjacent to the meter;
8. For domestic building with Smart Meter Monitoring System provision:
    a. The meters shall be fully compatible with Smart Meter Monitoring System as stipulated in ELE35 to allow connection for data retrieval by the System. Necessary data cables connections shall be included and wired to the interfacing terminals of the System.

ELE4.4.6 VOLTAGE SENSING RELAYS

ELE4.4.6.010.A GENERAL

1. Two numbers of voltage sensing relays of different brands for monitoring the mains supply conditions shall be provided to control the operation of the automatic changeover contactors / automatic transfer switches and to activate the starting of the standby generating set and alarm indication as shown on the drawings.

ELE4.4.6.025.9 FEATURES

1. The relay shall be suitable for monitoring voltage of 380/220V 3-phase 4-wire system;
2. The relay shall be provided with indication to show its operation status;
3. The voltage sensing elements shall operate from measured phase-to-neutral voltages. When the voltage at either one phase drops below the voltage setting and sustains for a period exceeding the time setting, the relay shall activate the dry contacts to open position. The dry contacts shall be reset to close position automatically when all the measured voltages resume normal;
4. The relay shall operate at 24V d.c. auxiliary power supply. The battery set and charger for the auxiliary power supply shall comply with the requirement as stipulated in ELE4.4.7.015;
5. The relay shall comply with the following requirement:

Description	Requirements
Adjustable voltage monitoring element setting	Undervoltage: 70 – 95%
Adjustable time delay setting	0 – 1 sec.
Expected mechanical life	0.2 million operations
Standard	IEC 60255 or other reputable national/international standards.
Operating temperature	0℃ to +50℃

ELE4.4.6.030.A FACTORY TESTING

1. The relay shall be tested on load with a dummy circuit at the ASSEMBLY manufacturer workshop for operation for at least 50 times with each operating voltage and time properly recorded before installed in the ASSEMBLY cubicle. Result shall be incorporated into the test report. The setting shall be properly sealed after the factory test.

ELE4.4.7 BATTERY SET AND CHARGER FOR CONTROL CIRCUIT

ELE4.4.7.015.9 BATTERY SET AND CHARGER

1. General:

   A separate battery and charger system shall be provided for the control circuit. The battery set and charger shall be manufactured by a specialised battery and charger manufacturer and be suitable for use under the intended service conditions;

2. Battery/Charger equipment:

   The battery/charger equipment shall be housed in a segregated front accessible compartment as defined in ELE4.2.055. The input voltage of the battery charger shall be 220V a.c., 50Hz and the output voltage of the battery shall be 24V d.c. for control circuit;

3. Batteries:

   a. The batteries shall be sealed nickel cadmium to IEC 61951-1 or nickel-metal hydride to IEC 61951-2, maintenance free type, rated at 5 hours discharge rate. Cells shall be of the sealed nickel cadmium sintered plate type or nickel-metal hydride type;

   b. The rated capacity of the battery for control circuits shall be sufficient for at least 24 hours operations without charging including at least 10 times change of state of the control relays.

4. Battery charger:

   The battery charger shall be automatic trickle-charge type with two rates charging to suit the batteries characteristics. The first rate of charging shall be capable of restoring full capacity and the second rate shall maintain the batteries in a fully charged condition. The standard charge rate and the float charge rate of the battery charger shall be adjustable to meet requirements of battery rating up to 10 Ampere-hour;

5. Battery re-charging time:

   The time required for re-charging batteries from fully discharged to fully charged condition shall be not more than eight hours. Battery over-current protection shall be provided to safeguard the battery under short circuit conditions and facilities shall also be provided to prevent the batteries from being overcharged;

6. Battery charger indication/facilities:

   The battery charger shall be provided with the following indications/facilities which shall be extended and mounted on the front door of the compartment:

   a. Mains On;

   b. Charger Fail;

   c. Voltmeter;

d. Ammeter;

e. Test Facilities.

ELE4.4.8 INDICATING LIGHTS

ELE4.4.8.010.9 INDICATING LIGHTS ON FRONT PANEL OF ASSEMBLY

1. All indicating lights on the front panels of each ASSEMBLY shall be LED type of diameter minimum 22mm and shall be provided with built-in transformer step down to 6V a.c. or d.c.. The lamp base shall be BA9S type. The service life of indicating light shall be at least 50,000 hours at rated voltage and 25ºC environment;
2. Removal of lamp lenses and bulbs shall be carried out at the front of the unit without the need of any special tool and opening of the panel doors.

ELE4.5 MISCELLANEOUS

ELE4.5.1 INFORMATION, MARKING AND LABELLING

ELE4.5.1.015.A INFORMATION TO BE GIVEN

1. The ASSEMBLIES shall be provided with one or more plates, marked in a durable manner and located in a place such that they are visible and legible when the ASSEMBLIES are installed;
2. The following shall be given on the nameplates:
   a. The manufacturer's name or trade mark;
   b. Type designation or identification number or other means of identification making it possible to obtain relevant information from the manufacturer;
   c. Standard of the ASSEMBLIES (e.g. IEC 61439-1 and IEC 61439-2:2011);
   d. Rated current of the ASSEMBLIES;
   e. Rated operational voltage and frequency;
   f. Rated insulation voltage;
   g. Short-circuit withstand strength;
   h. Degree of protection;
   i. Rating of main busbars.

ELE4.5.1.020.A LABELS AND MARKINGS

1. Each equipment, functional unit and settings of overcurrent and earth fault protection of air circuit breakers and moulded case circuit breakers of the ASSEMBLY shall be marked or labelled in a durable and indelible manner in both English and Chinese for identification;
2. Unless otherwise specified, all warning labels referred to in the previous clauses shall be coloured in red with white lettering in both English and Chinese denoting,

   "DANGER 380/220V

   危險 380/220 伏特"
3. The removable cover of the incoming conductor and connection compartment shall bear a warning label coloured in red with white lettering in both English and Chinese denoting,

   "INCOMING CONNECTION - DANGER - 380/220 V - SWITCH OFF FROM SUPPLY COMPANY'S SIDE BEFORE REMOVING COVER

   電源接點 - 危險 - 380/220V

   開蓋前必須切斷電力公司來電"
4. For other circuits of the ASSEMBLY which may be still live when the incoming circuit breaker(s) are switched off, such as the essential busbars, the circuit for discharging the capacitive electrical energy, etc., the covers shall bear appropriate warning labels (e.g. LIVE BUSBAR 危險 - 帶電電巴) for personnel gaining access to those parts;

5. For each spare protective device with current rating exceeding 200A, a reminding notification label should be provided and coloured in white with red lettering in both English and Chinese denoting,

   "THIS IS SPARE CIRCUIT BREAKER

   WHEN CONNECTING TO THE CIRCUIT, IT MUST BE INSTALLED IN ACCORDANCE WITH THE BUILDING ENERGY EFFICIENCY ORDINANCE AND THE CODE OF PRACTICE FOR ENERGY EFFICIENCY OF BUILDING SERVICES INSTALLATION. METERING AND MONITORING FACILITIES SHOULD BE INSTALLED WHERE APPLICABLE.

   此乃備用斷路器

   接駁電路時須按照《建築物能源效益條例》及《屋宇裝備裝置能源效益實務守則》規定並須適用的情況下安裝計量儀器及監察設施"

ELE4.5.2 VERIFICATION AND TESTING

ELE4.5.2.015.9 VERIFICATION

1. Two sets of shop drawings showing the details of the proposed ASSEMBLY including the front and end elevations, single line busbar diagrams, control wiring diagrams, list of equipment schedule and any other details as required by the Contract Manager, shall be submitted for approval prior to assembly;
2. The drawings shall indicate which portions of the ASSEMBLY are verified by testing, by calculation, measurement or by satisfying design rules if required by the Contract Manager. Documents such as test reports, calculations, etc., to verify the above conformity shall be submitted for examination.

ELE4.5.2.025.A WORKSHOP TESTS (FACTORY ACCEPTANCE TEST)

1. The following tests shall be performed at the manufacturer's workshop during the course of assembly and on completion immediately prior to transportation to Site:
   a. Inspection of the ASSEMBLY including wiring, electrical and mechanical connections, external and internal finish, degree of protection, creepage distance and clearance, etc.;
   b. Mechanical test;
   c. Primary and secondary injection tests to check that all measuring, protection and control circuits and associated components are operative;
   d. Continuity test;
   e. Dielectric properties test and insulation tests;
   f. Functional check, including the shunt trip operation of breakers at 70% and 110% of the rated control supply voltage, if applicable;
   g. Unless ELE4.1.028 (1) or (2) are fully satisfied, temperature rise limits test shall be carried out in accordance with clause 10.10.2.3.5 of IEC 61439-1 if any modifications are made to a verified ASSEMBLY.
2. All the above inspections and tests shall be carried out in accordance with IEC 61439-1 and IEC 61439-2 and IEC 60947-2 and IEC 60947-3 and the standard test report format prepared by the CM;
3. All test results shall be properly recorded with data entries using electronic means (e.g. notebook computer, tablet, etc.) at the time of testing by competent staff. The required electronic devices shall be provided by the manufacturer.

ELE4.5.2.030.A SITE ACCEPTANCE TESTS

1. After the erection of the ASSEMBLY on Site, the following test / inspections shall also be carried out:
   a. General inspection of the ASSEMBLY;
   b. Mechanical tests;
   c. Continuity and insulation resistance tests;
   d. Function checks;
   e. Contact resistance test (testing of a series of joints at one time for horizontal main busbars and vertical busbar riser / droppers; the test shall be recorded in the format approved by the CM);
   f. Secondary injection test to re-calibrate all protection relays or devices function in accordance with their performance curves.
2. All test results shall be properly recorded with data entries using electronic means (e.g. notebook computer, tablet, etc.) at the time of testing by competent staff. The required electronic devices shall be provided by the manufacturer.

ELE4.5.2.040.9 COMMISSIONING TESTS

The following inspections and tests shall be carried out immediately before the ASSEMBLY is put into normal service:

1. Voltage tests between any two combinations of each phase, neutral and earth;
2. Phase sequence tests on each outgoing unit;
3. Functional checks, especially on the controlling devices.

ELE4.5.3 AUXILIARY EQUIPMENT

ELE4.5.3.010.9 COMPLETENESS

Each ASSEMBLY shall be supplied complete with all operating handles, jigs, etc. required for the normal operation and inspection of all circuit breakers and switchgears of the ASSEMBLY.

ELE5.10.060.9 ACCEPTANCE TEST REPORT 15
ELE5.10.070.9 ACCEPTANCE TESTS DURING MAINTENANCE PERIOD 15

ELE5.1 GENERAL ARRANGEMENT

ELE5.1.010.9 HOUSING

The capacitor units shall be housed in a separated compartment to prevent the control equipment from being damaged by the capacitors in case of a fault.

ELE5.1.020.9 CONTROLS

For capacitor installation of ratings equal to 30 kVAr or less, no step-switching mechanism and control relay or regulator will be required. For ratings greater than 30 kVAr, the capacitor installation shall be switchable type complete with switching devices and automatic control relays.

ELE5.2 CUBICLE CABINET DESIGN

ELE5.2.010.9 CONSTRUCTION

The construction of the cabinet and the fixture of the capacitor installation shall be sufficiently rigid to stand the thermal, electrical and mechanical stresses due to short circuit, step-switching and discharging of the capacitor.

ELE5.2.020.9 MOUNTING OF SWITCHES

For switchable type capacitor cabinet, flush mounted indicating devices and selector control switches shall be fitted on the front panel which shall be in the form of a hinged door.

ELE5.2.030.9 DEGREE OF PROTECTION

The cubicle cabinet shall have a degree of protection not less than IP 31 and IP 2X when the cubicle door is in the "close" and "open" position respectively.

ELE5.2.040.9 POSITION OF MAIN FUSESWITCH

The main fuseswitch for the power factor correction equipment shall not be housed within the control cabinet.

ELE5.2.050.9 SPACING

1. Sufficient space shall be allowed between cables connecting distribution fuses to contactors and contactors to capacitor banks for insertion of clamp-on meters for current measurement.
2. The capacitor units shall be spaced to enable access to individual capacitor terminals for on-load electrical tests.

ELE5.3 CAPACITORS

ELE5.3.010.9 STANDARD

1. IEC 60831-1;
2. IEC 60831-2.

ELE5.3.020.9 RATED OUTPUT OF CAPACITOR BANK

The output kVAr rating of capacitor bank shall be provided according to the standard ratings listed below:

20, 25, 30, 40, 50, 60, 90, 120, 150, 180, 200, 240, 280 (subsequent increases in 40 kVAr steps).

ELE5.3.030.9 RATED OUTPUT OF CAPACITOR UNIT

The output kVAr rating of each capacitor unit shall be provided according to the standard ratings listed below (all in kVAr):

20, 25, 30, 40.

ELE5.3.040.9 SAFETY FEATURES

1. All capacitor elements shall be of self-healing type, capable of self-restoration after breakdown of insulation due to momentary over voltage. The self-healing process shall be complete within half-a-cycle and with no significant changes in capacitance and the loss angle;
2. The capacitor elements shall be completely encapsulated in metal or epoxy case and fitted with tear-off fuse or other effective means to minimize overpressure due to internal fault;
3. Capacitors shall be dry type only;
4. PCBs (polychlorinated biphenyls) shall not be used and dielectric shall be environment compatible, i.e. no pollution to environment in case of leakage;
5. All materials used in capacitors except the dielectric shall be non-flammable and self-extinguishing;
6. Fuses having a current rating 1.5 times the capacitor current shall be provided to protect each capacitor unit and shall comply with ELE3.13;
7. A label shall be fixed on the front surface of the cubicle to indicate, in English and Chinese, the operating procedures before accessing the live parts inside the cubicle compartment. The label shall be submitted to Contract Manager for Approval;
8. The metallic container of the capacitor units and also the cubicle cabinet shall be properly earthed by permanent connection.

ELE5.3.050.9 DISCHARGE DEVICE

1. A resistor discharge device of appropriate resistance value shall be provided to reduce the residual voltage to less than 50V within one minute after actuation of the device. The discharge device shall function automatically on loss of supply and the discharge circuit shall be rated to discharge the capacitor bank from the peak of 30% overvoltage;
2. The residual voltage shall be measured across the terminals of the whole capacitor bank, i.e. not across individual capacitor element or unit;

3. The discharge path shall have no disconnecting link, switch, fuse or series capacitor interposed.

ELE5.3.060.9 LOSSES

1. The losses measured under nominal voltage and frequency shall be less than 0.5 W per kVAr. Type test report to the satisfaction of the Contract Manager shall be submitted to verify that this requirement has been met;
2. Puncture of insulation due to momentary overvoltage across electrodes shall not lead to significant increase in losses.

ELE5.3.070.9 CAPACITANCE TOLERANCES

1. The capacitance shall not differ from the rated capacitance by more than:
   a. -5% to 15% for units and banks up to 100 kVar;
   b. 0% to 10% for units and banks above 100 kVar.
2. In three-phase units, the ratio of maximum and minimum value of the capacitance measured between any two-line terminals shall not exceed 1.08;
3. Rating plate bearing the information markings as stipulated in Sections 26 & 27 of IEC 60831-1, shall be provided for each capacitor unit and the capacitor bank.

ELE5.4 AUTOMATIC CONTROL EQUIPMENT

ELE5.4.010.9 APPLICATION

For capacitors of 40 kVAr and above, automatic control relay shall be provided to maintain the power factor at the specified value.

ELE5.4.020.9 OPERATION OF CONTROL SYSTEM

The control system shall continuously detect and measure the power factor and switch-in or switch-out bank(s) of capacitors in steps to maintain the designed power factor. The value of each step is determined as follows:

Total capacitor rating in kVAr	Minimum no. of steps	Maximum of each step
40	2	20 kVAr
50	2	25 kVAr
60	3	20 kVAr
90	3	30 kVAr
120	4	30 kVAr
150	5	30 kVAr
180	6	30 kVAr
200	5	40 kVAr
240	6	40 kVAr
280	7	40 kVAr

ELE5.4.030.9 STEPS

The number of steps shall be programmable within the range of 2 steps to 12 steps using a code switch.

ELE5.4.040.9 POWER FACTOR SELECTOR SWITCH

The power factor selector switch shall be continuously adjustable between 0.85 inductive to 0.95 capacitive.

ELE5.4.050.9 CONTROL RELAY

The control relay shall be designed in such a way that there shall be no relay hunting when the load power fluctuates. A starting reactive current (c/k ratio) setting device shall be provided to allow stepless adjustment between 0.075 to 1.0.

ELE5.4.060.9 SWITCHING TIME

The switching time between each switching stage shall be adjustable from 30 seconds to 60 seconds or above to give a time delay longer than the charging and discharging times of the previous stage so that there shall be no simultaneous charging or discharging of two stages.

ELE5.4.070.9 PROVISIONS FOR POWER FAILURE

In the event of power failure, all the capacitors shall be automatically disconnected and discharged. On restoration of supply, the relay shall, after a waiting time to ensure sufficient discharge of stored energy, commence operation in accordance with the selected switching programme and power factor setting.

ELE5.4.080.9 ACCESS TO CONTROL SWITCHES

Unless otherwise stated, all the control switches shall be front accessible without opening the cabinet door stated in ELE5.2.020.

ELE5.5 MANUAL CONTROL

ELE5.5.010.9 SELECTOR SWITCH

A selector switch for manual or automatic control of the equipment shall be provided inside the cubicle cabinet.

ELE5.5.020.9 PUSH-BUTTONS

Push-buttons shall be provided for steps "switching-in" and "switching-out" in the manual mode with the switching time delay as provided at ELE5.4.060.

ELE5.5.030.9 CAPACITOR CONTROL

The number of capacitors "switching-in" or "switching-out" shall be entirely manually controlled irrespective of the mode of controller output.

ELE5.6 ADDITIONAL MANUAL CONTROL

ELE5.6.010.9 OVERRIDE SWITCH

An additional selector switch to override the automatic control relay in case of its failure shall be provided inside the control cabinet.

ELE5.6.020.9 CAPACITOR CONTROL LOCATION

Under this manual control, the number of capacitors "switching-in" or "switching-out" shall be entirely manually controlled by additional push-buttons inside the control cabinet.

ELE5.7 CONTACTORS

ELE5.7.010.9 NUMBER

The number of contactors shall be determined by the number of switching stages stipulated in ELE5.4.020.

ELE5.7.020.9 SPECIFICATION

Contactors shall be in compliance with ELE3.15.

ELE5.8 INDICATING INSTRUMENTS

ELE5.8.010.9 LOCATION OF INDICATORS

Indicators shall be fitted on the front panel of the cubicle cabinet.

ELE5.8.020.9 INDICATORS FOR RATINGS GREATER THAN 30 KVAR

1. Supply ON/OFF indicator;
2. Power factor meter for inductive/capacitive indication;
3. Indicator showing the number of stages of capacitors being connected;
4. Indicator showing mode of operation, automatic or manual control;
5. Warning plate which reads "WARNING : WAIT 5 MINUTES AFTER ISOLATING SUPPLY BEFORE HANDLING" in both English and Chinese.

ELE5.8.030.9 INDICATORS FOR RATINGS EQUAL TO 30 KVAR OR LESS

1. Warning plate which reads "WARNING : WAIT 5 MINUTES AFTER ISOLATING SUPPLY BEFORE HANDLING" in both English and Chinese;
2. The warning plate specified in sub-clause (1) above shall constitute the minimum requirements and extra indicators relevant to the operation of the control equipment shall be provided to suit the design features of the equipment offered. In particular, the warning plate shall be provided on all access panels or doors;
3. Labels in the cubicle cabinet for indicators and control switches shall be in English or internationally accepted abbreviation.

ELE5.9 TYPE-TESTS AND ROUTINE TESTS

ELE5.9.010.9 TYPE-TESTS

Type-test reports to verify compliance with the specified requirements and details in IEC 60831-1 and IEC 60831-2 shall be submitted to the Contract Manager.

ELE5.9.020.9 ROUTINE TESTS

Routine tests for every capacitor supplied shall be carried out at manufacturer's works and test certificates shall be submitted to the Contract Manager.

ELE5.10 COMMISSIONING AND ACCEPTANCE TESTS

ELE5.10.010.9 FACTORY TESTS

Before putting the equipment into operation, acceptance tests shall be carried out in the manufacturing factory.

ELE5.10.020.9 MINIMUM ACCEPTANCE TESTS

The acceptance tests shall comprise at least the following:

1. Capacitance measurement and output calculation;
2. Measurement of the tangent of the loss angle (tan δ) of the capacitor;
3. Voltage test between terminal and container;
4. Test of the internal discharge device;
5. Control simulation test.

ELE5.10.030.9 VOLTAGE TEST

During voltage test between terminals, self-healing breakdowns will be allowed. However, the capacitance and tangent of the loss angle shall be measured subsequently and no significant changes in value shall be allowed.

ELE5.10.040.9 CONTROL SIMULATION TEST

During control simulation test, adequate temporary facilities, including field testers to simulate the actual load variations for checking the operation of the control relay and the correct functions of the power factor correction equipment, shall be provided.

ELE5.10.050.9 REPORT FORMATS

The report formats for the tests listed in ELE5.10.020 will be provided by the Contract Manager.

ELE5.10.060.9 ACCEPTANCE TEST REPORT

The acceptance test report for each capacitor installation should be submitted to the Contract Manager prior to delivery to Site.

ELE5.10.070.9 ACCEPTANCE TESTS DURING MAINTENANCE PERIOD

At the end of the Maintenance Period, or at any time instructed by the Contract Manager during the Maintenance Period, the Sub-contractor shall carry out the following and shall replace, at his own cost, any capacitor that fails the inspection and test:

1. Visual inspection;
2. Control simulation test;
3. 24-hour continuous measurements on power factor variations.

ELE6.3.120.9 IN-SERVICE RECORDS 9

ELE6.1 BUSBAR CHAMBERS

ELE6.1.010.9 STANDARD

Busbar chambers shall comply with and be verification tested to IEC 61439-6 in conjunction with IEC 61439-1.

ELE6.1.020.9 ENCLOSURE

1. The busbar chamber enclosure shall be made of sheet steel not less than 1.5 mm thick for ratings not exceeding 500A, and not less than 2 mm thick for rating above 500A;
2. The enclosure shall be formed in such a way as to give a rigid structure of sufficient strength;
3. The cover shall be provided with rubber gasket and fixed on to the main enclosure at the front by means of heavily electroplated hexagonal headed screws and nuts;
4. Either the screw or the nut shall be permanently fixed on to the main enclosure;
5. The enclosure shall be suitable for surface mounting with a degree of protection against ingress of foreign solid particles and liquids of at least IP31 of IEC 60529 with the cover closed. For application inside plant room where weatherproof requirement is specified in drawing, the degree of protection of the enclosure shall be of at least IP44.

ELE6.1.030.9 FINISH

All steel work shall be treated to prohibit corrosion by hot-dip galvanising or electrolytically coated with zinc. The inside and outside surfaces of the enclosure shall then be coated with not less than two layers of stove enamel finish paint of contrasting colours, or one layer of stoved enamel epoxy powder paint, of an Approved colour.

ELE6.1.040.9 BUSBARS

1. Busbars shall be hard drawn, high conductivity, air insulated, electro-tinned, solid copper bars to BS EN 13601;
2. The neutral busbar shall be of the same rating as the phase busbars;
3. Each busbar shall be marked with the appropriate phase colour at intervals of not more than 600 mm;
4. Busbars shall be mounted on insulators that shall follow the verification tested designs.

ELE6.1.050.9 TAP-OFF DEVICES

Unless otherwise Approved, proper tap-off devices in the form of tap-off clamps and cable lugs, where necessary, shall be provided for the tap-off cables and such devices shall not reduce the effective size or rating of the busbars. Slots through enclosures for tap-off cables shall be sealed with phenolic resin bonded paper laminated sheet not less than 6 mm thick.

ELE6.1.060.9 VERIFICATION TESTING

Busbar chambers shall be verification tested in accordance with Clause 10 of IEC 61439-6 in conjunction with IEC 61439-1. The verification of short-circuit strength shall be carried out by a Short-Circuit Testing Organisation at the value of short circuit current specified below:

	Busbar rating	Test circuit
1.	Not exceeding 500A	*Fused short circuit current of 40kA
2.	Over 500A	a. Short time withstand current of 40kA for one second; b. Peak withstand current of 84kA.

* With the use of fuses to IEC 60269-2 or BS 88-2.

ELE6.3 ALL INSULATED BUSBAR TRUNKING SYSTEM (BUSDUCT)

ELE6.3.010.9 GENERAL

1. This specification covers the all-insulated busbar trunking system including fittings & accessories (hereinafter referred to as "busduct" or "busducts") up to and including 2500A;
2. Busducts shall comply with IEC 60439-2, and meeting all clauses as described in this Specification. Other standards, e.g. National Electrical Manufacturers Association (NEMA) or Underwriters Laboratories Inc. (UL) may be considered as acceptable provided that the standard is not inferior to the relevant IEC standards;
3. All the materials and components use for the busducts shall be of the same make and same country/place of manufacture of the typed-tested ones;
4. The busduct shall be manufactured at the base country/place of the original manufacturer. Licensed to make at other country/place will not be accepted;
5. Busduct current rating indicated on the Schedule of Rates, drawings or the particular specifications is the anticipated full load current (concentrated load) that the busduct must be capable of carrying continuously;
6. If the busduct is installed in flatwise mounting, appropriate de-rating factor as recommended by the manufacturer shall be applied to the busduct;
7. Busducts shall be totally enclosed type with ingress of protection not less than IP55 for indoor installation, including tap-off units, and IP66 for outdoor installation without tap-off units;
8. Unique model numbers shall be used to differentiate busducts with or without tap-off units;
9. Permanent nameplates shall be fixed on each busduct section and fitting. The use of stickers is not considered permanent in these circumstances.

ELE6.3.020.9 DESIGN AND CONSTRUCTION

1. The busducts shall be factory fabricated, fully insulated, totally enclosed, non-ventilated (sandwich) type. The busduct shall be designed to operate under the service conditions as specified in ELE1.5;
2. The busduct shall be of three phases and full size neutral busbar type;
3. Same length of busduct sections shall be interchangeable and polarized for phase relation. Each length of fitting shall bear the manufacturer's name, catalogue no. and rating. Each length or fitting shall bear the manufacturer's name, catalogue no. and rating;
4. All busducts can be mounted either flatwise or edgewise without loss in their mechanical strength and the current carrying capacity;
5. All plug-in sections provided shall be standardised to 1200 mm (4 feet) nominal length.

ELE6.3.030.9 BUSDUCT ENCLOSURE

1. The enclosure of the busducts shall be rigidly constructed from galvanized sheet steel of not less than 1.5 mm thickness or aluminium of minimum 2.5 mm thickness. Where a combination of sheets of these two materials is used as the assembly, no apparent visible stress shall be observed during operation when the busducts are properly supported. However, the thickness of the metal sheets employed shall, in no case, be less than 1.5 mm each;
2. The enclosure shall have one of the following finishes and the colour shall be grey or the manufacturer's colour of standard production:
    a. Stoved enamel paint;
    b. Stoved epoxy powder paint;
    c. Anodic oxidation coatings to Class 25 of EN 12373-1 for aluminum alloy;
    d. Other equivalent finishes approved by the Contract Manager.
3. For plug-in type busduct, the plug-in access opening shall be equipped with a hinged cover which covers the opening when not in use. All openings shall be usable simultaneously, if required.

ELE6.3.040.9 BUSBARS

1. Busbars shall be of hard drawn, high conductivity, solid copper bar to BS EN 13601 or alternatively hard drawn, high conductivity solid copper bars of 97% International Annealed Copper Standard Conductivity;
2. The busbar including all electrical contact surfaces shall be electroplated with silver or tin. The busbars shall be of adequate size to carry the rated current of the busducts continuously without exceeding the temperature rise limits specified in IEC 60439-2 when tested in accordance with sub-clause 8.2.1 of IEC 60439-2 at ambient temperature of 40℃;
3. Each busbar shall be insulated over its entire length except at joints and contact surfaces. The insulation material shall be of at lease class B (130℃);
4. The insulation material shall be of heat-resistant, self-extinguishing, non-hygroscopic and high insulation resistance and mechanical strength to withstand the stresses under all services and fault conditions and it shall be tested in accordance with Clauses 8.2.14 of IEC 60439-2 or to the satisfaction of the CM;
5. The maximum voltage drop value of a three phases and neutral busduct shall be 10 volts per 100 metres run when the busduct is operating at a full rated sinusoidal a.c. current of 50 Hz (concentrated load), at a power factor of 0.85 and at an ambient temperature of 35℃. Use of higher current rating busducts to achieve the above maximum voltage drop value is acceptable subject to the maximum allowable structural opening size shown on the drawings not being exceeded;
6. Drilling of busbars for power take off shall not be permitted, unless otherwise approved by the CM.

ELE6.3.050.9 BUSBAR JOINTING

1. Two sections of busducts shall be joined by connecting the joint-ends of the busbars in an interleaved manner;
2. The joints shall be of bolt-on type. The contact pressure shall be maintained by insulated bolts through the joint with the bolt at earth potential. Soldered, welded or riveted joints shall not be permitted;
3. The bolt shall be torque indicating and be tightened up by means of a torque wrench as recommended by the manufacturer;

4. The joint shall be protected by metal cover plates of same type of material and finish as the busduct casing so that the degree of protection shall not be less than that of an unjoined busduct;
5. The design of jointing shall permit safe, practical checking of joints for tightness without de-energising the busbars, or exposing maintenance personnel to any electrical hazard;
6. It shall be possible to tighten up a joint from one side only of the busducts. The joint shall be so designed and located that removal of any length should not result in the removal of the adjacent lengths.

ELE6.3.060.9 BUSBAR SUPPORT

1. Busducts shall be securely fixed on the building structure by means of hangers and brackets specifically designed and supplied by the same manufacturers;
2. Unless otherwise specified, horizontal run busducts shall be supported by hangers spaced at intervals of not more than 2 meters. Extra number of hanger shall be required for joints. At least one hanger shall be provided for every section of the busducts. Additional supports as recommended by the busduct manufacturer shall be provided;
3. Vertical busducts shall be supported by spring hangers on every floor. The spring hangers shall be properly adjusted such that the loading of vertical busducts is evenly distributed among the supports. Additional guide brackets in intermediate position between two supports shall be provided, if necessary, to balance the offset loading of the tap-off units.

ELE6.3.070.9 EXPANSION UNIT

1. Expansion unit shall be provided where busduct is installed across any structural expansion joint. The expansion unit shall be so constructed that any lateral or axial displacement on both the conductors and the casing caused by any movement of the building joint (in all directions) can be absorbed easily and cause no distortion to the busduct in whatever form;
2. Thermal expansion units, if required, shall be so constructed that any change in length on both the conductors and the casing so caused by thermal expansion and contraction in all direction can be absorbed easily and cause no distortion of the busduct in whatever form;
3. All expansion units shall be protected from water dripping by means of properly fabricated enclosure, details of which shall be submitted for Approval.

ELE6.3.080.9 TAP-OFF UNIT

1. Power tapping-off from the busduct shall be taken by means of specially designed tap-off units. These devices shall be plug-in type units, which shall be held in position by means of wing nuts or other quick fastening and quick release device. Quick fastening device shall mean that no tools are required for the removal of tap-off units. The design and construction of tap-off units shall be such that the electricity supply to other floors will not be interrupted no matter the tap-off units were plugged in or removed;
2. All plug-in access openings shall be equipped with a hinged door which covers the openings when not in use. The plug-in access opening doors can only be opened by tools otherwise the plug-in access opening door should be padlockable. The Sub-contractor shall provide pad-locks to all spare padlockable doors. A master key shall open all pad-locks of the same busduct. Details of the plug-in access opening doors shall be submitted for Approval;

3. The plug-in or the bolt-on type tap-off unit boxes together with the jaws and internal connection terminals shall be of the same manufacturer and country / place of manufacture of the busducts. The Sub-contractor shall propose, with the support of the busduct manufacturer, a type of FCU complying with ELE3.2 for Approval. If any modification to the manufacturer's standard tap-off unit boxes is required to suit the particular type of FCU, such modification shall be designed and carried out by the busduct manufacturer. The manufacturer shall undertake that such modifications are safe and suitable for the intended purpose. No modification by the Sub-contractor on site is allowed. The plug-in box complete with built-in FCU and fuses shall be type tested to IEC 60439-1 & IEC 60439-2. Full fault level, protection coordination and earth fault calculations should be submitted by the Sub-contractor for CM's Approval;
4. The tap-off units shall be equipped with internal barriers so that when the covers of the boxes are removed / opened, a degree of protection of the least IP2X is still maintained. Internal phase barriers shall be provided where necessary;
5. The tap-off unit shall be mechanically inter-locked with the busduct to prevent installation or removal of the unit while the unit is in the ON position. In addition, the cover of the tap-off unit shall have interlocks to prevent the covers from being opened while the tap-off unit is in the ON position. Means shall also be provided to padlock the FCU in its OFF position;
6. Tap-off unit boxes shall make positive earth connection with the earthing conductors before the jaws make contact with the phase busbars. The earthing method shall be such that it cannot be defeated by future painting of the busduct housing;
7. Tap-off unit shall be equipped with means for direct positioning or hanging so that the weight of the unit is borne by the busduct before the plug-in jaws make contact.

ELE6.3.090.9 BUSDUCT FITTINGS AND ACCESSORIES

1. All the busduct fittings, as listed below but not limited to, shall be specifically designed to suit the requirements of the busduct concerned and made by the some manufacturer:
   a. Flanged end;
   b. Flatwise and edgewise elbow;
   c. Combination elbow;
   d. Flatwise and edgewise offset;
   e. End closer;
   f. Tee-joints.

ELE6.3.100.9 LABELS AND WARNING NOTICES

1. All labels and warning notices shall be in both English and Chinese characters. Details shall be submitted to the Contract Manager for Approval;
2. Warning notices shall be provided along the entire busduct with the following wording in both English and Chinese characters:

   "DANGER - LIVE PART"

   "危險 - 帶電部份"
3. The warning notice shall be in the form of durable self-adhesive type label with red lettering on yellow background. The label shall have a minimum size of 150 mm x 75 mm with the lettering not less than 20 mm high;

4. The warning notices shall be located on all visible sides of the busduct, including all fittings, with a maximum spacing of 2 m along each side.

ELE6.3.110.9 TESTING AND CERTIFICATION

1. Short circuit test shall be carried out and certified by a Short Circuit Testing Organisation;
2. Short-circuit test for the busduct shall be carried out in accordance with Clause 8.2.3 of IEC 60439-1 or to the satisfaction of the Contract Manager at the value of short-circuit current specified below:

	Busbar Rating	Test Current
a.	Not exceeding 500A:	* Fused short-time withstand current of 40 kA
b.	Over 500A & below 1600A:	Short-time withstand current of 40 kA minimum for one (1) second.
c.	1600A & above:	Short-time withstanding current of 50kA for one (1) second.

*IEC 60269-1 and IEC 60269-2 and BS 88 : Section 2.2 or BS 88-2.

3. Before energization, the Sub-contractor shall carry out insulation resistance test for whole length of the busway, including feeders, expansion joints, and tap off/plug-in to verify the insulation resistance of the busway between phases and phases to earth to be not less than 10MΩ. For length of the busway exceeding 50 m, it is acceptable to carry out the insulation resistance test in two sections.

ELE6.3.120.9 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the equipment including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE7.1 GENERAL REQUIREMENTS

ELE7.1.010.9 QUALITY SURVEILLANCE SCHEME

1. Where a national/international product standard exists, cables of the particular type shall be manufactured under BASEC licence or an Equivalent Quality Surveillance Scheme (EQSS) (e.g. HAR scheme recognized by the European Committee for Electrotechnical Standardization, CENELEC, etc.) and bear BASEC marking or the appropriate marking of the EQSS (e.g. 'X' HAR, where 'X' is one of the Approval Organizations' designation under CENELEC);
2. The EQSS shall be a System 5 product certification system in accordance with ISO/IEC 17067 for determining the conformity of a product with specified requirements through initial testing of samples of the product, assessment and surveillance of the involved quality system, and surveillance by testing of product samples taken from the manufacturer, the open market or the supply from the Purchasers;
3. The certification body providing the EQSS shall be accredited by Hong Kong Accreditation Services (HKAS) or its Mutual Recognition Agreement (MRA) partners in accordance with this Scheme, ISO/IEC 17065 and its corresponding International Accreditation Forum (IAF) Guidance;
4. The cable manufacturer shall have its own machineries and facilities to make the cables and laboratories to perform routine tests on cables. Cross licence and sub-contracting of cable manufacture can be acceptable subject to the advance approval is obtained from the approved certification body. Cables manufactured under Original Equipment Manufacture (OEM) or private labelling shall not be accepted;
5. The certification body providing the EQSS shall submit complete set of the EQSS document and substantiate with separate information to the satisfaction of the CM that their product certification work and quality surveillance scheme are equivalent to that of BASEC's by making reference and comparison to each of the following:
    a. Each factory location where cable production occurs, and its product, is separately audited / tested and certified;
    b. Audited quality management system requirements include all requirements of ISO 9001;
    c. Audit includes production equipment and processes, and factory in-process and off-line testing equipment, calibration, etc.. Factories must maintain specified minimum suite of laboratory testing equipment;
    d. Three year certification cycle in line with ISO requirements;
    e. Audit / sample pickup frequency at each factory shall be four times per annum with at least one being unannounced. Sample numbers selected shall be up to 150 per annum for building wires / flexes, 50 per annum for armoured and fire performance cables, and 50 per annum for IEC or special types, which the number shall be geared by volume of production. Reduced level of surveillance can be acceptable only if a risk assessment system is established in the scheme and the licensee maintains persistent satisfactory quality results that meet the criteria for reduced surveillance as defined in the risk assessment. In any case, the risk assessment system and acceptable criteria shall not be less stringent than that adopted by BASEC;

f. Alternative to item e above, EQSS having yearly routine surveillance test at each factory plus inspection acceptance tests to be carried out on each batch cables to be supplied for individual project will also be acceptable. The inspection acceptance tests shall be conducted on each size and type of cable and at least include the following:

   i. verify all the results of routine tests conducted by the factory as defined in the corresponding cable standard and carry out supplementary auditing tests if necessary;

   ii. conduct all the Sample Tests (S) as stipulated in the corresponding cable standards on minimum 10% of each size and type of cables reels;

   iii. conduct the following verification tests on all cables:

      - resistance of conductors;
      - absence of faults in insulation (the spark test);
      - voltage test.

      All the tests shall be carried out in an accredited laboratory. Identification of the tested batch of cables such as purchase order number(s) and date(s) shall be submitted for the CM's checking prior to delivery. The purchase order number(s) shall be printed on the cables as one of the markings on the cable.

g. Initial type testing covering all requirements of cable standards and any subsidiary materials, performance and test standards referenced;

h. Surveillance testing covers all type, sample and routine tests on each cable type over the certification cycle;

i. Full traceability maintained from incoming material, through production to factory final test, and for samples onwards from auditor selection of samples through to final test;

j. Minor irregularities of deviations on test results are handled as non-conformities and require root cause analysis, correction and corrective action;

k. In case of serious test failures product recall notices are issued to the manufacturer;

l. Complaints and appeals system in cases of concern, test failure or failure in-use, with range of sanctions applied;

m. Specific assessment criteria of test results for each type of cable;

n. The certified products, together with their links to news of suspensions, recalls, etc, shall be shown on the certification bodies' websites;

o. The surveillance test report shall be submitted to the CM for checking upon requested.

ELE7.1.020.9 CABLE COLOURS

1. The compliance of electric cables with a national / international product standard shall require their design, construction and manufacture to adhere to that particular standard in all aspects except the cable colours that unless otherwise stated, should be in line with the Electrical CoP;

2. For any electrical installation based on the new cable core colour code, the registered electrical workers employed shall have satisfied the Electrical & Mechanical Services Department training requirements for new cable core colour code.

ELE7.2 WIRING SYSTEM IN CONDUIT

ELE7.2.010.9 TYPE OF CABLE

The cable installed in conduits shall be one of the following types with copper conductors unless otherwise stated:

1. Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3;
2. PVC-insulated cables to BS 6231 Table 2;
3. Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41;
4. Single-core, non-sheathed, non-armoured, fire-resistant cables;
5. Single-core, sheathed, non-armoured, fire-resistant cables;
6. Multi-core, sheathed, non-armoured, fire-resistant cables.

ELE7.2.020.9 GRADE OF CABLE

The cable installed in conduits shall have the minimum voltage rating given in the table below:

	Type of Cables	Minimum Voltage Rating (V)
1.	Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3	450/750
2.	PVC-insulated cables to BS 6231 Table 2	600/1000
3.	Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41	450/750
4.	Single-core, non-sheathed, non-armoured, fire-resistant cables	450/750
5.	Single-core, sheathed, non-armoured, fire-resistant cables	600/1000
6.	Multi-core, sheathed, non-armoured, fire-resistant cables	300/500

ELE7.3 WIRING SYSTEM IN TRUNKING

ELE7.3.010.9 TYPE OF CABLE

The cable installed in trunkings shall be one of the following types with copper conductors unless otherwise stated:

1. Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3;
2. PVC-insulated cables to BS 6231 Table 2;
3. Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41;
4. Single-core, non-sheathed, non-armoured, fire-resistant cables;
5. Single-core, sheathed, non-armoured, fire-resistant cables;
6. Multi-core, sheathed, non-armoured, fire-resistant cables.

ELE7.3.020.9 GRADE OF CABLE

The cable installed in trunkings shall have the minimum voltage rating tabulated below:

	Type of Cables	Minimum Voltage Rating (V)
1.	Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3	450/750
2.	PVC-insulated cables to BS 6231 Table 2	600/1000
3.	Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41	450/750
4.	Single-core, non-sheathed, non-armoured, fire-resistant cables	450/750
5.	Single-core, sheathed, non-armoured, fire-resistant cables	600/1000
6.	Multi-core, sheathed, non-armoured, fire-resistant cables	300/500

ELE7.4 SURFACE WIRING SYSTEM IN FIXED INSTALLATIONS

ELE7.4.010.9 CABLES - GENERAL

Unless otherwise stated, the cable having copper conductors shall be one of the following types with the respective minimum voltage rating:

	Type of Cables	Minimum Voltage Rating (V)
1.	Single-core, PVC-insulated cables to BS EN 50525-2-31 or IEC 60227-3	450/750
2.	PVC-insulated, PVC-sheathed, non-armoured cables, 35 mm^2 and below, to BS 6004 Tables 3 & 4	300/500
3.	PVC-insulated cables to BS 6231 Table 2	600/1000
4.	XLPE-insulated, PVC-sheathed, non-armoured cables to BS 7889 or IEC 60502-1	600/1000
5.	Flexible cords to BS EN 50525-2-11	300/500
6.	Flexible cords to BS EN 50525-2-21	450/750
7.	XLPE-insulated, PVC-sheathed, armoured cables to BS 5467 or IEC 60502-1	600/1000
8.	Mineral-insulated cables to IEC 60702-1 or BS EN 60702-1	750
9.	Single-core, non-sheathed, non-armoured, low smoke zero halogen cables to BS EN 50525-3-41	450/750
10.	Single-core, flat twin and flat 3-core, sheathed, non-armoured, low smoke zero halogen cables with circuit protective conductor, to BS 7211 Table 5	300/500
11.	XLPE-insulated, low smoke zero halogen compound-sheathed, armoured cables to BS 6724, or IEC 60502-1 and IEC 60332-1-2 and IEC 61034-2 and IEC 60754-1	600/1000
12.	Single-core, non-sheathed, non-armoured, fire-resistant cables	450/750
13.	Single-core, sheathed, non-armoured, fire-resistant cables	600/1000
14.	Multi-core, sheathed, non-armoured, fire-resistant cables	300/500
15.	Multi-core, sheathed, armoured, fire-resistant cables	600/1000

ELE7.4.020.9 PVC-INSULATED, NON-SHEATHED, GENERAL PURPOSE, SINGLE-CORE CABLES

Cables shall comply with BS EN 50525-2-31 or IEC 60227-3.

ELE7.4.030.9 XLPE/PVC-INSULATED, PVC-SHEATHED, SINGLE-CORE CABLES

1. Cables with copper conductor sizes up to and including 35 mm^2 shall comply with BS 6004 Table 3;

2. Single-core cables with copper conductor sizes from 50 mm^2 to 1000 mm^2 inclusive shall comply with BS 7889 or IEC 60502-1.

ELE7.4.040.9 PVC-INSULATED, PVC-SHEATHED, FLAT TWIN CABLES

1. Cables with or without integral circuit protective conductor shall comply with BS 6004 Tables 3 & 4;
2. The colour of the PVC sheath shall be white.

ELE7.4.060.9 XLPE-INSULATED, PVC-SHEATHED, ARMOURED CABLES

1. XLPE-insulated, PVC-sheathed, armoured cables shall comply with BS 5467 or IEC 60502-1;
2. The XLPE insulated cable cores shall be sheathed with PVC which serves as bedding for the galvanized steel single-wire armouring of multi-core cables and for the aluminium single-wire armouring of single-core cables;
3. The XLPE insulation shall be able to operate continuously at a conductor operating temperature of 90℃.

ELE7.4.070.9 PVC-INSULATED CABLES FOR SWITCHGEAR AND CONTROLGEAR WIRING

Flexible cables shall comply with BS 6231 Table 2.

ELE7.4.090.9 MINIMUM SIZE OF LIVE CONDUCTOR

1. Cables for circuits of rating not exceeding 10A shall have CSA of not less than 1.5 mm^2;
2. Cables for circuits rated at 15A and above shall have CSA of not less than 2.5 mm^2;
3. Flexible cables and flexible cords shall have CSA of not less than 0.75 mm^2.

ELE7.4.100.9 CIRCUIT PROTECTIVE CONDUCTOR (CPC)

1. In installations where cables are clipped direct having CSA up to 16 mm^2 and below used for single phase circuit shall be twin-core with integral CPC except where:
   a. They are used in earth free situations; or
   b. They are used for extra low voltage circuits; or
   c. The CSA of the integral CPC cannot meet the requirement of the adiabatic equation laid down in BS 7671 or IEC 60364.
2. Separate CPC shall be single-core cables, to BS EN 50525-2-31 or IEC 60227-3;
3. Tee connection in the CPC shall not be allowed;
4. The minimum CSA of a CPC shall be 1.0 mm^2 if the CPC is incorporated in the same cables as the associated live conductors, otherwise the minimum CSA shall be 4 mm^2;
5. CPC shall be sized in accordance with ELE17.

ELE7.4.120.9 IDENTIFICATION OF CABLE CORE

The identification of cable cores shall follow the requirements of the Electrical CoP.

ELE7.5 WIRING SYSTEM USING MINERAL INSULATED CABLE

ELE7.5.010.9 TYPES OF CABLE

All mineral-insulated cables shall be copper sheathed with copper conductors complying with IEC 60702-1 or BS EN 60702-1.

ELE7.5.020.9 GRADE OF CABLE

Unless otherwise specified, all mineral-insulated cables shall be 750V (heavy duty) of IEC 60702-1 or BS EN 60702-1.

ELE7.5.030.9 LOW SMOKE ZERO HALOGEN (LSOH) OUTER COVERING

1. Mineral-insulated cables shall have LSOH thermoplastic outer covering when:
    a. They are exposed to weather;
    b. They are installed in situations where the atmosphere is likely to cause corrosion;
    c. They are laid upon or fixed direct to a concrete or stone surface subject to dampness;
    d. They are laid upon or fixed directly to a zinc coated surface, e.g. a galvanised cable tray or corrugated sheeting, subject to dampness;
    e. They are buried direct in the ground;
    f. They are as specified in ELE2 or the Drawings.
2. LSOH thermoplastic outer covering shall not be used in refrigerated spaces or other situations where the temperature is consistently below 0°C;
3. The LSOH thermoplastic outer covering shall have an orange colour.

ELE7.6 POWER DISTRIBUTION CABLES

ELE7.6.020.9 XLPE- INSULATED POWER CABLES WITH COPPER CONDUCTORS

XLPE insulated PVC-sheathed, armoured cable shall comply with the requirement specified in ELE7.4.060.

ELE7.6.040.9 GRADING OF POWER CABLES

All power cables for electricity supply shall have a grading of 600/1000V.

ELE7.7 CABLE GLANDS

ELE7.7.010.9 CONSTRUCTION

Cable glands shall be mechanical cable glands in compliance with BS 6121:Part 1 or BS EN 50262 and use brass as basic material.

ELE7.7.020.9 TERMINATION

For the termination of steel wire armoured cables of any of the following types, type D1W glands shall be employed for indoor applications while type E1W shall be employed for outdoor applications:

1. Cables to BS 5467 or IEC 60502-1;
2. Cables to BS 6724 or IEC 60502-1;
3. Fire-resistant cables.

ELE7.7.030.9 ATTACHMENTS

1. Each gland shall be provided with locknut and earth bond attachment of appropriate size and same material as the gland body for making electrical connection to the armour of the cable to be terminated;
2. Each gland shall be complete with a shroud made of the following materials according to the types of cables served:

Type of Cable	Material of Shroud
a. Cables to BS 5467 or IEC 60502-1	PVC
b. Cables to BS 6724, or IEC 60502-1 and IEC 60332-1-2 and IEC 61034-2 and IEC 60754-1	Low smoke zero halogen thermosetting or thermoplastic compound
c. Fire-resistant cables to BS 6387	Low smoke zero halogen thermosetting or thermoplastic compound

ELE7.7.040.9 CERTIFICATION

Test certificates giving the results of type-tests shall be produced to verify compliance with the test requirements stipulated in BS 6121: Part 1 or BS EN 50262.

ELE7.8 FIRE-RESISTANT CABLES

ELE7.8.010.9 GENERAL REQUIREMENTS

1. Fire-resistant cables shall be manufactured under licence of LPCB, BASEC or an Equivalent Quality Surveillance Scheme and shall comply, where applicable, the clauses specified in ELE8;
2. Valid approval documents issued by FSD and / or product certification bodies recognized by FSD for the fire-resistant cables shall be submitted to the Contract Manager for approval;
3. Fire-resistant cables and their application shall comply with the requirements stipulated in Fire Services COP, FSD's Circular Letters, and relevant BS or other international standards acceptable to the Director of Fire Services;
4. Fire-resistant cables shall have cross-sectional area of not less than 1.5 mm^2;
5. Non fire-resistant cables wholly installed in embedded concealed conduits complying with FSD's Circular Letters are allowed to apply for EXIT / directional signs and emergency lightings except those of which exposed conduits will be involved. In such cases, fire resistant cables shall be provided. For avoidance of doubt, only fire-resistant cables in concealed or exposed conduits shall be provided for all EXIT / directional signs in the entire domestic block, emergency lightings on ground floor of domestic blocks and all EXIT / directional signs / emergency lightings of which exposed conduits are involved;
6. Save as modified in the above clauses, the minimum fire-resistant cable requirements in respect of various fire service installations are listed below:

Item	Type of Fire Service Installations	Minimum Requirements
1.	Audio / visual advisory system	<u>For standard cables or cable systems as defined in BS 5839-1, they shall comply with</u>: (a) BS EN 50200 (PH30) and Annex E of BS EN 50200 (a duration of survival time of 30 minutes); or (b) BS EN 60702; or (c) BS 7629-1 (Cat. Standard 30); or (d) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F30 for cables of overall diameter exceeding 20mm); or (e) BS 6387 Cat. CWZ; or (f) Other international standards acceptable to the Director of Fire Services <u>For enhanced cables or cable systems as defined in BS 5839-1, they shall comply with</u>: (g) BS EN 50200 (PH120) and BS 8434-2 (a duration of survival time of 120 minutes); or (h) BS EN 60702; or

		(i) BS 7629-1 (Cat. Enhanced 120); or (j) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F120 for cables of overall diameter exceeding 20mm); or (k) BS 6387 Cat. CWZ; or (l) Other international standards acceptable to the Director of Fire Services.
2.	Automatic actuating device	<u>Cables shall comply with:</u> (a) BS 6387 Cat. CWZ; or (b) BS EN 60702; or (c) BS 8491 (minimum fire survival time of 120 minutes); or (d) BS 7629-1 (Cat. Enhanced 120); or (e) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F120 for cables of overall diameter exceeding 20mm); or (f) BS EN 50200 (PH120) and BS 8434-2 (a duration of survival time of 120 minutes); or (g) Other international standards acceptable to the Director of Fire Services.
3.	Automatic fixed installation other than water	
4.	Automatic fixed installation using water (other than sprinkler system)	
5.	Deluge system	
6.	Drencher system	
7.	Fire hydrant / hose reel system	
8.	Fixed foam system	
9.	Pressurization of staircase	
10.	Ring main system with fixed pump(s)	
11.	Smoke extraction system	
12.	Street fire hydrant system	
13.	Water mist system	
14.	Water spray system	
15.	Fire Service water supply system	
16.	Emergency generator	Cables from emergency generator to main essential switchboard(s) for fire service installations shall comply with the same requirements as those for items 2 to 15.
17.	Emergency lighting	<u>For standard cables or cable systems as defined in BS 5266-1, they shall comply with</u>: (a) BS 5266-1; or (b) BS EN 50200 (PH60) and Annex E of BS EN 50200 (a duration of survival time of 30 minutes) and one of following standards:

		(i) BS EN 60702 (ii) BS 7629-1 (Cat. Standard 60) (iii) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm); or (c) BS 6387 Cat. CWZ; or (d) BS 7846 (Cat. F60 for cables of overall diameter exceeding 20mm); or (e) Other international standards acceptable to the Director of Fire Services. <u>For enhanced cables or cable systems as defined in BS 5266-1, they shall comply with</u>: (f) BS 5266-1; or (g) BS EN 50200 (PH120) and BS 8434-2 (a duration of survival time of 120 minutes) and one of the following standards: (i) BS EN 60702 (ii) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm); or (h) BS 7629-1 (Cat. Enhanced 120); or (i) BS 6387 Cat. CWZ; or (j) BS 7846 (Cat. F120 for cables of overall diameter exceeding 20mm); or (k) Other international standards acceptable to the Director of Fire Services.
18.	Exit sign	The same requirements as those for item 17.
19.	Fire alarm system	<u>For standard cables or cable systems as defined in BS 5839-1, they shall comply with</u>: (a) BS 5839-1; or (b) BS EN 50200 (PH30) and Annex E of BS EN 50200 (a duration of survival time of 30 minutes); or (c) BS EN 60702; or (d) BS 7629-1 (Cat. Standard 30); or (e) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F30 for cables of overall diameter exceeding 20mm); or (f) BS 6387 Cat. CWZ; or (g) Other international standards acceptable to the Director of Fire

		Services. For enhanced cables or cable systems as defined in BS 5839-1, they shall comply with: (h) BS EN 50200 (PH120) and BS 8434-2 (a duration of survival time of 120 minutes); or (i) BS EN 60702; or (j) BS 7629-1 (Cat. Enhanced 120); or (k) BS 7846 (Cat. F2 for cables of overall diameter not exceeding 20mm or Cat. F120 for cables of overall diameter exceeding 20mm); or (l) BS 6387 Cat. CWZ; or (m) Other international standards acceptable to the Director of Fire Services.
20.	Fire detection system	The same requirements as those for item 19.
21.	Fireman's lift	Cables from the main essential switchboard for fire service installations to the main switch for lift power circuit, car lighting, etc., in the lift machine room shall comply with the same requirements as those for items 2 to 15.
22.	Sprinkler system	The same requirements as those for items 2 to 15.

ELE7.8.030.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with PRE.BS1.205 to verify the country / place of manufacture and authenticity of fire-resistant cables delivered to Site or installed.

ELE7.9 PREFABRICATED BRANCH CABLES

ELE7.9.010.9 GENERAL

1. Being XLPE-insulated, PVC-sheathed type, main and branch cables shall comply with one of the standards below:
    a. BS 7889;
    b. IEC 60502-1.
2. The sizes of main and branch cables shall be in line with those shown on the Drawings.

ELE7.9.020.9 TYPE OF CONDUCTORS

Main and branch cables shall be of copper conductors.

ELE7.9.030.9 TYPE OF BRANCH JOINTS

1. Each branch joint shall take the form of main and branch cables bound together to a compression connector that complies with one of the product standards below:
    a. BS EN 61238-1;
    b. JIS C 2810;
    c. HD 623 S1 or BS EN 50393;
    d. IEC 61238-1.
2. Each branch joint shall be assembled and encapsulated in a thermoplastic moulding, which is compatible with the cable sheath. The entire production process shall be under a quality management system to ISO 9001.

ELE7.9.040.9 VOLTAGE RATING

Prefabricated branch cables shall have a voltage rating of 600/1000V.

ELE7.9.050.9 INSTALLATION OF BRANCH CABLES

Prior to ordering, drawings to show the actual installation details of prefabricated branch cables shall be submitted to the Contract Manager for approval.

ELE7.9.060.9 PROTECTION

Cable ends for main and branch cables shall be sealed at factory before delivery to site.

ELE7.9.070.9 TYPE & ROUTINE TESTS

Prefabricated branch cables shall be assembled under a product specification that establishes at least the following test requirements:

1. Type tests:
    a. Heat cycle test according to the method given in one of the following:
        i. JIS C 2810 Class A;
        ii. HD 623 S1 or BS EN 50393;
        iii. BS EN 61238-1;

iv. Total 125 test cycles undergone - after the 25th cycle, the surface temperature of the thermoplastic moulding shall not exceed 75℃. This temperature shall also not reach more than 8℃ plus that at the 25th cycle when measurements are taken at the end of the 50th, 75th, 100th and 125th cycles.

b. Resistance to flame propagation according to one of the standards below:

i. JIS C 3005;

ii. BS 4066-1, or IEC 60332-1-1, or BS EN 60332-1-1 and BS EN 60332-1-2 and BS EN 60332-2-1;

iii. IEC 60332-1-2;

iv. IEC 60332-3 Category C.

c. Insulation resistance test: the cables in water shall have a minimum insulation resistance of 50MΩ;

d. Tensile strength test: the cables shall withstand without breakage twice the specified weight of main and branch cables for the duration of not less than 24 hours.

2. Routine tests:

a. Voltage withstand test: The cables in water shall withstand a minimum voltage of 3.5kV for 1 minute without breakdown;

b. Connector resistance or conductivity test according to the method given in one of the following:

i. JIS C 3005;

ii. The resistance measured between the connector before and after the tensile test mentioned above shall agree to each other within 12%;

iii. $R_1/R_2 \leq 1.2$ where

- R_1 is the cable resistance measured across the connector between the main and one of the branch cables; and
- R_2 is the summation of the resistance of individual cables having the same length of cable up to the connector and conductor sizes as the main and branch cables respectively.

ELE7.9.080.9 FACTORY TEST REPORT

Prefabricated branch cables shall prove to have satisfactorily passed all tests stipulated in the product specification in ELE7.9.070. Prior to delivery to site, a factory test report on routine tests shall be submitted to the Contract Manager for approval.

ELE7.9.090.9 SITE TESTS/INSPECTION

Each prefabricated branch cable shall satisfactorily pass the site inspections/tests below along its entire route once its installation is completed:

1. Visual inspection;
2. Insulation resistance test: the cables in air shall have a minimum insulation resistance of 2MΩ.

ELE7.9.100.9 MANUFACTURERS' RECOMMENDATIONS & SPECIAL TOOLS

Manufacturers' recommendations shall be followed and special tools/accessories shall be used in the installation of prefabricated branch cables on site.

ELE8.6 REFERENCE TABLES 18
ELE8.6.010.9 CORE IDENTIFICATION OF POWER CABLES 18
ELE8.6.020.9 INTERNAL BENDING RADII OF POWER CABLES 18

ELE8.1 GENERAL INSTALLATION REQUIREMENTS

ELE8.1.010.9 IDENTIFICATION OF CORE

Each core of a power cable shall be identified continuously throughout its entire length. The identification shall take the form of appropriate colour or number codes in accordance with ELE8.6.010 or the relevant British Standard specifications.

ELE8.1.020.9 IDENTIFICATION AT JOINT OR TERMINATION

At each joint or termination, a non-ferrous metallic label shall be fixed to the cable giving the size and identification of the cable, e.g. 50 mm^2 4-core XLPE/SWA/PVCS copper cable to "Services Block".

ELE8.1.030.9 USE OF SINGLE-CORE POWER CABLES WITH STEEL WIRE ARMOURS

Single-core power cables with steel wire armours shall not be used for a.c. circuits.

ELE8.1.040.9 SIZE OF NEUTRAL CONDUCTOR

The CSA of the neutral conductor shall have the same size as that of the phase conductors, unless otherwise specified.

ELE8.1.050.9 BENDING RADIUS OF CABLE

The internal bending radius of every power cable shall not be less than the appropriate values given in ELE8.6.020.

ELE8.1.060.9 MINIMUM SIZE OF CABLE CONDUCTOR

1. Cables for lighting, bell and control circuits shall have CSA of not less than 1.5 mm^2, and cables for power circuits shall have CSA of not less than 2.5 mm^2;
2. The CSA of any cable shall not be reduced at its point of termination, junction, joints etc.

ELE8.1.070.9 USE OF PVC-INSULATED CABLES AT LOW TEMPERATURE

PVC-insulated cables shall not be installed in refrigerated spaces or other situations where the temperature is consistently below 0℃.

ELE8.1.080.9 TERMINATION OF WIRING CONNECTIONS

All wiring connections are to be properly terminated.

ELE8.2 PARTICULAR INSTALLATION REQUIREMENTS

ELE8.2.010.9 CABLES MOUNTED ON SURFACE

1. Power cables mounted on the surface of walls or ceilings or other building structures shall either be cleated in position by Approved type cable cleats or cable saddles;
2. Cables cleats or cable saddles shall be provided along the entire cable route at regular intervals and at spacing in accordance with the requirements stipulated in the Electrical CoP unless otherwise specified on the Drawings;
3. Alternatively, the cables shall be supported on cable trays in accordance with the requirements of ELE9;
4. For vertical cable runs exceeding 100 m, tension releasing sections shall be provided in accordance with the recommendation of the cable manufacturer, failing which, a tension releasing section shall be provided for every 100 m vertical run.

ELE8.2.020.9 CABLES LAID IN ENCLOSED TRENCH

When more than one power cable is laid in an enclosed trench, the cables shall be spaced in accordance with BS 7671 or IEC 60364. Correction factors shall be applied to the current ratings as indicated in Table 4B and 4C of the above Standard. For cable sizes not shown in the above-mentioned tables, reference shall be made to the appropriate tables in the ERA Report 69-30 Part III.

ELE8.2.030.9 CABLES ENCLOSED IN DUCTS

1. General:
    a. Power cables installed in ducts shall conform to the provisions of ELE9;
    b. Prior to the drawing-in of the cables, the cylindrical ducts shall be cleaned with a cylindrical brush of appropriate size.
2. Pulling cables through ducts - general:
    a. Attachment to facilitate the pulling of cables through a duct shall be made to the cores, insulation, inner and outer sheath and not to the armour in order to avoid twisting;
    b. Attachment to the armour will only be permitted for small cables with the Approval of the Contract Manager;
    c. When pulling power cables into small ducts, an emulsion of graphite powder and soft soap in water may be used for brushing onto the cable surfaces where they enter the duct to reduce friction during pulling;
    d. The use of "French Chalk" or other methods will not be precluded provided that such materials or methods shall not damage the cables and that the prior Approval of the Contract Manager has been given.
3. Pulling cables through ducts - lead-sheathed insulated:
    a. When pulling-in lead-sheathed insulated power cables, the following stresses shall not be exceeded:
        i. Maximum stress in sheath - 10,000kPa (with stocking pulling grip);

ii. Maximum stress in conductors - 70,000kPa (with pulling eye attached to conductors).

b. When the cables are being drawn into ducts, the maximum pull shall be limited to 220,000 Newtons.

ELE8.2.040.9 CABLES BURIED DIRECT IN GROUND

1. Power cables buried direct in ground shall be armoured;
2. They shall be buried at a depth of not less than 450 mm and shall be protected by means of Approved cable cover tiles;
3. The bottom of the trench shall be covered, to a depth of 100 mm with a bedding layer of sand or fine soil;
4. On top of the cables, a layer of sand or fine soil, also to a depth of 100 mm, shall again be provided;
5. The sand or fine soil shall not be larger than 13 mm sieve;
6. Particular care shall be taken to ensure that there shall be no pebbles or small stones in the bedding layer or after the layer of fine sand or soil;
7. The cables shall then be covered, throughout the entire route, by cable cover tiles which shall be laid on top of the after layer.

ELE8.2.050.9 CABLE MARKERS

1. The route of all power cables buried direct in ground shall be clearly indicated by cable markers laid in the ground;
2. Cable markers shall be placed at regular intervals not exceeding 60 m apart and also at positions where the cable route changes direction;
3. At the position of each underground junction box, a cable marker shall also be installed. Such markers shall be engraved with, in addition to the wordings mentioned above, the appropriate information, such as "3 way Joint Box".

ELE8.2.060.9 CABLES CONNECTED TO OR IN CONTACT WITH BARE CONDUCTORS OR BUSBARS

1. PVC cables for interconnection between busbar risers and their outgoing switchgears, or between busbar chambers and their incoming/outgoing switchgears shall be to type CK of BS 6231 or equal and Approved;
2. Where cables to BS EN 50525-2-31 or BS 5467 or IEC 60502-1 are terminated to bare conductors or busbars of ACBs, MCCBs, fuse combination units or switch-disconnectors in the applications other than those given in sub-clause (1) above, the insulation and sheath of the cables shall be suitable for the maximum temperature of the terminals of the switchgear or equipment.
3. If the Sub-contractor fails to verify the above requirement as given in sub-clause (2) above to the satisfaction of the Contract Manager, the insulation and/or sheath of the cables shall be removed for a distance of 150 mm from the termination and replaced by at least 0.21 mm thick heat-resisting insulating tapes complying with IEC 60454-3-1 and suitable for operating temperatures up to 105℃.

ELE8.3 WIRING SYSTEM USING PVC INSULATED AND PVC SHEATHED CABLES

ELE8.3.1 WIRING SYSTEM

ELE8.3.1.010.9 GENERAL

1. XLPE/PVC insulated and PVC sheathed non-flexible cables shall be used for surface wiring in fixed installations. The cables shall not be buried in concrete or plaster;
2. PVC insulated and PVC sheathed flexible cables or flexible cords shall be used for connection to apparatus, appliances or equipment via an appropriate wiring accessory;
3. Flexible cables or flexible cords shall not be used in a fixed installation, except for final connection to a fixed equipment.

ELE8.3.1.020.9 JOINTS IN CABLES OR CORDS

Joints in cables or cords shall not be allowed unless Approved. In such cases, the joints shall be electrically and mechanically sound and shall be accessible for inspection.

ELE8.3.2 MATERIALS FOR ACCESSORIES

ELE8.3.2.010.9 WIRING ACCESSORIES

Wiring accessories, e.g. switches and socket outlets, shall be of the all-insulated pattern suitable for flush mounting on to a moulded box or pattress. In all other respects, they shall comply with ELE20.

ELE8.3.2.020.9 BOXES OR PATTRESSES

Moulded boxes or pattresses or the enclosure of surface mounted wiring accessories shall be of insulating material and shall comply with BS EN/IEC 60670-1 with dimensions to BS 4662. Each box or pattress shall have a copper earth terminal for the connection of the circuit protective conductors.

ELE8.3.2.030.9 CABLE FIXING CLIPS AND PINS

Buckle clips shall be of heavy gauge, heavily tinned brass with countersunk fixing holes. Fixing pins shall be of copper or brass with a minimum length of 15 mm.

ELE8.3.2.040.9 CABLE FIXING SADDLES AND SCREWS

Saddles shall be of heavy gauge galvanised steel. The fixing screws shall be of non-ferrous metal.

ELE8.3.3 INSTALLATION OF NON-FLEXIBLE CABLES

ELE8.3.3.010.9 CABLE ROUTES

1. All cables shall be run in a vertical or horizontal direction, and shall be secured flat on the surface of walls, columns, partitions or ceilings, etc. throughout the entire route, including at bends. Fixing on to the ceiling shall be avoided unless the cable is required to feed a point on the ceiling;
2. Where required, the cables may be run under floors, between partitions or inside ceiling voids provided that they are enclosed in ducts, conduits or trunking which comply fully with the relevant clauses in ELE9, ELE11, ELE12 and ELE13;
3. When cables are routed along or across steel joints, beams, stanchions, etc. they shall be enclosed in steel trunking/conduit or rigid PVC conduit;
4. Cables shall not be run as a span between beams, trusses, etc. without rigid support throughout their length.

ELE8.3.3.020.9 PROTECTION TO CABLES SUSCEPTIBLE TO DAMAGE

Cables susceptible to damage shall be protected by means of metal channels. Where protection is required for cables running up a wall from the floor, the metal channel shall be fixed to a minimum height of 2 m above finished floor level.

ELE8.3.3.030.9 CABLES PASSING THROUGH A BUILDING STRUCTURE

Where cables pass through a building structure such as a wall or column, the cables shall be drawn through PVC sleeves inserted into the building structure. The size of the PVC sleeves shall be such that the space factor shall not exceed 45%.

ELE8.3.3.040.9 CABLES CROSSING EXPANSION JOINT

Cables passing an expansion joint shall be formed into a loop such that any movement in the joint shall not stress the cables.

ELE8.3.3.050.9 CABLES PASSING THROUGH METAL WORK

Rubber grommets or insulated bushes shall be used to protect the cables passing through metal parts of a distribution board, a luminaires, a metal box or any other metal work.

ELE8.3.3.060.9 SEGREGATION FROM OTHER SERVICES

Cables shall be run at least 150 mm clear of all other non-electrical services.

ELE8.3.3.070.9 "LOOPING-IN" WIRING SYSTEM

The cables shall be wired on the "looping-in" system. Cable joints of any type in cable runs shall not be allowed.

ELE8.3.3.080.9 NEUTRAL CONDUCTOR AT SWITCH POSITION

The neutral conductor of a cable for a lighting final circuit shall be looped through an insulated connector enclosed in the moulded box or pattress housing the switch.

ELE8.3.3.090.9 TERMINATION OF CABLES

1. Cables terminated at a moulded box or pattress, a luminaire or other fittings shall have the overall protective sheaths carried into the moulded box or pattress, luminaire or other fittings for a minimum of 13 mm;
2. The circuit protective conductor shall be terminated at the earth terminal provided in the moulded box or pattress housing the wiring accessories;
3. Where it is not required to terminate the circuit protective conductor in an accessory, the circuit protective conductor shall not be cut back or removed. Instead it shall be coiled away from the live terminals or any bare conductors and shall be insulated and sleeved with a green-and-yellow PVC sleeve.

ELE8.3.3.100.9 BENDING RADII OF CABLES

The internal radii of cables shall not be less than the values given below:

Cable type	Overall diameter of cable, D (mm)	Minimum internal radius of cable
BS EN 50525-2-31 Clause 4.1 and BS 7889 or IEC 60502-1	$D \leq 10$	3 D
	$10 < D \leq 25$	4 D
	$D > 25$	6 D

ELE8.3.3.110.9 FIXING OF CABLES

1. Cables having an overall diameter not exceeding 10 mm shall be fixed by means of buckle clips. Cables of other diameters shall be fixed by means of cable saddles.
2.
   a. Where a number of cables running together on the surface of walls, columns, partitions or ceiling such that their aggregated width exceeds 50 mm, a 13 mm thick hardwood batten of adequate width shall be fixed along the cable route for mounting the cables;
   b. The hardwood batten shall be finished with one coat of Approved priming on front and edges, and treated at the back with waterproof compound;
   c. Lengths of the batten shall be properly fitted together and fixed in position by counter-sunk brass screws in rawplugs.

ELE8.3.3.120.9 FIXING OF CLIPS

1.
   a. Buckle clips shall be fixed to the surface of wall, column, partition or ceiling by pins secured to one plug inserted to a minimum depth of 20 mm;
   b. Where the buckle clips are fixed to plaster, concrete, etc. the plugs shall be made from teak dowelling of parallel length;
   c. The head of every pin shall be level with the surface of the clip so that no damage to the sheath of the fixed cables can occur.
2. Every hole in the buckle clip shall require a fixing pin;
3. A separate buckle clip shall be required for every cable of size above 2.5 mm^2 twin with CPC, or of equivalent size. Not more than two cables shall be allowed in one clip under all circumstances;
4. Buckle clips shall be provided along the entire cable route at regular intervals not exceeding 250 mm on horizontal runs and 400 mm on vertical runs;

5. A clip shall also be provided at a distance not exceeding 75 mm from a termination and from both sides of a bend.

ELE8.3.3.130.9 FIXING OF CABLE SADDLES

Cable saddles shall be securely fixed by fixing screws. Saddles shall be provided along the entire cable route at regular intervals. The spacing between adjacent saddles shall be in accordance with the requirements stipulated in the Electrical CoP unless otherwise specified on the Drawings.

ELE8.3.3.140.9 RATING FACTORS TO CURRENT RATING OF CABLES

There more than two twin cables are fixed together, or when the cables are installed at or in thermally insulated materials, etc., suitable rating factors, as recommended by the electrical CoP or BS 7671 or IEC 60364 shall be applied in determining the size of the cables to be installed.

ELE8.3.4 INSTALLATION OF FLEXIBLE CABLES AND FLEXIBLE CORDS

ELE8.3.4.010.9 CONNECTIONS TO PORTABLE EQUIPMENT

Flexible cables or flexible cords for connections to portable appliances or equipment shall be of suitable length (preferably 1.5 m to 2 m) to avoid undue risk of mechanical damage.

ELE8.3.4.020.9 CONNECTIONS TO FIXED EQUIPMENT

Exposed lengths of flexible cable or flexible cord used for final connections to fixed equipment or appliance shall be as short as possible.

ELE8.3.4.030.9 CONNECTIONS TO LUMINAIRES

Where a flexible cord supports or partly supports a pendant luminaires, the maximum mass acting on the cord shall not exceed 3 kg for flexible cord of 0.75 mm^2, and shall not exceed 5 kg for flexible cord of larger conductor cross sectional area.

ELE8.4 WIRING SYSTEM USING MINERAL-INSULATED CABLES

ELE8.4.1 MATERIALS FOR ACCESSORIES

ELE8.4.1.010.9 CABLE SADDLES AND CLIPS

Saddles and clips for fixing mineral-insulated cables shall be of the type specially made by the cable manufacturer for this purpose. Where the cables are fitted with low smoke zero halogen (LSOH) thermoplastic outer covering, the saddles or clips used shall also have LSOH thermoplastic or thermosetting covering.

ELE8.4.1.020.9 CONDUIT/ADAPTABLE BOXES

Conduit/adaptable boxes shall meet the requirements of ELE11.3.

ELE8.4.2 INSTALLATION OF CABLES

ELE8.4.2.010.9 CABLE ROUTES

Mineral-insulated cables shall be run neatly on the surface of the walls, columns, beams or ceilings in a vertical or horizontal direction, and at least 150 mm clear of all plumbing and mechanical services. The use of conduit and/or cable trunking to enclose such cables shall be kept to the minimum.

ELE8.4.2.020.9 CABLE SUPPORTS

1. Mineral-insulated cables shall be adequately supported by saddles which shall be obtained from the same manufacturer as the cables;
2. Saddles shall be provided through the entire cable route at regular intervals;
3. The spacing between adjacent saddles shall not exceed the values given in ELE8.4.3.010;
4. Saddles shall also be provided at a distance not exceeding 150 mm away from termination and from both sides of a bend.

ELE8.4.2.030.9 BENDING RADIUS

The minimum internal bending radius for mineral-insulated cables shall be 6 times the overall diameter of the cable.

ELE8.4.2.040.9 CABLE LOOP FOR PREVENTION OF VIBRATION

A loop shall be introduced in a cable immediately before its entry into the connected equipment which is subject to vibration or occasional movement. A clear space of at least 10 mm shall be maintained at the point in the loop where the cable passes over itself.

ELE8.4.2.050.9 CABLE TERMINATIONS

1. Cable termination shall generally comply with IEC 60702-2 or BS EN 60702-2;

2. The cable to be terminated shall be cut, screwed, sealed with cold compound and fitted with brass terminating glands, nuts, compression ring, gland body, sealing pot, disc and sleeves. The conductors shall be carried unbroken through the sealing pot to the terminal sockets or clamping screws;
3. The sealing shall be properly carried out to protect the cable ends from moisture and the insulation shall be thoroughly dry before the sealing is applied. The sealing material and any material used to insulate the conductors when they emerge from the insulation shall have adequate insulating and moisture proofing properties and shall retain these properties throughout the range of temperature they may be subjected to in service;
4. Where a mineral insulated cable is terminated at an insulating casing or enamelled/painted metal casing, the sealing pot shall be provided with a copper circuit protective conductor, complying with the requirements of BS EN 60228 and of an appropriate size in accordance with IEC 60702-2 or BS EN 60702-2;
5. Where more than one cable terminates at a galvanised or zinc coated enclosure the gland plate shall be of brass or insulating materials;
6. LSOH thermoplastic or thermosetting shrouded terminating glands shall be used when the cables are fitted with LSOH thermoplastic outer covering;
7. Only tools recommended by the manufacturer of the cables shall be used and the manufacturer's recommended methods of cable termination shall be adopted in all cases.

ELE8.4.2.060.9 INSULATION RESISTANCE

1. The insulation resistance between the cores and between each core and the sheath shall be measured before the cable end is sealed;
2. The measured insulation resistance, RI dependent on its length, l, on a 500V insulation resistance tester shall be given as follows:

Length, l (km)	Requirements on insulation resistance, R_I
$l < 0.1$	$R_I \geq 10{,}000\text{M}\Omega$
$l = 0.1$	$R_I \geq 10{,}000\text{M}\Omega$
$l > 0.1$	$l\,R_I \geq 1{,}000\text{M}\Omega$ km

3. If the reading is less than the values given above, the cable shall be heated by means of a blow lamp or similar device so that moisture is driven out to the open end of the cable and evaporated there;
4. Heating shall be continued until the measured insulation resistance reaches the values given above and the sealing shall be applied without delay;
5. The insulation resistance shall be measured when the cable end has been sealed, and shall meet the values given above;
6. For mineral-insulated cable with LSOH thermoplastic outer covering, adequate length of the LSOH thermoplastic outer covering shall be cut out in the event of low insulation resistance to achieve the required insulation resistance.

ELE8.4.2.070.9 IDENTIFICATION OF CORE

1. The cores of the mineral-insulated cables shall be identifiable at their termination by the application of sleeves or discs of appropriate colours as prescribed below:

Type	**Colour**
Single-phase circuit	Brown

Phase L1 of 3-phase circuit	Brown
Phase L2 of 3-phase circuit	Black
Phase L3 of 3-phase circuit	Grey
Neutral conductor of a circuit	Blue
Protective conductor	Green & Yellow

2. Identification sleeves shall comply with BS 3858 Type 3 where appropriate and shall have temperature rating similar to that of the seals.

ELE8.4.2.080.9 BONDING OF CABLE SHEATH TO METALWORK

Where a mineral-insulated cable passes through or makes contact with any metal, the metal and cable sheath shall be effectively bonded together.

ELE8.4.2.090.9 USE OF SINGLE-CORE CABLES

Single-core mineral-insulated cables running together shall be laid with the cable sheaths in contact. Mineral-insulated cables for 3-phase circuits shall be laid in trefoil formation. Where the cables used are rated at 100A or above, gland plates of apparatus shall be of brass.

ELE8.4.2.100.9 PROTECTION FROM MECHANICAL DAMAGE

The mineral-insulated cables shall be protected by steel conduits or steel sheathings where the cables are exposed in vulnerable positions. Where cables pass through floors, ceilings and walls, the holes shall be made good with cement or other non-combustible material and where cables pass through steelwork, the holes must be bushed.

ELE8.4.2.110.9 RESTRICTION OF USE

Mineral-insulated cables shall not be used:

1. In discharged lighting circuits unless suitable Approved precautions have been taken to avoid excessive voltage; or
2. For earthed concentric wiring system.

ELE8.4.3 REFERENCE TABLE

ELE8.4.3.010.9 MAXIMUM SPACING OF SADDLES FOR MINERAL-INSULATED CABLES

1. The spacing between adjacent saddles shall not exceed the values given in the table below:

Maximum Spacing of Saddles for Mineral-Insulated Cables		
Overall Diameter of Cable, D (mm)	Maximum Spacing (mm)	
	Horizontal Run †	Vertical Run †
$D \leq 9$	600	800
$9 < D \leq 15$	900	1200
$15 < D$	1500	2000

† The spacing stated for horizontal runs may be applied also to runs at an angle of more than 30° from the vertical. For runs at an angle of 30° or less from the vertical, the vertical spacing is applicable.

2. Saddles shall be provided at a distance not exceeding 150 mm away from a termination and away from both sides of a bend.

ELE8.5 CABLE JOINTS AND TERMINATIONS

ELE8.5.010.9 GENERAL

1. Joints and terminations of all power cables shall be made by skilled cable jointers who shall be approved by the Contract Manager before work commences;
2. No reduction in the number of strands of a cable core shall be allowed at a cable joint or termination;
3. Ferrules, compression connectors and bare portions of cable core resulting from a jointing or terminating process shall be insulated with an Approved type insulating tape or heat shrinkable tubing after completion of the process. Such insulating tape or heat shrinkable tubing shall have equal or better electrical and mechanical properties than those of the original insulation removed, and shall be adhered to the cores etc. securely and permanently. The final thickness shall be in a smooth contour throughout the whole length;
4. Every compression joint shall be of a type which has been the subject of a test certificate as described in BS 4579 or IEC 61238-1. When a compression joint is made, the appropriate tools specified by the manufacturer of the joint connectors shall be used.

ELE8.5.020.9 JOINT BOXES AND TERMINATING BOXES

1. Boxes for joints in all power cables shall be of cast-iron, compound filled and of adequate size;
2. The boxes shall be fitted with suitable armouring clamps and glands;
3. The armouring of the cables shall be terminated at the armouring clamps and the inner sheath shall pass through the gland;
4. The box shall be warmed thoroughly before the compound is poured to allow total adhesion between the compound and the box. The compound shall then be allowed to cool and tapped up before the box is closed. No air locks shall be formed within the box.

ELE8.5.030.9 USE OF COLD COMPOUND AND PLASTIC SHELLS

With the consent of the Contract Manager, plastic shells fitted with suitably sized armour bond and filled with Approved type cold pouring encapsulating compound may be used as an alternative to the compound filled cast iron joint boxes for jointing XLPE/PVC-insulated power cables. In such cases, the complete jointing kit, including plastic shell, compound, insulating tape etc., shall be from the same proprietary manufacturer who is specialised in manufacturing products for this purpose. The jointing method and procedure shall be in strict accordance with the manufacturer's recommendations.

ELE8.5.040.9 EARTH CONTINUITY ACROSS JOINTS

A circuit protective conductor having adequate CSA and of same material as the phase conductors shall be installed and connected to maintain the effectiveness of the earth continuity across every cable joint.

ELE8.5.050.9 STRAIGHT-THROUGH JOINTS FOR COPPER CONDUCTORS

1. In a straight-through joint for copper conductors, the two conductors shall be butted together after the strands have been soldered solid and shall be jointed by means of a weak back ferrule, soldered to the cores. Soldering shall be carried out by pouring tinman's solder over the cores and weak back ferrule. In no circumstances shall direct flame from a blowlamp be used for soldering;
2. As an alternative, conductors may be jointed by Approved type compression connectors using appropriate tools and connectors.

ELE8.5.060.9 TEE-JOINTS FOR COPPER CONDUCTORS

When two cables with copper conductors are tee-jointed, the branch conductor shall be connected to the main conductor by means of claw type or weak back ferrules. The strands in both branch and main conductors are to be sweated solid before sweating to the ferrule. Soldering shall be carried out as detailed in ELE8.5.050.

ELE8.5.100.9 TERMINATION OF XLPE/PVC-INSULATED POWER CABLES WITH COPPER CONDUCTORS

1. XLPE/PVC-insulated power cables shall be terminated in a gland fitted with an armour clamp;
2. Provision shall be arranged to enable a watertight seal to be made between the gland and the inner PVC or low smoke zero halogen sheath;.
3. The gland body shall be provided with an internal conical seating to receive the armour clamping cone and a clamping nut which shall secure the armour clamping cone firmly to the armour wires ensuring that the armour wires are tightly clamped between the armour cone and conical armour seating;
4. The spigot on the gland body shall be threaded to suit standard conduit accessories;
5. A shroud shall be fitted to cover the body of the gland and the exposed armour wires.

ELE8.5.120.9 USE OF HEAT SHRINKABLE TUBING

1. With the consent of the Contract Manager, heat shrinkable tubing and accessories may be used for cable joints or terminations. All tubing and accessories shall be specially designed for this purpose and shall be suitable for use with the type and construction of cable to be jointed or terminated;
2. The heat shrinkable materials shall have electrical and mechanical properties equal to or better than those of the cable insulation and sheath, where applicable. After the application of the heat, the heat shrinkable materials shall seal the interfaces between the heat shrinkable materials or between the heat shrinkable materials and the cable surfaces;
3. Whenever heat shrinkable tubing and accessories are used, the complete kit shall be from the same proprietary manufacturer who is specialised in manufacturing products for this purpose. The method and procedures adopted shall be strictly as those laid down by the manufacturer.

ELE8.5.130.9 OTHER METHODS OF JOINTING AND TERMINATION

Methods for jointing or terminating a power cable, other than those specified in the Section, will not be precluded provided that:

1. The method used shall be proven to be capable of affording the degree of safety and efficiency not less than that achieved by those specified in this Section;

2. The method used shall satisfy the requirements of the BS 7671 or IEC 60364;
3. The prior Approval of the Contract Manager has been obtained.

ELE8.6 REFERENCE TABLES

ELE8.6.010.9 CORE IDENTIFICATION OF POWER CABLES

Function of core	Colour code	Number code
Phase conductor of a single phase circuit	Brown	L
Phase conductor of a three-phase circuit	Phase L1: Brown Phase L2: Black Phase L3: Grey	L1 or L2 or L3 according to the phase concerned
Neutral conductor	Blue	N

Note: Cores used as protective conductors shall have an exclusive colour identification of green-and-yellow, unless otherwise stated.

ELE8.6.020.9 INTERNAL BENDING RADII OF POWER CABLES

Type of cables	Minimum radii
1. XLPE-insulated cables to BS 5467 or IEC 60502-1 or BS 6724 with copper conductors	6 D
2. Multi-core, sheathed, armoured, fire-resistant cables to BS 7846	8 D
3. Single-core, sheathed, non-armoured, fire-resistant cables	
4. Multi-core, sheathed, non-armoured, fire-resistant cables not covered by BS 7629:Part 1	
5. Multi-core, sheathed, non-armoured, fire-resistant cables to BS 7629:Part 1	6 D

Where D is the overall diameter of the cable.

ELE9.2.120.9 FIXING OF CABLES ON TRAYS 7

ELE9.1 CABLE DUCTS

ELE9.1.010.9 MATERIALS FOR DUCTS

Cable ducts shall be formed from concrete, PVC, metal or such other materials as may be specified by the Contract Manager in ELE2 or on the Drawings.

ELE9.1.020.9 METALLIC DUCTING

Metallic ducting shall comply with the same requirements as metal trunking.

ELE9.1.030.9 CONCRETE DUCTS CAST IN-SITU

Ducts cast in in-situ concrete shall be formed so that the radial thickness of the concrete or screed surrounding the cross-section of the complete ducting shall not be less than 15 mm at every point.

ELE9.1.040.9 CABLES IN CONCRETE DUCTS

Cables in ducts formed from concrete shall be PVC insulated and PVC sheathed with wire armour, or paper insulated with lead sheath and armoured or mineral insulated with PVC outer covering.

ELE9.1.050.9 CABLES IN WOOD DUCTS

Cables in ducts formed from wood shall be PVC insulated, or PVC insulated and PVC sheathed, and shall be held in position by clips, saddles, or equal and Approved fixings.

ELE9.1.060.9 CABLES IN UNDERGROUND DUCTS

Cables in underground ducts shall be of armoured type as specified in ELE7.

ELE9.1.070.9 INTERNAL BARRIERS

1. In every vertical duct, which is designed as totally enclosed without ventilation, internal barriers shall be provided to prevent the air at the top of the duct from attaining an excessively high temperature;
2. The distance between adjacent barriers shall be the distance between floors;
3. Where the floor to floor distance exceeds 5 m, additional barriers shall be provided at intervals not exceeding 5 m.

ELE9.1.080.9 FIRE BARRIERS

Where a cable duct passes through fire resistant structural elements, such as floors or walls designated as fire barriers, the opening thus formed shall be sealed with fire resistant materials having the same degree of fire resistance as the structural element. In addition, suitable internal fire barriers shall also be provided. An internal barrier may also serve as an internal barrier described previously in ELE9.1.070 above.

ELE9.1.090.9 ACCESSORIES FASTENED TO DUCT COVER

Where a duct cover is used as a support for fixing socket outlet or other accessories, provision shall be made to enable the cover to be removed, so that the enclosed cables can be accessed without taking down the socket outlet or other accessories from the cover.

ELE9.1.100.9 STEEL CONDUITS TERMINATED AT A DUCT

Steel conduits terminating at a duct shall each be securely fixed by means of conduit coupler and brass male brush.

ELE9.1.110.9 RADIUS OF CURVATURE

Where a change in direction in a duct occurs, provision shall be made to enable the cables in the duct to have adequate radii of curvature in accordance with ELE7 and ELE8.

ELE9.1.120.9 DRAW-IN PITS

1. Where cables in a duct are inaccessible for the greater part of their lengths, adequate number of draw-in pits shall be provided at regular intervals of not greater than 45 m;
2. Sufficient room shall be available in the draw-in pits to enable cables to be manoeuvred without damage;
3. In the case of armoured cables, the draw-in pits shall be concrete or brick lined and shall be fitted with a waterproof heavy cast iron lid;
4. Draw-in pits shall not be filled with sand or other materials.

ELE9.1.130.9 SPACE FACTOR

The space factor in a cable duct shall not exceed 35%.

ELE9.1.140.9 SEGREGATION OF CABLES OF DIFFERENT CIRCUIT CATEGORIES

Separate ducts shall be provided for cables of different circuit categories. However, cables of different categories may be allowed to pass through the same draw-in pit provided that they are properly and appropriately segregated.

ELE9.1.150.9 SEALING OF DUCT ENTRIES TO BUILDING

1. After the cables have been installed, both the cables and the exposed duct end shall be sealed to form a gas, water and fire barrier;
2. Open ends of spare ducts shall be closed with duct plugs as shown on drawings to prevent gas and water ingress. If the open ends of spare ducts are located in two separate fire compartments, either one end shall be further sealed with fire resistant material of fire rating not less than the fire resistant requirement of the compartments.

ELE9.1.160.9 SEALING OF DUCT ENTRIES TO MANHOLES/DRAWPITS

After the cables have been installed, all cables duct ends at the manholes/drawpits, including the spare ducts shall be sealed up to form a gas and water barrier according to the installation details as shown on the Drawings.

ELE9.2 METAL CABLE TRAYS

ELE9.2.010.9 MATERIALS FOR TRAYS

Metal cable trays shall be perforated, formed from plain steel sheet complying with BS 1449:Part 1 and shall be hot-dipped galvanised to ISO 1460, ISO 1461 after perforation. Cable trays shall have corrosion protection not lower than medium protection to BS EN 50085-1 and BS EN 50085-2-1 or Class 5 to IEC 61537.

ELE9.2.020.9 DIMENSION OF TRAYS

Cable trays have the following dimensions:

Nominal width	Minimum height of upstand	Nominal thickness of steel sheet
100 mm	12 mm	1.2 mm
150 mm	12 mm	1.2 mm
225 mm	12 mm	1.5 mm
300 mm	20 mm	1.5 mm
450 mm	20 mm	2.0 mm
600 mm	20 mm	2.0 mm

ELE9.2.030.9 BEND PIECES

Bend pieces shall be of the same material, thickness and finish as the main body of the cable tray and shall have an inner radius of 50 mm and a straight length of 100 mm at each end.

ELE9.2.040.9 PERFORATIONS IN BEND PIECES

1. No perforation shall be made in the circular portion of all bend pieces having a nominal width of 150 mm or 100 mm;
2. Perforation may be allowed in bend pieces having a nominal width of 225 mm or above provided that the perforation is made along a line passing through the centre of curvature of the bend pieces and set at an angle θ to the normal of the axis of the cable tray;
3. The values of θ are tabulated below:

Nominal width of cable tray	Value of θ
225 mm and 300 mm	45°
450 mm and 600 mm	30° and 60°

ELE9.2.050.9 TEE PIECES

Tee pieces shall be of the same material, thickness and finish as the main body of the cable tray. The distance measured between the point of the intersection and the end of the tee piece shall not be less than 100 mm.

ELE9.2.060.9 CONNECTIONS BETWEEN ADJACENT LENGTHS OF TRAY

1. Connections between adjacent lengths of tray, tee or bend pieces, shall be made by butt joints and fixed by mushroom-head steel roofing bolts and nuts complying with BS 1494:Part1;
2. The connection shall be mechanically strong so that no relative movement between the two lengths can occur.

ELE9.2.070.9 CUTTING OF TRAYS

Cable trays shall be cut along a line of plain metal only, i.e. they shall not be cut through the perforation. All cut edges of the galvanised cable tray shall be prepared and treated with a cold galvanised paint.

ELE9.2.080.9 CABLE TRAY ACCESSORIES

1. Manufacturer's standard items of accessories shall be used;
2. Site fabrication of accessories shall only be allowed after Approval and shall be kept to a minimum;
3. Where special sections are required, the material, thickness and finish shall be as specified for the standard items.

ELE9.2.090.9 HOLES IN TRAYS

Holes cut in a cable tray for the passage of cables shall be provided with grommets. Alternatively they shall be bushed or lined.

ELE9.2.100.9 SPACE BEHIND TRAYS

A minimum clear space of 20 mm shall be left behind all cable trays.

ELE9.2.110.9 FIXING OF TRAYS

1. Cable trays shall be fixed securely to the walls, ceiling or other structure by means of mild steel hangers or brackets of adequate mechanical strength;
2. The hangers or brackets shall be painted in accordance with ELE28.7;
3. Fixings for cable trays shall be disposed at regular intervals not exceeding 1200 mm and on both sides of, and at a distance not exceeding 225 mm from, a bend or intersection.

ELE9.2.120.9 FIXING OF CABLES ON TRAYS

1. For horizontal run of multi-core cables to BS 5467, cable ties for securing these cables to cable trays shall be made from nylon or polypropylene material. In the cases of low smoke zero halogen or fire-resistant multi-core cables, stainless steel cable ties shall be used;
2. For vertical run of multi-core armoured cables, cable cleats of cast iron with hot dipped galvanised finish or die cast aluminium shall be used for the fixture of multi-core armoured cables. In the case of multi-core non-armoured cables mounted vertically, metallic cable clamps or clips shall be used;
3. Single-core cables shall be secured to the cable tray by non-magnetic metallic cable cleats, clamps or clips specially designed to suit the dimensions of the cables. In the case of low smoke zero halogen or fire-resistant single-core cables, the cable cleats, clamps or clips shall be resistant to a flame at 950℃;

4. The cleats, clamps or clips of these single-core cables shall be secured to the cable tray by means of bolts, washers and nuts.

ELE11.4.030.9 REMOVAL OF BURRS AND SHARP EDGES 10
ELE11.4.040.9 MAKING GOOD OF DAMAGED COATING 10

ELE11.1 CONDUIT SYSTEM

ELE11.1.010.9 CONCEALED CONDUIT SYSTEM

Unless otherwise specified in ELE2 or shown on the Drawings, conduits shall be concealed within walls, floor slabs, false ceilings, or other suitable space.

ELE11.1.020.9 SURFACE CONDUIT SYSTEM

Where surface conduits are specified, they shall be fixed by distance saddles, and shall run only in a vertical or horizontal direction.

ELE11.1.030.9 MINIMUM SIZE OF CONDUIT

The minimum outside diameter of any conduit to be used shall be 20 mm. Where special situations demands, 16 mm conduit may be used subject to prior Approval being obtained from the Contract Manager.

ELE11.1.040.9 STANDARD

Steel conduits, except flexible conduits, shall be of heavy gauge, screwed, longitudinally welded. All conduits shall comply with BS 4568: Part 1 or IEC 61386-21 or BS EN 61386-21.

ELE11.2 CONDUITS AND FITTINGS

ELE11.2.010.9 TYPE-TESTING

Steel conduits and conduit fittings shall be type-tested for complete compliance with the following Standards by an Accredited Laboratory:

1. Steel conduits: BS 4568:Part 1 or IEC 61386-21 or BS EN 61386-21;
2. Conduit fittings: BS EN 61386-1 or IEC 61386-1;
3. Steel boxes for Electrical Accessories: IEC 60670-1 with dimensions to BS 4662.

ELE11.2.020.9 FLEXIBLE STEEL CONDUITS

1. Flexible steel conduits and solid type brass adaptors shall comply with BS EN 61386-1, or IEC 61386-1 and IEC 61386-23. In addition, the conduits shall be of the metallic watertight pattern, PVC oversheathed and with a separate circuit protective conductor drawn into the conduit for each continuity. PVC oversheath will not be required for installations within ventilated ceiling voids;
2. Length of each flexible conduit shall not be more than 1 m for general applications or 2 m inside false ceiling and raised floor.

ELE11.2.030.9 CONDUIT FITTINGS

1. All conduit fittings shall comply with BS EN 61386-1 or IEC 61386-1;
2. Adaptable boxes complete with covers shall be of cast iron, galvanised, or sheet steel having a protection against corrosion in accordance with IEC 60670-1. Unless otherwise specified, boxes of the preferred sizes only, as given in IEC 60670-1, shall be used. Screws for securing the cover shall be of stainless steel;
3. Circular boxes, dome covers and hook covers shall be of galvanised malleable cast iron. Ceiling mounted boxes shall be of deep pattern type having an internal depth of not less than 60 mm;
4. Bushes and plugs shall be of brass;
5. Distance saddles shall be of galvanised cast iron. The screws for fixing the saddles shall be of brass;
6. Solid or inspection tee-pieces, couplers or elbows shall not be used on any conduit installation.

ELE11.2.040.9 METAL BOXES FOR ACCESSORIES

1. Metal boxes for the enclosure of electrical accessories in conduit installation shall comply with IEC 60670-1 with dimensions to BS 4662;
2. 35 mm and 47 mm deep boxes shall be used to house accessories such as domestic switches, socket outlets, etc.;
3. 16 mm and 25 mm deep boxes may be used to house specially designed electrical accessories of shallow pattern subject to prior Approval.

ELE11.2.050.9 CLASS OF PROTECTION AGAINST CORROSION

1. Steel conduits shall have Class 4 protection against corrosion in accordance with BS 4568: Part 1 or IEC 61386-1 or BS EN 61386-1 i.e. heavy protection both inside and outside (e.g. hot-dip zinc coating or sherardizing);

2. Steel conduit fittings shall have Class 4 protection in accordance with BS EN 61386-1 or IEC 61386-1 i.e. heavy protection both inside and outside (e.g. hot-dip zinc coating or sherardizing);
3. Metal boxes for the enclosure of electrical accessories shall have protection both inside and outside in accordance with IEC 60670-1.

ELE11.2.060.9 CORROSION RESISTANCE TEST

Upon request from the Contract Manager, documentary evidence that the batch/consignment of steel conduits and conduit fittings delivered to site having satisfied the corrosion protection requirement as stipulated in the relevant Standards mentioned in ELE11.2.010 shall be provided.

ELE11.3 CONDUIT AND WIRING INSTALLATION

ELE11.3.010.9 CONDUIT CONTINUITY

1. The steel conduit installation shall be mechanically and electrically continuous throughout, and efficiently earthed;
2. Earth continuity of the conduit installation shall be tested before concreting of floors and walls and also on completion of the entire installation;
3. Where the circuit protective conductor is formed by the conduits, the terminal of the socket outlet shall be connected by a separate protective conductor, having the same cross sectional area and type as the live conductors, to an earth terminal incorporated in the associated metal box or enclosure;
4. Flexible conduit shall not be used as a protective conductor.

ELE11.3.020.9 JOINTS IN STEEL CONDUITS

1. Joints in steel conduits shall be made by means of a solid coupler into which the adjacent ends of the two conduits shall be inserted and screwed up tightly in order to make the conduit run mechanically and electrically continuous;
2. Running couplings shall be avoided. Where such a coupling cannot be avoided, the coupler shall be screwed up tightly onto the short threaded portion of one conduit, the threaded portion of which shall project approximately half way into the length of the coupler. The threaded portion of the mating conduit should also project approximately half way into the coupler;
3. Electrical continuity should be ensured by tightening up a hexagon locknut against the coupler;
4. Any exposed threads on either conduit shall be painted with at least two coats of anti-rust paint.

ELE11.3.030.9 PROVISION OF ADAPTABLE BOXES

1. An adequate number of suitably sized adaptable boxes shall be provided in all conduit runs to enable cables to be drawn in easily and without damage;
2. Adaptable boxes shall be provided immediately after every two bends, after a bend plus a total maximum straight run of 10 m or after a maximum straight run of 15 m;
3. Where an adaptable box is required for conduits installed in the floor screed, it shall be fitted in such a manner that the lid is covered by the same material as the remainder of the floor, and shall remain accessible at all times.

ELE11.3.040.9 SPACING BETWEEN CONDUITS

Adjacent or parallel conduits cast in concrete (except the first 200 mm straight runs from the same box) shall be separated by a spacing of not less than 25 mm so as to allow concrete aggregate to pass and set between them.

ELE11.3.050.9 TERMINATION OF STEEL CONDUITS AT METAL CASING

1.

   a. Where a steel conduit terminates at a metal casing, a coupler or a brass adaptor for flexible conduit together with a brass male bush shall be used;

b. The brass male bush shall be screwed into the coupler or adaptor from the inside of the metal casing through a clearance hole drilled in the metal casing to suit the bush;

c. Both the conduit and the bush shall be screwed tightly into the coupler or adaptor so as to grip the metal casing securely for mechanical and electrical continuity;

d. Threads on the steel conduit shall be at least half the coupler length, and no threads on the metal casing shall be allowed;

e. The connection between the flexible conduit and the adaptor shall be securely fixed and effectively watertight.

2. Where the metal casing is painted or enamelled, the electrical continuity between the conduit and the casing shall be achieved by means of a separate protective conductor of adequate size connecting the conduit and an earth terminal inside the metal casing through a copper earthing placed between the bush and the metal casing. Neither the paint nor the enamel shall be damaged or removed to achieve electrical continuity.

ELE11.3.060.9 CONDUIT BENDS

Conduits shall not be bent with an acute angle. The internal radius of the bend shall not be less than 2.5 times the outside diameter of the conduit.

ELE11.3.070.9 CHASES FOR CONDUITS

Chases for conduits to be concealed in walls, columns or beams shall be vertical or horizontal.

ELE11.3.080.9 CONDUITS CROSSING EXPANSION JOINTS

1. Where a conduit crosses an expansion joint, special arrangements shall be made to allow relative movement to occur on either side of the expansion joint;
2. A separate circuit protective conductor shall be installed to maintain an effective electrical continuity across the expansion joint;
3. The circuit protective conductor shall have a cross-sectional area rated to suit the largest live conductors drawn into the conduits in accordance with for the Electrical CoP.

ELE11.3.090.9 USE OF EXTENSION PIECE

1. An extension piece shall be fitted to a conduit box where the plaster wall finish (including plaster) is more than 25 mm from the conduit box;
2. Only extension pieces of the correct depth shall be used;
3. Under no circumstances shall multiple extension pieces be permitted.

ELE11.3.100.9 PREVENTION OF INGRESS OF FOREIGN MATTER

1. During the building construction, all open ends of the conduit termination, which are liable to be filled with water, moisture or other foreign matter, shall be plugged with Approved conduit stopping plugs; paper or rag materials will NOT be allowed for this purpose;
2. Conduit boxes in similar circumstances shall also be similarly plugged to prevent concrete or plaster from entering the boxes during the building construction.

ELE11.3.110.9 PREVENTION OF ACCUMULATION OF WATER OR MOISTURE

1. The conduits shall be so laid to prevent accumulation of condensed moisture in any part of the installation. Due care shall also be taken to prevent the ingress of water into the conduits from leakage in walls and ceilings of the building structure;
2. Approved type of sealant for the prevention of condensed moisture shall be applied to ceiling conduit outlets installed in a cool space subject to the influx of warm air.

ELE11.3.120.9 CONDUITS LAID DIRECT IN THE GROUND

Steel conduits laid direct in ground or buried in soil shall be painted with two coats of bituminous paint before installation.

ELE11.3.130.9 FIXING OF SURFACE MOUNTED BOXES

In surface conduit installations, conduit boxes, adaptable boxes and metal boxes for accessories shall be securely fixed to walls, ceilings or other substantial parts of a structure by means of suitable brass screws correctly spaced. The fixing of these boxes shall be independent of the fixing of the associated conduits.

ELE11.3.140.9 FIXING OF SADDLES

1. Galvanised distance saddles, for the support of surface conduits, shall be provided throughout the entire route at regular intervals;
2. The spacing between the adjacent saddles shall not be more than those given in the Electrical CoP;
3. Each bend of a surface conduit shall be supported by a saddle on either side of the bend, and the saddles shall be fixed as near to the bend as practicable;
4. Distance saddles shall be fixed with brass screws in Rawplugs or other Approved method.

ELE11.3.150.9 CONDUITS INSTALLED OUTDOORS OR IN DAMP SITUATIONS

Where conduits are installed outdoors or in damp situations all conduit fittings and conduit accessories, shall not be placed in contact with other metals with which they are liable to set up electrolytic action. In addition, where the conduit installation is subjected to weather, the conduit fittings and conduit accessories shall be provided with weatherproof sealant or other materials to ensure that the installation is completely weatherproof.

ELE11.3.160.9 SWABBING OUT OF CONDUITS

Conduits shall be swabbed out and free from moisture before wiring work is commenced. The swabbing operation shall be carried out under the supervision of the authorised representative of the Contract Manager. Only Approved draw-in tape or wire of appropriate size and absorbent cloth shall be used.

ELE11.3.170.9 CONDUITS PASSING THROUGH FIRE RESISTANT BARRIERS

Where conduits pass through fire resistant structural elements, such as walls and floors designated as fire barriers, the opening made shall be sealed according to the appropriate degree of fire resistance of the wall and floor. In addition, where conduits are installed in channels, ducts, ducting, trunking or shafts which pass through such elements, suitable internal fire resistant barriers shall also be provided to prevent the spread of fire.

ELE11.3.180.9 IDENTIFICATION

Conduits, where required to be distinguished from pipelines of other services, shall use orange as the basic identification colour in compliance with BS 1710.

ELE11.3.190.9 CABLE CAPACITY OF CONDUITS

1. The number of cables drawn into a conduit shall be such that no damage will be caused to the cables or to the conduits during their installation;
2. In determining the size of the conduit, the "unit system" method as recommended by the Electrical CoP shall be adopted;
3. For cables and conduits NOT included in the Electrical CoP, the number of cables drawn into a conduit shall be such that the resulting space factor shall not exceed 40%.

ELE11.3.200.9 METHOD OF DRAWING CABLES INTO CONDUITS

Cables shall be drawn into conduits by using Approved draw-in tape or wire of the appropriate size. Only lubricating materials which are confirmed in writing from a cable manufacturer or recognised certification body that there will be no adverse effect on the cable insulation for the lifetime of the cable may be allowed to be used for drawing cables into conduits.

ELE11.3.210.9 SEGREGATION OF CABLES OF DIFFERENT CIRCUIT CATEGORIES

Separate conduits shall be provided for cables of different circuit categories.

ELE11.3.220.9 "LOOPING-IN" WIRING SYSTEM

Each conductor in a run shall be of one continuous length and wired on the "loop-in" system. No joint in cable run will be allowed.

ELE11.3.230.9 NUMBER OF FINAL CIRCUITS IN CONDUIT

A conduit serving final circuits direct from a distribution board or from an adaptable box used as a final distribution point shall contain one final circuit except in the case of lighting final circuit where two circuits with 1.5 mm^2 cables will be permitted in a 20 mm conduit. For 3 phase final circuits, a separate conduit shall be used for each circuit.

ELE11.3.240.9 GROUPING OF CABLES IN CONDUIT

1. Where an adaptable box is used as the final distributing point, a number of final circuits may be grouped together between the distribution board and the adaptable box by means of conduits of appropriate diameter. All live conductors of the same a.c. circuits shall be drawn into the same conduit;
2. Correction factors for grouping, as recommended by the Electrical CoP, shall be applied in determining the size of cables to be installed.

ELE11.3.250.9 NEUTRAL CABLE OF LIGHTING POINT

The neutral cable of a lighting final circuit shall be routed in the conduit direct to the lighting point and shall not pass through the switch box.

ELE11.4 TOOLS AND WORKMANSHIP

ELE11.4.010.9 TOOLS

Conduit bends shall be formed on a bending machine, and the conduits shall not be flattened at bends.

ELE11.4.020.9 CUTTING OF HOLES

Holes in metal work for the termination of conduits shall be drilled with a twist drill of the correct size or by means of other hole cutting device.

ELE11.4.030.9 REMOVAL OF BURRS AND SHARP EDGES

Burrs and sharp edges are to be removed from the ends of conduits before they are installed.

ELE11.4.040.9 MAKING GOOD OF DAMAGED COATING

Where the protective coating on a steel conduit has been damaged after installation, such surface shall be painted with at least two coats of an Approved anti-rust paint to prevent corrosion.

ELE12.4 TOOLS AND WORKMANSHIP 8

ELE12.4.020.9 CUTTING IN TRUNKING 8
ELE12.4.030.9 MAKING GOOD OF DAMAGED COATING 8

ELE12.1 TRUNKING SYSTEM

ELE12.1.010.9 ARRANGEMENT OF CABLES

Cables in each final circuit and/or in each sub-main shall be bunched and tied or clipped together.

ELE12.1.020.9 PROVISION OF CABLE RETAINING BARS AND CABLE SUPPORTS

1. Trunking, which is installed in such a position that the cables would fall out when the cover is removed, shall be fitted with cable retaining bars or other suitable devices to prevent cables from falling out;
2. Trunking installed in a vertical plane shall contain sufficient supporting devices within the trunking to prevent strain on the cables due to the weight of the cables, and to prevent vertical movement of the cables.

ELE12.1.030.9 CABLE CAPACITY OF TRUNKING

1. The number of cables put into a trunking shall be such that no damage is caused to the cable or the trunking;
2. In determining the size of the trunking required for a particular installation, the "unit system" method as recommended by the Electrical CoP shall be adopted;
3. For cables and trunking not included in the Electrical CoP, the number of cables to be enclosed in the trunking shall be such that the resulting space factor shall not exceed 45%.

ELE12.1.040.9 CORRECTION FACTORS FOR GROUPING

Where more than three loaded conductors or more than one multi-core cable are enclosed in a common trunking, suitable correction factors for grouping, as recommended by BS 7671 or IEC 60364, shall be applied in determining the size of the cables to be installed.

ELE12.1.050.9 SEGREGATION OF CABLES OF DIFFERENT CIRCUIT CATEGORIES

1. Where a common trunking is used to accommodate cables for different circuit categories, they shall be effectually segregated by means of partitions or dividers;
2. The partitions or dividers shall be adequately secured to the body of the trunking.

ELE12.2 MATERIALS FOR TRUNKING SYSTEM

ELE12.2.010.9 GENERAL

1. Trunkings and fittings shall comply with BS EN 50085-2-1, IEC 61084-2-1 or equivalent unless otherwise specified;
2. Manufacturer's standard fittings such as tee or angle pieces, connectors etc. shall be used throughout unless prior Approval has been obtained from the Contract Manager;
3. Factory prefabricated trunking assemblies of repetitive pattern can be used for congested areas like meter rooms on various floors. Mock-up installation shall be set up for the Contract Manager's approval prior to mass production of the prefabricated trunking assemblies.

ELE12.2.020.9 CLASS OF PROTECTION AGAINST CORROSION

Trunking and fittings shall have continuous hot-dip zinc coating on both sides with a minimum coating mass of 275 g/m^2.

ELE12.2.030.9 CONSTRUCTION

1. Trunking shall be of square or rectangular cross-section of which one side of the trunking shall be removable or hinged;
2. If screws are used to secure the cover or the connector, they shall not project internally over 2mm to avoid causing damage to the cables inside;
3. Where partitions or dividers are provided for the segregation of circuits, they shall be rigidly fixed to the main body of the trunking.

ELE12.2.040.9 MARKING ON TRUNKING

Every standard length of trunking shall bear an easily legible and durable marking by means of moulding, pressing or engraving showing the name or the trademark of the manufacturer, British Standard and / or International Electrotechnical Commission Standard, as appropriate. For short pieces without durable marking, the marking shall be provided at the internal wall of every piece of trunking in the form of painting or printed adhesive label.

ELE12.2.050.9 DIMENSIONS

1. The sizes, body and cover thicknesses and preferred lengths of surface trunking shall comply with Code 14C of the Electrical CoP;
2. Trunking to special order, having dimensions differing from those given in Code 14C of the Electrical CoP, may be used provided they meet all the other requirements as stated in this specification and with tolerance in external dimensions not exceeding +5%.

ELE12.2.060.9 CONNECTIONS BETWEEN LENGTHS OF TRUNKING

1. Connections between adjacent lengths of trunking, tee or angle pieces, accessories, etc. shall be made by means of U-shaped butt joints. The two adjacent ends of the trunking shall be fixed so that there shall be no relative movement between them. At least two screws shall be used to attach each connector to each section of the trunking;
2. Electrical continuity shall be achieved by means of a copper tape of minimum size 2mm x 12mm connecting the two adjacent ends of the trunking;
3. Prefabricated trunking assemblies shall have sections connected by welding or screws. Welding points shall be touched up with anti-rust paint.

ELE12.2.070.9 TRUNKING COVERS

1. Trunkings and fittings shall have removable or hinged covers extending over the entire length. The covers shall be of the same material and finish as those of the trunking body;
2. Removable covers shall be held in position on the trunking by the natural elasticity of the material of the cover (e.g. spring capped trunking); a means formed as an integral part of the cover (e.g. captive screws); or stainless steel spring clips fixed rigidly on trunking body by welding or by adhesive suitable for fixing metallic parts;
3. Bends, tee junctions, etc. shall be fitted with removable or hinged covers;
4. When trunking is mounted up-side-down or installed inside lift shaft, the trunking covers shall be fixed by screws.

ELE12.2.080.9 SCREWS

1. Screws used for securing the cover or connector and for the fixing of the trunking shall have isometric threads;
2. They shall be of brass or steel and if of steel they shall be protected against corrosion by a finish at least equal to the zinc coating specified in BS 7371-12;
3. Electro-brass plated screws or self-tapping screws will not be acceptable.

ELE12.3 INSTALLATION OF TRUNKING SYSTEM

ELE12.3.010.9 LAYOUT

Trunking shall be installed neatly on the surface of the walls, columns or beams and shall be truly vertical and horizontal.

ELE12.3.020.9 TRUNKING CONTINUITY

The trunking body and cover shall be mechanically and electrically continuous throughout, and efficiently earthed.

ELE12.3.030.9 CONNECTION TO APPARATUS

Connection between trunking and apparatus shall be by a screwed coupler and brass male bush, or a standard flange coupling or an adaptor neck, fabricated or casted. Direct attachment of trunking to apparatus will only be permitted if cable entries are provided with smooth bore bushes or grommets and the return edge of the lid of the trunking is left intact.

ELE12.3.040.9 CONNECTION TO DISTRIBUTION BOARD

Where connection is made between trunking and a distribution board, the cable entry or entries shall be sized to accept all cables from all used and "spare" ways.

ELE12.3.050.9 FIXING OF TRUNKING

1. Individual pieces of trunking shall be independently supported by means of at least two fixed points per piece;
2. On straight runs supports for trunking shall be fixed at regular intervals with maximum spacings as given in Code 25B of the Electrical CoP;
3. For runs with bends, supports shall be fixed as near to the bend as practicable;
4. Overhead trunking shall be suitably supported by means of mild steel hangers, brackets or other Approved devices, so that no visible sag is observed when loaded with cables. These supports shall be painted with at least two coats of an Approved anti-rust paint to prevent corrosion.

ELE12.3.060.9 CABLES THROUGH TRUNKING

Cables penetrating through trunking shall be protected by conduits except for PVC insulated and sheathed cables if such cables form part of a surface wiring system. In such cases, the holes in the trunking, through which such cables penetrate shall be fitted with suitable rubber grommets or insulated bushes.

ELE12.3.070.9 TRUNKING PASSING THROUGH FIRE RESISTANT BARRIERS

1. Whenever trunking passes through a fire resistant structural element, such as a floor or wall, designated as fire barrier, the opening thus formed shall be sealed with Approved type of fire resisting material according to the appropriate degree of fire protection required. In addition, suitable internal fire barriers shall also be provided to prevent the spread of fire or smoke through the trunking;
2. In vertical trunking installations, internal fire barriers shall be provided between floors or at intervals of 5 m apart whichever is less.

ELE12.3.080.9 PREVENTION OF ELECTROLYTIC ACTION

Whenever the trunking is installed in damp situations, or where the trunking is likely to be exposed to weather, the trunking shall be kept away from other metalwork with which electrolytic action is liable to be established.

ELE12.3.090.9 PREVENTION OF INGRESS WATER

Every entry to the trunking shall be so placed as to prevent and/or to be protected against the ingress of water.

ELE12.4 TOOLS AND WORKMANSHIP

ELE12.4.020.9 CUTTING IN TRUNKING

Holes in trunking shall be drilled, punched or cut by ring saw. After cutting, burrs and sharp edges on the trunking shall be removed to prevent abrasion of cables.

ELE12.4.030.9 MAKING GOOD OF DAMAGED COATING

Where the protective coating on the trunking has been damaged after installation or after welding, such surface shall be painted with at least two coats of an Approved anti-rust paint to prevent corrosion.

ELE13.7.040.9 ALLOWANCE FOR THERMAL EXPANSION 9

ELE13.1 CONDUIT SYSTEM

ELE13.1.020.9 STANDARDS

1. Rigid plain polyvinyl chloride (PVC) conduits, conduit fittings and PVC boxes shall comply with the respective Standards listed below:

PVC conduits	IEC 61386-21 or BS EN 61386-21
PVC conduits fittings	IEC 61386-1 or BS EN 61386-1 or BS 4607:Part 1 for male bush and female adaptor or BS 4607:Part 5 for plain moulded slip type couple and expansion type coupler
PVC circular conduit boxes and adaptable boxes	IEC 60670-1 or BS EN 61386-1 or BS 4607-5
PVC boxes for electrical accessories	IEC 60670-1 and dimensions to BS 4662

2. All PVC conduits, fittings and boxes shall be of the same make.

ELE13.1.030.9 COLOUR

All PVC conduits, fittings and boxes shall be white in colour.

ELE13.1.040.9 FLAME RESISTANCE

All PVC conduits, fittings and boxes shall be non-flame-propagating and self-extinguishing.

ELE13.1.050.9 TEMPERATURE CLASSIFICATION

All PVC conduits, fittings and boxes shall comply with the temperature classification for transport, installation and permanent application not less than -5℃. For PVC conduits, where the ambient temperature at the place of manufacture is likely to be below -5℃, the temperature classification of conduits shall be capable for transport, installation and permanent application not less than -25℃.

ELE13.2 RIGID PLAIN PVC CONDUITS

ELE13.2.010.9 CONSTRUCTION AND SIZE

1. PVC conduits shall be rigid, plain and of a non-threadable type;
2. The nominal diameter of rigid plain PVC conduits shall be within the range of 20 mm to 32 mm unless otherwise specified.

ELE13.2.020.9 MECHANICAL PROPERTIES

Rigid plain PVC conduits shall have heavy mechanical strength, capable of withstanding the heavy compression and impact tests specified in IEC 61386-21 or BS EN 61386-21.

ELE13.2.030.9 TYPE-TEST CERTIFICATES

1. Rigid plain PVC conduits shall be type-tested for complete compliance with IEC 61386-21 or BS EN 61386-21 by an Accredited Laboratory;
2. Test certificates or test reports are acceptable for the purpose of product testing and certification.

ELE13.2.040.9 MARKING

1. Rigid plain PVC conduits shall be marked on the surface with the first four digit classification code for declared properties in accordance with IEC 61386-21 or BS EN 61386-21;
2. The PVC conduits shall have a minimum classification code of 4421. If the ambient temperature at the place of manufacturer of the PVC conduits is likely to be below -5℃, the classification code of the PVC conducts shall be upgraded to 4441.

ELE13.4 PVC CONDUIT FITTINGS

ELE13.4.010.9 CONSTRUCTION

1. Plain, moulded slip-type couplers and expansion type couplers to IEC 61386-1 or BS EN 61386-1 shall be used in the jointing of conduits;
2. Saddles and spacers in compliance with IEC 61386-1 or BS EN 61386-1 shall be used for fixing of conduits unless otherwise specified.

ELE13.4.020.9 TYPE-TEST CERTIFICATES

1. PVC conduit fittings shall be type-tested for complete compliance with the following standards by an Accredited Laboratory:
   a. Plain moulded slip type coupler: IEC 61386-1 or BS EN 61386-1 or BS 4607-5;
   b. Male bush and female adaptor: IEC 61386-1 or BS EN 61386-1 or BS 4607-1.
2. Test certificates or test reports are acceptable for the purpose of product testing and certification.

ELE13.5 PVC CIRCULAR CONDUIT BOXES, PVC BOXES FOR ELECTRICAL ACCESSORIES AND PVC ADAPTABLE BOXES

ELE13.5.010.9 CONSTRUCTION AND DIMENSIONS

1. All PVC boxes and their covers shall comply with the relevant International Standard and British Standard Specifications listed above in ELE13.1.020;
2. All screw holes shall be fitted with metal inserts. Other than PVC adaptable boxes, each box shall be provided with a brass earthing terminal complete with screw for the connection of circuit protective conductor (CPC);
3. Ceiling-mounted circular conduit boxes shall be of deep pattern type having an internal depth of not less than 60 mm. Extension rings shall comply with IEC 60670-1;
4. Each PVC box shall be moulded in one piece;
5. The minimum wall thickness of IEC 60670-1 boxes and adaptable boxes shall be 2 mm;
6. For flush installation, the overall sizes of the covers of the PVC adaptable boxes shall be larger than the adaptable boxes on each edge by at least 5 mm. Screws for securing the cover shall be of stainless steel;
7. BS 4662/IEC 60670 boxes equipped with spouts for mounting wiring accessories can be used as an alternative for easy connection to conduits.

ELE13.5.020.9 MECHANICAL PROPERTIES

1. All PVC boxes shall comply with the requirements for mechanical properties stated in the relevant International Standard and British Standard Specifications listed in ELE13.1.020 above;
2. PVC adaptable boxes shall be moulded of sufficient mechanical strength to withstand forces encountered in concealed conduit wiring system application and complete with provision for prevention of deformation of the boxes where necessary;
3. Boxes for the suspension of luminaires or other equipment, where considerable heat will be produced, shall be fitted with steel insert clips;
4. Plastic boxes shall not be used in situations where the temperature of the box is likely to exceed 60℃ or where the mass suspended from the box exceeds 3 kg.

ELE13.5.030.9 TYPE-TEST CERTIFICATES

1. PVC circular conduit boxes, PVC boxes for electrical accessories and PVC adaptable boxes shall be type-tested for complete compliance with IEC 60670-1 by an Accredited Laboratory;
2. Test certificates or test reports are acceptable for the purpose of product testing and certification.

ELE13.5.040.9 TOLERANCE IN SETTING-OUT OF CONCEALED JUNCTION/ADAPTABLE BOXES ON WALLS AND SLABS INSIDE DOMESTIC FLATS AND AT PUBLIC AREAS IN STANDARD BLOCKS

The deviation of the installed position of concealed junction/adaptable boxes from the specified position as shown in the Drawings shall be within a tolerance of ±150 mm with the following considerations:

1. Inside domestic flats:

   In general, the sockets outlets and lighting switches etc. shall be at the same level in the same room. Vertical levels of boxes designed at the same level on the same structural wall shall be within ±8 mm, and that on the same panel wall shall be within ±3 mm.

2. At public areas:

   In general, junction boxes shall be aligned and properly confined in a small area. The regular pattern of the boxes and their alignment along the corridors' ceiling slabs shall be maintained within ±10 mm.

3. The installed position of boxes after taking the above tolerance into consideration shall not contravene the requirements of the position of switches/sockets as stipulated in the Design Manual - Barrier Free Access 2008; nor have conflict with other installations such as skirting, door frame, etc.;

4. Deviations exceeding the tolerance under special site condition shall be subject to the approval of the Contract Manager.

ELE13.5.050.9 CONCEALED CONDUITS INSTALLATION ON PANEL WALLS WITH PRE-INSTALLED CONDUITS

1. Coordinate with Main Contractor for the alignment of the concealed conduit in the slab and the pre-installed in panel walls;

2. Interconnect conduits from ceiling slab to pre-installed conduits in panel wall partitions including the provision of conduits, couplers, sockets and all electrical accessories;

3. Wherever necessary, adjust alignment of conduits in ceiling slab and conduit ends at the open slots of panel walls for smooth interconnection;

4. Interconnect the draw wires in the conduits in ceiling slab and the draw wires in the pre-installed conduits for subsequent wiring work;

5. Attend and coordinate with the Main Contractor for the making good of the open slots on panel wall;

6. Installation of concealed conduits in panel walls shall follow the Electrical CoP. Unless otherwise specified, mechanical protection cover for pre-installed conduits shall comply with the Electrical CoP.

ELE13.6 CONDUIT AND WIRING INSTALLATION

ELE13.6.010.9 CONDUIT BENDS

Conduit bends shall have an internal radius of at least 4 times the outside diameter of the conduit.

ELE13.6.020.9 BENDING, JOINTING AND TERMINATING OF CONDUITS

The method of carrying out the conduit bends, conduit joints, fixing conduits to boxes without spouts, and the tools and materials to be used shall be as recommended by the manufacturer of the conduits.

ELE13.6.030.9 EARTHING

Unless otherwise specified, a PVC insulated cable shall be drawn into the conduit system to serve as the circuit protective conductor (CPC), the cross-sectional area of which shall comply with Electrical CoP for the size of the largest live conductors enclosed.

ELE13.6.040.9 EARTHING FOR PRE-INSTALLED STEEL CONDUIT

In case pre-installed steel conduit is adopted in panel wall, provide earthing of the metal boxes to the corresponding wiring accessories with cost agreed with and borne by the Main Contractor.

ELE13.7 TRUNKING AND FIXING

ELE13.7.010.9 GENERAL

Trunking of sizes up to 100 mm x 100 mm shall have covers of the clip-on type. Larger sizes shall have covers secured by special plastic rivets.

ELE13.7.020.9 FIXING OF TRUNKING

1. The trunking shall be fixed and supported in the normal way by screws, but the holes in the trunking shall be made oversize to allow for the movement of expansion;
2. Washers shall be used under the head of the screw which should not be tightened to its full extent;
3. The spacing between adjacent supports for trunking shall not be larger than those given in the Electrical CoP.

ELE13.7.030.9 EARTHING

Unless otherwise specified, a PVC insulated cable shall be drawn into the trunking system to serve as the circuit protective conductor (CPC), the cross-sectional area of which shall comply with the Electrical CoP for the size of the largest live conductors enclosed.

ELE13.7.040.9 ALLOWANCE FOR THERMAL EXPANSION

Due allowance shall be made for the expansion of the PVC tubing at high temperatures. Expansion coupling or other fittings shall be included in a straight run of 8 m or more. Saddles or clips shall be of sliding fit.

ELE14 LIGHTNING PROTECTION SYSTEM

ELE14.1 PROTECTION OF STRUCTURES AGAINST LIGHTNING..... 4

ELE14.1.010.9 INSTALLATION OF LIGHTNING PROTECTION SYSTEMS 4
ELE14.1.020.9 SCOPE 4
ELE14.1.050.9 AIR TERMINATION ON ROOF AND UPPER ROOF 4
ELE14.1.055.9 AIR TERMINATION ON SIDE WALLS 4
ELE14.1.060.9 DOWN CONDUCTORS 4
ELE14.1.080.9 EARTH TERMINATION 5
ELE14.1.110.9 BONDING TO OTHER SERVICES 5
ELE14.1.120.9 BONDING TO METALWORK 5
ELE14.1.130.9 JOINTS IN CONDUCTORS 5
ELE14.1.140.9 TESTING 6

ELE14.1 PROTECTION OF STRUCTURES AGAINST LIGHTNING

ELE14.1.010.9 INSTALLATION OF LIGHTNING PROTECTION SYSTEMS

1. The lightning protection system shall comprise an air termination network connected by down conductors to earthing electrodes;
2. The lightning protection systems shall be installed in accordance with Project Specific Specification and Drawings, and as directed by the Contract Manager.

ELE14.1.020.9 SCOPE

1. This section covers lightning protection systems applicable to buildings and similar structures;
2. It does not cover the protection of overhead lines and other specialised applications;
3. The installation shall conform to the requirement and recommendations set out in IEC 62305-1 and IEC 62305-2 and IEC 62305-3 and IEC 62305-4, or BS EN 62305-1 and BS EN 62305-2 and BS EN 62305-3 and BS EN 62305-4, or AS/NZS 1768.

ELE14.1.050.9 AIR TERMINATION ON ROOF AND UPPER ROOF

1. An air termination consisting of a network of aluminium roof conductors shall be provided on roof and upper roof as shown on the Drawings;
2. All salient points of the roof structure shall be incorporated in the air termination network;
3. All metallic projections, chimneys, ducts, vent pipes, railings, gutters, etc., on or above the main surface of the roof of the roof structure, shall be fixed to, and form part of, the air termination network by appropriate clamps;
4. Aluminium roof conductors shall be of 25 mm x 3 mm and fixed to the roof structure at regular intervals of not more than 0.5 m by means of spacer saddles;
5. The spacer saddles shall be of pressing or casting aluminium alloys.

ELE14.1.055.9 AIR TERMINATION ON SIDE WALLS

1. Air termination on external wall of the building, if required, shall be in form of tinned copper plate of thickness not less than 4 mm mounted on the cast in bonding point as shown on the Drawings;
2. The cast in bonding point shall be of copper and pre-welded to a 70 mm^2 PVC insulated cable. The cable shall be bonded to two reinforcement bars by means of rod-to-cable clamps;
3. The tinned copper plate shall have good contact with the cast in bonding point and shall be properly protected to avoid covering up by the external wall paint. The fixing screws shall be welded to the tinned copper plate after testing to be having negligible resistance to the down conductor. The Sub-contractor shall coordinate with the Main Contractor on the sequence of installation during construction.

ELE14.1.060.9 DOWN CONDUCTORS

1. Down conductors shall be of 25 mm x 3 mm aluminium strips, or steel reinforcement bars as shown on the Drawings;

2. The reinforcement bars extended from the foundation shall be tested to be having low earthing resistance before selected as down conductors. At each down conductor position, two reinforcement bars shall be used;
3. Continuity shall be maintained between different sections of the selected reinforcement bars by using clamps as shown on the Drawings. Each connection shall be tested to be at negligible resistance before concreting. The Sub-contractor shall ensure the reinforcement bars at the same position, from foundation up to the roof, to be used as the down conductors;
4. The reinforcement bars selected as down conductors shall be connected to the aluminium roof conductors and the cast in bonding point on external wall according to the details and locations as shown on the Drawings;
5. The total resistance measured from the earth inspection pit to each down conductor on roof and to each cast in bonding point on external wall shall be recorded.

ELE14.1.080.9 EARTH TERMINATION

The building foundation shall be used as the earth electrode of the lightning protection system. The steel reinforcement bars of the foundation shall be connected to earth inspection pits via cast in bonding point and copper tape as shown on the Drawings. The complete lightning protection system shall have a combined resistance to earth not exceeding 10 ohms. Where it is difficult, due to local conditions, to obtain a value of less than 10 ohms by the sole use of the foundation, additional rod electrodes complying with ELE17.3 shall be provided and connected to the copper link inside the earth inspection pits until the combined resistance to earth not exceeding 10 ohms. The proposed installation details shall be submitted for the Contract Manager's approval prior to commencement of works.

ELE14.1.110.9 BONDING TO OTHER SERVICES

1. Lightning protection systems shall normally be kept segregated from the metalwork of other services;
2. The earthing of electrical system shall be bonded to the lightning protection system through the main earthing terminal provided inside the main switch room and services rooms as shown on the Drawings;
3. Cables, earthing systems and pipes belonging to the Supply Company, the Telephone Companies, the Hong Kong & China Gas Co. Ltd. and other utility companies shall not be bonded except with the written permission of such companies.

ELE14.1.120.9 BONDING TO METALWORK

Unless otherwise stated, metalwork on roof shall be bonded to the roof conductor by means of 25 mm x 3 mm aluminium strip. The bonding of movable items to the lightning protection system shall use flexible copper braid with termination nut suitable for connection to aluminium conductor. The connections shall be of negligible resistance, metal to metal and mechanically sound with non-ferrous nuts, bolts and washers using clamps where necessary.

ELE14.1.130.9 JOINTS IN CONDUCTORS

Joints in aluminium roof conductors shall be made by suitable tape clamps. The tape clamps shall each be provided with at least 4 screws or bolts. All such joints shall have negligible resistance and good mechanical strength.

ELE14.1.140.9 TESTING

1. On completion of the installation, the lightning protection system shall be tested and recorded in accordance with the checklists given in Appendix 13 of the Electrical CoP;
2. The earthing resistance of the foundation metalwork shall also be tested in accordance with Code 21 of the Electrical CoP with test instruments approved by the Contract Manager;
3. The results of all tests shall be submitted to the Contract Manager for record.

ELE16.2.090.9 MOUNTING OF CALL BELL PUSHES 5
ELE16.2.140.9 SEGREGATION OF CIRCUITS 5

ELE16.1 TELECOMMUNICATION SYSTEMS

ELE16.1.010.9 SCOPE

1. This sub-section covers the conduit installations for the following systems:
   a. Telephone;
   b. Inter-communication and Public Address (PA) Systems;
   c. Communal Aerial Broadcast Distribution (CABD) System;
   d. Subscription Television Distribution Network (STDN).
2. Separate conduits shall be provided for each of these systems;
3. Nylon draw-wires of adequate strength shall be provided in all empty conduits.

ELE16.1.020.9 CONDUITS FOR TELEPHONE AND PA SYSTEMS

Conduits shall be of PVC not smaller than 20 mm in diameter, and shall be installed in accordance with ELE11.

ELE16.1.030.9 OUTLET BOXES FOR TELEPHONE POINTS

1. At each telephone outlet position, the conduit shall be terminated at a 47 mm deep BS 4662 box for electrical accessories with blank cover plate. If the outlet is installed with a telephone outlet plate by the FTNS operator, the provision of blank cover plate is not required;
2. Outlet boxes shall be located at skirting level or otherwise as stated on the Drawing;
3. The cover plate shall be of moulded material unless otherwise specified.

ELE16.1.040.9 OUTLET BOXES FOR PA SYSTEMS

1. At each PA outlet position, the conduit shall be terminated at a 47 mm deep BS 4662 box for electrical accessories with blank cover plate. If the outlet is installed with equipment on top, the provision of blank cover plate is not required;
2. Outlet boxes shall be fixed at skirting level or otherwise as stated on the Drawing.

ELE16.1.060.9 CONDUITS FOR CABD/STDN SYSTEMS

1. Conduits for CABD/STDN systems shall be of PVC, not smaller than 25 mm in diameter, and shall be installed generally in accordance with ELE11;
2. They shall be kept clear of power and telephone conduits and shall be arranged to cross them at right angles whenever possible;
3. Draw-in boxes shall be provided at intervals of not exceeding 10 metres and at all 90° changes of direction, unless otherwise shown on the Drawings.

ELE16.1.070.9 OUTLET BOXES FOR CABD/STDN SYSTEMS

1. At each CABD/STDN outlet position, the conduit shall be terminated in a 47 mm deep BS 4662 box for electrical accessories with blank cover plate. If the outlet is installed with CABD/STDN socket, the provision of blank cover plate is not required;
2. Outlet boxes shall be fixed at skirting outlet plate level or otherwise as shown on the Drawing.

ELE16.2 BELL AND AUDIBLE WARNING SYSTEM

ELE16.2.040.9 CALL BELL AND DOOR BELL SYSTEMS

1. Bells shall operate at a voltage not exceeding 24V a.c. obtained from a double wound transformer which shall be connected to the mains supply through a 2A fused connection unit, unless otherwise specified;
2. Unless otherwise specified cables shall be 1.5 mm^2 PVC insulated cables enclosed in conduit for concealed conduit installation.

ELE16.2.050.9 BELLS FOR EXTRA LOW VOLTAGE

1. Call bells shall be of the underdome type having a gong of approximately 75 mm diameter and shall be fixed to a substantial frame;
2. Door bell shall be 2 tones sound and of a wall mounted design with white or ivory colour cover and is to be free of any projection on the rear surface;
3. Door bell shall be classified, as a minimum requirement, to Class II as described in IEC 60335-1;
4. The insulating enclosure of the door bell shall be opened only with the use of a tool and this insulating enclosure shall provide a degree of protection of at least IP20 as described in IEC 60529. Where the enclosure can be opened without the use of a tool, every conductive part which is accessible if the enclosure is open shall be behind an insulating barrier which prevents a person from coming into contact with those parts; this insulating barrier shall provide a degree of protection of at least IP20 as described in IEC 60529 and be removable only by use of a tool.

ELE16.2.060.9 BELL TRANSFORMERS

1. Bell transformers shall be a single phase, double wound, safety isolating transformer specifically intended to supply domestic sound signalling equipment and comply with IEC 61558-2-8. Factory test certificates shall be submitted as evidence of compliance with the required standard;
2. The transformer shall be inherently short circuit proof. The reactance of the transformer winding shall be of such value that a continuous short circuit across the terminals of the secondary winding shall not damage the transformer, or cause dangerous overheating;
3. The windings, core and terminals of the transformer shall be contained within an insulating plastic case.

ELE16.2.070.9 CONNECTION OF BELL TRANSFORMERS

Bell transformers shall be connected to the lighting final circuit as shown on the Drawing, unless otherwise specified.

ELE16.2.080.9 CALL BELL PUSHES

1. Call bell pushes for indoor use shall be of flush pattern with white or ivory colour front plate;
2. Call bell pushes for outdoor use, or for areas where they may be subjected to rain or water, shall be weatherproof.

ELE16.2.090.9 MOUNTING OF CALL BELL PUSHES

1. In conduit installations, bell pushes shall be fixed in 35 mm deep, BS 4662 boxes for electrical accessories;
2. In surface cable installations, bell pushes shall be fixed in a plastic pattress;
3. Bell pushes shall not be mounted on doors without Approval.

ELE16.2.140.9 SEGREGATION OF CIRCUITS

Cables for operation at extra low voltage shall not be routed in the same conduit with cables for operation at higher voltages.

ELE17.12.020.9 APPLICATION IN HOUSEHOLD INSTALLATIONS 15
ELE17.12.030.9 EQUIPMENT OUTSIDE SAME EQUIPOTENTIAL ZONE 15

ELE17.1 GENERAL

ELE17.1.010.9 SCOPE

Unless otherwise specified the protective measures for fault protection is by earthed equipotential bonding and automatic disconnection of supply.

ELE17.1.020.9 COMPLIANCE WITH RULES AND REGULATIONS

The Sub-contractor shall provide the earthing system for the electrical installation, and also bond the electrical installation and extraneous conductive parts to fully comply with the Electrical CoP, BS 7671, Supply Rules and BS 7430 Code of practice for earthing.

ELE17.1.030.9 BONDING FOR EXTRANEOUS CONDUCTIVE PARTS

1. Building exposed metallic parts such as metallic doors, windows, louvres, burglar bars, railings, water supply pipeworks, drainage pipe, catladder etc. are extraneous conductive parts requiring equipotential bonding;
2. Main equipotential bonding

   Main equipotential bonding conductors should be provided in accordance with ELE17.5,
3. Supplementary Bonding

   Supplementary bonding conductors should be provided in accordance with ELE17.6,
4. The Sub-contractor shall ensure the bonding for extraneous conductive parts is sound and the result complies with the Electrical CoP and BS 7671 by proper measurement with records at good time. For those parts of equipotential bonding system found not electrical conductive, the Main Contractor and the Sub-contractor shall be responsible for rectification of their own works as early as possible.

ELE17.2 MAIN EARTHING TERMINALS

ELE17.2.010.9 LOCATION

A solid copper main earthing terminal of ample size shall be provided for every electrical installation at a position near the main incoming switch or switchboard for the connection of the circuit protective conductors, the main equipotential bonding conductors, the structural earthing terminal and the earthing conductors to create the equipotential zone.

ELE17.2.020.9 SEPARATE BUILDINGS OR UNITS

Where an installation distributes to a number of buildings or units, a separate main earthing terminal shall be provided for each individual building or unit at the point of intake thereby creating a separate equipotential zone in each building or unit.

ELE17.2.030.9 CONNECTION TO EARTH

The mains earthing terminal shall be connected to Earth via an earthing conductor to an earth electrode or a group of electrodes.

ELE17.3 EARTH ELECTRODES

ELE17.3.010.9 TYPES OF EARTH ELECTRODES

Unless otherwise specified in Project Specific Specification or on the Drawings, rod electrodes shall be installed.

ELE17.3.020.9 ROD ELECTRODES

1.

a. Rod electrodes shall be of mild steel inner core with a bonded hard drawn copper sleeve of an Approved type.

b. The overall diameter of the rod shall not be less than 14 mm and the thickness of the copper sleeve shall not be less than 0.25 mm;

c. The minimum length shall be 2.4 m. The length shall comprise a single piece of rod or two 1.2 m pieces coupled together;

d. Additional lengths, whenever required, shall each be of 1.2 m, connected together by a coupling;

e. The penetrating end of the rod electrode shall be a hardened steel point.

2. Rod electrodes shall be driven into the ground within an earth pit. Only Approved tools e.g. electric hammer or pneumatic hammer shall be used for their installation;

3. The number of rod electrodes and the location of the earth pits shall be determined on site such that the resultant earth loop impedance will effect the disconnection of supply within 5 sec. by the protective device in case of any earth faults occurred at any part of the installation other than the final circuits;

4.

a. In cases where the earthing resistance achieved by one rod is not sufficiently low for the purpose required, additional lengths or additional rods shall be installed;

b. For the latter application, the additional rods shall be driven into the ground outside the resistance area of the previously installed rods;

c. Under normal circumstances, a mutual separation of 3.5 m is considered adequate;

d. All rods thus installed shall be connected together by means of 25 mm x 3 mm copper tapes enclosed in PVC ducts and laid at a minimum depth of 600 mm below ground surface;

e. The connecting copper tapes shall be run in direct lines between the rods.

ELE17.4 EARTHING CONDUCTORS

ELE17.4.010.9 CONDUCTOR MATERIALS

Earthing conductors shall be copper tapes 25 mm x 3 mm in cross section and for outdoor application, the copper tapes shall be tinned.

ELE17.4.020.9 CONNECTION TO ELECTRODES

1. The earthing conductor shall be connected to the earth electrode(s) by means of Approved copper connector-clamps such that the connection can only be disconnected by means of a tool;
2. The connection shall be contained within a concrete lined earth pit with a substantial removable cover to ensure accessibility and maintainability.

ELE17.5 MAIN EQUIPOTENTIAL BONDING CONDUCTORS

ELE17.5.010.9 CONDUCTOR MATERIALS

Unless otherwise specified, main equipotential bonding conductors shall be of copper.

ELE17.5.020.9 BONDING POSITIONS

1. Main equipotential bonding conductors shall connect the extraneous conductive parts of other services within the premises to the main earthing terminal of the installation;
2. Such extraneous conductive parts shall include main water and gas pipes, other service pipes and risers and exposed metallic parts of the building structure liable to transmit a potential;
3. Connections shall be made as near as practicable to the point of entry of the non-electrical services into the premises concerned, and shall be on the installation side of the possible breaks in the system, such as gas meter or water meter.

ELE17.5.030.9 BONDING METHOD

Unless otherwise specified or shown on Drawings, the main equipotential bonding conductors shall be securely and reliably connected to extraneous conductive parts of the non-electrical services by means of a connector-clamp of an Approved type suitable for the particular applications or other effective bonding methods approved by the Contract Manager. All contact surfaces shall be clean and free from non-conducting materials, such as grease or paint, before making the connection.

ELE17.6 SUPPLEMENTARY BONDING CONDUCTORS

ELE17.6.010.9 CONDUCTOR MATERIALS

Unless otherwise specified, supplementary bonding conductors shall be of copper.

ELE17.6.030.9 APPLICATION

Supplementary bonding of extraneous conductive parts will be required whenever such conductive parts are likely to be accessible simultaneously with other extraneous conductive parts, or exposed conductive parts, and are not electrically connected to the main equipotential bonding by means of permanent and reliable metal-to-metal joints of negligible impedance.

ELE17.6.040.9 BONDING METHODS

1. Unless otherwise specified or shown on Drawings, the supplementary bonding conductors shall be solidly and effectively connected to the extraneous or exposed conductive parts by means of a connector-clamp of an Approved type suitable for the application or other effective bonding methods approved by the Contract Manager. All contact surfaces shall be clean and free from non-conducting materials, such as grease or paint, before making the connection;
2. For surface conduit installations, the supplementary bonding conductors shall be terminated at the nearest conduit or conduit box forming an integral part of the conduit installation;
3. Unless otherwise specified or shown on Drawings, for concealed conduit installations, the subject extraneous or exposed conductive part shall be terminated via a cord outlet plate with 1 no. supplementary bonding conductor. The BS 4662 conduit box of the cord outlet plate, forming an integral part of the conduit installation shall be located as near as possible to the bonding position and the exposed part of the supplementary bonding conductor shall be made as short as possible;
4. When necessary and required, insulated connector enclosed in base box of cord outlet plate (for bonding conductor) or base box of electrical equipment in vicinity of extraneous or exposed conductive part can be used for interconnection of all associated supplementary bonding conductors from related extraneous or exposed conductive part or from earthing terminal of the nearby electrical equipment in order to achieve the requirements of the Electrical CoP on electrical bonding.

ELE17.7 CIRCUIT PROTECTIVE CONDUCTORS (CPC)

ELE17.7.010.9 GENERAL

Circuit protective conductors (CPC) may be formed by a separate conductor/cable, the metallic sheath or armour of a cable, part of the same cable as the associated live conductor, rigid steel conduits, trunking or ducting, or the metal enclosure of the wiring system. Flexible conduits and the exposed conductive parts of equipment shall not form part of the circuit protective conductors.

ELE17.7.030.9 CPC FOR FLEXIBLE CONDUIT

For every length of flexible conduit, a separate circuit protective conductor shall be provided inside the conduit to ensure the earth continuity of the installation between the two ends of the flexible conduit.

ELE17.7.040.9 CPC FOR BUSBAR TRUNKING AND BUSWAY

1. A copper tape, 25 mm x 3 mm in cross section shall be provided for the entire length of a busbar trunking or busway. The copper tape shall be bonded to the busbar trunking or busway at intervals not exceeding 3 m and at the position of each tape-off point;
2. Subject to prior Approval the provision of copper tapes for a busbar trunking or busway may be exempted provided that the enclosure of the busbar trunking or busway can be proved to satisfy the full requirements of the circuit protective conductor.

ELE17.7.050.9 CPC FOR FINAL RING CIRCUIT

For wiring systems using PVC insulated, PVC sheathed cables, the circuit protective conductor of every ring final circuit shall also be run in the form of a ring having both ends connected to the earth terminal at the origin of the circuit.

ELE17.8 JOINTS IN PROTECTIVE CONDUCTORS

ELE17.8.010.9 PROVISION FOR DISCONNECTION

Provision shall be made in an accessible position for disconnecting a protective conductor from the main earthing terminal or the earth electrode to permit testing and measurements of earthing resistance.

ELE17.8.020.9 MEANS OF DISCONNECTION

Such joints shall only be disconnected by means of a tool, be mechanically strong and shall be tinned to maintain the electrical continuity reliably.

ELE17.8.030.9 USE OF SWITCHING DEVICES

No switching devices shall be inserted in a protective conductor.

ELE17.9 IDENTIFICATION AND LABELLING

ELE17.9.010.9 COLOUR IDENTIFICATION

1. All cables used as protective conductors, including earthing conductors, main equipotential bonding conductors, supplementary bonding conductors and circuit protective conductors shall be identified by the colour combination "green and yellow";
2. Bare copper tapes used as protective conductors shall also be made similarly identifiable, by the application of tapes with the above colour combination at maximum 2 m intervals and at each tee-off points.

ELE17.9.020.9 LABELS FOR EARTHING AND BONDING CONNECTIONS

Every point of connection for earthing conductor to an earth electrode and the main equipotential bonding shall be provided with a warning notice in accordance with ELE28.1.

ELE17.10 SIZING OF PROTECTIVE CONDUCTORS

ELE17.10.010.9 PROTECTIVE CONDUCTORS

1. The cross sectional area of a protective conductor, excluding equipotential bonding conductors, shall comply with Code 11 C of the Electrical CoP. Alternatively, it can be calculated using the formula given in Regulation 543.1.3 of BS 7671;
2. When a separate PVC insulated copper cable is used as the protective conductor and not contained in conduit, trunking, ducting or other enclosure of a wiring system, it shall have a minimum cross sectional area of 4 mm^2 and shall be insulated to BS EN 50525-2-31 or better unless its CSA is greater than 6 mm^2;
3. When metal enclosures for cables are used as protective conductors, they shall have CSA equivalent to that of copper, not less than that resulting from the above-mentioned adiabatic equation.

ELE17.10.020.9 PROTECTIVE CONDUCTORS BURIED IN SOIL

Where protective conductors are buried in the soil, they shall comply with Code 11H(a) of the Electrical CoP.

ELE17.10.030.9 EQUIPOTENTIAL BONDING CONDUCTORS

1. The cross sectional area of a main equipotential bonding conductor shall comply with Code 11E(d) of the Electrical CoP;
2. The cross-sectional area of a supplementary bonding conductor shall comply with Code 11F(d) of the Electrical CoP.

ELE17.11 EARTH FAULT LOOPS

ELE17.11.010.9 AUTOMATIC DISCONNECTION TIME

The characteristics of the protective devices for automatic disconnection shall be coordinated with the earthing impedances of the circuits and comply with Code 11B(b) of the Electrical CoP.

ELE17.11.030.9 MAXIMUM EARTH FAULT LOOP IMPEDANCE

1. The maximum permissible earth fault loop impedance shall comply with Code 11 I of the Electrical CoP;
2. Where the armouring of an armoured cable forms part of the circuit protective conductor, and if the maximum earth fault impedance exceeds the specified limits, a separate protective conductor of appropriate size shall be provided.

ELE17.12 USE OF RESIDUAL CURRENT-OPERATED CIRCUIT BREAKER (RCCB)

ELE17.12.010.9 GENERAL

1. RCCBs shall be installed for final circuits where the earth fault loop impedance is too high to allow sufficient earth fault current to operate the overcurrent protective device within the specified automatic disconnection time of 0.4 seconds or 5 seconds. In such cases, the product of the rated residual operating current in amperes of the residual current-operated circuit breaker and the earth fault loop impedance, in ohms, of the circuit shall not exceed 50;
2. Residual current-operated circuit breaker shall meet the requirements specified in ELE3.6.

ELE17.12.020.9 APPLICATION IN HOUSEHOLD INSTALLATIONS

RCCBs used to protect socket outlet circuits in a household or similar installation shall have a rated operating residual current not exceeding 30 mA.

ELE17.12.030.9 EQUIPMENT OUTSIDE SAME EQUIPOTENTIAL ZONE

For circuits supplying fixed equipment outside the equipotential zone shall refer to Code 11B(b)(iii) of the Electrical CoP.

ELE18.1 GENERAL

ELE18.1.010.9 COMPLIANCE WITH REGULATION

Domestic appliances together with their electric components and cabling shall comply with the currently-in-force edition of Electrical Products (Safety) Regulation, CAP 406G, Laws of Hong Kong.

ELE18.2 400MM SWEEP ROTARY CEILING FAN

ELE18.2.010.9 CAPACITY

The unit shall be capable of an air delivery of not less than 1.1 m^3/s.

ELE18.2.020.9 DIMENSION

The sweep diameter of the unit shall be 400 mm.

ELE18.2.030.9 DUTY

1. The unit shall be suitable in all respects for operation in ambient air condition of 40℃ and 95% R.H;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase a.c. supply;
3. The fan shall not require periodic lubrication;
4. The fan shall operate quietly at all speeds.

ELE18.2.040.9 CONSTRUCTION

1. General:
    a. The unit shall be of deluxe pattern with smooth, safe edges and "easy-to-disassemble" design for cleaning;
    b. The fan shall have high quality aluminium or plastic blades;
    c. The fan shall be fully balanced after assembly;
    d. The blades shall be enclosed by chromed, closely meshed metal guard. The gap of the guard slots shall preferably be not greater than 13 mm at the widest;
    e. The fan shall be provided with rotary mechanism for a swing of 360° when mounted on the ceiling;
    f. The whole unit shall be finished to manufacturer's standard light colour Approved by the Contract Manager.
2. Electrics:
    a. All electrical components, cables etc. shall conform to the appropriate British Standards Specification, or shall be of fully equivalent quality and capacity;
    b. All exposed metal parts of the unit shall be suitably earthed via the 3 core flexible cable;
    c. The fan shall be provided with two (2) metres of 0.75 mm^2, 3 core, PVC insulated and sheathed flexible cable.

ELE18.3 400MM SWEEP ELECTRIC WALL FAN

ELE18.3.010.9 CAPACITY

The unit shall be capable of an air delivery of not less than 1.1 m^3/s.

ELE18.3.020.9 DIMENSION

The sweep diameter of the unit shall be 400 mm.

ELE18.3.030.9 DUTY

1. The unit shall be suitable in all respects for operation in ambient air condition of 40℃ and 95% R.H;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase a.c. supply;
3. The fan shall not require periodic lubrication;
4. The fan shall operate quietly at all speeds.

ELE18.3.040.9 CONSTRUCTION

1. General:
    a. The unit shall be of deluxe pattern with smooth, safe edges and "easy-to-disassemble" design for cleaning;
    b. The fan shall have high quality aluminium or plastic blades;
    c. The fan shall be fully balanced after assembly;
    d. The blades shall be enclosed by chromed, closely meshed metal guard. The gap of the guard slots shall preferably be not greater than 13 mm at the widest;
    e. The unit shall be suitable for direct fixing on to a wall. Conversion from Desk Fan will NOT be accepted;
    f. The unit shall be fitted with "3-speed and off" push bottom or pull switch.
    g. The fan shall be provided with oscillating and tilting mechanism for horizontal swing and vertical adjustment respectively;
    h. The oscillator shall have a clutch that slips or disengages if the fan meets an obstruction as it swings. The mechanism shall also be easily disengaged when not required;
    i. The whole unit shall be finished to manufacturer's standard light colour Approved by the Contract Manager.
2. Electrics:
    a. All electrical components, cables etc. shall conform to the appropriate British Standards Specification, or shall be of fully equivalent quality and capacity;
    b. All exposed metal parts of the unit shall be suitably earthed via the 3 core flexible cable;
    c. The fan shall be provided with two (2) metres of 0.75 mm^2, 3 core, PVC insulated and sheathed flexible cable.

ELE18.4 DOMESTIC EXHAUST FAN

ELE18.4.010.9 CAPACITY

The unit shall be capable of the following air extraction rate:

1. 0.06 m³/s for 150 mm diameter fan;
2. 0.23 m³/s for 230 mm diameter fan;
3. 0.47 m³/s for 300 mm diameter fan.

ELE18.4.020.9 DUTY

1. The unit shall be suitable in all respects for operation in ambient air condition of 40℃ and 95% R.H;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase a.c. supply;
3. The fan shall operate quietly at all speeds;
4. The unit casing, outlet grille, fan blade and shutters shall be moulded in rigid flame-retardant plastic. This shall also apply to the motor casing if not manufactured in metal.

ELE18.4.030.9 CONSTRUCTION

1. General:
   a. The unit shall be suitable for mounting on window glass and partitions;
   b. The unit shall have in-built draught excluding shutters suitable for remote control through an "on/off" switch;
   c. The unit shall have "easy-to-disassemble" design for cleaning and maintenance;
   d. The fan shall be fitted with silent running, self-aligning, self-oil bearings;
   e. The fan shall be fully balanced after assembly;
   f. The whole unit shall be finished in white or ivory colour or alternatively to manufacturer's standard light colour Approved by the Contract Manager.
2. Electrics:
   a. The fan shall be driven by a totally enclosed, single phase, induction motor;
   b. All exposed metal parts of the fan shall be suitably earthed via the 3-pin plug;
   c. The fan shall be of single speed and be capable of being switched on and off by a remote 5A switch;
   d. The fan shall be provided with two (2) metres of 0.75 mm², 3 core, PVC insulated and sheathed flexible cable.

ELE18.5 ELECTRIC HAND AND FACE DRYER

ELE18.5.010.9 GENERAL

1. The electrically operated hand and face dryer shall be of good design and pleasant appearance, suitable for heavy duty operation. It shall be of robust construction, intrinsically safe, tamperproof and the drying cycle shall not exceed 35 seconds;
2. The dryer shall be suitable for operation on 220V, 50Hz, single phase, a.c. supply with full bonding to earth through an amply sized 3 core supply cable;
3. The dryer shall be suitable for mounting on the surface of walls, including ceramic tiles.

ELE18.5.020.9 STANDARD CONSTRUCTION

1. The front shall be manufactured from a fully enveloping one piece metal, or Approved high strength plastic cover, fitted with a capacitive touch switch, or insulated metal push button marked "Touch or Push" (as applicable) to start, bi-directional air flow nozzle spring loaded to automatically return to the hand drying position and permanently engraved operating instructions recessed if applicable;
2. Metallic covers shall be finished with acid resistant porcelain enamel;
3. The cover shall be secured to the dryer base by recessed Allen head, or similar type bolts. The base shall be secured to the wall by at least three mounting bolts;
4. The air inlet shall be at the bottom and shall be protected by a suitably sized protective vaned grill. The air outlet shall similarly be protected by metal vanes inside the bi-directional nozzle;
5. All metal parts shall be of stainless, cadmium, or chromium plated steel;.
6. The dryer shall be suitable for back and side cable entry with an insulated bushing;
7. The dryer shall be complete with internal electrical overload protection for the fan motor and preferably also for the heater unit.

ELE18.5.030.9 ALTERNATIVE CONSTRUCTION

As an alternative, tenderers may offer units having an infra-red proximity detector, in lieu of the touch switch, or push button control. In this case the operation instructions shall, by internationally recognisable symbols, clearly indicate the method of operation. It would also be preferable for these instructions to state in both English and Chinese:

"Place hands below the air outlet to start."

ELE18.5.040.9 MAINTAINABILITY

The equipment offered shall be designed for easy maintenance.

ELE18.6 QUARTZ MOVEMENT WALL CLOCK

ELE18.6.010.9 GENERAL

1. The clock shall be of deluxe wall hanging pattern having a nominal clock-face diameter of not less than 300 mm;
2. It shall be of Quartz-crystal oscillator controlled movement type and battery operated.

ELE18.6.020.9 CONSTRUCTION

1. The clock shall be of a design which can be flush mounted on the wall and is to be free of any projections on the rear surface;
2. The clock dial shall be white with large Arabic Numerals in black and graduated in minutes;
3. The hour, minutes and second full sweep hands shall preferably be of distinct colour complete with a glass or clear plastic covered front;
4. The rim of the clock shall either be metal or plastic finished in white or ivory colour and the clock movement shall be enclosed to protect it from dust;
5. The type and voltage of the battery powering the clock shall be specified in the supplier's quotation. It shall have a minimum normal use life of at least one year and shall be easily replaceable by non-skilled labour.

ELE18.6.030.9 ACCURACY

The accuracy of timekeeping shall not exceed ±0.5 sec./day at room temperature (25℃) and the clock unit shall be tropicalised and dust-proof.

ELE18.7 CEILING FANS

ELE18.7.010.9 SCOPE

Each ceiling fan shall be complete with speed regulator. The sweep diameter of the unit shall be 900 mm, 1200 mm or 1400 mm as shown on the Drawings or specified in Project Specific Specification.

ELE18.7.020.9 CAPACITY

The unit shall be capable of an air delivery as below:

Sweep diameter of the unit (mm)	Air delivery (m^3/s)
900	2.2
1200	3.9
1400	4.5

ELE18.7.030.9 DUTY

1. The unit shall be suitable in all respects for operation in ambient air condition of 40℃ and 95% R.H.;
2. The unit shall be suitable for operation on 220V, 50Hz, single phase A.C. supply;
3. The unit shall be designed for heavy duty commercial and domestic usage;
4. The fan shall operate quietly at all speeds.

ELE18.7.040.9 CONSTRUCTION

1. Motor:
    a. The motor shall be a totally enclosed, capacitor run induction motor, with internal stator and external squirrel-cage rotor;
    b. The rotor shall be mounted in grease lubricated ball bearings;
    c. The power factor shall not be less than 0.8 at any speed. The motor shall be rated for continuous operation under ambient air conditions of 40℃ and 95% R.H. and the temperature of the windings shall not exceed 50℃ after two (2) hours of continuous operation;
    d. All electrical components, cables etc. shall conform to the appropriate British Standards Specification or shall be of fully equivalent quality and capacity.
2. Blades:
    a. 900 mm Sweep diameter units:
        i. The fan shall be fitted with three (3) blades. "Twisted" blades are preferred;
        ii. The blade assemblies shall consist of one piece all aluminium blades of not less than 1.5 mm thickness;
        iii. Where the one piece blades are twisted to give the required angle of incidence to the blades there shall be large radius bends to prevent stress concentrations in the blade roots;
        iv. Anti-vibration bushes shall be installed between the one piece blades and the motor frame;

v. The blades, shall be securely fastened to the frame of the motor by machine screws and spring washers, the whole designed to ensure that there is no possibility of a blade becoming detached during operation.

b. 1200 mm & 1400 mm Sweep diameter units:

i. The fan shall be fitted with three (3) blades. "Twisted" blades are preferred;

ii. The blade assemblies shall consist of blades manufactured from heavy gauge aluminium riveted to steel blade carriers. The rivets shall conform to appropriate British Standards Specification;

iii. The blade carriers will be manufactured from mild steel plate of not less than 3 mm in thickness and of not less than 40 mm width at the narrowest point, pressed to shape. The blades shall be of not less than 1.5 mm thickness;

iv. Where the blade carriers are twisted to give the required angle of incidence to the blades there shall be large radius bends to prevent stress concentrations in the blade roots;

v. Anti-vibration bushes shall be installed between the blades and blade carriers;

vi. The blade carriers shall be securely fastened to the frame of the motor by machine screws and spring washers, the whole designed to ensure that there is no possibility of a blade becoming detached during operation.

3. Terminals and capacitor:

a.

i. The plastic terminal block and capacitor shall be mounted in a ferrous metal connecting piece, located between the fan and the down-rod;

ii. The leads from the stator windings shall be connected to the terminal block;

iii. An earthing terminal, consisting of a round head brass screw and washer shall be provided on the connecting piece;

iv. All exposed metal parts of the fan unit shall be connected to this earthing terminal.

b.

i. The bottom portion of the connecting piece shall be screwed on to the shaft of the motor;

ii. The connecting piece shall be tightened on to a shoulder formed on the motor shaft;

iii. A 4 mm minimum thickness steel hexagonal lock-nut shall then be fitted and tightened in position. The connecting piece shall additionally be secured in the fully tightened position by two hardened steel grub screws;

iv. These screws shall engage in shallow depressions drilled in the shaft after the connecting piece has been tightened in place to ensure positive locking.

4. Down-rod assembly:

a. The down-rod assembly shall consist of a down-rod and a steel shackle with a hard rubber roller for suspension of the fan;

b.

i. The down-rod shall be supplied, as required, in lengths of 200 mm, 300 mm, 450 mm, 600 mm, 750 mm, 900 mm and 1200 mm measured from the top of the connecting piece to the centre of the pin in the shackle at the top;

ii. Cables of a length to suit the down-rod shall be provided;

iii. The down-rod shall be manufactured from 12 mm bore standard mild steel/iron pipe of not less than 3 mm, wall thickness, having an external diameter of approximately 20 mm;

iv. It shall be accurately threaded at one end and shall be screwed into the top portion of the fan connecting piece (capacitor housing) from which it shall protrude by a minimum of 2 mm;

v. It shall be locked in position by two (2) hexagonal steel lock nuts, having a minimum thickness of 6 mm, tightened on to the upper machined surface of the fan connecting piece;

vi. The down-rod shall also be locked to the fan connecting piece by means of a steel split-pin, of not less than 5 mm diameter, passing through both the fan connecting piece and the down-rod.

c.

i. The split-pin holes in the fan connecting piece shall be of such a diameter that the split-pin is a light push fit therein;

ii. The matching split-pin holes in the down-rod shall be just sufficiently large so that the split-pin shall be a light push fit, when the hole is in its worst position relative to the threading;

iii. All burrs and sharp edges shall be removed from the split-pin holes in both the fan connecting piece and the down-rod.

d.

i. The steel suspension shackle shall be welded to the down-rod;

ii. Welding shall be of good quality and to the satisfaction of the Contract Manager;

iii. The rubber roller shall be mounted on an 8 mm diameter steel clevis pin secured by a split-pin.

e.

i. The ends of the down-rod shall be rounded off and free from burrs;

ii. There shall be no sharp edges which could cause damage to the insulation of the wiring.

5. Suspension joints and threaded parts:

a. Joints along the suspension rod must be of double-locking design. i.e. at least two independent positive locking devices must be employed to prevent a joint from loosening itself;

b. All factory-assembled threaded components which form part of a suspension joint must be bonded with glue as approved by the Contract Manager;

c. The maximum clearance between threaded mating parts must not exceed 1% of their mean diameter;

d. The down-rod threaded end shall be interchangeable with the existing government ceiling fans;

e. The direction of rotation of the fan shall be such that all screwed joints tend to be tightened when the fan is in operation.

6. Canopies:

   Two (2) canopies shall be provided manufactured from plastic or pressed steel sheet and fitted over the upper and lower ends of the down-rod. They shall be fixed to the down-rod by grub screws.

7. Balance:

   a. All fans shall be fully balanced after assembly, with any necessary adjustment being made to ensure that they shall not oscillate due to out-of-balance forces;

   b. All blades shall be given a single identification number, or letter, permanently stamped thereon, with a corresponding mark stamped on the motor body so that the fan blades may be reassembled in the correct position.

8. Finish:

   The whole fan shall be finished in high quality stove enamel, white or ivory colour.

9. Speed Regulator:

   a. The speed regulator shall be of robust construction with at least three (3) speed controls and an "OFF" position, built on a flame retardant moulded plastic, or insulated steel base and enclosed by a flame-retardant moulded plastic cover or metal cover. Plastic cover shall be in white or ivory colour to match the fan. Metal cover shall be of stainless steel or metalclad finish;

   b. For choke type regulator, an earth terminal shall be provided on the base with an earth wire permanently connected to the steel core of the choke unit;

   c. The rotary switch of the speed regulator shall be designed for smooth and easy movement by hand between different speed positions.

ELE19.11 REFRIGERATORS 12
ELE19.11.010.9 METHOD OF SUPPLY 12

ELE19.1 GENERAL

ELE19.1.010.9 CONNECTIONS TO APPLIANCES

1. Domestic appliances shall each be connected to the electrical supply through a suitable wiring accessory and a suitable length (preferably 1.5 m to 2 m) of flexible cable or PVC insulated cables enclosed in a flexible conduit;
2. For portable appliances, plugs and sockets shall be used. For fixed appliances, the wiring accessories shall be opened or removed only by means of a tool;
3. Wiring accessories shall meet the requirements of ELE20. They shall be installed as near as practicably possible to the appliances they are supplying. Fuse-links shall comply with BS 1362 and shall have current ratings suitable for the appliances to be controlled;
4. Flexible cables for final connection to domestic appliances shall be white in colour unless otherwise specified, and shall be circular sheathed, twin with CPC to BS EN 50525-2-11 (PVC-insulated) or to BS EN 50525-2-21 (rubber-insulated), all with copper conductors. The cores of the flexible cables shall have identification colours in accordance with Code 13 D of the Electrical CoP.

ELE19.1.020.9 USE IN BATHROOMS

No portable appliance shall be installed in a room containing a fixed bath or shower. Fixed appliances installed in such a room shall be located out of reach by a person using the bath or shower, and the controlling switches shall be located outside the room.

ELE19.1.030.9 ENGRAVING FOR IDENTIFICATION

The front plate of every switched socket outlet, connector box, spur box or control switch feeding a fixed domestic appliance shall be engraved in accordance with ELE28 to indicate its correct function.

ELE19.1.040.9 EARTHING OF APPLIANCES

All domestic appliances except Class II equipment to BS 2754 shall be effectively earthed to the main earth via a circuit protective conductor. Where the cables for final connection to a fixed appliance are enclosed in a flexible conduit, effective earthing shall be achieved by means of a separate circuit protective conductor drawn into the flexible conduit.

ELE19.1.050.9 APPLIANCES REQUIRING AN EXCLUSIVE CIRCUIT

The following types of domestic appliances shall be supplied from an exclusive final circuit:

1. Household electric cookers;
2. Water heaters other than oversink water heaters;
3. Water boilers;
4. Room coolers;
5. Appliances having a nominal power rating of 3 kW or above.

ELE19.2 CEILING FANS & CEILING-MOUNTED ROTARY FANS

ELE19.2.010.9 METHOD OF SUPPLY

1. Supply to a ceiling fan or a ceiling mounted rotary fan shall be by means of a 2A fused connector box with earthing facilities;
2. The fused connector box shall be square, suitable for mounting on a moulded box or plastic pattress to BS 4662 or IEC 60670-1.

ELE19.2.020.9 FIXING

1. Every ceiling fan shall be suspended from a substantial hook fixed securely to the ceiling structure;
2. Rotary fans shall be fixed direct to the ceiling structure.

ELE19.2.030.9 FAN REGULATORS

1. Fan regulators shall be fixed on the surface of walls;
2. In a concealed conduit installation, the fan regulator shall be mounted on a back-plate over a recessed 35 mm deep BS 4662 or IEC 60670-1 box where the conduit shall be terminated. The back-plate shall be made of 3 mm thick galvanised steel with suitable grommeted hole for cable entry;
3. In a surface conduit installation, the fan regulator shall be mounted on a special fabricated box made of 1.5 mm thick galvanised sheet steel and having the same size as the regulator. The conduit shall be terminated at this specially made surface mounted box through which the cables shall enter the fan regulator;
4. In a surface wiring installation, the fan regulator shall be mounted on a wooden block. Grooves shall be formed at the back surface of the wooden block to suit the cables, and holes shall be drilled to enable the cables to enter the fan regulator from the rear.

ELE19.3 WALL-MOUNTED FANS

ELE19.3.010.9 METHOD OF SUPPLY

Supply to a wall mounted fan shall be by means of a 2A fused connector box in a similar manner as for a ceiling fan, except that the fused connector box shall be fixed on the wall adjacent the fan.

ELE19.3.020.9 FIXING

Wall mounted fans shall be fixed by means of a wall mounting bracket supplied with the fans or sit on a mounting bracket or batten made of teak wood or other material approved by the Contract Manager.

ELE19.4 EXHAUST FANS

ELE19.4.010.9 METHOD OF SUPPLY

1. Unless otherwise specified, supply to a domestic type exhaust fan shall be by means of a connection unit, and shall be controlled by a fused connection unit with double-pole switch as shown on the Drawing;
2. Supply to an industrial type exhaust fan shall be by means of a fused spur box and shall be controlled by a 20A switch D.P. with pilot light.

ELE19.4.020.9 FIXING

1. Exhaust fans shall be installed on the structural opening by means of a steel mounting plate;
2. Where an exhaust fan is intended to draw exhausted air through a fume cupboard, the fan shall be ducted to the fume cupboard by means of PVC pipes of suitable size and length.

ELE19.4.030.9 BUILDERS WORK IN CONNECTION WITH FIXING VENTILATION FANS

The openings in slabs or walls or window glass for mounting roof extractors and/orother ventilation fans shall be provided by the Main Contractor. However, the Sub-contractor shall submit detailed drawings to the Contract Manager to indicate the dimensions of the openings and the details of the diaphragm plates and the proposed method of mounting for Approval prior to installation.

ELE19.6 ELECTRIC FIRES AND HEATERS

ELE19.6.010.9 WALL-MOUNTED RADIATORS

Supply to wall-mounted radiators shall be fed through a fused spur box and shall be controlled by a 15/20A, D.P. switch with pilot light.

ELE19.6.020.9 PANEL FIRES

1. Method of supply:

   Panel fires rated at 3 kW or less shall be supplied and controlled by a connection unit and a double-pole switch with pilot light.

2. Fixing:

   The connection unit shall be installed on the same side of the panel fires as where the flexible cable enters the panel fires unless otherwise specified.

ELE19.6.030.9 TUBULAR HEATERS

Tubular heaters shall be supplied and controlled by a 13A 3-pin switched socket outlet.

ELE19.7 WATER HEATERS & WATER BOILERS

ELE19.7.010.9 OVERSINK WATER HEATERS

1. Method of supply:
    a. Supply to an oversink water heater shall be by means of a fused spur box and shall be controlled by a 15/20A, D.P. switch with pilot light at a distance of not less than 2 m from any water taps;
    b. The front plate of the fused spur box shall have an outlet hole and the necessary cordgrip for the flexible cable.
2. Fixing:

    In a surface wiring installation, the fused spur box and the 15/20A, D.P. switch shall each be mounted on a moulded box or plastic pattress to BS 4662 or IEC 60670-1.

ELE19.7.020.9 OTHER TYPES OF WATER HEATER

1. Method of supply:

    Supply to domestic water heaters, other than oversink type, shall be controlled by a 20A D.P. switch with pilot light.
2. In a concealed or surface conduit installation:
    a. The PVC insulated cables shall be enclosed in a conduit from the control switch to a standard circular conduit box fitted with a dome cover and then through a flexible conduit from the dome cover to the water heater;
    b. The dome cover and the conduit box shall be fixed as near to the water heater as practicable.
3. In a surface wiring installation:
    a. The control switch shall be mounted on a moulded box or plastic pattress;
    b. Final connection to the water heater shall be taken direct from the control switch via a flexible cable, twin with CPC;
    c. The control switch shall be fixed as near to the water heater as practicable.

ELE19.7.030.9 WATER BOILERS

The installation of a water boiler shall be similar to that for a water heater except that the control switch shall have a rating of 30A.

ELE19.7.040.9 WASH BOILERS & TEA URNS

1. Method of supply:

    Wash boilers and tea urns having a rating of 3 kW or less, shall be supplied and controlled by a connection unit and a double-pole switch with pilot light.
2. Fixing:

    The connection unit shall be installed on the same side of the wash boiler and tea urn as where the flexible cable enters the wash boiler and tea urn unless otherwise specified.

ELE19.8 ELECTRIC COOKERS

ELE19.8.010.9 BABY BELLING COOKERS

The installation of a Baby Belling type cooker shall be similar to that for a wash boiler.

ELE19.8.020.9 HOUSEHOLD COOKERS

1. Method of supply:

   Supply to a household cooker shall be controlled by a cooker control unit of rating not less than 45A unless otherwise specified. The control unit shall be installed at a height of 1350 mm above finished floor level;

2. In a concealed or surface conduit installation:

   a. The PVC insulated cables from the control unit shall be enclosed in a conduit and terminated at an insulated terminal block inside a 47 mm deep BS 4662 or IEC 60670-1 conduit box;

   b. The PVC insulated cables shall then be changed into PVC insulated and sheathed cable twin with CPC before connecting to the cooker;

   c. The insulated terminal block shall be mounted on the wall at 300 mm above finished floor level;

   d. The PVC insulated and sheathed cable twin with CPC shall be 1.5 m to 2 m long to allow the cooker to be moved for cleaning purposes.

3. In a surface wiring installation:

   PVC insulated and sheathed cable twin with CPC shall be used throughout.

ELE19.9 ELECTRIC HAND DRYERS

ELE19.9.010.9 ELECTRIC HAND DRYERS

The supply to an electric hand dryer shall be by means of a fused spur box complete with an integral D.P. switch and pilot light. The front plate of the fused spur box shall have an outlet hole and the necessary cordgrip for the flexible cable.

ELE19.10 ROOM COOLERS

ELE19.10.010.9 METHOD OF SUPPLY

Supply to a room cooler shall be by means of a connection unit or an insulated terminal block and a control switch, both of which shall have a current capacity of not less than the rated value of the room cooler. The control switch shall be D.P. with pilot light.

ELE19.10.020.9 POSITION OF CONNECTION UNIT AND TERMINAL BLOCK

The connection unit or insulated terminal block shall be installed adjacent to the room cooler and shall be on the same side of the room cooler as where the flexible cable enters the room cooler. Where it is not possible to ascertain where the flexible cable enters the room cooler, the connection unit or insulated terminal block shall be installed on the left side of the room cooler, as viewed from the front.

ELE19.11 REFRIGERATORS

ELE19.11.010.9 METHOD OF SUPPLY

Supply to a refrigerator shall be by means of a fused spur box fitted with a 20A D.P. switch or a 13A socket outlet as shown on the Drawing.

ELE20.1 WIRING ACCESSORIES - GENERAL

ELE20.1.010.9 STANDARD

Wiring accessories shall meet the general requirements of BS EN 60670-22 and BS 5733, unless otherwise specified.

ELE20.1.020.9 COLOUR AND CONSISTENCY

Unless otherwise specified, wiring accessories of the same cover plate material shall be of the same colour scheme and for those used for domestic purpose, they shall be in white. All wiring accessories in domestic units, with the exception of batten lampholders, shall be from the same range of product of a single manufacturer.

ELE20.1.030.9 MOUNTING

1. In surface cable installations, they shall be fixed onto moulded boxes or pattresses;
2. In conduit installations, they shall be mounted on either plastic moulded boxes or cast iron galvanised boxes;
3. Where a waterproof or flameproof pattern is required, they shall be mounted as the particular circumstances demand.

ELE20.1.040.9 ENCLOSURES

Moulded boxes or pattersses and steel or cast iron boxes for the enclosure of wiring accessories shall comply with IEC 60670-1 and dimensions to BS 4662 and shall meet the requirements specified in ELE11, ELE12 and ELE13 where appropriate.

ELE20.1.050.9 ENGRAVING

The front plate of each socket or control switch feeding an essential circuit or a fixed electrical appliance, such as wash boiler, water heater, cooker, wall-mounted fan, wall mounted radiator, incinerator, exhaust fan, room cooler, etc., shall be engraved according to the appliance being controlled. Details of the inscription shall be submitted to the Contract Manager for approval. See Project Specific Specification for particular project requirements, if any.

ELE20.2 DOMESTIC SWITCHES

ELE20.2.010.9 GENERAL

1. Standard:

   Switches for domestic and similar purposes shall comply with BS EN 60669-1.

2. Mounting:

   a. They shall be mounted at a height of 1350 mm above finished floor level unless otherwise specified;

   b. Unless otherwise specified, lighting switches shall be designed for flush mounting on to pattresses or boxes to IEC 60670-1 and dimensions to BS4662.

3. Type-testing:

   Lighting switches shall be type-tested for complete compliance with BS EN 60669-1 by an Accredited Laboratory.

ELE20.2.020.9 LIGHTING SWITCHES

1. Type:

   Lighting switches shall be suitable for use on a.c. circuits, and shall be of the quick make-and-break type when used in d.c. circuits. Suspension pear type switches will not be permitted.

2. Front plate:

   a. The front plate shall be made of an insulating material such as urea-formaldehyde or polycarbonate and white in colour;

   b. The B.S. number shall be indelibly marked on the lighting switch assembly;

   c. The whole assembly shall have a pleasant appearance and shall be fixed onto the enclosure by means of bright electroplated oval head screws;

   d. The screws shall be flush with the surface of the front plate.

3. Cable terminals:

   a. Cable terminals shall be suitably positioned for easy cable termination and suitably shrouded to prevent accidental contact with other metal or current-carrying parts;

   b. The ends of the terminal screws shall be so shaped as to prevent damage to the conductor;

   c. Current carrying parts of cable terminals shall be made of copper, brass, phosphor-bronze or other metal at least equivalent with regard to its conductivity and resistance to corrosion.

4. Plastic pattresses:

   a. Lighting switches for surface cable installations shall be fixed onto proprietary-made plastic pattresses;

   b. The pattress shall be complete with copper earthing terminal and shall be at least 25 mm internal depth to accommodate the cables to be installed and to prevent acute bends of the cables;

   c. The colour, shape and material of the pattress shall match that of the front plate of the switch.

5. Rating:

   Lighting switches shall be single pole rated at 5AX or 10AX as specified in Project Specific Specification or on the Drawings;

6. Multi-gang mounting:

   When lighting switches are mounted adjacent to one another, they shall be grouped in a single enclosure (multigang box) and shall share a common switch plate, subject to a maximum of three lighting switches per single-gang plate;

7. Location:

   Lighting switches, installed adjacent to a door shall be located on the handle side of the door and shall be as near to the door as practicable.

ELE20.2.030.9 D.P. SWITCHES FOR APPLIANCES

1. Switches controlling appliances with heating elements or appliances permanently connected to the supply shall be of double pole type, and shall have a rating not smaller than the current capacity of the appliances being controlled;
2. The front plate of each such switch shall be properly engraved in accordance with ELE20.1.050;
3. The pilot light, where specified, shall be formed by a neon lamp with resistor and a red coloured lens.

ELE20.2.040.9 SPARKLESS SWITCHES

1. Sparkless switches shall be of the tilting mercury type;
2. The contacts of a sparkless switch shall be contained in a sealed glass capsule;
3. The rating shall be as specified in Project Specific Specification or on the Drawings.

ELE20.2.050.9 TIME SWITCHES

As ELE3.17.

ELE20.2.060.9 SWITCHES EXPOSED TO WEATHER

Switches mounted outdoors, or in positions where they may be exposed to rain or water, shall be weatherproof with ingress protection of at least IP55 to BS EN 60529 or IEC 60529. Switches with covers on top to achieve the IP requirement are not acceptable.

ELE20.2.070.9 APPLICATION IN BATHROOMS ETC.

No switch shall be installed inside a room containing a fixed bath or shower or inside a toilet.

ELE20.2.080.9 DOOR BELL PUSH BUTTON

Door bell pushes button shall be of large press button type and flush pattern with white or ivory colour front plate to BS EN 60669-1.

ELE20.3 SOCKET OUTLETS

ELE20.3.010.9 GENERAL

1. Socket outlets and plugs rated at 5A and 15A for general application shall comply with BS 546 and the Electrical CoP;
2. Socket outlets and plugs rated at 13A shall comply with BS 1363: Parts 1 & 2;
3. All socket outlets shall be of 3 pin, and shall be of the shuttered type;
4. 5A socket outlets may be unshuttered provided they are installed on the ceiling or at high level and are not normally accessible;
5. Socket outlets intended for supplying fixed or stationary appliances shall be located as near as possible to the appliances.

ELE20.3.020.9 13A SOCKET OUTLETS

1. Design:

   Unless otherwise specified, socket outlets shall be designed for flush mounting onto pattresses or boxes to IEC 60670-1 and dimensions to BS 4662;

2. Type-testing:

   Socket outlets shall be of 3-pin shuttered type and shall be type-tested for complete compliance with BS 1363: Part 2 by an Accredited Laboratory;

3. Front plate:

   a. The front plate shall be made of an insulating material such as urea-formaldehyde or polycarbonate and white in colour;

   b. The B.S. number shall be indelibly marked on the socket outlet assembly;

   c. The whole assembly shall have a pleasant appearance and shall be fixed onto the enclosure by means of bright electroplated oval head screws;

   d. The screws shall be flush with the surface of the front plate.

4. Cable terminals:

   a. Cable terminals shall be suitably positioned for easy cable termination and suitably shrouded to prevent accidental contact with other metal or current-carrying parts;

   b. The ends of the terminal screws shall be so shaped as to prevent damage to the conductor;

   c. Current carrying parts of cable terminals shall be made of copper, brass, phosphor-bronze or other metal at least equivalent with regard to its conductivity, and resistance to corrosion.

5. Plastic pattresses:

   a. Socket outlets for surface cable installations shall be fixed onto proprietary-made plastic pattresses;

   b. The pattress shall be at least 25 mm internal depth to accommodate the cables to be installed and to prevent acute bends of the cables;

   c. The colour, shape and material of the pattress shall match that of the front plate of the socket outlet.

ELE20.3.030.9 INTEGRAL SWITCH FOR SOCKET OUTLETS

For socket outlet with integral switch, the integral switch shall be of single pole, forming part of the same front plate as the socket outlet.

ELE20.3.040.9 WEATHERPROOF SOCKET OUTLETS

Weatherproof socket outlets of appropriate types and ratings shall be provided as shown on drawings. The socket outlets shall comply correspondingly with the following requirements:

1. Industrial type surface mounting socket outlet to BS EN 60309-2 or IEC 60309-2 with a push-on cap and cap retaining ring having ingress protection of at least IP44 to BS EN 60529 or IEC 60529. The socket outlet shall be suitable for wall mounting and the outlet shall face downward, to facilitate plug insertion and to minimize ingress of water;
2. General purpose type socket outlet to BS 1363 with the plug fully enclosed by protective cover and with the cord entry properly sealed when in use condition and having ingress protection of at least IP44 to BS EN 60529 or IEC 60529. The hinge mechanism for the protective cover shall be of sturdy construction with opening angle greater than 120 degrees.

ELE20.3.060.9 SHAVER SUPPLY UNITS

1. Electric shaver supply units shall comply with BS EN 61558-1 and BS EN 61558-2-23, or IEC 61558-1 and IEC 61558-2-23 and shall be insulated, suitable for flush mounting;
2. Each unit shall comprise two outlets one for 110V and the other for 220V obtained from a double wound transformer;
3. The complete unit shall be enclosed in a galvanised metal box for flush mounting, or a cast iron or plastic surface box for surface mounting.

ELE20.3.070.9 SOCKET OUTLETS TO SURFACE CONDUIT INSTALLATIONS

In pump rooms, plant rooms, boiler houses, switch rooms and other places where surface conduit and accessories are installed, socket outlets shall be metalclad, with bronze front plate, unless otherwise specified.

ELE20.3.080.9 PLUGS

1. Plugs for 13A socket outlets shall be fitted with a fuse, complying with BS 1362 or IEC 60269-1, suitably rated to suit the appliance connected to it;
2. Where the current rating of the appliance cannot be ascertained, a 13A fuse shall be fitted;
3. Every plug shall be fitted with a cord grip which is so designed that no stress will be taken by the terminals or the conductors of the flexible cable connected to it;
4. The extent of provision of plugs, if required, is given in Project Specific Specification or Drawings.

ELE20.3.090.9 SOCKET OUTLETS IN HAZARDOUS AREAS

1. The installation of socket outlets in hazardous areas should be avoided as far as possible;
2. Where it is absolutely essential to install a socket outlet in such an area, the socket outlet shall comply with BS EN 60309-2 or IEC 60309-2 and shall be controlled by a sparkless switch;

3. The socket outlet shall be interlocked with the plug so that removal or insertion shall not be possible unless the controlling switch is in the OFF position;
4. The plug shall have shrouded pins and the design of the pin contacts shall be such as to guard against development of hot spots or sparking.

ELE20.3.100.9 SOCKET MOUNTING HEIGHT

Unless otherwise specified socket outlets shall be mounted at a height of 1350 mm above finished floor level in kitchens, sculleries, ironing rooms and the like, and at a height of 300 mm above finished floor level in other locations.

ELE20.3.110.9 SOCKET OUTLETS FOR DIFFERENT VOLTAGE SYSTEMS

Socket outlets and plugs for one voltage system shall not be interchangeable with those for use at other voltage and/or frequency systems in the same installation.

ELE20.3.120.9 APPLICATION IN BATHROOMS ETC.

No socket outlets, other than shaver supply units complying with BS, shall be installed inside a room containing a fixed bath or shower or inside a toilet.

ELE20.4 CONNECTION UNITS

ELE20.4.010.9 CONNECTION UNITS - GENERAL

1. Design:

   Unless otherwise specified, connection units shall be suitable for flush mounting onto pattresses or boxes to IEC 60670-1 and dimensions to BS 4662;

2. Type-testing:

   Connection units shall be type-tested to BS 5733 by an Accredited Laboratory;

3. Current rating:

   The current rating of connection units shall be at least 20A unless otherwise specified on the Drawings;

4. Front plate:

   a. The front plate shall be made of an insulating material such as urea-formaldehyde or polycarbonate and white in colour;

   b. Where pilot light and integral switch are specified, the light shall comprise a neon lamp and a red coloured lens, and the switch shall be of double pole, unless otherwise specified, and forming part of the same front plate;

   c. The front plate shall also incorporate a flex outlet with a clamp for anchoring the flexible cord;

   d. The whole assembly shall have a pleasant appearance and shall be fixed onto the enclosure by means of bright electroplated oval head screws;

   e. The screws shall be flush with the surface of the front plate.

5. Cable terminals:

   a. Cable terminals shall be suitably positioned for easy cable termination and suitably shrouded to prevent accidental contact with other metal or current-carrying parts;

   b. The ends of the terminal screws shall be so shaped as to prevent damage to the conductor;

   c. Current carrying parts of cable terminals shall be made of copper, brass, phosphor-bronze or other metal at least equivalent with regard to its conductivity and resistance to corrosion.

6. Plastic pattresses:

   a. Connection units for surface cable installations shall be fixed onto proprietary-made plastic pattresses;

   b. The pattress shall be complete with copper earth terminal and shall be at least 25 mm internal depth to accommodate the cables to be installed and to prevent acute bends of the cables;

   c. The colour, shape and material of the pattress shall match that of the front plate of the unit.

ELE20.4.020.9 FUSED CONNECTION UNITS

1. Fused connection units shall comply with BS 1363: Part 4 and contain plugs incorporating cartridge fuse-links to BS 1362 or IEC 60269-1 of a.c. rating either 2A or 13A as shown on the drawings;

2. The plug shall only be removable by the use of a tool;
3. The unit shall be clearly marked with the word "FUSE" or "FUSED" in a conspicuous position on the front plate;
4. Fused connection unit shall be type-tested by an Accredited Laboratory.

ELE20.5 INSULATED TERMINAL BLOCKS

ELE20.5.010.9 VOLTAGE RATING

The rated voltage of terminal blocks shall not be less than 435V between terminals and 250V to earth.

ELE20.5.020.9 CONSTRUCTION

Terminal blocks shall comprise brass connectors with screw connections, all contained within a moulded block suitable for working temperature up to 100°C.

ELE20.5.030.9 DESIGN

Terminals shall be designed to clamp the conductor between metal surface with sufficient contact pressure but without causing damage to the conductors. With the largest recommended conductor in position, and tightly clamped, there shall be at least two full threads of the screw engaging in the connector.

ELE21.1 LAMPS

ELE21.1.010.9 LED MODULE AND LED LAMP

1. The LED module and self-ballasted LED module shall be manufactured and tested to comply with BSEN 62031 or IEC 62031:

2. The performance of the LED module and self-ballasted LED lamp shall comply with the following requirements:

   a. Luminous Efficacy (lumen/watt)

      The luminous efficacy of different types of luminaires under different colour temperatures to be used in the Sub-contract shall be provided to indicate its performance;

   b. Lumen Maintenance (L70)

      The lumen output shall deliver at least 70% of its initial value after operating 35,000 hours and 25,000 hours for LED module and self-ballasted LED lamp respectively. For compliance with the L70 threshold lumen maintenance requirements, the lumen maintenance data of each colour temperature LED light source using 6,000 hours is acceptable for projecting the L70. The required lumen maintenance at 6,000 hours shall not be less than 94.1% and 91.8% for L70 = 35,000 hours and L70 = 25,000 hours respectively;

   c. Colour Rendering Index (CRI)

      CRI shall be minimum 80 and 60 for indoor luminaires and outdoor luminaires respectively;

   d. Correlated Colour Temperature (CCT)

      The colour temperature of a group of LED light sources in the same room or space shall not be visually noticeable. The nominal CCT of the LED light source shall preferably be one of the following values:

2,700K	2,725 ± 145K
3,000K	3,045 ± 175K
3,500K	3,465 ± 245K
4,000K	3,985 ± 275K
5,700K	5,665 ± 355K
6,500K	6,530 ± 510K

3. Self-ballasted LED lamps for general lighting services shall comply with BS EN 62560 or IEC 62560 and BS EN 62612 or IEC 62612, and the following requirements:

   a. The operating frequency of the built-in driver shall be not less than 20kHz or at a sufficiently high frequency to ensure no flickering causing health risk to viewers;

   b. The lamp shall have been in continuous and satisfactory operation locally in similar application and supply scale for at least one year up to the time of material submission. The corresponding in-service records with supply scale and proven satisfactory operation shall be provided upon request by the Contract Manager;

c. The lamp manufacturing plant and facilities shall conform to ISO 9001 with proper quality control scheme in place to ensure delivering consistent and high-quality products. Relevant documentation shall be provided upon request by the Contract Manager to substantiate the quality assurance system covering the purchasing and quality control of lamp components, design and manufacturing process, qualification and experience of plant operating personnel as well as testing and delivery of end products.

ELE21.1.015.9 DOUBLE-CAPPED LED TUBULAR LAMP

1. Double-capped LED tubular lamp shall be suitable for direct connection to supply mains of 220V±6% and 50Hz±2%, and CCT 4000K, unless otherwise specified, with built-in driving and control circuits, and safety design to avoid voltage being present at the opposite pin when inserted at one end. The operating frequency of the built-in driver shall be not less than 20kHz or at a sufficiently high frequency to ensure no flickering causing health risk to viewers. The LED tubular lamp shall be compatible with market norms and capable to operate irrespective of the tube orientation when inserted in luminaires or lamp holders with simple wiring connection;
2. The lamp shall comply with BS EN 62776 or IEC 62776 in addition to the corresponding International Standards listed in ELE21.1.010 and meet the following minimum requirements:
   a. Luminous efficacy: 100 lm/W;
   b. Lamp life: 35 000 hours (L70);
   c. Colour Rendering Index: 80;
   d. Total power factor: 0.85;
   e. The initial luminous output of double-capped LED tubular lamp shall not be less than that shown on the table below:

Length of double-capped LED tubular lamp	Initial luminous output (lm)
600 mm	920
1200 mm	1700
1500 mm	2400

3. The lamp shall be suitable to operate and fully compatible with emergency lighting modification unit without flickering, if supplied under this Sub-contract, as stipulated in ELE21.12;
4. The lamp shall have been in continuous and satisfactory operation locally in similar application and supply scale for at least one year up to the time of material submission. The corresponding in-service records with supply scale and proven satisfactory operation shall be provided upon request by the Contract Manager;
5. The lamp manufacturing plant and facilities shall conform to ISO 9001 with proper quality control scheme in place to ensure delivering consistent and high-quality products. Relevant documentation shall be provided upon request by the Contract Manager to substantiate the quality assurance system covering the purchasing and quality control of lamp components, design and manufacturing process, qualification and experience of plant operating personnel as well as testing and delivery of end products.

ELE21.1.020.9 TUBULAR FLUORESCENT LAMPS

1. Tubular fluorescent lamps with preheated cathode, for general lighting service, shall be manufactured and tested to BS EN 60081 or IEC 60081 or BS1853: Part 2. Lamps shall start satisfactory with switch-start control gears operated on 220V 50Hz single-phase supply;
2. Lamps shall have the colour appearance of 'white' the colour temperature of 4000 K and the colour rendering index of 85. Initial luminous output and the minimum luminous output at 2000 burning hours shall not be less than that shown in the table below:

26 mm diameter fluorescent tubular lamp	Initial luminous output at 100 hours (lm)	Minimum luminous output at 2000 hours (lm)
600 mm	1350	1250
1200 mm	3300	3100
1500 mm	5150	4900

3. Lamp life expectancy shall not be less than 8000 hours. By the end of lamp life, the luminous output shall not be less than 80% of initial luminous output specified above;
4. Lamps shall be fitted with bi-pin G13 lamp caps, 26 mm diameter, they shall be completely interchangeable with, and shall operate on, the corresponding circuits for 38 mm diameter fluorescent lamp.

ELE21.1.025.9 COMPACT FLUORESCENT LAMPS

Compact fluorescent lamps with preheated cathode, either with built in control gear or separate control gear, shall be manufactured and tested to BS EN 60901 or IEC 60901 and BS EN 61199 or IEC 61199.

ELE21.1.030.9 COMPACT FLUORESCENT LAMPS

1. Construction:
   a. The lamp shall be as follows;
      i. 10W or 13W (consist of four narrow fluorescent tubes, bonded together with a 2-pin, single end type G24d-1 lamp base or 4-pin, single end type G24q-1 lamp base);
      ii 11W (consist of two narrow fluorescent tubes, bonded together with a 2-pin, single end type G23 lamp base or 4-pin, single end type 2G7 lamp base);
      iii 18W (consist of four narrow fluorescent tubes, bonded together with a 2-pin, single end type G24d-2 lamp base or 4-pin, single end type G24q-2 lamp base);
      iv 24W (consist of two narrow fluorescent tubes, bonded together with a 4-pin, single end type 2G11 lamp base or four narrow fluorescent tubes, bonded together with a 4-pin, single end type 2G10 lamp base);
      v. 26W (consist of four narrow fluorescent tubes, bonded together with a 2-pin, single end type G24d-3 lamp base or 4-pin, single end type G24q-3 lamp base).
   b. The lamp base shall form an integral housing for the integrated starter and radio interference suppressor;

c. Ignition of the lamp should be almost instantaneous with minimum flickering;

d. The lamp wattage shall be rated with a.c. supply voltage of 220V 50Hz single-phase for the operating gear.

2. Luminous characteristic:

a. The initial luminous output shall be not less than 600 lumen for 10W, 900 lumen for 11W, 900 lumen for 13W, 1200 lumen for 18W, 1800 lumen for 24W, 1800 lumen for 26W. They shall have a colour temperature of 4000K unless otherwise specified;

b. The life expectancy of the lamp shall not be less than 8000 hours for switch start circuit and 12000 hours for high frequency start circuit;

c. The initial luminous output shall be measured at the end of 100-hour ageing period;

d. The lumen maintenance shall not be less than 80% of the initial value. This value shall be measured after 2000 hours operation including the ageing period.

3. Marking:

Each lamp shall be indelibly marked with the following information:

a. The manufacturer's identification;

b. The country/place of manufacture;

c. The rated wattage.

4. Performance and endurance tests:

The lamp shall be type-tested by an Independent Testing Laboratory/Institution in accordance with BS EN 60901 or IEC 60901 for lamp ageing test; BS EN 13032-1 for lamp luminous output test, BS EN 61199 or IEC 61199 for safety requirement.

ELE21.1.040.9 DISCHARGE LAMPS

1. All discharge lamps shall comply with BS EN 62035 or IEC 62035. High pressure sodium lamp shall also comply with BS EN 60662 or IEC 60662; Low pressure sodium lamp shall comply with BS EN 60192 or IEC 60192; High pressure mercury lamp shall comply with BS EN 60188 or IEC 60188; Metal halide lamp shall comply with BS EN 61167 or IEC 61167;

2. Mercury vapour and metal halide lamps shall have fused silica discharge tubes whereas low pressure sodium lamps shall employ glass having an internal layer of a different glass resistant to sodium vapour;

3. The discharge tube of high pressure sodium lamps shall be made translucent alumina;

4. Discharge lamps shall be started without heating the electrodes.

ELE21.1.050.9 ANCILLARY EQUIPMENT AND CIRCUITRY OF DISCHARGE LAMPS

The ancillaries complying with BS EN 61347-1 and BS EN 61347-2-8 and BS EN 60921 and BS EN 61347-2-9 and BS EN 60923 and BS EN 61048 and BS EN 61049, or IEC 61347-1 and IEC 61347-2-8 and IEC 61347-2-11 and IEC 60921 and IEC 61347-2-9 and IEC 60923 and IEC 61048 and IEC 61049 shall be adopted to suit the respective lamp parameters to achieve maximum light output consistent with lamp life. The function of the ancillary gear and circuitry shall be:

1. To operate the lamp, and its rated output in lumens, and to attain the rated life of lamp under normal running conditions;

2. To ensure reliable starting under all conditions for which the installation has been designed;
3. To suppress the generation of radio television interference;
4. To restrict, within specified limits, the level of noise generated by the inductor windings and to minimise the generation of additive harmonics;
5. To limit the temperature rise of cables, lampholders, and all ancillary gear with particular reference to inductors and capacitors.

ELE21.1.060.9 PROVISION OF LIGHT SOURCES

The Sub-contractor shall supply and fix light source(s) in all luminaires except those in the luminaires at acoustic balcony and the lampholders in domestic units.

ELE21.2 LAMPHOLDERS

ELE21.2.010.A BATTEN LAMPHOLDERS

1. Unless otherwise specified, batten lampholders shall be suitable for flush mounting on plastic pattresses or BESA boxes;
2. Batten lampholders shall be type-tested for complete compliance with BS EN 60238 or IEC 60238 by an Accredited Laboratory;
3. The lampholder shall be of all-insulated Edison screw socket pattern manufactured from moulded hard white or ivory colour plastic material which shall be unaffected by the heat from the lamp, and shall be fitted with a shaded carrier ring and a ventilated shield unless otherwise specified;
4. The screw shell of the lamp holder shall not be designed as a current carrying part;
5. The metal screw shell shall be made of corrosion resistant material or electroplated to prevent corrosion and type-tested with neutral salt spray test for 48 hours in accordance with BS EN ISO 9227 or ISO 9227 by an Accredited Laboratory. For the electroplated metal screw shell, the protection rating showing the ability of the coating to prevent the base metal from corrosion with no visible defect shall be 10/- in accordance with BS EN ISO 10289 or ISO 10289. For metal screw shell made of corrosion resistant material, no rust shall appear on the surface of the shell;
6. The whole assembly shall have a pleasant appearance and shall be fixed onto the enclosure by means of bright electroplated oval head screws;
7. An earthing terminal shall be provided to each lampholder for connection to the circuit protective conductor of the final circuit;
8. Cables terminals shall be made of brass, suitably positioned for easy cable termination and suitably shrouded to prevent accidental contact with other metal or current-carrying parts. The ends of the terminal screws shall be so shaped as to prevent damage to the conductor;
9. Batten lampholders for surface cable installation shall be fixed onto proprietary-made plastic pattresses. The pattress shall have sufficient space for accommodating the cables to be installed and to prevent acute bends of the cables. The colour, shape and material of the pattress shall match that of the lampholder;
10. Batten lampholders shall be of type “E27” unless otherwise specified.

ELE21.2.020.9 CORD GRIP LAMPHOLDERS

1. Cord grip lampholders to BS EN 61184 or IEC 61184 shall be white or ivory in colour and fitted with cord grips so designed that no stress can be taken by the conductors of terminals;
2. Lampholders shall be of the all-insulated bayonet socket pattern fitted with shade carrier ring, a ventilated shield, or a moulded white plastic cone as required;
3. They shall be suitable for PVC insulated and sheathed, circular flexible cable of not less than 0.75 mm^2 size;
4. White moulded plastic break joint rings shall be used;
5. Where a flexible cord supports, or partly supports, a luminaire, the maximum mass supported by the cord shall not exceed the values as given in ELE8.3.4.030;
6. Lampholders shall be of type "22d" with temperature rating of "T2" unless otherwise specified.

ELE21.2.030.9 LAMPHOLDERS FOR WEATHERPROOF LUMINAIRES

Weatherproof luminaires shall be fitted with porcelain lampholders, complying with BS EN 61184 or IEC 61184.

ELE21.2.040.9 LAMPHOLDER FOR LED TUBULAR LAMPS

Lampholders for use with LED tubular lamps shall be bi-pin type, complying with IEC 60061-1 and BS EN 60061-2 or IEC 60061-2. They shall be made in moulded white plastic material and designed to hold the tube in position without the need for an additional clip.

ELE21.3 LUMINAIRES

ELE21.3.010.9 GENERAL

1. Luminaires shall be well constructed and shall comply with the requirements of BS 4533 or BS EN 60598 or IEC 60598 and be chosen to suit the conditions under which they will operate;
2. Luminaires to be supplied shall contain components of the same brands and models as those shown on type test certificates. However, luminaires equipped with alternative controlgear will be acceptable if the Sub-contractor can meet the following conditions to the satisfaction of the Contract Manager:
    a. The Sub-contractor shall seek the luminaire manufacturer's confirmation that the use of these alternatives will neither jeopardize safety nor have any adverse effect on performance;
    b. The Sub-contractor shall submit the luminaire manufacturer's test certificates that can prove the concerned luminaire, together with alternative controlgear, to have satisfactorily undergone endurance tests and thermal tests specified in BS EN 60598-1 or IEC 60598-1 or BS 4533 Section 102.1 or IEC 60598-2-1 respectively. Tests conducted on the luminaire manufacturer's premises are acceptable;
    c. Luminaires with alternative controlgear shall be of the same construction as the original one that comes with a full set of type test certificates;
    d. Alternative controlgear shall meet their respective product standards stipulated in the Specification.
3. For other special luminaires, particularly specified in the project the Sub-contractor shall confirm to provide adequate substantiations to justify these special luminaires on safety and performance aspects to the satisfaction of the Contract Manager. For special luminaires other than those specified in this specification and without comprehensive test reports, the Sub-contractor shall submit adequate substantiations to justify these special luminaires be suitable for the installation without jeopardising their safety and performance to the satisfactory of the Contract Manager, particularly on operation voltage / frequency / power factor (220V, 50Hz at 0.85 lagging or above), heat resistant of wiring (at least 90^{O}C), IP rating (minimum IP54 for outdoor luminaires), insulation resistance (not less than 1MΩ between phases and phase to earth), excessive temperature rise (not to cause the luminaires be operated in overheat condition) and safety device provision to prevent dropping (required for luminaires mounted on high position). In addition, under no circumstances shall the wiring be visible in the lamp compartment.

ELE21.3.020.9 INDOOR LUMINAIRES (EXCEPT SF84 & SF85)

1. The luminaires shall comply with the following standards in conjunction with BS EN 60598-1 or IEC 60598-1, where the luminaires fall into the respective categories:

IEC 60598-2-1	Luminaires – Part 2: Particular requirements. Section 1: Fixed general purpose luminaires
BS 4533-102.1	Luminaires – Part 102: Particular requirement – Section 102.1: Specification for fixed general purpose luminaires
BS EN 60598-2-2 or IEC 60598-2-2	Luminaires – Part 2 Particular requirements. Section 2: Recessed luminaries

BS EN 60598-2-22 or IEC 60598-2-22	Luminaires – Part 2 Particular Requirements. Section 22: Luminaires for emergency lighting

2. Unless otherwise specified, the following components of the luminaire, where fitted, shall be manufactured in accordance with the relevant BS EN or IEC Specifications and shall carry the BSI Kitemark or the mark of an equivalent Quality Surveillance Scheme:

   a. Ballast:

      i. Electromagnetic ballast: BS EN 61347-1 and BS EN 61347-2-8, or IEC 61347-1 and IEC 61347-2-8 and IEC 61347-2-11 or;

      ii. Electronic ballast: BS EN 61347-1 and BS EN 61347-2-3, or IEC 61347-1 and IEC 61347-2-3 .

   b. Capacitor: BS EN 61048 and BS EN 61049 or IEC 61048 and IEC 61049.

3. Compact fluorescent luminaires shall be radio interference suppressed to limits specified in BS EN 55015 or EN 55015. Test certificates and reports shall be submitted as evidence of compliance as and when required by the Contract Manager;

4. The controlgear loss of compact fluorescent lamp shall not be greater than the corresponding maximum allowable values as specified in the Hong Kong Voluntary Energy Efficiency Labelling Scheme for electronic ballast issued by EMSD;

5. LED luminaires shall comply with the following requirements:

   a. Optics such as diffuser, reflector etc. for luminaires adopting LED tubes or lamps shall be specifically designed for use with LED tubes or lamps to achieve desirable polar curve/ luminous distribution and to avoid glare;

   b. The driver control unit for LED luminaire shall include the components of power factor correction and radio interference suppression. The operating frequency of the built-in driver shall be not less than 20kHz or at a sufficiently high frequency to ensure no flickering causing health risk to viewers. The driver shall conform to the following international standards if applicable:

BS EN 55015 or EN 55015	Limits and methods of measurement of radio disturbance characteristics of electrical lighting and similar equipment
BS EN 61000-3-2 or IEC 61000-3-2	Electromagnetic compatibility (EMC) – Part 3-2: Limits – Limits for harmonic current emissions (equipment input current $\leqq$ 16A per phase)
BS EN 61347-1 or IEC 61347-1	Lamp controlgear – Part 1: General and safety requirements
BS EN 61347-2-13 or IEC 61347-2-13	Lamp controlgear – Part 2-13: Particular requirements for DC or AC supplied electronic controlgear for LED modules
BS EN 61547 or IEC 61547	Equipment for general lighting purposes – EMC immunity requirements
BS EN 62384 or IEC 62384	DC or AC supplied electronic control gear for LED modules – Performance requirements

Certificate of compliance shall be provided for each of the different ratings of drivers to be used;

c. Technical information of the LED drivers shall be provided to indicate the performance of the drivers. The data shall include, but not limited to, minimum and maximum input voltage, frequency, maximum operating temperature, rated output voltage, rated output current, rated output power and power factor;

d. The rated life of LED driver shall not be less than 35,000 hours operating at maximum allowable ambient temperature of not lower than 40℃;

e. The irradiance and radiance emission limits of the LED luminaires, that are exposed to view directly, shall be tested to comply with the hazard 'Risk Group 1' (low risk) or 'Exempt Group' as stated in the requirements of the BS EN/IEC 62471 – Photobiological safety of lamps and lamp systems;

f. The LED luminaires shall be certified to 'Restriction of Hazardous Substances (RoHS) Compliance';

g. Full set of photometric data for each type of LED luminaires prepared to CIBSE TM5 or IES format shall be submitted for general lighting design purpose;

h. The LED luminaires shall be rated for continuous service at the intended application conditions with maximum ambient temperature exceeding 40ºC without affecting the performance requirements as for luminaire efficacy, lumen maintenance (L70), colour rendering index, total power factor, and correlated colour temperature as stated in this specification;

i. Each model of LED luminaire or self-ballasted LED lamp shall be tested to comply with the performance requirements stated in this specification. The Sub-contractor shall submit the test report and certify each model of LED luminaire or self-ballasted LED lamp to be complying with the BS EN or IEC standards or other recognised international/national standards.

6. The luminaire shall have been in continuous and satisfactory operation locally in similar application and supply scale for at least one year up to the time of material submission. The corresponding in-service records with supply scale and proven satisfactory operation shall be provided upon request by the Contract Manager;

7. The luminaire manufacturing plant and facilities shall conform to ISO 9001 with proper quality control scheme in place to assure delivering consistent and high-quality products. Relevant documentation shall be provided upon request by the Contract Manager to substantiate the quality assurance system covering the purchasing and quality control of luminaire components, design and manufacturing process, qualification and experience of plant operating personnel as well as testing and delivery of end products;

8. The overall power factor of the luminaire shall not be less than 0.85 lagging;

9. Internal wiring shall be appropriately colour coded, neatly wired and properly terminated;

10. A sample of the luminaires shall be submitted to the Contract Manager for inspection and Approval as and when required.

ELE21.3.030.9 OUTDOOR LUMINAIRES

1. The luminaires shall comply with the following standards in conjunction with BS EN 60598-1 or IEC 60598-1, where the luminaires fall into the respective categories:

IEC 60598-2-1	Luminaires – Part 2: Particular requirements. Section 1: Fixed general purpose luminaires
BS 4533-102.1	Luminaires – Part 102: Particular requirement –

	Section 102.1: Specification for fixed general purpose luminaires
BS EN 60598-2-3 or IEC 60598-2-3	Luminaires – Part 2 Particular Requirements. Section 3: Luminaries for road and street lighting
BS EN 60598-2-5 or IEC 60598-2-5	Luminaires – Part 2 Particular Requirements. Section 5: Floodlights

2. Unless otherwise specified, the following components of the luminaire, where fitted, shall be manufactured in accordance with the relevant BS EN or IEC Specifications and shall carry the BSI Kitemark or the mark of an equivalent Quality Surveillance Scheme:

   a. Ballast:

      i. Electromagnetic ballast: BS EN 61347-1 and BS EN 61347-2-8 and BS EN 60921, or IEC 61347-1 and IEC 61347-2-8 and IEC 60921;

      ii. Electronic ballast: BS EN 61347-1 and BS EN 61347-2-3, or IEC 61347-1 and IEC 61347-2-3.

   b. Capacitor: BS EN 61048 and BS EN 61049 or IEC 61048 and IEC 61049.

3. Compact fluorescent luminaires shall be radio interference suppressed to limits specified in BS EN 55015 or EN 55015. Test certificates and reports shall be submitted as evidence of compliance as and when required by the Contract Manager;

4. The controlgear loss of compact fluorescent lamp shall not be greater than the corresponding maximum allowable values as specified in the Hong Kong Voluntary Energy Efficiency Labelling Scheme for electronic ballast issued by EMSD;

5. LED luminaire shall comply with the following requirements:

   a. Optics such as diffuser, reflector etc. for luminaires adopting LED tubes or lamps shall be specifically designed for use with LED tubes or lamps to achieve desirable polar curve/ luminous distribution and to avoid glare;

   b. The driver control unit for LED luminaire shall include the components of power factor correction and radio interference suppression. The operating frequency of the built-in driver shall be not less than 20kHz or at a sufficiently high frequency to ensure no flickering causing health risk to viewers. The driver shall conform to the following international standards if applicable:

BS EN 61347-2-13 or IEC 61347-2-13	Lamp controlgear – Part 2-13: Particular requirements for DC or AC supplied electronic controlgear for LED modules
BS EN 61547 or IEC 61547	Equipment for general lighting purposes – EMC immunity requirements
BS EN 62384 or IEC 62384	DC or AC supplied electronic control gear for LED modules – Performance requirements
BS EN 55015 or EN 55015	Limits and methods of measurement of radio disturbance characteristics of electrical lighting and similar equipment
BS EN 61000-3-2 or IEC 61000-3-2	Electromagnetic compatibility (EMC) – Part 3-2: Limits – Limits for harmonic current emissions

	(equipment input current $\leqq$ 16A per phase)
BS EN 61347-1 or IEC 61347-1	Lamp controlgear – Part 1: General and safety requirements

Certificate of compliance shall be provided for each of the different ratings of drivers to be used;

c. Technical information of the LED drivers shall be provided to indicate the performance of the drivers. The data shall include, but not limited to, minimum and maximum input voltage, frequency, maximum operating temperature, rated output voltage, rated output current, rated output power and power factor;

d. The rated life of LED driver shall not be less than 35,000 hours operating at maximum allowable ambient temperature of not lower than 40℃;

e. The irradiance and radiance emission limits of the LED luminaires, that are exposed to view directly, shall be tested to comply with the hazard 'Risk Group 1' (low risk) or 'Exempt Group' as stated in the requirements of the BS EN/IEC 62471 – Photobiological safety of lamps and lamp systems;

f. The LED luminaires shall be certified to 'Restriction of Hazardous Substances (RoHS) Compliance';

g. Full set of photometric data for each type of LED luminaires prepared to CIBSE TM5 or IES format shall be submitted for general lighting design purpose;

h. The LED luminaires shall be rated for continuous service at the intended application conditions with maximum ambient temperature exceeding 40ºC without affecting the performance requirements as for luminaire efficacy, lumen maintenance (L70), colour rendering index, total power factor, and correlated colour temperature as stated in this specification;

i. Each model of LED luminaire or self-ballasted LED lamp shall be tested to comply with the performance requirements stated in this specification. The Sub-contractor shall submit the test report and certify each model of LED luminaire or self-ballasted LED lamp to be complying with the BS EN or IEC standards or other recognised international/national standards.

6. The luminaire shall have been in continuous and satisfactory operation locally in similar application and supply scale for at least one year up to the time of material submission. The corresponding in-service records with supply scale and proven satisfactory operation shall be provided upon request by the Contract Manager;

7. The luminaire manufacturing plant and facilities shall conform to ISO 9001 with proper quality control scheme in place to assure delivering consistent and high-quality products. Relevant documentation shall be provided upon request by the Contract Manager to substantiate the quality assurance system covering the purchasing and quality control of luminaire components, design and manufacturing process, qualification and experience of plant operating personnel as well as testing and delivery of end products.

8. Internal wiring shall be appropriately colour coded, neatly wired and properly terminated;

9. The overall power factor of the luminaire shall not be less than 0.85 lagging;

10. The type of protection against electric shock shall be Class I or II; and the degree of protection against ingress of dust and moisture shall be at least IP54 unless otherwise specified;

11. Outdoor luminaires shall be able to withstand the weather. Metalwork shall be protected against corrosion, and luminaire parts which have to be removed for access to the interior shall be properly gasketed to restrict the entrance of moisture and dirt. Stirrup mounting and similar parts shall be heavily galvanised, and bolts shall either be made of stainless steel or be galvanised;
12. The adjustment nuts and bolts of the luminaires that will be mounted high on buildings or columns shall be captive to prevent loss or accident during servicing. Safety devices shall be provided to prevent luminaires mounted on high positions from dropping;
13. The luminaires installed in such locations that are within hand reach shall be strongly constructed, fitted with an impact-resistant transparent or diffusing cover, and shall have secret key fixings for the cover to the body of the luminaires. Where necessary, wire guards shall be fitted over the cover to give extra protection;
14. A sample of each of the luminaires shall be submitted to the Contract Manager for inspection and Approval as and when required.

ELE21.3.040.9 INDOOR BATTEN TYPE LED LUMINAIRES (SF11L TO SF24L, SF33L & SF39L)

1. A type-test certificate together with the associated report(s) issued by an Accredited Laboratory shall be submitted as evidence of compliance with the required standard;
2. The luminaires shall be classified, as a minimum requirement, to Class I and IP20 as described in BS EN 60598-1 or IEC 60598-1;
3. Each luminaire shall be supplied as a complete set comprising, where applicable, the main part, end plates, cover plate/reflector/diffuser, double-capped LED tubular lamps, bi-pin lampholder, fused terminal block, integral earthing terminal and internal wiring, etc.;
4. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;
5. The main part of the luminaire shall be made of substantive sheet steel of minimum thickness 0.5 mm, pretreated to prohibit corrosion on both sides and finish coated in gloss white stoved enamel or epoxy powder on the outside surface. It shall be formed and suitably shaped into one continuous U-channel piece to give a fairly rigid structure on its own, but can be further strengthened by ribs where necessary;
6. The luminaire shall be provided with cover plate (for SF11L to SF14L, SF33L), reflector (for SF15L to SF19L, SF39L), or diffuser (for SF20L to SF24L) as appropriate. The cover plate and reflector shall be of the same material and finish as the main part, but the reflector shall be finish coated on both inside and the outside surfaces. The cover plate and reflector shall be of one continuous piece formed and suitably shaped to give adequate mechanical strength. The fixing screw for the cover plate and reflector shall be captive with the main part. The diffuser shall be made of clear prismatic plastic material unless otherwise specified;
7. The end plate for the main part shall be of white finish and can be made of plastic or sheet steel. If made of sheet steel, the end plate shall be of the same material and finish as the main part. A knockout shall be formed on the end plate for conduit entry. The bi-pin lampholder can either be integral with the end plate or alternatively be mounted on the main part or end plate;

8. The main part shall be formed with knockouts on the mounting face for fixing to conduit and BESA box. The fused terminal block shall be conveniently positioned and securely fixed to the main part. The mounting face of the main part shall be purposely formed with small protrusions to adequately cover the heads of any fixing screws projecting beyond its outside surface;
9. A label shall be affixed near the lampholders to indicate only double-capped LED tubular lamp is suitable for the luminaire and fluorescent tube shall not be used.

ELE21.3.050.9 CORROSION RESISTANT TYPE LED LUMINAIRES (SF25L, SF26L & SF34L - SF36L)

1. A type-test certificate together with the associated test report(s) issued an Accredited Laboratory shall be submitted as evidence of compliance with the required standard;
2. The luminaire shall be classified, as a minimum requirement to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;
3. The luminaire shall be supplied as a complete set comprising, where applicable, the main part, reflector/diffuser, bi-pin lampholder, fused terminal block, integral earthing terminal and internal wiring, etc.;
4. A fused terminal block fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1 shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;
5. The main part of the luminaire shall be a one piece moulded polycarbonate or glass fibre reinforced plastic finished in light grey colour. The mounting face of the main part shall be formed with a knockout for back entry and holes for mounting screws. The two ends of the main part shall each be provided with a hole for conduit entry which shall be sealed with a suitable plastic plug;
6. The reflector shall be made of substantive sheet steel pretreated and finish coated in gloss white stoved enamel or epoxy powder. It shall be of one continuous piece formed and suitably shaped to give adequate mechanical strength. The bi-pin lampholder shall be conveniently positioned and securely fixed onto the tray;
7. The reflector shall be securely mounted to the main part by screws, or other suitable means, which shall remain captive with the main part;
8. The diffuser shall be a one piece moulded clear prismatic polycarbonate with smooth outer surface. It shall be fixed to the main part by means of an adequate number of stainless steel clips. The clips shall remain captive with the main part when the diffuser is removed;
9. A neoprene or silicone gasket shall be provided between the main part and the diffuser and shall be retained firmly in the purposely formed groove in the main part;
10. A label shall be affixed near the lampholders to indicate only double-capped LED tubular lamp is suitable for the luminaire and fluorescent tube shall not be used.

ELE21.3.060.9 BULKHEAD TYPE FLUORESCENT LUMINAIRES (SF 8 & SF 50)

1. Luminaires shall be licensed with the BSI Kitemark Scheme or with an equivalent Quality Surveillance Scheme. The licence and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
2. The luminaire shall be classified, as a minimum requirement, to Class I and IP 54 as described in BS EN 60598-1 or IEC 60598-1;

3. The luminaire shall be supplied as a complete set comprising the main part, reflector/gear tray, diffuser, ballast, 4-pin single ended type 2G7 lamp base compact fluorescent tube lampholder, metal lamp supporter, fused terminal block, integral earthing terminal and internal wiring. Earthing terminal shall be fitted to the main part and not the reflector/gear tray;
4. The electronic ballast used in the luminaire shall comply with ELE21.20;
5. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;
6. The main part of the luminaire shall be a one piece aluminium alloy diecasting, pretreated and finished stoved enamel in cream colour on the outside surface. The main part shall be formed with knockouts on the mounting face for fixing to conduit and BESA Box. The two ends of the main part shall each be provided with a threaded hole for 20 mm conduit entry and shall be fitted with a suitable threaded plastic plug;
7. The reflector/gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The ballast, lampholder and metal lamp supporter shall be conveniently positioned and securely fixed onto the tray;
8. The reflector/gear tray shall be securely hinged to the main part and maintained in normal position by captive screw(s);
9. An isolating device with tinned contacts shall be provided between the main part and the reflector/gear tray such that the mains supply will be isolated automatically on opening the reflector/gear tray;
10. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 or IEC 60227-3 with a maximum conductor temperature of 90℃. Under no circumstances shall the wiring be visible in the lamp compartment;
11. The diffuser shall be a one piece moulded clear prismatic polycarbonate. It shall be fixed to the main part with secret head captive screws openable by a special tool, and shall be securely strapped or hinged to the main part when opened. The quality of diffuser shall be certified by an independent accredited laboratory on the following tests:
    a. Impact test complying with BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25℃ without visible damage; and
    b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.
12. A neoprene or silicone gasket shall be provided between the main part and the diffuser and shall be retained firmly in the purposely formed groove in the main part;
13. Prior to the time of material submission for approval, the luminaire including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE21.3.080.9 GAS DISCHARGE LUMINAIRES

Luminaires for gas-discharge lamps, such as fluorescent, mercury vapour, sodium vapour etc., which utilise chokes as part of the circuit, shall be complete with capacitors of sufficient capacitance to ensure that the overall power factor of the lighting circuit does not fall below 0.85 lagging. The control gear shall be placed as near as possible to the discharge lamp it serves.

ELE21.3.090.9 FLAMEPROOF LUMINAIRES

Not used.

ELE21.3.100.9 SPOT LIGHTS (SF42)

1. The luminaire shall be licensed with the BSI Kitemark Scheme or with an equivalent Quality Surveillance Scheme. The licence and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
2. The luminaire shall be classified, as Class I or Class II, IP20 (minimum) and suitable for direct mounting on normally flammable surfaces as described in BS EN 60598-1 or IEC 60598-1;
3. The luminaire shall be fitted with a PAR 38 Reflector Lamp of wattage and type of diffusion (flood or spot) as specified on the Drawings;
4. The main part of the luminaire shall be rotatable in all directions within 90 degree perpendicular to the exposed side of the mounting surface;
5. The luminaire shall be of surface mounting type unless otherwise specified;
6. The colour of the exposed part of the luminaire shall be as specified on the Drawings.

ELE21.3.110.9 TILTED SPHERICAL SEMI-RECESSED LIGHTS (EYE-BALL LIGHT) (SF43)

1. The luminaire shall be designed and constructed in accordance with BS EN 60598-2-2 or IEC 60598-2-2. The luminaire shall be licensed with the BSI Kitemark Scheme or with an equivalent Quality Surveillance Scheme. The licence and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
2. The luminaire shall be classified, as Class I or Class II, IP20 (minimum) and suitable for direct mounting on normally flammable surfaces as described in BS EN 60598-1 or IEC 60598-1;
3. The luminaire shall be fitted with a PAR 38 Reflector Lamp of wattage and type of diffusion (flood or spot) as specified on the Drawings;
4. The main part of the luminaire shall be rotatable in all directions within 30 degree perpendicular to the exposed side of the mounting surface;
5. The main part of the luminaire shall be able to be dismantled from the exposed side of the mounting surface without having to dismantle any part of the mounting surface;
6. The colour of the exposed part of the luminaire shall be as specified on the Drawings.

ELE21.3.120.9 CYLINDRICAL FULLY RECESSED LIGHTS (DOWN LIGHTS) (SF44)

1. The luminaire shall be designed and constructed in accordance with BS EN 60598-2-2 or IEC 60598-2-2. The luminaire shall be licensed with the BSI Kitemark Scheme or with an equivalent Quality Surveillance Scheme. The licence and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
2. The luminaire shall be classified, as Class I or Class II, IP20 (minimum) and suitable for direct mounting on normally flammable surfaces as described in BS EN 60598-1 or IEC 60598-1;

3. The luminaire shall be fitted with a PAR 38 Reflector Lamp of wattage and type of diffusion (flood or spot) as specified on the Drawings;
4. The main part of the luminaire shall be able to be dismantled from the exposed side of the mounting surface without having to dismantle any part of the mounting surface;
5. The colour of the exposed part of the luminaire shall be as specified on the Drawings.

ELE21.3.130.9 CIRCULAR FULLY RECESSED LIGHTS (DOWN LIGHTS) WITH PLC LAMP (SF45)

1. The luminaire shall be designed and constructed in accordance with BS EN 60598-2-2 or IEC 60598-2-2;
2. The luminaire shall be classified, as Class I or Class II, IP20 (minimum) and suitable for direct mounting on normally flammable surfaces as described in BS EN 60598-1 or IEC 60598-1;
3. The luminaire shall be fitted with bi-pin PLC Lamp(s) of 10, 13, 18 or 26 watts as specified on the Drawings;
4. The main part of the luminaire shall be able to be dismantled from the exposed side of the mounting surface without having to dismantle any part of the mounting surface;
5. The luminaire shall be supplied as a complete set comprising the gear box, ballast, power factor correction capacitor, lampholder, terminal block, integral earthing terminal, internal wiring, trim, gear box supporting structure, false ceiling clamping fixture, reflector and lamp;
6. The reflector shall be made of aluminium;
7. The gear box shall be made of sheet steel of minimum thickness 0.5 mm and be integral with the main part of the luminaire by a rigid metallic structure both of which shall be pretreated to prohibit corrosion;
8. The gear box shall house the ballast, capacitor, lampholder and terminal and be provided with a knockout for flexible conduit entry;
9. The colour of the exposed part of the luminaire shall be as specified on the Drawings.

ELE21.3.140.9 OVAL BULKHEAD FLUORESCENT FITTING (SF83)

1. The luminaire shall be classified, as a minimum requirement to Class I and IP55 as described in BS EN 60598-1 or IEC 60598-1 and suitable for wall mounted;
2. The luminaire shall be supplied as a complete set comprising the main part, reflector/gear tray, diffuser, ballast, starter and starter-holder, power factor correction capacitor, lampholder, fused terminal block, integral earthing terminal and internal wiring;
3. The luminaire shall be fitted with 26W compact fluorescent lamp unless otherwise specified on the Drawings;
4. The luminaire shall have die-cast aluminium housing, UV-stabilized vandalproof polycarbonate diffuser. The diffuser shall be held in place by the retaining ring which is fixed onto the housing by stainless screws;
5. A neoprene or silicone rubber gasket shall be provided between the main part and the diffuser and shall be retained firmly in the main part.

ELE21.3.150.N LIGHT EMITTING DIODE (LED) STRIP (SF90)

1. The LED strip shall be classified, as a minimum requirement, to Class III and IP65 for outdoor condition (Other than outdoor condition, the corresponding IP rating to suit specific environmental conditions) as described in BS EN 60598-1 or IEC 60598-1;
2. The LED strip shall be rated with d.c. supply voltage of 12/24V for operating in extra low voltage;
3. The LED strip set shall be supplied comprising the flexible bending strip completed with cable wiring, LED driver of at least same IP rating of the LED strip unless otherwise specified and the LED driver completed with stainless steel weatherproof enclosure in outdoor condition, aluminium profile and all necessary accessories;
4. The material of the surface shall be made of silicone with a smooth surface with UV and flame resistant. The strip shall be affixed inside the aluminium profile where appropriate. The strip shall be easily replaced and reassembled for maintenance;
5. The lumen maintenance at 50,000 hours for the LED strip shall not be less than 70%. Lumen maintenance life time shall be in accordance with IES LM-80 and extrapolated methodologies of IES TM-21;
6. Unless otherwise specified, the luminous efficacy shall not be less than 60 lm/W and the colour rendering index shall not be less than 80;
7. The mounting detail with durable fixing method shall be submitted and approved by the CM;
8. The driver shall comply ELE21.3.020 in Clause 5(b)(c)(d) for indoor condition and ELE21.3.030 in Clause 5(b)(c)(d) for outdoor condition;
9. The controller shall be capable for dimming control by means of pulse width modulation and / or colour changing for specified dimmable and / or colour changing function;
10. The LED strip shall be RGB LED module for dimmable and colour changing function and the control system shall comply with ELE21.24 for overall control of the LED strip for specified dimmable and / or colour changing function.

ELE21.4 POLE TOP LANTERNS (SF 29)

ELE21.4.010.9 GENERAL

Lanterns shall comply with BS EN 60598-2-3 or IEC 60598-2-3 and shall be suitable for vertical pole top mounting for 76 mm x 76 mm spigot.

ELE21.4.020.9 LAMP TYPE

1. Lanterns shall be compatible with the following types of lamps:
   a. SON : one 50W or 70W;
   b. MBF/U : one 80W or 125W.
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.4.030.9 CONSTRUCTION

1. The lantern body shall consist of a truncated mould-cone held between a cast aluminium base incorporating a spigot cap and a die-cast light alloy upper rim. The vertical rods which join the base to the upper rim shall also support the lamp holder assembly;
2. The lantern shall be covered with an aluminium or UV stabilised glass reinforced polyester top canopy secured by a nylon or aluminium alloy screw cap. Alternatively, the canopy can be hinged to the upper rim and secured with a stainless steel toggle switch catch;
3. A clear anti-vandal UV stabilised polycarbonate prismatic cone designed to give a symmetrical all round light distribution in the lower hemisphere, shall be securely fixed to the lantern;
4. The fitting shall be supplied with an integral set of the required control gear comprising ballast, capacitor, ignitor as appropriate to the type of lamp fitted.

ELE21.5 GLOBE LANTERNS (SF 27, SF 28)

ELE21.5.010.9 GENERAL

1. Lanterns shall comply with BS EN 60598-2-3 or IEC 60598-2-3 and shall be suitable for vertical pole-top mounting or on wall-mounted bracket;
2. Type-test report(s) issued by BSI or an Accredited Laboratory shall be submitted as evidence of compliance with the above BS.

ELE21.5.020.9 LAMP TYPE

1. Lanterns shall be compatible with the following types of lamps:
   a. MBF/U: one 80W or 125W;
   b. SON: one 50W or 70W.
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.5.030.9 CONSTRUCTION

1. The diffuser support of the lantern shall be made of corrosion-resistant die-cast aluminium alloy with black enamelled finish. Diffuser support made of matt black or grey high strength plastic may be accepted;
2. The globe shall be made of clear polycarbonate with a smooth surface and UV stabilised. The globe shall be secured to the support by means of captive socket headed screws shrouded on the bottom of the diffuser support. The globe shall be easily removed and reassembled for maintenance;
3. A heat shield shall be provided and fixed positively on to its correct position without adjustment;
4. Suitable prismatic glass refractor or aluminium lamp shield enclosing the lamp shall be provided to control the glare;
5. The bracket to which the lantern is fixed shall be of the same manufacturer as the lantern and fixed as recommended by the manufacturer;
6. All control gear such as ballast, capacitor and ignitor shall be provided and housed inside the globe.

ELE21.6 SIDE-ENTRY STREET LANTERNS (SF 30, SF 31)

ELE21.6.010.9 GENERAL

Lanterns shall comply with BS EN 60598-2-4 or BS EN 60598-2-3 or IEC 60598-2-3 and shall be suitable for side entry to suit 25 mm BSP mounting bracket.

ELE21.6.020.9 LAMP TYPE

1. Lanterns shall be compatible with the following types of lamps:
    a. MBF/U: one 80W or 125W;
    b. SON: one 70W;
    c. SOX: one 35W.
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.6.030.9 CONSTRUCTION

1. The main body of the lantern shall be cast from pressure die-cast aluminium alloy or high impact, corrosive resistant material with a separate compartment for housing the control gear, such as ballast, capacitor, ignitor, etc.;
2. Lanterns shall be so constructed that their live parts are not accessible when the lanterns have been installed and wired as in normal use, and when opened as necessary for replacing lamps even if the replacement cannot be achieved by hand;
3. The lantern shall incorporate an injection moulded UV stabilised polycarbonate diffuser which shall be securely fixed to the main body of the lanterns. Another device shall be provided to prevent the diffuser from falling should the fixing device fail under normal conditions;
4. Optical control shall be achieved by means of the diffuser and silver anodized aluminium reflector to give the required light distribution;
5. The bracket to which the lantern is fixed shall be obtained from the same manufacturer as the lantern and fixed as recommended by the manufacturer.

ELE21.7 OUTDOOR AREA FLOODLIGHTS (SF 46)

ELE21.7.010.9 GENERAL

1. Floodlights shall comply with BS EN 60598-2-5 or IEC 60598-2-5 and shall be suitable for outdoor use;
2. The degree of protection against ingress of dust and moisture shall be at least IP65.

ELE21.7.020.9 LAMP TYPE

The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.7.030.9 LIGHT DISTRIBUTION

The light distribution shall be as specified in ELE2 or on the Drawings.

ELE21.7.040.9 MAIN BODY CONSTRUCTION

The main body shall be manufactured in aluminium alloy. Luminaire of one-piece glass reinforced plastic moulded body may be acceptable.

ELE21.7.050.9 FRONT FRAME AND GLASS

The front glass shall be toughened type and framed by a non-ferrous metal or glass reinforced plastic frame with silicon rubber gasket. The frame shall be hinged and secured to the main body by screw catches or swivel bolts which shall not possibly fall off even in loose position.

ELE21.7.060.9 REFLECTOR

The reflector shall be made of durable and highly reflective material.

ELE21.7.070.9 WIND SPEED PERFORMANCE

The floodlight, including its fixing/mounting accessories, will be able to withstand wind speeds of 150 km/h on the projected surface of the floodlight assembly without undue deformation, deflection or vibration.

ELE21.7.080.9 STABILITY

1. Fixings which carry the weight of the floodlight and internal accessories shall be provided with appropriate means to prevent dislodgement of any part of the floodlight either in service or during maintenance. Parts of the floodlight which are fixed other than with at least two devices, for example, screws or equivalent means of sufficient strength, shall have such extra protection necessary to prevent those parts from falling if a fixing device fails under normal conditions;
2. A safety chain shall also be provided between the floodlight and the lamp pole to ensure that the floodlight will not drop down should the floodlight support fail. the chain shall be of galvanised steel and of adequate strength to support at least three times the weight of the floodlight.

ELE21.7.090.9 ANGULAR ADJUSTMENT

Floodlights shall be provided with means for angular adjustment in the azimuth and zenith planes and there shall be provision for positive locking after any such adjustment has been effected.

ELE21.7.100.9 FIXING ACCESSORIES

All exposed external hinges, screws, bolts, washers of the luminaires shall be of stainless steel. All the associated means for attaching the floodlight to its support, such as mounting/fixing bracket, universal pole clamp etc., shall be made of galvanised steel or appropriate corrosion resistant materials.

ELE21.7.110.9 WINDAGE AREA AND WEIGHT

The maximum projected area in any horizontal direction of the pole-mounted floodlight, including the fixtures and gear box etc., shall be 0.2 m^2. The total weight of each floodlight assembly shall be not more than 18 kg in aggregate.

ELE21.7.120.9 INTEGRATED CONTROL-GEAR

Unless otherwise specified, all control gear such as ballast, capacitor, ignitor shall be provided and integrated inside the lantern.

ELE21.7.130.9 CABLE ENTRY

Compression type cable gland suitable for 9-11 mm O/D cable for cable entry shall be provided.

ELE21.8 BOLLARDS (SF 37)

ELE21.8.010.9 GENERAL

1. Bollards shall comply with BS EN 60598-2-4 or BS EN 60598-2-3 or IEC 60598-2-3 and shall be of outdoor type with a cylindrical external shape;
2. The dimensions of the bollard shall be as indicated on the Drawings or otherwise specified.

ELE21.8.020.9 LAMP TYPES

1. Bollards shall be compatible with the following types of lamps:
   a. MBF/U: up to 50W;
   b. SON: up to 50W;
   c. CFL: up to 26W.
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.8.030.9 CONSTRUCTION

1. The external body of the bollard shall be of extruded aluminium with a durable and scratch-proof outer coating to a colour specified by the Contract Manager. The bollard shall be of base-plate mounted type;
2. The optical assembly of the bollard shall be made of a clear UV stabilised polycarbonate lens with or without an external corrosion resistant metal louvre as specified;
3. A wiring compartment shall be provided within the bollard. It shall be of adequate size to accommodate all the control and switch gear, wiring, etc., and space for one MCB with room for working with hands and tools easily. A gland plate, for armoured cable or conduit termination, shall be provided inside the wiring compartment;
4. Removal of any part of the luminaire should only be possible by using tools other than a slotted head or Philips head screw driver.

ELE21.9 STEEL LAMP COLUMNS (3, 4, 5, 10, 12 M NOMINAL HEIGHT)

ELE21.9.010.9 GENERAL

The columns shall comply with BS 5649 Part 5 and BS EN 40-1 and BS EN 40-2 and BS EN 40-3-1 and BS EN 40-3-2 and BS EN 40-3-3, or BS 5649 Part 5 and EN 40-1 and EN 40-2 and EN 40-3-1 and EN 40-3-2 and BS EN 40-3-3. In general 3, 4 and 5 m columns shall be suitable for post top lanterns and 10 and 12 m columns shall be suitable for mounting four floodlights and complete with mounting arm(s), step bars, and a working platform.

ELE21.9.020.A CONSTRUCTION

1. Construction shall be similar or equivalent to that shown in the Master Details of the Housing Department;
2. Unless otherwise approved, columns shall be provided with ground root but, if mounted on podium slab, shall be provided with flange plate;
3. The base compartment shall have adequate room to accommodate a corrosion resistant services box to house MCBs and cable connection unit;
4. The compartment door shall be fixed flush with the column by corrosion resistant bolts or tamper proof door lock;
5. The whole column, after installation, shall have ingress protection not less than IP33 and shall be effectively earthed;
6. For column fixed with post top lantern and IP CCTV camera, a lower compartment door with corrosion resistant services box for post top lantern and an upper compartment door with steel adaptable box for IP CCTV camera shall be provided respectively;
7. The segregation of power and signal cables inside column shall comply with EMSD's Code of Practice for the Electricity (Wiring) Regulations.

ELE21.9.030.A DIMENSIONS

The following dimensions shall be complied with:

Nominal Height	Minimum Root Length	Minimum Door Size	Min Clear Compartment Space (depth x width)
3, 4, 5 m (Fixed with post top lantern and IP CCTV camera)	800 mm	200 x 70 mm (Upper Door) 400 x 80 mm (Lower door)	80 x 60 mm
3, 4, 5 m	800 mm	400 x 80 mm	80 x 60 mm
10 m	1500 mm	500 x 140 mm	140 x 140 mm
12 m	1700 mm	500 x 140 mm	140 x 140 mm

ELE21.9.040.9 CORROSION PROTECTION

The whole column including all ferrous accessories shall be hot-dip galvanised to BS EN ISO 1461 after fabrication. The external surface above ground shall be painted with etched primer suitable for galvanised surfaces before any finish coating according to ELE21.14. The external surface of the ground section shall be protected with bitumen coating to a height 50 mm above the cement skirt.

ELE21.9.050.9 STRENGTH

The column shall be of adequate strength to withstand the imposed static and wind load. It shall be fabricated in accordance with the Master Details of the Housing Department, or otherwise, the structural design shall be verified by calculation in accordance with BS EN 40-3-1 or EN 40-3-1 and BS EN 40-3-3 or EN 40-3-3 with partial load factors Class B and maximum horizontal deflection Class 1. The calculation shall be counter-checked by an independent Registered Professional Engineer (RPE) recognised by Hong Kong Engineers Registration Board.

ELE21.10 LOW BAY FLOODLIGHTS (WIDE LIGHT DISTRIBUTION)

ELE21.10.010.9 GENERAL

1. Unless otherwise specified below, the luminaire shall be in compliance with sub-clauses ELE21.4.030 (1) to (4);
2. The luminaire shall comply with BS 4533 : Section 102.1 or EN 60598-2-1 or IEC 60598-2-1 and shall be suitable for ceiling mounting. The ballast and capacitor shall be manufactured in accordance with the following standard and shall carry the B.S.I. Kitemark or the mark of an Equivalent Quality Surveillance Scheme:
   a. Ballast - BS EN 61347-1 and BS EN 61347-2-9 and BS EN 60923, or IEC 61347-1 and IEC 61347-2-9 and IEC 60923
   b. Capacitor - BS EN 61048 and BS EN 61049, or IEC 61048 and IEC 61049
3. The degree of protection against ingress of dust and moisture shall be at least IP54 as described in BS EN 60598-1 or IEC 60598-1.

ELE21.10.020.9 LAMP TYPE

Unless otherwise specified on the Drawings, the type of lamp used shall be 150W SON.

ELE21.10.030.9 CONSTRUCTION

1. The luminaire shall be of robust construction with excellent resistance against vandalism. The main body shall be made of die-cast aluminium or steel coated in corrosion resistant textured finish;
2. The diffuser shall be a one piece moulded prismatic polycarbonate which shall be securely fixed to the main body by means of an adequate number of stainless steel screws. Gasket of appropriate type shall be provided between the main body and the diffuser and shall be retained firmly in the purposely formed groove in the main body;
3. The reflector shall be made of durable and highly reflective material, painted white or as approved;
4. All control gears such as ballast, capacitor, ignitor shall be provided and integrated inside the luminaire.

ELE21.10.040.9 LIGHT DISTRIBUTION

The luminaire shall be capable of giving a uniform light distribution for a mounting height as low as three metres with limited glare. As requested by the Contract Manager, photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application. Unless otherwise specified, the luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic as follows:

Angle from Vertical Plane (Degrees) (5 degrees step)	Luminous Intensity (Cd / 1000 lumen)
0 - 25	Not less than 90 in both planes

30 - 55	Not less than 80 in either transverse or axial plane
60 - 70	Not less than 50 in either transverse or axial plane

ELE21.11 SELF-CONTAINED EXIT SIGNS AND DIRECTIONAL SIGNS

ELE21.11.010.9 TYPE OF FITTING

Unless otherwise specified, all EXIT or directional signs shall be internally illuminated by LED, acceptable to the Fire Services Department and suitable for operation at 220V±6%, 50Hz ± 2%, single phase a.c. supply.

ELE21.11.030.9 STANDARDS

The complete EXIT or directional signs shall, where applicable, meet the requirements of Fire Services COP, BS 5499: Part 10 and BS EN/IEC 60598-2-22. The driver control unit regulating the operation of LED shall comply with BS EN/IEC 62384.

ELE21.11.040.9 CONSTRUCTION AND COMPONENTS

1. The dimensions, lettering, construction and the general layout of EXIT or directional signs shall conform to the appropriate type of standard EXIT or directional signs as shown on the Master Details of the Housing Department unless otherwise specified. If the dimensions and construction of EXIT or directional signs based on the Manufacturer's proposal are deviated from the above, Contract Manager's prior approval shall be obtained;
2. The LED and associated control gear shall be securely fixed and contained inside the sign box. The live parts shall be properly shielded when the sign box is opened for maintenance. The assembly shall comply with the following:
    a. The LED shall be of white colour and with colour temperature within 5000 – 9000K;
    b. Adequate LED shall be provided to produce a luminance of at least 100 cd/m^2 in white area of the sign in both normal and emergency operation mode during the entire life of the LED;
    c. The total power consumption including the charger and control gear for the EXIT or directional sign shall not be greater than 5W during full charge of the battery unless otherwise approved;
    d. The minimum lumen output of the LED shall be maintained at or above 70% of the initial value after operating for 5.7 years (i.e. 50 000 hours) and this lifetime (L70) shall be supported with calculation using TM-21-11;
    e. The following document shall be submitted for Contract Manager's checking:
        i. Test report showing the offered sign complies with the standards specified in ELE21.11.030;
        ii. Job reference.
3. All components such as fused terminal block, driver control unit, etc. shall be securely fixed and contained inside the sign box. Internal wiring shall be heat-resistant PVC cable suitable for operation at or above 90℃ and comply with BS 6231 Table 2 (Type CK) or IEC 60227-3 and be appropriately colour coded, neatly wired and properly terminated;

4. If emergency lighting modification unit is specified inside the EXIT or directional sign box, the emergency lighting modification unit (conversion kit) shall comply with ELE21.12; the EXIT sign and directional signs shall comply with BS 5266-1 and BS EN/IEC 60598-2-22 and the operation shall comply with ELE21.11.050 and ELE21.11.060 respectively.

ELE21.11.050.9 FITTINGS TO EXIT SIGN AND DIRECTIONAL SIGN

The Sub-contractor shall supply and install the following fittings and features on the external surface of the EXIT or directional sign if emergency lighting modification unit (conversion kit) is specified.

1. LED indication lamp to show that the mains supply is "on";
2. LED indication lamp to show that the battery is being charged;
3. A self-returning switch to simulate failure of normal supply to test the emergency operation of the EXIT or directional sign.

ELE21.11.060.9 OPERATION

The EXIT sign and directional sign shall be of maintained type if emergency lighting modification unit (conversion kit) is specified:

1. Under normal conditions, the 220V a.c. mains shall power the LED and charge a sealed nickel cadmium battery or nickel-metal hydride battery through a battery charger. On failure of mains supply, the emergency lighting modification unit shall instantaneously switch to battery power operation. Upon restoration of mains supply, the unit shall switch back to normal power and the batteries shall be re-charged again. The changeover operations shall be automatic;
2. The duration of emergency operation shall be at least 3 hours after the mains supply fails with a light output up to the end of the duration of not less than the requirements specified in ELE21.12.070;
3. The charging system shall be capable of recharging the battery to full capacity in 24 hours after a total discharge of the battery.

ELE21.11.070.9 SAMPLE

A sample of the EXIT or directional signs box shall be submitted for Approval prior to installation.

ELE21.11.080.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with PRE.BS1.205 to verify the country / place of manufacture and authenticity of self-contained exit signs and directional signs delivered to Site or installed.

ELE21.12 EMERGENCY LIGHTING MODIFICATION UNITS (CONVERSION KITS)

ELE21.12.010.9 QUALITY SURVEILLANCE SCHEME

The emergency lighting modification units (conversion kits) shall be licensed with BSI Kitemark Scheme or with an Equivalent Quality Surveillance Scheme. The license issued by BSI or other licensing organisation shall be submitted as evidence of compliance with the required standard.

ELE21.12.020.9 CONSTRUCTION

1. The modification unit comprising an emergency lighting module, a battery pack and related connecting devices (e.g. cables, screw, etc.) can be fully or partially contained inside the connected luminaire;
2. The emergency lighting module shall comply with BS EN/IEC 61347-1 and BS EN/IEC 61347-2-7 and BS EN 60929 for luminaire with fluorescent lamp and shall comply with BS EN/IEC 61347-2-13 for luminaire with LED. The type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. The cables used for the modification unit shall be heat-resistant PVC cable suitable for operation at or above 90ºC and comply with BS 6231 Table 2 (Type CK) or IEC 60227-3;
4. The batteries used for the modification unit shall be high temperature (70℃) sealed rechargeable nickel cadmium batteries complying with BS EN/IEC 61951-1, or nickel-metal hydride batteries complying with BS EN/IEC 61951-2;
5. The complete modification unit or remaining components of the modification unit, if mounted separately from the connected luminaire, shall be housed inside a metallic box with inner or outer finishes protected against corrosion.

ELE21.12.030.9 OPERATION MODE

The unit shall be capable of being connected in maintained or non-maintained operation modes as specified on the Drawing.

ELE21.12.040.9 CHARGING SYSTEM

The charging system shall be capable of recharging the battery to full capacity in 24 hours after a total discharge of the battery.

ELE21.12.050.9 BATTERIES

Batteries with adequate initial capacity shall be chosen to compensate for the loss of effective capacity during service life cycle such that the interval between batteries replacement shall not be less than four years.

ELE21.12.060.9 BATTERY PROTECTION

The battery shall be protected against over-discharge by a low voltage "cut-out" device which shall disconnect the battery from the load once the discharging voltage of the battery drops below 1V per cell.

ELE21.12.070.9 LIGHT OUTPUT DURING EMERGENCY OPERATION MODE

The batteries shall be of adequate capacity such that, from 5 seconds to 3 hours after failure of normal supply, the light output of the emergency luminaire shall not be less than the following ballast lumen factor of the lamp/LED at normal supply voltage:

LED Tubular Lamp / Fluorescent Lamp Type and Wattage	Minimum Ballast Lumen Factor
LED Tubular Lamp (600mm)	0.24
LED Tubular Lamp (1200mm)	0.14
LED Tubular Lamp (1500mm)	0.10
18W Tubular (600 mm)	0.24
30W Tubular (900 mm)	0.14
36W Tubular (1200 mm)	0.14
58W Tubular (1500 mm)	0.10
18W Compact 4-pin	0.21
24W Compact 4-pin	0.16
36W Compact 4-pin	0.14
LED Exit Sign and Directional Sign	Minimum Ballast Lumen Factor
450mm long (approx.)	0.5
610mm long (approx.)	0.5

ELE21.12.080.9 INDICATION AND TESTING FACILITIES

The emergency modification unit shall have the following fixtures:

1. LED indication lamp to show that the mains supply is "on";
2. LED indication lamp to show that the battery is being charged;
3. A self-returning switch to simulate failure of normal supply for testing the emergency operation of the complete emergency lighting assembly.

ELE21.12.090.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall produce documentary evidences in accordance with PRE.BS1.205 to verify the country / place of manufacture and authenticity of emergency lighting modification units (conversion kits) delivered to Site or installed.

ELE21.13 INSTALLATION OF LAMPS AND LUMINAIRES

ELE21.13.010.9 "GRID" SYSTEMS

1. Unless otherwise stipulated, fluorescent luminaires installed on the "grid" system, shall be suspended from the ceiling by means of two chromium plated steel chains, with 20 mm oval links. The chains shall be fixed to chromium-plated carrier rings which shall be screwed into 2A 3-pin socket front plates by removing one of the fixing screws. Where no socket exists at a point at which it is necessary to suspend a chain, a carrier ring stud shall be embedded into the ceiling slab as circumstances dictate;
2. Electricity supply to the luminaires shall be obtained from the nearest 2A 3-pin socket enclosed in a circular conduit box in the ceiling via a 3-core circular flexible cable having CSA of not less than 0.75 mm^2;
3. Sockets shall be positioned as shown on the Drawings, but if no drawing exists, they shall be positioned on a square grid at approximately 1.5 m centres, depending upon the size and geometry of the area concerned.

ELE21.13.020.9 TUBE PENDANTS

Tube pendants shall comprise a dome cover and a piece of screwed steel conduit of suitable length to give the required mounting height of the luminaire. A lock nut shall be provided to bear against the conduit entry of the luminaires.

ELE21.13.030.9 PLAIN PENDANTS

Plain pendants shall comprise a ceiling rose and a cord-grip lampholder connected by a flexible cord having a suitable length to give the required mounting height of the lamp shade.

ELE21.13.040.9 LUMINAIRES MOUNTED ON WOODEN BATTENS

When a luminaire is not provided with facility for a surface cable entry the luminaire shall be mounted on a suitably shaped wooden batten or pattress. The cable shall then enter the luminaire from the rear through a slot and a hole formed in the batten.

ELE21.13.050.9 CABLES IN ENCLOSED LUMINAIRES

1. Cables entering or within the gear compartment of an enclosed type luminaire shall be properly protected against damage due to the excessive heat generated by the lamp within the luminaire;
2. Protection shall be by means of sleeving the insulation of the cables with fibre glass or other equivalent heat resistant insulating materials. The sleeves shall be provided for all cables within the luminaire;
3. Alternatively protection shall be by means of using heat resisting cables selected in accordance with Requirement 522.2.2 of BS 7671.

ELE21.13.060.9 STROBOSCOPIC EFFECT

Luminaires, other than those using tungsten filament lamps, installed over rotating machinery, shall be arranged so that at least two luminaires connected to different phases are used to illuminate the machinery's moving parts. Alternatively where different phases are not available, or the use of which is impractical, separate tungsten filament lamps shall be used in addition to the gas discharge lamps to eliminate the stroboscopic effect.

ELE21.13.070.9 PAINTING OF PLASTIC ITEMS

Painting of the factory fabricated lighting equipment and luminaire to meet the colour requirements stipulated in this Specification or to meet the directions of the Contract Manager is not acceptable.

ELE21.13.080.9 PAINTING OF EXPOSED METAL PARTS

Metal parts such as cover plates for adaptable boxes, blanking plate for any boxes and conduit pendants, etc. shall be painted white or a suitable colour to match the interior finish of a particular location as specified in ELE28.7.

ELE21.13.090.9 LUMINAIRE TRACK SYSTEMS

1. The electrical supply track system for luminaires (hereinafter referred as the track system) shall be designed and constructed in accordance with the requirements as described in BS EN 60570 or IEC 60570;
2. A type-test certificate together with the associated test report(s) issued by BSI or an Accredited Laboratory shall be submitted as evidence of compliance with the required standard;
3. The track system shall be classified as Class I, IP20 (minimum) and suitable for ordinary interior use for mounting on, or flush with, or suspended from walls and ceilings;
4. The track system shall have a rated current of not exceeding 16A per conductor for distribution of supply to luminaires. It shall consist of three conductors for a single circuit system or five conductors for a system of three separately switchable circuits;
5. Components of the track system shall be so designed that there is no risk of accidental contact between the earthing contacts of the components and the current-carrying parts of the track during insertion and removal by the user;
6. Suitable adaptors shall be used to provide sound electrical and mechanical connections of luminaires to the track so that the weight of the adaptors and/or luminaires are not supported by the electrical connections of the adaptors and the track. The live parts of the adaptor shall not be touchable when the adaptor is in partial or complete engagement and is wired as in normal use. Each adaptor when used in a 3-circuit track system shall be provided with a pre-switched circuit selection function so that the luminaire can be switched to the designed circuit before installation;
7. The track shall be protected from corrosion by using anodized aluminium or stove enamelled paint or equivalent material.

ELE21.13.100.9 PHOTOCELL DEVICES

1. Photocell devices shall be of adjustable type suitable for on/off control under illumination level ranging at least from 50 to 1500 lux, with ingress protection of at least IP55. The device shall comply with IEC 60669-2-1 with a built-in additional circuitry to achieve an on/off time delay of at least 30 seconds and switch-off threshold greater than the illumination level after switching on of the controlled luminaires so as to eliminate hunting due to short period changes in illumination or light from controlled luminaires. The photocell devices shall have indication to show activation/deactivation status upon reaching the preset on/off level or the time delay setting be adjustable to zero to facilitate commissioning on Site. The required functions shall be demonstrated on Site upon completion of installation;
2. A label in red numbers and characters of legible size shall be provided by the side of each photocell device to indicate the corresponding control zone.

ELE21.14 EXTERNAL LIGHTING SYSTEM

ELE21.14.010.9 SCOPE

This section covers pole mounted tungsten or discharge lighting installations for street lighting, security lighting, floodlighting and general area lighting.

ELE21.14.020.9 SPECIFICATION AND DRAWINGS

External lighting installations shall be installed in accordance with ELE2.

ELE21.14.030.9 LUMINAIRES

1. The type of lamps and luminaires including reflectors to be used shall be as specified in this Specification or as directed by the Contract Manager;
2. The luminaires shall be securely mounted on the poles;
3. A safety chain shall also be provided between the luminaires and the lamp pole to ensure that the luminaires will not be dropped down in case the luminaires support fails;
4. The chain shall be of galvanised steel and of adequate strength to support at least three times the weight of the luminaire.

ELE21.14.040.9 CONSTRUCTION OF LAMP POLES

1. Lamp poles shall be constructed of mild steel pipe of one, two or three sections of diameter and modulus all as specified on Drawings;
2. Pole caps, cat ladders and platforms shall be fitted where shown;
3. Material samples and working drawings shall be submitted when requested by the Contract Manager;
4. The poles shall be finished overall with at least two coats of primer and two coats of finishing paint after erection;
5. The colour of the finishing paint shall be as directed by the Contract Manager.

ELE21.14.050.9 FOUNDATIONS FOR LAMP POLES

Lamp poles shall be securely bolted down in an upright position to the foundations constructed in accordance with the Drawings.

ELE21.14.060.9 SERVICE BOXES

1. A mild steel service box shall be provided on each pole at an appropriate height above ground level to accommodate the MCB control box. The construction of the service box and the MCB control box shall be as shown on the Drawings;
2. Each lamp circuit shall be protected by an MCB. Where the CSA of the incoming/outgoing cable cores are larger than that which can be accommodated by the terminal of the MCB, a fixed insulator connector block of adequate rating shall be installed with a tail to the MCB. Alternatively, a copper busbar may be used;
3. Where the service box serves more than one circuit, the supply to the MCBs shall be by means of a copper busbar of adequate rating. The phase conductors of the incoming/outgoing cables shall then be terminated to the busbar by means of cable sockets;

4. Each control box shall be fitted with a neutral block of adequate rating and having sufficient number of ways for the incoming/outgoing cable cores. It shall be securely fixed to the base of the control box by means of a 6 mm thick paxolin block;
5. The service box shall be fitted with a 3 mm thick galvanised mild steel cover made waterproof with a 3 mm thick soft rubber or neoprene gasket. The cover shall be fixed by means of four M6 brass fixing bolts and washers and shall be hinged if specified;
6. Provision shall be made in the batten plate of the box for supporting and terminating up to three numbers of incoming/outgoing PVC/SWA & PVCS cables by means of suitable cable glands. The cable sizes shall be as specified in ELE2 or on the Drawings.

ELE21.14.070.9 UNDERGROUND CABLES TO POLES

1. Underground cables for external lighting systems shall be copper cored, PVC insulated, steel wire armoured and PVC sheathed cables (PVC/SWA & PVCS) unless otherwise specified;
2. Cables shall enter and leave the pole below ground level and each cable shall terminate in a gland fixed to the MCB control box;
3. The cable cores between the glands and the terminals shall not be in tension.

ELE21.14.080.9 CABLES BETWEEN SERVICE BOX AND LUMINAIRES

1.
   a. Cables from the neutral terminal block and the MCBs to the luminaires shall be PVC insulated and PVC sheathed having CSA as specified;
   b. Arrangements shall be made to prevent the cores from being under tension where they are attached to terminals;
   c. All cables shall be contained within the poles;
   d. Rubber grommets shall be installed where cable pass through any metal works.
2. Where the sustained arc voltage of a discharged lamp exceeds 250V, the cables used for connecting the lamp and the control-gear shall be of heat resistant type to BS 6231 or equivalent as recommended by the lamp manufacturer according to lamp requirements;
3. Where the design of the cable termination of the luminaires is only suitable for flexible cables, PVC insulated and PVC sheathed flexible cables shall be used. Such cables shall enter the luminaires by means of suitable waterproof compression glands;
4. Where four or more floodlights are mounted on a pole, the flexible cables shall be connected to the luminaires by means of a mild steel connector box with waterproof hinged cover. The connector box shall be fitted near to the top of the pole, all as shown on the Drawings.

ELE21.14.090.9 SWITCHES FITTED TO POLES

1. Where specified switches may be mounted on the pole for local control;
2. Switches mounted on the pole shall be fixed on to it by tapped holes and brass fixing screws;
3. The switches shall be waterproof or be contained within a waterproof type galvanised metal case, with an external galvanised metal operating knob or handle;

4. Switches shall be fitted at least 2 m above finished ground level.

ELE21.14.100.9 CONTROL GEAR FOR DISCHARGE LIGHTING

1. Control gear for discharge lamps shall be contained within a galvanised steel box mounted on or inside the pole as directed by the Contract Manager;
2. When mounted on the pole, the steel box shall be watertight and positioned at a height higher than normal working level in such a way that a ladder is needed for access;
3. The box shall be of adequate size to accommodate all control gear, cable and connections;
4. The method of construction shall be similar to the service box.

ELE21.14.110.9 TESTING OF ILLUMINATION LEVEL

1. Illumination and luminance measurements shall be carried out after dark using Lux meter and luminance meter with valid calibration certificates issued by accredited calibration laboratory;
2. The proposed measurement procedures, measurement locations and aiming adjustment of luminaires shall be submitted for Contract Manager's agreement before carrying out the test; particularly to avoid obtrusive light affecting occupants of nearby properties and to direct the light into the area required to avoid waste light. When situations necessitate the technical support from the local lighting specialist / supplier(s), the Sub-contractor shall arrange and bear the necessary cost for the local lighting specialist / supplier(s)'s presence and advice during commissioning of the external lighting installation at project completion stage;
3. The Sub-contractor shall carry out re-adjustment of the aiming angle of the luminaires or if necessary, to incorporate additional lourvres, baffles or shields to the respective luminaires to control the affect of spill light;
4. The date, time and climatic conditions when the measurement was conducted, measurement locations, type and geometric details of the lighting installation, location and aiming of luminaires, installation drawings, record photos, technical details of measuring instruments etc., shall all be prepared and detailed in a submission report with format to be agreed by the Contract Manager.

ELE21.16 NEW TUBULAR BULKHEAD FLUORESCENT LUMINAIRE WITH ELECTROMAGNETIC BALLAST (SF 71 & SF 73)

ELE21.16.010.9 GENERAL

1. The luminaire shall comply with BS 4533: Section 102.1 or EN 60598-2-1 or IEC 60598-2-1;
2. The luminaire shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. Unless otherwise specified, the following components of the luminaire shall be manufactured in accordance with the relevant British Standard Specifications and shall carry the BSI Kitemark/ENEC Mark or the mark of an equivalent Quality Surveillance Scheme:
   a. Ballast: BS EN 61347-1 and BS EN 61347-2-8 and BS EN 60921, or IEC 61347-1 and IEC 61347-2-8 and IEC 61347-2-11 and IEC 60921;
   b. Starter: BS EN 60155 or IEC 60155;
   c. Capacitor: BS EN 61048 and BS EN 61049 or IEC 61048 and IEC 61049.
4. The luminaire shall be classified, as a minimum requirement, to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;
5. The overall power factor of the luminaire shall not be less than 0.85 lagging;
6. The luminaire shall be radio interference suppressed to limits specified in BS EN 55015 or EN 55015. Test reports shall be submitted as evidence of compliance as and when required by the Contract Manager;
7. The maximum controlgear loss of the lamp shall be equal or smaller than the maximum allowable value as specified in the table below:

Lamp type	Nominal lamp wattage (L_w)	Maximum allowable lamp controlgear loss (W)
Compact fluorescent	L_w < 18W	6
	L_w ≥18W	9

ELE21.16.020.9 LAMP TYPE

1. The luminaire shall be compatible with either single or twin 24W 4-pin 2G11 compact fluorescent lamp;
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.16.030.9 LIGHT DISTRIBUTION

1. The luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic certified by independent accredited laboratory as follows:

Angle from Vertical Plane (Degrees)	Luminous Intensity (Cd / 1000 lumen)	
	Transverse plane	Axial plane
0 - 5	> 175	> 170
10 - 15	> 170	> 165
20 - 25	> 165	> 150
30 - 35	> 150	> 135
40 - 45	> 140	> 110
50 - 55	> 130	> 75
60 - 65	> 130	> 40
70 - 75	> 120	> 15
80 - 90	> 110	> 10

2. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

ELE21.16.040.9 CONSTRUCTION

1. The luminaire shall be supplied as a complete set comprising the main part, gear tray/reflector, diffuser, 4-pin 2G11 compact fluorescent tube, lampholder, lamp supporter, ballast, power factor correction capacitor, starter, fused terminal block, integral earthing terminal and internal wiring. Earthing terminal shall be fitted to the main part and not the reflector/gear tray;
2. The main part of the luminaire shall be a one piece aluminium alloy diecasting, pretreated and finished stoved enamel in cream or white colour on the outside surface. The main part shall be formed with knockouts on the mounting face for fixing to conduit and BESA Box. The two ends of the main part shall each be provided with a threaded hole for 20 mm conduit entry and shall be fitted with a suitable threaded plastic plug;
3. The gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The gear tray shall be securely hinged to the main part and maintained in normal position by captive screw(s);
4. An isolating device with tinned contacts shall be provided between the main part and the gear tray such that the mains supply will be isolated automatically on opening the gear tray;
5. The ballast, capacitor, starter, 4-pin lampholder and lamp supporter shall be conveniently positioned and securely fixed onto the tray. The starter shall be positioned in such a way as to be accessible for detachment from the exterior of the gear tray without opening the gear tray;
6. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;
7. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 with a maximum conductor temperature of 90℃. Internal wiring shall be neatly wired and properly terminated. Under no circumstances shall the wiring be visible in the lamp compartment;

8. The diffuser shall be a one piece moulded clear prismatic polycarbonate. It shall be fixed to the main part with secret head captive screws openable by a special tool, and shall be securely strapped or hinged to the main part when opened. The quality of diffuser shall be certified by an independent accredited laboratory on the following tests:

    a. Impact test complying with BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25℃ without visible damage; and

    b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.

9. A neoprene or silicone gasket shall be provided between the main part and the diffuser and shall be retained firmly in the purposely formed groove in the main part.

ELE21.17 NEW CIRCULAR BULKHEAD FLUORESCENT LUMINAIRE WITH ELECTROMAGNETIC BALLAST (SF 75 & SF 77)

ELE21.17.010.9 GENERAL

1. The luminaire shall comply with BS 4533: Section 102.1 or EN 60598-2-1 or IEC 60598-2-1;
2. The luminaire shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. Unless otherwise specified, the following components of the luminaire shall be manufactured in accordance with the relevant British Standard Specifications and shall carry the BSI Kitemark/ENEC Mark or the mark of an equivalent Quality Surveillance Scheme:
   a. Ballast: BS EN 61347-1 and BS EN 61347-2-8 and BS EN 60921 or IEC 61347-1 and IEC 61347-2-8 and IEC 61347-2-11 and IEC 60921;
   b. Starter: BS EN 60155 or IEC 60155;
   c. Capacitor: BS EN 61048 and BS EN 61049 or IEC 61048 and IEC 61049.
4. The luminaire shall be classified, as a minimum requirement, to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;
5. The overall power factor of the luminaire shall not be less than 0.85 lagging;
6. The luminaire shall be radio interference suppressed to limits specified in BS EN 55015 or EN 55015. Test reports shall be submitted as evidence of compliance as and when required by the Contract Manager;
7. The maximum controlgear loss of the lamp shall be equal or smaller than the maximum allowable value as specified in the table below:

Lamp type	Nominal lamp wattage (L_w)	Maximum allowable lamp controlgear loss (W)
Compact fluorescent	L_w < 18W	6
	$L_w \geq$18W	9

8. The input power of the ballast/lamp circuit shall meet Class B1 of proposed CELMA standard.

ELE21.17.020.9 LAMP TYPE

1. The luminaire shall be compatible with either single or twin 24W 4-pin 2G10 compact fluorescent lamp;
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.17.030.9 LIGHT DISTRIBUTION

1. The luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic certified by independent accredited laboratory as follows:

Angle from Vertical Plane (Degrees)	Luminous Intensity (Cd / 1000 lumen)	
	Transverse plane	Axial plane
0 - 5	> 125	> 125
10 - 15	> 120	> 120
20 - 25	> 115	> 115
30 - 35	> 110	> 110
40 - 45	> 85	> 85
50 - 55	> 75	> 75
60 - 65	> 60	> 60
70 - 75	> 40	> 40
80 - 90	> 20	> 20

2. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

ELE21.17.040.9 CONSTRUCTION

1. The luminaire shall be supplied as a complete set comprising the main body, gear tray/reflector, diffuser, 4-pin 2G10 compact fluorescent tube, lampholder, ballast, power factor correction capacitor, starter, fused terminal block, integral earthing terminal and internal wiring;
2. The main body of the luminaire shall be a one piece moulded polycarbonate or aluminium alloy diecasting, pretreated and finished stoved enamel in cream or white colour on the outside surface. The main body shall be formed with knockouts on the mounting face for fixing to conduit and BESA box;
3. The gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The reflector/gear tray shall be securely mounted to the main body by screws, or other suitable means, which shall remain captive with the main body, or the tray, when the tray is detached from the main body. In the detached position, the tray shall be securely strapped or hinged to the main body;
4. The ballast, capacitor, starter and 4-pin lampholder shall be conveniently positioned and securely fixed onto the tray. The starter shall be positioned in such a way as to be accessible for detachment from the exterior of the gear tray without opening the gear tray;
5. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed in such a way as to be easily accessible for fuse replacement;
6. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 with a maximum conductor temperature of 90℃. Internal wiring shall be neatly wired and properly terminated. Under no circumstances shall the wiring be visible in the lamp compartment;
7. The diffuser shall be a one piece moulded clear prismatic or reeded polycarbonate. A circular trim can be mounted if required. The diffuser or the trim shall be fixed to the main body with secret head captive screws or equivalent, openable by a special tool, and shall be securely strapped or hinged to the main body when opened. The quality of diffuser, trim and main body if polycarbonate is used, shall be certified by an independent accredited laboratory on the following tests:

a. Impact test complying with BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25℃ without visible damage; and

b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.

8. A neoprene or silicone gasket shall be provided between the main body and the diffuser and shall be retained firmly in the purposely formed groove in the main body.

ELE21.18 NEW TUBULAR BULKHEAD FLUORESCENT LUMINAIRE WITH ELECTRONIC BALLAST (SF 72 & SF 74)

ELE21.18.010.9 GENERAL

1. The luminaire shall comply with BS 4533: Section 102.1 or EN 60598-2-1 or IEC 60598-2-1;
2. The luminaire shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. The luminaire shall be classified, as a minimum requirement, to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;
4. The electronic ballast used in the luminaire shall comply with ELE21.20;
5. The luminaire shall meet the electromagnetic compatibility requirements specified in BS EN 55015 and BS EN 61000-3-2 and BS EN 61547, or EN 55015 and IEC 61000-3-2 and IEC 61547. Test certificates or reports shall be submitted as evidence of compliance with the required standard;
6. The overall power factor of the luminaire shall not be less than 0.95 unless otherwise specified;
7. The maximum controlgear loss of the lamp shall comply with the requirements of the latest version of Hong Kong Voluntary Energy Efficiency Labelling Scheme for Electronic Ballasts, EMSD;
8. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

ELE21.18.020.9 LAMP TYPE

1. The luminaire shall be compatible with either single or twin 24W 4-pin 2G11 compact fluorescent lamp;
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.18.030.9 LIGHT DISTRIBUTION

1. The luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic certified by independent accredited laboratory as follows:

Angle from Vertical Plane (Degrees)	Luminous Intensity (Cd / 1000 lumen)	
	Transverse plane	Axial plane
0 - 5	> 175	> 170
10 - 15	> 170	> 165
20 - 25	> 165	> 150
30 - 35	> 150	> 135

40 - 45	> 140	> 110
50 - 55	> 130	> 75
60 - 65	> 130	> 40
70 - 75	> 120	> 15
80 - 90	> 110	> 10

2. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

ELE21.18.040.9 CONSTRUCTION

1. The luminaire shall be supplied as a complete set comprising the main part, gear tray/reflector, diffuser, 4-pin 2G11 compact fluorescent tube, lampholder, lamp supporter, ballast, fused terminal block, integral earthing terminal and internal wiring. Earthing terminal shall be fitted to the main part and not the reflector/gear tray;
2. The main part of the luminaire shall be a one piece aluminium alloy diecasting, pretreated and finished stoved enamel in cream or white colour on the outside surface. The main part shall be formed with knockouts on the mounting face for fixing to conduit and BESA Box. The two ends of the main part shall each be provided with a threaded hole for 20 mm conduit entry and shall be fitted with a suitable threaded plastic plug;
3. The gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The gear tray shall be securely hinged to the main part and maintained in normal position by captive screw(s);
4. An isolating device with tinned contacts shall be provided between the main part and the gear tray such that the mains supply will be isolated automatically on opening the gear tray;
5. The ballast, 4-pin lampholder and lamp supporter shall be conveniently positioned and securely fixed onto the tray;
6. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;
7. The electronic ballast shall be of preheat starting. One electronic ballast can be used for twin lamp circuit;
8. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 with a maximum conductor temperature of 90 ℃. Internal wiring shall be neatly wired and properly terminated. Under no circumstances shall the wiring be visible in the lamp compartment;
9. The diffuser shall be a one piece moulded clear prismatic polycarbonate. It shall be fixed to the main part with secret head captive screws openable by a special tool, and shall be securely strapped or hinged to the main part when opened. The quality of diffuser shall be certified by an independent accredited laboratory on the following tests:
    a. Impact test complying with of BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25°C without visible damage; and
    b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.

10. A neoprene or silicone gasket shall be provided between the main part and the diffuser and shall be retained firmly in the purposely formed groove in the main part.

ELE21.19 CIRCULAR BULKHEAD FLUORESCENT LUMINAIRE WITH ELECTRONIC BALLAST (SF 76 & SF 78)

ELE21.19.010.9 GENERAL

1. The luminaire shall comply with BS 4533: Section 102.1 or EN 60598-2-1 or IEC 60598-2-1;
2. The luminaire shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
3. The luminaire shall be classified, as a minimum requirement, to Class I and IP54 as described in BS EN 60598-1 or IEC 60598-1;
4. The electronic ballast used in the luminaire shall comply with ELE21.20;
5. The luminaire shall meet the electromagnetic compatibility requirements specified in BS EN 55015 and BS EN 61000-3-2 and BS EN 61547, or EN 55015 and IEC 61000-3-2 and IEC 61547. Test certificates or reports shall be submitted as evidence of compliance with the required standard;
6. The overall power factor of the luminaire shall not be less than 0.95 unless otherwise specified;
7. The maximum controlgear loss of the lamp shall comply with the requirements of the latest version of Hong Kong Voluntary Energy Efficiency Labelling Scheme for Electronic Ballasts, EMSD.

ELE21.19.020.9 LAMP TYPE

1. The luminaire shall be compatible with either single or twin 24W 4-pin 2G10 compact fluorescent lamp;
2. The exact type of lamp used shall be as specified in ELE2 or on the Drawings.

ELE21.19.030.9 LIGHT DISTRIBUTION

1. The luminaire, in each of transverse plane and axial plane, shall have the light distribution characteristic certified by independent accredited laboratory as follows:

Angle from Vertical Plane (Degrees)	Luminous Intensity (Cd / 1000 lumen)	
	Transverse plane	Axial plane
0 - 5	> 125	> 125
10 - 15	> 120	> 120
20 - 25	> 115	> 115
30 - 35	> 110	> 110
40 - 45	> 85	> 85
50 - 55	> 75	> 75

60 - 65	> 60	> 60
70 - 75	> 40	> 40
80 - 90	> 20	> 20

2. Photometric data shall be submitted for assessment to ascertain that the luminaire is suitable for the intended application as requested by the Contract Manager.

ELE21.19.040.9 CONSTRUCTION

1. The luminaire shall be supplied as a complete set comprising the main body, gear tray/reflector, diffuser, 4-pin 2G10 compact fluorescent tube, lampholder, ballast, fused terminal block, integral earthing terminal and internal wiring;
2. The main body of the luminaire shall be a one piece moulded polycarbonate or aluminium alloy diecasting, pretreated and finished stoved enamel in cream or white colour on the outside surface. The main body shall be formed with knockouts on the mounting face for fixing to conduit and BESA box;
3. The gear tray shall be made of substantive sheet steel or diecast aluminium alloy, pretreated and finish coated in gloss white stoved enamel. The reflector/gear tray shall be securely mounted to the main body by screws, or other suitable means, which shall remain captive with the main body, or the tray, when the tray is detached from the main body. In the detached position, the tray shall be securely strapped or hinged to the main body;
4. The ballast and 4-pin lampholder shall be conveniently positioned and securely fixed onto the tray;
5. A fused terminal block, fitted with a suitably-rated fuse to BS 1362 or IEC 60269-1, shall be properly fixed to the body in such a way as to be easily accessible for fuse replacement;
6. The electronic ballast shall be of preheat starting. One electronic ballast can be used for twin lamp circuit;
7. The luminaire shall be neatly wired up with heat resistant PVC cable to BS 6231 with a maximum conductor temperature of 90℃. Internal wiring shall be neatly wired and properly terminated. Under no circumstances shall the wiring be visible in the lamp compartment;
8. The diffuser shall be a one piece moulded clear prismatic or reeded polycarbonate. A circular trim can be mounted if required. The diffuser or the trim shall be fixed to the main body with secret head captive screws or equivalent, openable by a special tool, and shall be securely strapped or hinged to the main body when opened. The quality of diffuser, trim and main body if polycarbonate is used, shall be certified by an independent accredited laboratory on the following tests:
    a. Impact test complying with BS EN 60598-1 or IEC 60598-1 with impact energy of 6.5Nm at 25°C without visible damage; and
    b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change.
9. A neoprene or silicone gasket shall be provided between the main body and the diffuser and shall be retained firmly in the purposely formed groove in the main body.

ELE21.20 ELECTRONIC BALLAST

ELE21.20.010.9 GENERAL

1. The electronic ballast shall comply with BS EN 61347-1 or IEC 61347-1, BS EN 61347-2-3 or IEC 61347-2-3 and BS EN 60929 or IEC 60929;
2. The electronic ballast shall be suitable for 220V ±6% 50Hz supplies;
3. The electronic ballast shall be automatically re-start after a sudden voltage fluctuation outside its normal operating range and the luminaire shall resume to normal operation.

ELE21.20.020.9 QUALITY ASSURANCE

1. The electronic ballast shall be licensed with the BSI Kitemark/ENEC Mark Scheme or with an equivalent Quality Surveillance Scheme. The license and associated type-test report(s) issued by BSI or the licensing organisation shall be submitted as evidence of compliance with the required standard;
2. The electronic ballast shall be radio interference suppressed to limits specified in BS EN 55015 or EN 55015. Harmonics generated by electronic ballast shall be within the limit set by BS EN 61000-3-2 or IEC 61000-3-2. The total harmonic distortion (THD) of supply current shall be less than 15%. The electronic ballast shall comply with the EMC immunity requirements in BS EN 61547 or IEC 61547. Test certificates or reports shall be submitted as evidence of compliance with the required standard.

ELE21.20.030.9 ENERGY EFFICIENCY

The maximum controlgear loss of the lamp shall comply with the requirements of the latest version of Hong Kong Voluntary Energy Efficiency Labelling Scheme for Electronic Ballasts, EMSD.

ELE21.20.040.9 PERFORMANCE

1. The overall power factor of the luminaire shall not be less than 0.95;
2. The ambient temperature (ta) of the electronic ballast shall be ranged from -5°C to +50°C;
3. The electronic ballast shall withstand a casing temperature (tc) of 70°C minimum;
4. The mean service life at maximum case temperature shall be 50,000 hours minimum;
5. The lamp operating frequency shall be larger than 30kHz unless otherwise specified;
6. The leakage current of each ballast shall be less than 0.5mA;
7. The electronic ballast shall withstand overvoltage at 320V for one hour;
8. The electronic ballast shall allow high voltage insulation testing (Megger testing) of building wiring to be undertaken without disconnecting the power supply.

ELE21.20.050.9 PROVEN RECORD OF RELIABILITY

The electronic ballast shall have satisfactory proven record of reliability in local service for a minimum period of one (1) year after all the above mentioned type test certification.

ELE21.20.060.9 SUITABILITY FOR APPLICATION

The maximum number of electronic ballast suitable for use with Type B or C miniature circuit breaker in accordance with BS EN 60898-1 or IEC 60898-1 at different lamp wattage shall be submitted for assessment to ascertain that the ballast is suitable for intended application when required by the Contract Manager.

ELE21.21 FLUORESCENT LUMINAIRE AND LAMP (T5)

ELE21.21.030.9 LUMEN OUTPUT FOR 16 MM DIAMETER (T5) TUBULAR FLUORESCENT LAMPS

Rated power of lamp (W)	Min. Lumen output at 25°C (4000K)	Length (mm)
14	1200	549
21	1900	849
28	2600	1149
35	3300	1449
24	1750	549
39	3100	849
54	4450	1149
49	4300	1449

ELE21.21.040.9 AVERAGE RATED LIFE FOR FLUORESCENT LAMP (T5)

The average rated life of fluorescent lamp (T5) shall be not less than 20,000 hours.

ELE21.22 MOTION DETECTOR UNIT

ELE21.22.010.A GENERAL

Motion detector unit shall consist of a motion sensor mounted on a steel housing with terminal block inside for connection of cable. It shall be used to control the on / off of the light fitting by detection of motion and ambient light level. The unit shall be surface mounted via the concealed conduit entry on the body of the light fitting.

ELE21.22.020.A CONSTRUCTION

1. The housing of the motion detector unit shall be made of galvanized sheet steel of not less than 1.6 mm thick. The inside and outside surfaces shall be painted with one coat of primer, followed by a coat of stoved enamel finish of colour same as that of the light fitting to be controlled;
2. Cable termination blocks, properly fixed to the housing, shall be provided for connection of cables in / out the unit. A fused terminal block, fitted with a suitably rated fuse to BS 1362 or IEC 60269-1, shall be provided for the phase conductor;
3. The connection between the motion detector unit and the light fitting shall be neatly wired up with heat resistant PVC cable to BS 6231 or IEC 60227-3 with a maximum conductor temperature of 90℃. Alternatively, protection shall be by means of sleeving the insulation of the cables with fibre glass or other equivalent heat resistant insulating materials. The sleeves shall be provided for all cables within the luminaire.

ELE21.22.030.9 MOTION SENSOR

1. The motion sensor shall be flush-mounted on the housing and comply with the following specification:
   a. Type of sensor: passive infrared, ceiling mounted;
   b. Operation voltage: 220V, 50Hz, single phase a.c. supply;
   c. Detection range: 360 degree;
   d. Detection distance: 3 m at floor level for 2.5 m mounting height;
   e. Connected load: capable to supply upto 100W circuit of fluorescent light fittings;
   f. Time delay: automatically turns off 10 minutes (adjustable) after no motion object is detected;
   g. Built-in light level sensor (to be provided when specified on Drawings): turns the connected light fitting off when natural light level raised above a pre-set level which shall be adjustable to suit the site conditions;
   h. Quality standard: U.L. listed or equivalent certification.
2. The setting of the motion detector unit shall not be affected by switching on/off of the power supply to the circuit.

ELE21.22.040.9 MOCK-UP INSTALLATION

The motion detector units and the associated light fittings shall be installed at the sample floor for testing. Approval on the motion detector units shall be given only when the function has been tested to be satisfactory.

ELE21.22.050.X DELETED

ELE21.23 BULKHEAD TYPE LIGHT EMITTING DIODE (LED) LUMINAIRES (SF84 & SF85)

ELE21.23.010.9 GENERAL

1. The luminaires shall be suitable for operation at:
   a. 220V + 10%, 50 Hz + 2%, single phase, mains supply;
   b. Ambient temperature: peak 40℃ for 4 hours continuously with an average of 35℃ over 24 hours period;
   c. Ambient relative humidity: up to 98%.
2. The luminaires shall be fully assembled and passed the burn-in test under the specified ambient conditions for 48 hours before shipment from factory;
3. The luminaires shall be integrated with thermal management system such that no force ventilation (e.g. electric fan) shall be employed for cooling;
4. Enclosure of the luminaires shall have a degree of protection meeting the minimum requirement of IP54 as described in IEC 60529;
5. The luminaires design shall duly consider elimination of discomfort glare with adoption of appropriate glare control diffuser and/or reflector, etc.. The rating of discomfort glare caused directly from the luminaires shall be calculated for each typical installation area in compliance with recommendations of authoritative guidance such as the CIE Unified Glare Rating Method. Full set calculation basing on eye level at 1.5m above finished floor together with photometric data shall be provided;
6. Technical information of the luminaires including identity and technical data of key components (e.g. LED, driver unit, light diffuser, etc.) together with relevant certificates of compliance and test report on measurements basing on the IES LM-79-08 Method shall be submitted. The IES LM-79-08 report shall be issued by testing laboratory accredited by the Hong Kong Accreditation Service (HKAS) or their equivalence under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or a scheme for which HOKLAS has concluded a mutual recognition agreement;
7. In case the luminaires manufacturer wishes to change any key component(s) (e.g. LED, driver unit, light diffuser, etc.) or to modify the circuit design, the new luminaires configuration shall produce at least the same quantity and quality of light (i.e. correlated colour temperature, colour rendering index, lumen output, etc.) and shall be submitted to the accredited laboratories specified in sub-clause (6) for testing. Full set of the relevant certified test reports in accordance with the IES LM-79-08 Method must be submitted for inspection;
8. The luminaires manufacturer shall have at least three years of proven experience and history in the design and manufacture of LED lighting systems; particularly lighting products for illumination purpose, relevant company information and job references shall be provided;
9. The luminaires including key components submitted for the IES LM-79-08 test shall have been in continuous and satisfactory operation either locally and / or overseas for at least one year up to the time of tender submission. The corresponding in-service records with supply scale and proven satisfactory operation shall be submitted for information.

ELE21.23.020.9 CONSTRUCTION

1. The luminaires shall be supplied as complete sets each comprising the housing enclosure, light diffuser, LED panel, segregation partition, fused terminal block, integral earth terminal, driver unit and internal wiring. Both the fused and earth terminal blocks shall be fitted at the inside surface of the housing instead of the segregation partition;
2. The housing of the luminaires shall be a one piece aluminium alloy diecasted, pretreated and finished in cream or white colour epoxy powder coating on the outside surface. The housing shall be formed with knockouts on the mounting face for fixing to conduit and BESA Box. The two ends of the housing shall each be provided with a threaded hole for 20mm diameter conduit entry and shall be fitted with a suitably threaded plastic plug;
3. The segregation partition shall be made of sheet steel or aluminium alloy. It shall be securely hinged to the housing and maintained in normal position by captive screw(s);
4. An isolating device with electrical contacting pins complying with IEC 60998-1 shall be provided inside the housing such that the mains supply will be isolated automatically on opening the hinged partition;
5. The LED panel shall be securely fixed onto the segregation partition interlaid with thermal grease, thermal pad or thermal epoxy. The driver unit shall be conveniently positioned either at the inside surface of the housing or on the other side of the segregation partition as appropriate to suit the housing enclosure and thermal management design. Both the LED panel and driver unit shall be easily replaceable without the use of special tools;
6. A fused terminal block fitted with a 2A fuse to BS 1362 or IEC 60269-3 shall be properly fixed onto the inside surface of the housing in such a way as to be easily accessible for fuse replacement;
7. Wiring inside the housing enclosure shall be of heat resistant copper cable to BS 6231 Table 2 or IEC 60227-3 or other international standards with rated conductor operating temperature of at least 90℃. Internal wiring of different voltage categories shall be neatly segregated, wired and properly terminated. Under no circumstance shall the internal wiring be visible after removing the light diffuser from the housing enclosure;
8. The cable connection between components after the fused terminal block shall be in the form of plug and socket or other connection means to facilitate easy replacement of individual components;
9. The light diffuser shall be moulded prismatic / translucent polycarbonate or other types of durable material. It shall be fixed to the housing with secret head captive screws openable by a special tool, and shall be securely strapped or hinged to the housing when opened. The diffuser shall be certified by an independent accredited laboratory on compliance to the following tests:
    a. Impact test complying with Section 4.13 of IEC 60598-1 with impact energy of 6.5Nm at 25°C without visible damage;
    b. Exposure test complying with BS EN ISO 4892-2 for a period of not less than 48 hours exposure without visible change;
    c. Glow wire test at 850 ℃ according to BS EN 60598-2-22.
10. A neoprene or silicone gasket shall be provided between the housing and the light diffuser and shall be retained firmly in the purposely formed groove in the housing;
11. Alternative luminaires construction may be accepted subject to meeting the performance specification and with the approval of the Contract Manager.

ELE21.23.030.9 LED PANEL

1. The LED panel comprising array of LEDs on a metal core printed circuit board or thermally enhanced substrate incorporated with thermal, mechanical, and electrical interfaces shall be fixed onto the segregation partition. The selected LEDs shall comply with the following minimum requirements:
   a. Colour rendering index (CRI) : not less than 75;
   b. Correlated colour temperature (CCT): 4,000K (nominal) [3,985K (target) + 275K tolerance];
   c. Chromaticity of LEDs: variation within 0.007 on the CIE 1976 (u',v') diagram over the Maintenance Period.
2. The Sub-contractor shall submit written confirmation from the luminaires manufacturer that the selected LED manufacturer has the patent right to produce the supplied LED chipsets including the relevant packaging technology together with the material submission;
3. Circuit design and configuration of the LEDs shall be such that in case a single LED fails open or short circuit, minimum 80% of the remaining LEDs shall maintain operation. Should a single LED fails open or short circuit, the other LEDs shall not be overstressed significantly thus increasing the likelihood that other LEDs will fail;
4. Detail specification of the LED array including the following information shall be submitted:
   a. Colour rendering index, correlated colour temperature including the binning and rated junction temperature of individual LED;
   b. Power rating, design driving current and forward voltage range of individual LED;
   c. IES LM-80-08 test report issued by the United States Environmental Protection Agency recognized accreditation bodies accredited laboratory basing on LED solder point temperature of 55°C, 85°C and a third temperature selected by the LED manufacturer;
   d. Basing on the luminaires design, internal components configuration, and the ambient conditions specified in ELE21.23.010, the associated calculations and thermal test report shall be submitted for substantiation of the anticipated maximum operating junction temperature of LED(s) within the array;
   e. Design operating voltage range of the LED array;
   f. Design total lumen output from the LED array;
   g. Design operating current and power consumption of the LED array at the respective driver unit dimming settings of 60%, 70%, 80%, 90% and full lumen output at 100%;
   h. Calculations on the projected service life at 90% and 70% of initial lumen output (i.e. L90 and L70).

ELE21.23.040.9 LED DRIVER

1. Constant current mode LED driver shall be offered for connection between the fused terminal block and the LED panel. The driver unit shall be compatible with the connected LED array and selected to fulfil the LED array power consumption requirement with safety margin;
2. The driver unit shall include components for power factor correction, radio interference suppression, harmonic suppression and also dimming facility;

3. Overload, short circuit, over voltage, over temperature and surge protection shall be incorporated with auto-recovery capability;

4. The dimming circuitry shall be designed for five steps lumen output control, namely, 60%, 70%, 80%, 90% and 100% with tolerance of ±5% at each step using either PWM or analogue DC voltage control signal. The dimming circuit design shall eliminate flickering effect and hence visual fatigue. A toggle / rotary switch with position indicator shall be provided on the segregation partition aside the LED panel to facilitate easy adjustment of the dimming setting;

5. Efficiency of the driver at dimming settings of 80% and above shall not be less than 80%;

6. The design service life of the driver units operating inside the luminaires at the ambient conditions specified in ELE21.23.010 shall be at least 50,000 hours basing on cumulative failure rate of 10%. In-house reliability validation report or test report issued by accredited laboratory for the driver unit shall be submitted;

7. Detail specification of the driver unit including the following information shall be provided:

   a. Make and technical data of electrolytic capacitors adopted inside the driver unit including the temperature rating, voltage rating and service life, etc.;

   b. Make and technical data of LED driver control IC including the MTBF rate / Failure-In-Time rate, life expectancy, circuit protections, etc., in case the component has been incorporated in the driver circuit;

   c. Electrical operating parameters and dimming methodology as adopted by the driver unit;

   d. Driver casing temperature at the manufacturer's declared temperature measurement point for the hottest spot on the driver casing. In any case, the design casing withstanding temperature shall not be less than 70 ℃;

   e. Test report for the driver unit casing temperature taken at the temperature measurement point under the operating ambient conditions specified in ELE21.23.010 and dimming setting at 100% full lumen output;

   f. Test report recorded the respective driver losses at the rated output current and at the operating current under different dimming settings;

   g. Drawing showing the physical dimensions and screw fixing positions of the driver unit.

ELE21.23.050.9 PERFORMANCE REQUIREMENTS

1. The luminaires shall comply with the following performance requirements:

a.	Maximum LED junction temperature within the array	:	not exceeding the temperature at which 70% of the initial lumen output be maintained at 50,000 operating hours referencing to the IES LM-80-08. The lumen output at 50,000 operating hours can be inferred from the test with test duration not less than 9,000 hours and from IES TM-21-11 for the offered LEDs basing on ambient temperature of luminaire projected to 40ºC
b.	Luminaire efficacy	:	minimum 70 lm/W at 100% full lumen output
c.	Estimated lumen maintenance	:	lumen output of the installed luminaires shall be maintained at or above 90% and 70% of the initial value (i.e. minimum 700 lumen initially for SF84 and 1400 lumen for SF85) after operating for 2 years and 5.7 years respectively

basing on 24 hours operation a day

d.	Overall power consumption of the luminaires	:	Maximum 10W for SF84 and 20W for SF85 respectively
e.	Overall operating power factor of the luminaires	:	0.85 (minimum) at all dimming settings
f.	Total harmonic distortion (THDI)	:	15% (maximum) at 100% setting
g.	Surge immunity level according to IEC61000-4-5	:	4kV

ELE21.23.060.9 STANDARD

1. The bulkhead type LED luminaires, their components and constituent parts shall comply with the following standards:

Luminaires / Components / Materials	**Recognised Standard or Approved Equivalent**	
Luminaires	Luminaires – Part 1: General Requirement	IEC 60598-1 Class 1
	Luminaires – Part 2: Particular Requirements Section 1: Fixed General Purpose Luminaires	IEC 60598-2-1
	Luminaires – Part 2-22: Particular Requirements on non-flammability provisions and external parts subject to 850^{o}C glowing / hot wire test	BS EN 60598-2-22
	IESNA Approved Method for the Electrical and Photometric Measurements of Solid-State Lighting Products	IES LM-79-08
	Electromagnetic Compatibility (EMC) Limits	IEC 61000-3-2 IEC 61000-3-3
	Limits and Methods of Measurement of Radio Disturbance Characteristics of Electrical Lighting and Similar Equipment	EN 55015 / CISPR 15
	Equipment for General Lighting Purposes – EMC Immunity Requirements	IEC 61547
	Telecommunications (Control of Interference) Regulations	Cap 106B
	Photo-biological Safety of Lamps and Lamp Systems	IEC 62471
LED chipset	IESNA Approved Method for Measuring Lumen Maintenance of LED Light Sources	IES LM-80-08
	LED Modules for General Lighting – Safety Specifications	IEC 62031
	IESNA Projecting Long Term Lumen Maintenance of LED Light Sources	TM-21-11

Driver unit	Lamp Controlgear - Part 1: General and Safety Requirements	IEC 61347-1
	Lamp Controlgear - Part 2-13: Particular Requirements for D.C. or A.C. Supplied Electronic Controlgear for LED Modules	IEC 61347-2-13
	DC or AC Supplied Electronic Control Gear for LED Modules – Performance Requirements	IEC 62384

ELE21.23.070.9 LIGHT DISTRIBUTION

1. Full set of photometric data for the luminaires prepared to IES format including the polar curve on the light distribution shall be submitted. The photometric data shall be certified by an independent accredited laboratory;
2. The luminous flux of SF85 shall be at least double that of SF84;
3. Software simulation of the lighting effect shall be submitted for Contract Manager's approval basing on photometric data of SF84 and the following design requirements:
    a. Typical corridor width of 1.5m;
    b. Fixing height of luminaires at 2.4m above finished floor;
    c. Spacing of 1.8m measured from centre to centre of adjacent luminaires;
    d. Reflectance of architectural finishes to be 0.8 for ceiling, 0.75 for the walls and 0.4 for the floor;
    e. Illumination level at the finished floor along the centre line of the corridor shall achieve a minimum of 85 lux (i.e. based on a maintenance factor of 70% with the driver units dimming setting at 100% full lumen output);
    f. Vertical illumination level measured on wall at 1.2m above finished floor shall achieve a minimum of 70 lux (i.e. based on a maintenance factor of 70% lumen maintenance with the driver units dimming setting at 100% full lumen output).

ELE21.23.080.9 VERIFICATION OF PERFORMANCE

1. The cumulative failure rate of each type of luminaires installed at each domestic block shall not exceed 5% and the lumen maintenance shall not be less than 90% of the initial illumination level at the end of Maintenance Period;
2. Typical installation areas installed with SF84 and SF85 with dimming setting designated by the Contract Manager at each domestic block shall be selected for verification of initial illumination level before completion of relevant Section of Works and illumination measurements shall be conducted in accordance with the illuminance grid spacing as recommended in BS EN 12464-1. The luminaires should have been initially run for a period recommended by the LED manufacturer before conducting the illumination measurement. Contract Manager or his representative, the Sub-contractor and the local supplier / agent together with the luminaires manufacturer shall be present to witness the illumination measurement while the associated report shall be submitted for record;
3. 5 nos. SF84 and 5 nos. SF85 shall be randomly selected from each domestic block, and packed at the presence of Contract Manager's representative and the Sub-contractor with proper marking and identification. These luminaires shall be further sent to an accredited laboratory for measurement of photometric parameters covering luminous flux, CRI, CCT and luminaire efficacy, etc.. The relevant photometric measurement report shall then be submitted for record and the luminaires shall be re-installed at different locations within the building as assigned by the Contract Manager or his representative;

4. Illumination measurements shall be, unless otherwise instructed by the Contract Manager, continuously conducted quarterly in the first year and half-yearly in the second year at each selected area as identified in sub-clause (2) after the initial illumination measurement. The Sub-contractor shall submit measurement report within 2 weeks after each measurement. In case the illumination level falls below 90% of that measured at the end of the Maintenance Period, the Sub-contractor shall take down the luminaires at the concerned area(s) identified in sub-clause (3) above for further sending to an accredited laboratory for verification of photometric performance. The associated costs for testing and installation of replacement luminaires for continuation of lighting services shall be borne by the Sub-contractor;

5. In case the cumulative failure rate stated in sub-clause (1) exceeds 5% or test report from the accredited laboratory indicates any taken down luminaires in sub-clause (4) with measured photometric parameter(s) below the Specification requirement, particularly if average lumen maintenance falls below 90% as compared with initial test result identified in sub-clause (3), the Sub-contractor shall accompany the local supplier / agent together with the luminaires manufacturer on investigating the cause(s) leading to the high failure rate and / or excessive degradation on the photometric performance. The Sub-contractor shall then submit a report explaining the root cause(s) and an improvement action plan for approval. Notwithstanding the explanation of root causes and the improvement action plan, the Contract Manager can instruct all the luminaires installed in the whole block(s) be replaced with brand-new ones, and the associated cost shall be borne by the Sub-contractor;

6. The Sub-contractor shall coordinate with the local supplier / agent together with the luminaires manufacturer to provide free on-site technical support during commissioning of the installation works at the project completion stage and illumination measurements and assessment of lighting performance during the Maintenance Period.

ELE21.23.090.X DELETED

ELE21.23.100.9 QUALITY ASSURANCE

1. The luminaires manufacturing plant and facilities shall conform to ISO 9001 with proper quality control scheme in place to assure delivering consistent and high-quality products. Relevant documentation shall be provided upon request by the Contract Manager to substantiate the quality assurance system covering the purchasing and quality control of luminaires components, luminaires design and manufacturing process, qualification and experience of plant operating personnel as well as testing (including the burn-in test) and delivery of end products;

2. The luminaires including their components shall be “Restricted of Hazardous Substances (RoHS)” and complying with EC Directive. The luminaires manufacturer shall keep up to date the appropriate documentation for the components used and quality control processes in place ensuring RoHS compliance. Relevant documentation shall be provided upon request by the Contract Manager;

3. The luminaires shall be of certified products under the “Product Certification Scheme for LED Lighting Products” published by the Hong Kong Electronic Industries Association. The product conformity certificate shall be issued by a certification body accredited by the Hong Kong Accreditation Service (HKAS) or an accreditation body which has entered into a mutual recognition agreement with the HKAS.

ELE21.23.110.9 UNIT RATES OF SPARE PARTS

1. The Sub-contractor shall obtain written confirmation from the local supplier / agent of the luminaires on the associated unit rates for major spare parts including the LED panel, driver unit and light diffuser, etc. at the end of the Maintenance Period for reference.

ELE21.24 LIGHTING MANAGEMENT SYSTEM

ELE21.24.010.N GENERAL

1. Where specified in the Project Specific Specification or shown on the Drawings, Lighting Management (LM) System shall be provided for overall control of lighting system;
2. All materials and equipment of the LM System shall be products of manufacturer certified under ISO 9001 quality assurance standard. The LM System shall be of proprietary product and have well-proven relevant local job references. For new LM system which has not been installed in Hong Kong before, demonstration on the performance of the LM system shall be provided to the satisfaction of the CM before approval of it.

ELE21.24.020.N SYSTEM REQUIREMENT

1. The LM System shall consist of, but not limited to, interfacing units, controllers, lighting control modules, field devices and distributed communication network that enables complete control and operation of the LM System. Where specified in the Project Specific Specification or shown on the Drawings, the user / operator workstation shall be provided and comprise of keyboard, mouse and minimum 23" LED monitor display;
2. Field devices shall include, but not limited to, local lighting control switches, dimming control switches, colour changing switches, and other devices as specified;
3. The LM System shall be fully addressable and configured in a total system integrated approach, allowing the connected field devices be independently supervised by the lighting control modules;
4. The LM System and equipment including the lightings shall be configured in high degree of flexibility in ease of extension, modification, adaptability and re-programming of the lighting installation to cater for future addition, alteration and rezoning / regrouping of lighting control;
5. The LM System shall be provided with maintenance by-pass or other similar feature so that the lighting fittings can be locally isolated for "ON" switching in case of ad-hoc need, emergency or equipment failure;
6. The communication network shall be of Cat 5 unshielded twisted pair (UTP) cable or similar to be approved by the CM. Where the LM system of digital addressable type is specified, the communication network shall be of the type as recommended by the system manufacturer.

ELE23.3 GENERAL & SPECIAL REQUIREMENTS

ELE23.3.1 - SCOPE

ELE23.3.1.010.9 INSTALLATION TO COMPLY WITH THIS SPECIFICATION

The communal aerial broadcasting distribution (CABD) installation shall comply in every respect with this Specification which details the intrinsic properties (including materials and workmanship) of the installation unless otherwise specified in the currently in force Hong Kong Laws, Project Specific Specification, Drawings and/or written instructions by the Contract Manager.

ELE23.3.1.020.9 SCOPE OF THE WORKS

This Specification, Project Specific Specification, Tender Equipment Schedule and Drawings detail the performance requirements of the Works. The Works to be carried out in accordance with this Specification shall include the whole of the design for a CABD installation only, installation and supply of all materials necessary to form a complete installation including any necessary tests, adjustments, commissioning and maintenance as prescribed and all other incidental sundry components together with the necessary labour for installing such components, for the proper operation of the installation.

ELE23.3.1.030.9 TERMS AND DEFINITIONS

In this Specification, the following words or expressions shall have the meanings assigned to them except when the context otherwise requires:

Guided Drawings	The drawings for reference purpose to show detailed arrangements of the common standard installations.
Headend	Equipment connected between the receiving aerials and the remainder of the broadcast reception system to process the signals to be distributed. The headend may, for example, comprise channel amplifiers, channel converters, combining and separating networks.
Splitter	A device in which the signal energy at the input port is divided equally or unequally between two or more output ports.
Tee-unit	A device that a 'through' output to connect a series of other Tee-units in cascade and one, or more user's tap for connecting to user's outlets.

ELE23.3.1.040.9 EXECUTION OF THE WORKS

1. The Sub-contractor shall employ a contractor on the “List of Approved Suppliers of Materials and Specialist Contractors for Public Works” for “Broadcast Reception Installation” to carry out the works for the CABD system. The name of the contractor shall be included on the Schedule of Information to be supplied by Tenderer at the time of tender submission. Subsequent to the acceptance of tender, the afore-mentioned contractor shall not be changed unless otherwise approved by the Contract Manager;

2. The “List of Approved Suppliers of Materials and Specialist Contractors for Public Works” for “Broadcast Reception Installation” may be found on the website of the Development Bureau, the Government of the HKSAR.

ELE23.3.2 - STATUTORY OBLIGATIONS AND OTHER REGULATIONS

ELE23.3.2.010.9 STATUTORY OBLIGATIONS AND OTHER REQUIREMENTS

The CABD installation shall comply with the statutory obligations stipulated in the following Laws of the HKSAR and other documents currently in force:

1. Statutory Obligations:
    a. The Specification No. HKTA-1103 "Performance Requirements of Television Signals Input to the Head End of Subscription Television System";
    b. The Specification No. HKTA-1104 "Performance Requirements for In-building Coaxial Cable Distribution System (IBCCDS)" issued by the Office of Communications Authority (OFCA) (hereinafter referred to as the Performance Specification;
    c. The Specification No. HKTA-1105 "Technical Information for Frequency Planning of In-Building Coaxial Cable Distribution System(IBCCDS)" issued by OFCA;
    d. Fire Service (Installations and Equipment) Regulations, Fire Services Ordinance, Chapter 95, and other subsidiary legislation made under the Ordinance;
    e. Other Statutory Regulations as detailed in ELE1.4.010.
2. Other Requirements:
    a. Testing & Commissioning Procedure No. 7 for Broadcast Reception Installation in Government Buildings, Hong Kong issued by Building Services Branch, Architectural Services Department, the Government of the HKSAR;
    b. Other Standards as detailed in ELE1.4.020.
3. Safety Requirements:
    a. The Specification No. HKTA-1101 "Performance and Safety Requirements for Subscription Television System";
    b. The Specification No. HKTA-1102 "Radiation Limits and Measurement Methods for In-Building Coaxial Cable Distribution System (IBCCDS)";
    c. The Specification No. HKTA-1104 "Performance Requirements for In-building Coaxial Cable Distribution System (IBCCDS)" issued by OFCA (hereinafter referred to as the Performance Specification.);
    d. The Specification No. HKTA-1105 "Technical Information for Frequency Planning of In-building Coaxial Cable Distribution System (IBCCDS)" issued by OFCA;
    e. Other safety requirements as detailed in ELE1.4.010.

ELE23.4 INSTALLATION METHODOLOGY

ELE23.4.1 - CABD SYSTEM DESIGN

ELE23.4.1.010.9 GENERAL

1. A CABD system is designed with an aim to convey the best receivable signal at a particular site to individual users sharing the same system. The CABD system performance shall comply with BS EN 60728-1 and BS EN 60728-10, or EN 60728-1 and EN 60728-10;
2. At any particular site, the CABD system shall be designed to convey the best receivable digital and analogue terrestrial TV and FM signals to individual users sharing the same system;
3. The CABD system shall allow for digital terrestrial TV broadcasting (DTTB) distribution whose details OFCA has announced. Furthermore, the CABD system shall meet the requirements laid down in HKTA 1104, HKTA 1105 & BS EN 60728-1 and BS EN 60728-10, or EN 60728-1 and EN 60728-10.

ELE23.4.1.020.9 VOLTAGE COVERED BY THIS SPECIFICATION

All apparatus, equipment, materials and wiring shall be suitable for use on 220V ±6%, 50 Hz ±2%, a single phase a.c. system.

ELE23.4.1.030.9 ONE CABD SYSTEM PER BUILDING BLOCK

One CABD system shall be installed for each building block in a particular project.

ELE23.4.1.040.9 CHOICE OF EQUIPMENT AND SITING OF AERIALS

1. For the avoidance of doubt, no signal field strength will be provided. The Sub-contractor shall be responsible for their own signal field strength measurements and deemed to have inspected, measured and investigated the actual conditions on site as necessary, and finding out any source of interference that may affect the installation for choice of equipment and sitting of aerials. The Sub-contractor shall be responsible for the performance of the CABD system in accordance with the specification.
2. The location of aerials shall be the best position for reception with minimum interference from reflection and tidal effect. Should the system be subject to such interference after the commissioning of the system, the Sub-contractor shall be responsible for all necessary rectification work including the relocation of aerials and modification / adjustment to the system to the satisfaction of the CM at no extra cost to the Employer during the Maintenance Period.

ELE23.4.1.050.9 SELECTING THE GAIN OF TV AND FM AERIALS

To maximize signal to noise ratio and to achieve good directivity, the gain of TV and FM aerials shall be chosen to be as high as possible and in compliance with other requirements when specified in the Project Specific Specification for the installation.

ELE23.4.1.060.9 SEPARATE DOWN LEADS FOR THE TV AND FM SIGNALS

1. The TV and FM signals shall be conveyed through separate down leads to the respective amplifiers in the headend circuit for amplification;

2. The Sub-contractor shall allow one spare down leads for future digital terrestrial television.

ELE23.4.1.070.9 SELECTION OF AMPLIFIERS

For systems design, which involves the use of amplifiers in the headend o drive the TV channel amplifiers and/or FM channel amplifier, the first amplifiers to be used for the TV and/or FM signal path shall be a TV bandpass preamplifier and/or a FM band preamplifier respectively. Alternatively, a TV bandpass filter shall be used for the TV signal path and shall be connected to the input of the first wideband amplifier, notwithstanding that it is a preamplifier or a distribution amplifier. Such design practice shall ensure that the amplifiers of the system shall not be overloaded by strong out-of-band signals.

ELE23.4.1.080.9 LOSS ALLOWANCE

A 3 dB attenuation factor shall be included in the calculation of system level to account for practical installation losses such as cable joints.

ELE23.4.1.090.9 ENCLOSURE OF HEADEND CIRCUIT COMPONENTS

The headend circuit components shall be enclosed in a well-ventilated enclosure fitted with lock. The equipment shall be adequately screened from radio interference caused by lift equipment, starters, etc.. The case shall be properly secured against the wall and have sufficient space for cable routing and bending.

ELE23.4.2 - PERFORMANCE REQUIREMENTS

ELE23.4.2.010.9 SIGNAL LEVELS AT FM/TV OUTLETS

The r.m.s. voltage of each vision carrier at the peak of the modulation envelope when measured at the user's outlet across a non-inductive 75 ohm resistor (or referred to 75 ohm) shall be:

1. Minimum level:
    a. 60 dBμV for analogue terrestrial TV signals;
    b. 50 dBμV for digital terrestrial TV signals;
    c. 50 dBμV for FM signals.
2. Maximum level:
    a. 77 dBμV for analogue terrestrial TV signals;
    b. 74 dBμV for digital terrestrial TV signals;
    c. 70 dBμV for FM signals.

ELE23.4.2.020.9 PERMISSIBLE DIFFERENT SIGNAL LEVELS IN AN OUTLET

1. The difference in level between the weakest and the strongest TV signals at the same outlet ("tilt") shall not exceed the following:
    a. 12 dB for frequency range between 47 and 862 MHz;
    b. 6 dB in the range of 60 MHz;
    c. 3 dB between adjacent channels.
2. The difference in level between the weakest and the strongest FM signals at the same outlet shall not exceed 15 dB for frequency range 88 and 108 MHz.

ELE23.4.2.030.9 INTERMODULATION

1. At each outlet, the level of any unwanted signal generated in the system in any channel shall make the minimum carrier-to-noise be the following:
   a. 44 dB for analogue terrestrial TV signals;
   b. 34 dB for digital terrestrial TV signals;
   c. 48 dB for FM signals.
2. Bit error rate (BER) of digital signals after error correction shall be better than 3 x 10^{-6};
3. Modulation error ratio (MER) shall be not less than 30 dB.

ELE23.4.2.040.9 MUTUAL ISOLATION BETWEEN OUTLETS

To minimize the local oscillator energy from one receiver causing interference to other receivers on the same cable system, the mutual isolation between outlets connected separately to a spur feeder shall not be less than 36 dB for Terrestrial TV, and 42 dB for FM signal.

ELE23.4.3 - TERRESTRIAL TELEVISION SYSTEM

ELE23.4.3.010.9 TERRESTRIAL AERIALS

1. The mast or poles and the aerials shall be of heavy duty construction and be designed to be able to operate normally under a loading pressure associated with a sustained wind speed of up to 170 km/hr. and gusts up to 240 km/hr. The Sub-contractor shall be responsible for liaison with the Main Contractor to ensure the support structure provided by the Main Contractor is adequate for their aerials installation and also be responsible for checking the positions of the builder's work on Site where reception is at its best before any concrete work is carried out;
2. If the FM aerial is required to be mounted on the same mast for the TV aerial, the TV aerial shall be mounted below the FM aerial and the two aerials shall be separated by at least 1.8 m apart so as to achieve the minimum interaction;
3. The aerial system shall be adequately earthed and protected against lightning in accordance with IEC 62305-1 by mean of bonding the aerial masts or supporting frames of antenna to the air termination for the lightning protection system under the sub-contract with at least 25x3 mm^2 aluminium tape or an acceptable equivalent;
4. Separate downleads shall be employed for the TV and FM aerials. The TV and FM signals shall not be combined in front of the channel amplifiers.

ELE23.4.3.020.9 PREAMPLIFIERS AND FILTERS

1. TV bandpass preamplifiers shall be used in weak TV field strength areas. Similarly, FM band preamplifiers shall be used in weak FM field areas;
2. Alternatively, TV/FM bandpass filters shall be incorporated if wideband preamplifier is used.

ELE23.4.3.030.9 AMPLIFIERS

1. Signal amplification within the system shall be provided with channel amplifiers at the headend for signal processing and wideband distribution amplifiers;
2. At sites where the aerial is not in direct line-of-sight with the transmitter, the channel amplifier shall be equipped with automatic gain control circuitry;

3. When channel amplifiers are required, this shall include one channel amplifier for FM reception, at least two (2) channel amplifiers for closed circuit TV reception, two (2) interconnection points to combiners / amplifiers transmitting four (4) UHF and twenty (20) VHF signals from Domestic Pay Television Programme Services (DPTPS), two (2) additional spare interconnection points for future uses and Nine (9) channel amplifiers for reception of any one TV channel group as required by the location of reception in accordance with the frequency plans allocated for TV and FM. DPTPS will provide the above combiners and amplifiers for their UHF and VHF signals. Only one TV channel group transmitted by any one transmitter shall be relayed;
4. The design levels used for the output of all amplifiers shall be 4 dB lower than their respective maximum allowable output with the exception of channel amplifiers equipped with AGC and all amplifiers following these AGC channel amplifiers. The maximum allowable output is the output level at which the specification limit for unwanted signal detailed in the wideband amplifiers, FM channel amplifiers and TV channel amplifiers & AGC channel amplifiers etc. can no longer be met with further increase in outputs;
5. The headend equipment of each system shall be installed at the topmost Telecom Room and / or as shown on the Drawings;
6. Cable routing shall be as short as possible and where possible screened from the sight of the TV Transmitter.

ELE23.4.3.040.9 FREQUENCY CONVERTERS

Television signals shall be conveyed at the received signal frequencies. If frequency conversion is required, the outlet frequencies shall be in the frequencies 470 to 862 MHz for television reception.

ELE23.4.3.050.9 UHF MODULATORS

The video signals from the closed circuit television system cameras shall be modulated to UHF range channels and combined at the headend of the system.

ELE23.4.3.060.9 SPLITTERS/TEE-UNITS

All splitters and tee units shall have a wide bandwidth to allow for cascaded mode of operation. The maximum number of tee units in cascade shall be limited to 6. Mock-up tests may be required to assess the design prior to installation, if in the opinion of the Contract Manager, the cascaded chain is too long as to create unacceptable signal tilting.

ELE23.4.3.070.9 COAXIAL CABLES

1. The wiring installation from the aerial and any interconnecting point of free TV signals at the topmost Telecom Room to the head-end equipment, amplifiers and tee units / splitters on other floors shall be carried out in surface / concealed conduit system and surface trunking system, and as shown on the Drawings;
2. Coaxial cables terminating at aerial arrays shall be neatly and securely fixed to the supporting structures by means of PVC strapping with nylon stubs or flexible moulded nylon self-locking cable ties at intervals not greater than 250 mm;
3. Co-axial cable shall not be bent to a radius smaller than 15 times the outer diameter of the cable. Joints in the cable runs and looping of cables at outlet terminals shall NOT be allowed;
4. All wiring shall be properly installed and segregated in accordance with the Electrical CoP;

5. The wiring installation in each domestic unit shall be in concealed conduits. The TV / FM socket outlets shall be mounted on concealed BS 4662 boxes located as shown on the Drawings. The number of the Sub-contractor's coaxial cables to be installed in a conduit of any size shall be limited to two (2);
6. A set of spare conduits running from the Meter / Telecom Room on respective floors to individual flats, along with the conduits for CABD system, is designated for future telecommunication and broadcasting services. Under no circumstances, will the Sub-contractor be allowed to use these spare conduit facilities. In addition, the Sub-contractor shall propose the conduits to be used for the CABD system and the number of cables running in each of them whereas no works can commence without the Contract Manager's prior approval for such proposal;
7. All coaxial cables shall have distinctive labels along its length. All coaxial cables except the underground cables shall be white or ivory in colour;
8. Domestic Pay Television Programme Services (DPTPS) Operators' coaxial cables will be run in common trunkings, conduits and boxes with the CABD coaxial cables. The Sub-contractor shall closely liaise and coordinate with the DPTPS Operators on the shared use of trunkings, conduits and boxes.

ELE23.4.3.080.9 FM/TV OUTLETS

1. Looping of outlets to achieve the sufficient isolation shall not be acceptable. Only isolation using splitters and tee units with isolation shall be considered;
2. The FM/TV socket outlets shall be mounted at 100 mm above the skirting level unless otherwise specified and located as shown on the Drawings;
3. The outlets shall be fixed on electrical accessory boxes with made of insulating material in compliance with 47 mm deep. BS 4662 boxes whose colour and shape shall match those of the FM/TV outlets. Outlets shall be white or ivory in colour.

ELE23.4.3.090.9 FIBRE OPTICAL CABLE SYSTEM

1. Fibre optical cable system should be provided where the length of main trunk cable without splice exceeds 200 meters. The fibre optical cable in riser shall be enclosed in a galvanized iron cable trunking with space factor not exceeding 40%. In any case, the cable trunking should not be smaller than 50 mm X 50 mm. Where the main trunk is installed underground, the fibre optical cables shall be protected by minimum 100 diameter galvanized iron pipes and cable draws;
2. Fibre optical cable amplifier shall be provided where the total attenuation loss of the optical circuit exceeds the maximum output power of the transmitter;
3. Loose tube buffer fibre optical cables shall be specified for outdoor or locations subject to moisture or temperature variations;
4. The length of fibre optical cables without splice between the optical transmitter and the fibre optical splitter shall not exceed 5000 meters and between the fibre optical splitter and the fibre optical transceiver exceeds 2000 meters.

ELE23.5 MATERIAL & EQUIPMENT

ELE23.5.1 - TERRESTRIAL TELEVISION SYSTEM

ELE23.5.1.010.9 TERRESTRIAL AERIALS

The terrestrial aerials shall be suitable for both analogue and digital terrestrial television and shall comply with EN 60728-11 and EN 50083-2 and EN 60728-5 and the following:

1. TV aerial should have a gain of at least 13 dB and a front to back ratio not less than 20 dB. The aerial shall be of the type to minimize ghost image;
2. FM aerial should have a gain of 4 to 7 dB;
3. The impedance of the aerial should be 75 ohm unbalanced;
4. The aerial system should be provided with a durable protective coating;
5. The aerial mast should be made of stainless steel;
6. The aerial should be capable of receiving digital signal.

ELE23.5.1.020.9 PREAMPLIFIERS AND FILTERS

The performance of the preamplifiers, TV bandpass preamplifiers, FM bandpass preamplifiers, TV bandpass filters and FM bandpass filters shall be suitable for both analogue and digital terrestrial television and shall comply with EN 60728-11 and EN 50083-2 and EN 60728-5 and the following:

1. Preamplifiers

Television Standard	CCIR – PAL I System
Frequency	FM : 88 to 108 MHz TV : 470 to 862 MHz
Gain	According to manufacturer's specification
Gain Control Range	In accordance with manufacturer's specification
Input	Split input configuration preferred
Maximum Output Level	According to manufacturer's specification
Unwanted Signal (IM-Distortion)	Better than –60 dB* at maximum output level
Stray RF Radiation	Less than 4×10^{-9}W
Noise Figure	Less than 3.5 dB
Flatness of Response	± 1.5 dB
Screen Factor	Not less than 60 dB
Hum Modulation	Better than –50 dB
Voltage Standing Wave Ratio (VSWR)	Input VHF Better than 1.5 : 1 UHF Better than 2 : 1 Output Better than 2 : 1
Impedance (Input & Output)	75 ohm

Connectors for Coaxial Cables	Saddle & screw clamp or F type connector
Operating Temperature	-10℃ to 60℃
Operating Humidity	Up to 98%
Power Supply	220V ± 6%, 50Hz ± 2Hz
Safety Isolation	Tested at 2 kV r.m.s. Designed to confirm to IEC 60065
Housing	Outdoor application

* Measured by two signal method with carrier frequencies set at reference zero

2. TV Bandpass Preamplifiers

Frequency Range	Within CH21 – CH62
Passband	According to manufacturer's specification & compatible with site conditions
Gain within Passband	According to manufacturer's specification
Unwanted Signal (IM Distortion)	Better than –60 dB* at maximum output level
Flatness of Response within passband	± 1.5 dB
Attenuation outside Passband (with reference to Passband Output Level)	At f_L -20 MHz ≥ 5 dB f_H +20 MHz f_L -60 MHz ≥ 18 dB f_H +60 MHz f_L -150 MHz ≥ 30 dB f_H +150 MHz where f_L: centre frequency of the lowest channel within the passband f_H: centre frequency of the highest channel within the passband
Noise Figure	Less than 3.5 dB
Impedance (Input & Output)	75 ohm
Screening Factor	Not less than 60 dB
Housing	Weatherproof housing suitable for outdoor mounting

* Measured by two signal method with carrier frequencies set at reference zero

3. FM Bandpass Preamplifiers

Frequency Range	88 to 108 MHz
Gain	According to manufacturer's specification & compatible with site conditions
Unwanted Signal Output (IM Distortion)	Better than –46 dB* maximum level

Flatness of Response within passband	± 1.5 dB
Selectivity (@ –20 dB point)	Not more than 60 MHz
Noise Figure	Less than 3.5 dB
Impedance (Input & Output)	75 ohm
Screening Factor	Not less than 60 dB
Housing	Weatherproof type housing for outdoor mounting

* Measured by two signal method with carrier frequencies set at reference zero

4. TV Bandpass Filters

Frequency Range	Within CH21 – CH62
Passband	According to manufacturer's specification & compatible with site conditions
Loss within Passband	Not more than 1.5 dB
Attenuation outside Passband	At f_L -20 MHz ≥ 3 dB f_H +20 MHz f_L -60 MHz ≥ 10 dB f_H +60 MHz f_L -150 MHz ≥ 20 dB f_H +150 MHz where f_L: centre frequency of the lowest channel within the passband f_H: centre frequency of the highest channel within the passband
Impedance (Input & Output)	75 ohm
Screening Factor	Not less than 60 dB

5. FM Bandpass Filters

Frequency Range	88 to 108 MHz
Loss within Passband	Not more than 1.5 dB
Selectivity (at –20 dB point)	Not more than 60 MHz
Impedance (Input & Output)	75 ohm
Screening Factor	Not less than 60 dB

ELE23.5.1.030.9 AMPLIFIERS

The performances of the wideband amplifiers, FM channel amplifiers and TV channel amplifiers & AGC modules shall be suitable for both analogue and digital terrestrial television and shall comply with EN 60728-11 and EN 50083-2 and EN 60728-3 and the following:

1. Wideband Amplifiers

Television Standard	CCIR – PAL I System
Frequency Range	88 to 862 MHz
Gain	According to manufacturer's specification & compatible with site conditions
Gain Control Range	According to manufacturer's specification & compatible with site conditions
Maximum Output Level	According to manufacturer's specification
Unwanted signal output (IM Distortion)	Better than –60 dB* at maximum level
Adjustable Slope	≥3 dB
Hum Modulation	Better than –50 dB
Stray RF Radiation	Less than 4 $x10^{-9}$W
Noise Figure	Less than 7 dB
Nominal Impedance (Input & Output)	75 ohm
Screen Factor	Not less than 60 dB
VSWR	Input VHF better than 1.5:1 Input UHF better than 2:1 Output better than 2:1
Impedance (Input & Output)	75 ohm
Coaxial Sockets	F type
Operating Temperature	-10℃ to +60℃
Operating Humidity	Up to 98%
Deviation with Temperature	Gain less than 1.0 dB/20℃ change Flatness less than 0.5 dB/20℃ Output Level less than 0.5 dB/20℃ Noise Figure less than 0.5 dB/20℃
Power	220 ± 6%, 50Hz ± 2Hz
Power Consumption	Less than 20W
Safety Isolation	Tested at 2 kV r.m.s. Designed to confirm to IEC 60065
Weather proofing	Indoor application
Housing	Either internally or externally fully screened metal box complete with suitable mounting legs for vertical mounting
Earthing	All metal parts to be properly earthed
Identification	Clearly mark 'IN' & 'OUT' signal sockets
Accessories	All necessary coaxial cable plug and accessories

* Intermodulation Ratio is measured by two signal method with carriers set at reference level of 0 dB.

2. FM Channel Amplifiers

Frequency Band	FM
Frequency Range	88 to 108 MHz
Gain	According to manufacturer's specification & compatible with site conditions
Gain Control Range	According to manufacturer's specification & compatible with site conditions
Noise Figure	Less than 7 dB
Output Level	According to manufacturer's specification
Unwanted Signal Output (IM Distortion)	Better than -60 dB* at maximum level
Selectivity (@-30 dB point)	Less than 60 MHz
Operating Temperature	-10℃ to +60℃
Operating Humidity	Up to 98%
Impedance (Input & Output)	75 ohm
Deviation with Temperature	Gain less than 1.0 dB/20℃ change Flatness less than 0.5 dB/20℃ Output Level less than 0.5 dB/20℃ Noise Figure less than 0.5 dB/20℃
Power Supply	220V ± 6%, 50 Hz ± 2 Hz D.C. output regulated with good transient suppression. Line powering facility is available by means of individual switches via the input coaxial sockets.
Safety Isolation	Tested at 2 kV r.m.s. Designed to conform to IEC 60065
Electromagnetic compatibility limit	According to EN 50083-2 Class A
Weather proofing	Indoor application
Housing	Modular type construction of robust and attractively designed plug-in units with connecting links between TV channel amplifier outputs. Fully internally metal-screened. Earthing on metal chassis.
Identification	Clearly marked 'IN' & 'OUT' signal sockets

* Measured by three signal method with carrier frequencies set at reference zero.

3. TV Channel Amplifiers & Automatic Gain Control (AGC) Modules.

   The TV channel amplifiers shall be suitable for working with a group of adjacent channels.

Television Standard	CCIR – PAL I System & Digital Terrestrial Television Broadcasting (DTTB) System suitable
Frequency Range	470 to 862 MHz, Channel Selectable with 0.25 MHz tuning steps

Gain	According to manufacturer's specification & compatible with site conditions
Gain Control Range	According to manufacturer's specification & compatible with site conditions
Minimum Output Level	>110 dBμV
Maximum Output Level	According to manufacturer's specification
Unwanted Signal Output (IM Distortion)	Better than –60 dB* at maximum level
Stray RF Radiation	Less than 4 $x10^{-9}$W
Noise Figure	Less than 7 dB
Flatness of Response	Better than ±1 dB within channel
AGC Facility	Better than ±1 dB output variation for a full range change of at least ±20 dB of the nominal input
Selectivity for non-adjacent channel application	At f_o ± 8 MHz not less than 70 dB
Hum Modulation	Better than –50 dB
Impedance (Input & Output)	75 ohm
Coaxial Sockets	F Type
Operating Temperature	-10℃ to +60℃
Operating Humidity	Up to 98%
Deviation with Temperature	Gain better than –1.0 dB/20℃ change Flatness better than 0.5 dB/20℃ Output Level less than 0.5 dB/20℃ Noise Figure less than 0.5 dB/20℃
Power Supply	220V ± 6%, 50 Hz ± 2 Hz D.C. output regulated and protected against accidental or fault condition short circuits with an automatic reset facility. Mains indicator light shall be of neon type.
Safety Isolation	Tested at 2 kV r.m.s. D.C. Designed to conform to IEC 60065
Electromagnetic Compatibility Limit	According to EN 50083-2 Class A
Weather Proofing	Indoor application
Housing	Modular type construction of robust and attractively designed plug-in with connecting links between amplifiers outputs. Fully internally metal-screened. Earthing on metal chasis.
Identification	Clearly mark 'IN' & 'OUT' signal sockets
Accessories	All necessary coaxial cable plugs and accessories

* Inter-modulation Ratio is measured by three signal method with both vision and sound carriers set at 7 dB and colour sub carrier at 17 dB.

ELE23.5.1.040.9 FREQUENCY CONVERTERS

The frequency converters shall comply the following:

Television Standard	CCIR – PAL I System & DTTB System suitable
Converted Frequency Band	470 to 862 MHz, channel selectable (specific frequency to be determined by OFCA, Hong Kong)
Frequency Stability	Drift ≤ ±75 kHz (0℃ to 55℃) for supply voltage variation 220V ± 6%, 50 Hz ± 2%
Selectivity	Not less than 70 dB at f_o ±8 MHz (where f_o = centre frequency of channel)
Unwanted Signal (IM Distortion)	Better than –60 dB
Noise Figure	Less than 9 dB
Interference	As section 6 of HKTA 1104 specification issued by OFTA
Luminance Linearity	Less than 3%
Differential Gain	Less than 2%
Differential Phase	Less than 2°
Picture Sync Ratio Distortion	Less than 2%
Group Delay	Less than 25nS
Electromagnetic Compatibility Limit	According to EN 50083-2 Class A
Input & Output Socket	F Type
Input & Output Impedence	75 ohm
Minimum Output Level	110 dBμV/-60 dB IMD
Flatness of Response	±1 dB
AGC Facility	Better than ±1 dB output variation for a full range change of at least ±20 dB of the nominal input

ELE23.5.1.050.9 UHF MODULATORS

The UHF modulators shall comply the following:

Video Input Interface	RCA (CVBS)
RF Modulation Standard	DTMB
Video Encoding Standard	MPEG2 or H.264
Video Resolution Support	576i and 576p
LCN Assignment	1 to 999
Video Input Level	1 ± 0.3V (peak to peak)
Video Input Impedance	75 ohm
Video Bandwidth	0.020 – 5.0 MHz
Group Delay	≤ 50 ns
Differential Gain	3%
Differential Phase	3°
Video Signal to Noise Ratio	≥ 57 dB

Output Frequency Range	470 to 862 MHz (Fixed channel or channel selectable)	
Output Impedance (F type)	75 ohm	
Output Level	Without Integrated Channel Amplifier	>80 dBμV
	With Integrated Channel Amplifier	>110 dBμV
Frequency Response	±1 dB	
Unwanted Spurious Signals through out 470-860 MHz	≥60 dB	
Screening Factor	≥75 dB	

ELE23.5.1.060.9 SPLITTERS / TEE-UNITS

All splitters and tee units shall have a wide bandwidth to allow for cascaded mode of operation and shall comply with EN 60728-11 and EN 50083-2 and EN 60728-4 and the following:

Frequency Range	88 to 862 MHz
Number of Outputs or Taps Connection	According to manufacturer's specification
Through Loss	According to manufacturer's specification
Side Loss	According to manufacturer's specification
Electrical System	Transformer / directional / resistance
Mutual Attenuation between Outputs	Not less than 13 dB for splitters and not less than 30 dB for tee units at all in-band frequencies
Screening Factor	Not less than 75 dB for RF shield application
VSWR	470 to 600 MHz – 2:1 600 to 862 MHz – 1.5:1
Impedance	75 ohm

ELE23.5.1.070.9 COAXIAL CABLES

1. All coaxial cables used shall be of 75 ohm type copper cables designed for transmitting UHF (470 to 862 MHz) and VHF (88 to 108 MHz) signals. All coaxial cables used shall comply with the relevant sections of EN 50083-1, EN 50083-8 and EN 50117;
2. The feeder shall conform to IEC 60096-3 (cable designation 370 or above of BS 5425-1 and the trunk feeder shall be to cable designation 550 or above of BS 5425-1);
3. Underground cables shall be of low loss coaxial copper cable with polyethylene outer sheath, copper foil outer conductor. These shall conform to IEC 60096 (cable designation 550 MB or above of BS 5425-1).

ELE23.5.1.080.9 FM / TV OUTLETS

1. Outlets shall be dual socket type for FM / TV (88 to 862 MHz) signals complete with frequency dividing network and the respective socket shall be identified with labels embossed on the front plate;

2. The outlets shall comply with EN 60728-11 and EN 50083-2 and EN 60728-4 and shall be suitable for flush mounting on 47 mm deep BS 4662 boxes;

3. The FM / TV outlet shall comply the following:

Frequency Range	FM: 88-108 MHz TV: 470-862 MHz
Features	Double outlet configuration one for FM and one for TV, flush mounting type complete with cover, connected from tap output of tee unit. The TV socket outlet shall only accept a male plug.
Distribution Loss	FM (88 to 108 MHz) not more than 1.5 dB TV (470 to 862 MHz) not more than 1.5 dB
Mutual Attenuation	Between FM-TV not less than 15 dB from 88 to 862 MHz
Screening Factor	Not less than 60 dB for RF shield application Not less than 25 dB for non RF shield application
Connection to TV Outlet	F type
Connection for FM Outlet	F type
Impedance	75 ohm
Safety Isolation	Tested at 2 kV r.m.s. Designed to conform to IEC 60065

ELE23.5.1.090.9 ALLOWANCES FOR DIGITAL TERRESTRIAL TV BROADCASTING (DTTB) SYSTEM

1. The CABD system shall allow for the future additional channel installation of DTTB equipment whose details OFCA has already announced, such as digital headend amplifiers / converters to enable a satisfactory reception and distribution of DTTB broadcasting signals;

2. The DTTB equipment shall be compatible with the CABD system installed and in no circumstances cause interference to the original analogue terrestrial channels.

ELE23.6 INSPECTION, TESTING & COMMISSIONING DURING CONSTRUCTION PERIODS

ELE23.6.1 - GENERAL REQUIREMENTS

ELE23.6.1.010.9 GENERAL

1. The purpose of Inspection, Testing and Commissioning during construction is to ensure the quality of delivered material and equipment and the workmanship of the installation comply with the relevant Regulations, Standards, Code of Practice and requirements of the Sub-contract and the function and performance of the systems meet the requirements specified in the Sub-contract;
2. Inspection and testing shall be carried out on all new installations and alterations to an existing installation in accordance with the requirements of this Section;
3. At the start of the Sub-contract, the Sub-contractor shall propose and obtain agreements from the Contract Manager on the time frames for the process of verification of materials and equipment delivered on site, inspection and testing of installed works;
4. The Sub-contractor shall be responsible for the submission of relevant and sufficient documents to the Contract Manager to describe the materials, equipment and installations to be inspected, tested and commissioned before carrying out of the inspection, tests and commissioning;
5. The Sub-contractor shall provide all necessary specialists, labour, materials, tools, instruments and equipment for carrying out of inspections, testing including analyzing the data, and commissioning. The Sub-contractor's specialist approved by the Contract Manager shall undertake all testing and commissioning procedures;
6. The Sub-contractor shall dispatch competent and experienced commissioning engineers to carry out the test and commissioning of the installation. Such personnel shall collaborate closely with the Contract Manager on site, who will witness the tests carried out under the Sub-contract. The Sub-contractor shall provide the Contract Manager with access to inspect all equipment during any phase of the installation and shall provide all reasonable facilities for such access. The Sub-contractor shall notify the Contract Manager of impending tests in sufficient time to allow the Contract Manager to be present. Parts to be subjected to witnessed tests will not be accepted unless the relevant test result are provided and has been signed by the Contract Manager and Sub-contractor;
7. All tests at site shall be performed in the sequence required by the construction and commissioning programme. The Sub-contractor shall prepare itemised and detailed testing and commissioning schedule. These schedules shall be prepared and submitted to the Contract Manager at least three months before the commencement of the test and approved by the Contract Manager. The schedule shall be completed by the Sub-contractor and presented to the Contract Manager for approval;
8. All instrument used for testing should be calibrated as specified in the Specification for the inspection, measuring and testing of the installation. The Sub-contractor shall submit to the Contract Manager valid calibration certificates issued and signed by approved calibration organizations before the use of the instruments;

9. The entire installation shall be commissioned and tested in accordance with the latest edition of "Testing and Commissioning Procedure for Broadcast Reception Installation in Government Buildings, Hong Kong Special Administrative Region";
10. The Sub-contractor shall record all data and information gathered during all inspections, testing and commissioning and produce reports to the Contract Manager within 3 weeks after the inspection;
11. The Sub-contractor at their own expense shall rectify all defects in performance, material and workmanship before the installation is accepted.

ELE23.6.1.020.A COMPONENT ACCEPTANCE

1. The following components offered for the CABD installation shall have at least three(3) years of proven local performance history. Relevant job reference(s) shall be submitted to the CM for approval:
   a. TV and FM bandpass filters or preamplifier;
   b. Channel amplifers;
   c. Broadband amplifiers (with or without AGC) / Frequency converters;
   d. Splitters / tap-off units;
   e. FM / TV outlets;
   f. Coaxial cables.
2. The Sub-contractor shall arrange acceptance tests for preamplifiers, amplifiers, broadband filters and frequency converters, at least one month before and no earlier than six months before actual installation, and submit the test report to the CM.. In the event of the components failing the acceptance tests, the Sub-contractor shall resubmit fresh components for further tests until the components are accepted. The acceptance tests for the components are exempted, if the Sub-contractor is able to submit the relevant test records to the CM to verify that the components have been tested and accepted for using in HA projects in the last 24 months prior to the approval date of the material submission;
3. The Sub-contractor shall bear the cost of all testing required by the CM on any CABD equipment;
4. In addition, the CM shall have the right to order any components to be tested, if, in his opinion, the components are suspected of not complying with this Specification. All components failing such tests shall be replaced by the Sub-contractor at their own cost to the satisfaction of the CM.

ELE23.6.1.030.9 VERIFICATION OF MATERIALS AND EQUIPMENT DELIVERED

1. All materials and equipment delivered to site shall be verified by the Contract Manager that they comply with the requirements and conform to the materials and equipment approved by the Contract Manager;
2. The Sub-contractor shall request in writing the Contract Manager to inspect materials and equipment delivered on site in accordance with the agreed time frame;
3. The request for inspection shall be made together with detail descriptions of the materials/equipment including, but not limited to, brand name, model number, country of origin, their tested standards and record of Contract Manager's approval for the using the materials and equipment.

ELE23.6.1.040.9 INSPECTION AND TESTING OF INSTALLED WORKS

1. The Sub-contractor shall request in writing in accordance with the agreed time frame to the Contract Manager for the inspection and witness testing of installed works in order to ensure that the installed works conform to the approved drawings and also meet the requirements of the Sub-contract;
2. Inspection and testing of installed works may be carried out for the whole or portion by portion of an installation, as appropriate. The Sub-contractor shall make proposal to the Contract Manager and obtain the Contract Manager's agreement on the arrangement before commencement of the works;
3. The request shall be made together with descriptions or drawings showing details of the works including, but not limited to, area/location of the works and types of installations;
4. Request for inspection for works to be covered up subsequently shall be made according to the work progress and well before the installations are covered up by subsequent activity. The Sub-contractor is responsible for any delay and its associated financial or time loss arising from late or unsatisfactory planning and arrangement of inspection and testing of works incurred to himself and others, consequential or otherwise.

ELE23.6.1.050.9 COMMISSIONING AND FUNCTIONAL AND PERFORMANCE TESTS

1. All installations and equipment shall be properly commissioned and tested to ensure that they are operating to deliver the design capacities and at the most optimum favourable operation conditions of the installations and the equipment and they are functioning properly in accordance in accordance with the design requirements;
2. The Sub-contractor shall submit proposed testing and commissioning programmes, testing and commissioning methods, procedures and formats of test records to the Contract Manager for approval at least three (3) months before commencement of commissioning and testing or within four (4) months after commencement of the Sub-contract whichever is earlier. The submission shall be submitted together with a list of major equipment with their crucial information such as brand names, model numbers, types, capacities and locations;
3. The Sub-contractor shall check and ensure that all related building items such as false ceiling, partitions, windows, louvers, etc. that will affect proper operation of the system have been provided and ready for carrying out of the commissioning before starting commissioning works;
4. The Sub-contractor shall check and ensure that all related building services items including those provided by others are available and ready for carrying out of the commissioning before starting commissioning works;
5. The Sub-contractor shall carry out commissioning work portion by portion rather than waiting until completion of the whole system if the commissioning work is more effective and appropriate to be proceeded in such arrangement. Nevertheless, after completion of the whole installation, the Sub-contractor shall commission the whole system in one go in order to ensure that the whole system is operating smoothly to deliver the design capacities and at its optimum favourable operation condition;
6. The Sub-contractor shall test the system on their own and is satisfied that the performance of the system comply with the design requirements before making requests to the Contract Manager for witness of commissioning and tests;

7. Commissioning and testing shall be conducted strictly under the specified design condition as far as possible. For commissioning works or tests that would be affected by environment condition or other factors outside the Sub-contractor's control and it is unlikely that the commissioning works or tests can be arranged to be proceeded under the design condition, the Sub-contractor shall submit alternative proposal for the Contract Manager's approval for carrying out the commissioning works or tests under condition with slight deviation from the specified design condition. Nevertheless, the Sub-contractor shall demonstrate from the result of commissioning and testing, either by means of calculation or other methods that the system can operate to deliver the design capacities;
8. The Sub-contractor shall, at its own cost, provide temporary TV channels at the headend in addition to the receivable off air and CCTV channels at the time of testing and commissioning. This is to demonstrate that the system shall be able to operate and deliver the design output for a total of not less than 30 TV channels;
9. In addition to the commissioning and test reports submitted by the Sub-contractor within 3 weeks after the commissioning and tests, the Sub-contractor shall compile all inspection, test and commissioning records in one report and submit it to the Contract Manager within 4 weeks after contract completion.

ELE23.6.2 - EQUIPMENT CALIBRATION

ELE23.6.2.010.9 GENERAL

The Sub-contractor shall make available the calibrated equipment and the associated calibration records etc. whenever the relevant test is performed. The equipment together with the relevant documentation shall conform to the requirements as set out in the following:

1. Accreditation:

   The equipment shall be calibrated an accredited laboratories. The calibration shall be made against certified equipment having a known valid relationship to internationally or nationally recognized standards. Where no-such standards exist, the basis used for calibration shall be documented. In such cases, the laboratories shall provide satisfactory evidence of correlation of results, for example by participation in a suitable programme of inter-laboratory comparisons or proficiency testing.

2. Acceptance of the calibration of the equipment:

   The calibration and acceptance of the calibration of the equipment shall comply with the requirements as set out in the schedule.

3. Document the calibration process:

   The Sub-contractor shall define and document the process employed for the calibration of the equipment including details of equipment type, unique identification, location, frequency of checks, check method, acceptance criteria and the action to be taken when results are unsatisfactory.

4. Calibration records of the equipment:

   The Sub-contractor shall maintain and submit calibration records of the equipment to the Contract Manager and the records shall include:

   a. The description and unique identification of equipment;
   b. The date of equipment calibration;
   c. The calibration results obtained after and, where relevant, before any adjustment and repair;

d. The assigned calibration interval;

e. The calibration procedure;

f. The designated limits of permissible error or accuracy of equipment;

g. The source of the calibration used to obtain traceability;

h. The relevant environmental conditions and a statement about any corrections thus necessary;

i. A statement of the uncertainties involved in calibrating the equipment and of their cumulative effect;

j. Details of any maintenance such as servicing, adjustment, repairs or modifications carried out;

k. Any limitations in use;

l. Identification of the person(s) performing the calibration;

m. Identification of person(s) responsible for ensuring the correctness of the recorded information;

n. Unique identification (such as serial numbers) of any calibration certificates and other relevant documents concerned.

5. Calibration under suitable environmental conditions:

   Calibration shall be carried out under suitable environmental conditions considering the conditions under which the equipment is used for inspections, measurements and tests.

6. Label marked "calibrated":

   The Sub-contractor shall identify the equipment with a label marked "calibrated" and approved identification record to show the calibration status and the next due date.

7. Doubt on the accuracy of the equipment:

   The Sub-contractor shall re-calibrate the equipment at intervals as shown in the schedule, or at shorter periods when the Contract Manager has doubt on the accuracy of the equipment.

8. Return of equipment:

   The equipment shall be returned to the Sub-contractor at the completion of the Sub-contract when there is no outstanding or remedial works to be completed.

ELE23.6.3 - TESTING & COMMISSIONING

ELE23.6.3.010.9 VISUAL INSPECTION

A visual inspection shall be carried out before testing of the installation in order to verify the following:

1. Compliance with Regulations and / or CoP:

   The installation has been carried out in compliance with regulations and / or CoP.

2. Correctness:

   The correctness of the designation of the installation; and

3. Visual Damage:

   There is no visual damage to the installation.

ELE23.6.3.020.9 TESTING & COMMISSIONING

The Sub-contractor shall carry out complete performance tests for all equipment and systems installed by him, make all necessary adjustments, commission the installations and submit the test reports, all to the satisfaction of the Contract Manager who may require the Sub-contractor to repeat all or some of the tests in the presence of his or her representatives before the installation will be accepted. Where relevant, the following tests shall be carried out in the sequence indicated. In the event of any test indicating failure to comply, that test and those preceding tests, the results of which may have been influenced by the fault indicated, shall be repeated after the fault has been rectified.

1. Signal Level Measurement of TV Headend and Trunk Distribution Equipment:
    a. Measure the input and output signal levels of each headend and trunk distribution equipment item with the signal level meter, starting from the antenna side. All the TV channels to be distributed shall be measured. For FM signals, three of the principal programmes to be distributed, namely those with the lowest, middle and highest frequencies, shall be measured;
    b. The input and output signal levels shall agree with the calculation done by the Sub-contractor on the approved System Schematic Diagram(s).
2. The Automatic Gain Control (AGC) Performance of TV Channel Amplifiers:
    a. If the TV channel amplifiers are fitted with AGC facilities, the AGC functions shall be tested. The input signal of each AGC channel amplifier shall be varied by +10 dB and –10 dB from its nominal value. External amplifier and attenuator shall be temporarily inserted at the channel amplifier input for this test;
    b. For proper AGC function, the channel amplifier output shall not vary by more than ±1 dB.
3. Measurement of Signal Levels at FM/TV Outlets:
    a. The signal level at FM/TV outlets shall be measured by the signal level meter for each TV channel and three of the principal FM programmes to be distributed, namely those with the lowest, middle and highest frequencies;
    b. The signal levels shall fall within the following items:

Channel	Minimum Signal Level (dBμV)	Maximum Signal Level (dBμV)	"Tilt"
Analogue Terrestrial TV	60	77	i. 12 dB for 47 to 862 MHz ii. 6 dB in the range of 60 MHz iii. 3 dB between adjacent channels
Digital Terrestrial TV	50	74	
FM	50	70	15 dB

Note: "Tilt" is the difference in signal level between the strongest and the weakest TV signals.

4. Mutual Isolation between FM/TV Outlets:
    a. The mutual isolation between FM/TV outlets from the same tee unit shall be measured. About 3 pairs of outlets shall be tested for each type of tee unit;
    b. The mutual isolation shall not be less than 36 dB for terrestrial TV and 42 dB for FM signal.
5. Functional Testing:

The picture quality at TV outlets shall be measured by a Portable TV monitor c/w sound monitoring loudspeaker for each TV channel. The test results shall be recorded in the report.

ELE23.7 MAINTENANCE REQUIREMENTS

ELE23.7.010.9 GENERAL MAINTENANCE REQUIREMENTS

1. The Sub-contractor shall furnish maintenance, free of further charge, for the complete installation for a period of twenty-four (24) months from the date of acceptance. This maintenance shall include the following services:
   a. Routine inspection, testing and maintenance services;
   b. Emergency inspection, testing and repairs.
2. All inspection, testing, maintenance services and repairs shall be carried out generally in accordance with the manufacturers' recommendation/ instructions and to the satisfaction of the Contract Manager;
3. The Sub-contractor shall despatch competent and experienced engineers and technicians equipped with the testing instruments, tools, equipment etc. to inspect, service, test, adjust and maintain the installation in a satisfactory operating condition. The Sub-contractor shall allow for carrying out such inspection, service, testing, adjustment and maintenance at a time outside normal office hours including general holidays;
4. All labour and materials including cleaning materials, lubricants, battery electrolyte, tools, instruments etc., and transportation required for carrying out routine and emergency inspection, testing, repair, replacement and maintenance services shall be included in this Sub-contract. Any renewals or repairs necessitated by reason of negligence of the end user or misuse of the equipment by the end user or by reason of any other causes not due to the fault of the Sub-contractor shall be carried out by the Sub-contractor and paid for in accordance with the Sub-contract with prior notice to the Contract Manager;
5. The Sub-contractor shall be responsible for all repairs necessary to maintain the installation in a safe, reliable and operative condition at all times. The Sub-contractor must ensure that their servicing staff carrying out necessary repairs immediately utilising manufacturer's original replacement parts. Any component taken down for services shall be reinstated within 2 hours or otherwise replaced by a spare unit at the Sub-contractor's expenses;
6. After each routine inspection, testing and maintenance service, the Sub-contractor shall furnish to the Contract Manager within 14 days a report complete with the following details:
   a. Date and time of inspection, testing and maintenance service;
   b. Persons carrying out the task;
   c. Details of inspection and maintenance service;
   d. Results of all tests performed;
   e. Any external factors significantly affecting the service and test results;
   f. Any follow-up actions as required.

ELE23.7.020.9 ON-CALL MAINTENANCE AND REPAIR SERVICE

1. The Sub-contractor shall dispatch technically competent and specially trained personnel for on-call maintenance and repair service and restore the malfunction CABD System to proper working order within the time period as specified below:

a. The Sub-contractor shall respond immediately to system fault or breakdown affecting the service to a whole building or effecting 'no picture' for large-scale residents and inspect the failure within one hour during office hours or two hours if outside office hours after receiving a call for service from the Contract Manager or his or her representatives or from the estate office. The system shall be restored to normal within 4 hours. In the event that it being impossible to perform the requirement within the time stipulated, the Sub-contractor shall explain immediately to the Contract Manager or his or her representatives the reason for such non-conformance;

b. For any other system minor fault, or complaints not involving loss of picture, the Sub-contractor shall restore the system to proper working order within 24 hours from receiving a fault report from the Contract Manager or his or her representatives.

2. The on-call maintenance and repair services shall include all works, whether they are of mechanical, electrical or electronic nature which are found necessary to maintain the CABD System in good and safe working order at all times and in conformity with:

   a. The Specification No. HKTA-1103 "Performance Requirements of Television Signals Input to the Head End of Subscription Television System" issued by OFCA;

   b. The Specification No. HKTA-1104 "Performance Requirements for In-building Coaxial Cable Distribution System (IBCCDS)" issued by OFCA (hereinafter referred to as the Performance Specification);

   c. The Specification No. HKTA-1105 "Technical Information for Frequency Planning of In-Building Coaxial Cable Distribution System" issued by OFCA.

   Should the Sub-contractor find it necessary to remove any system equipment to his Workshop for repair, he shall install, at the time of removal, a suitable replacement equipment for temporary use at no cost to the Housing Authority in order to maintain the system in proper working condition during the entire period of repair;

3. In case a system breakdown call occurs in Outlying Islands (e.g. Cheung Chau), the Sub-contractor shall, as far as practicable, restore the system to normal operating condition in 24 hours from receiving the call;

4. The Sub-contractor shall provide all transport, labours and materials including cleaning materials, tools and testing instruments required for the on-call maintenance and repair service. The Sub-contractor shall employ sufficient number of competent technicians and have adequate number of testing instruments for the service;

5. The Sub-contractor should note that the cost for the provision of the on-call repair service for the CABD system as well as the overtime work during on-call services is deemed to have been included in this Sub-contract;

6. The on-call repair service for CABD System shall be provided once the system is included in the Sub-contract and shall last until the end of the Sub-contract. Therefore, the Sub-contractor should make sufficient allowance in her tender;

7. The Sub-contractor shall within one week after the commencement of the Sub-contract, submit a name list with at least two names and telephone numbers of his English and Cantonese speaking representatives to whom repair calls should be directed;

8. For indicative purposes, the average number of on-call maintenance and repair service is around 23 per month. However, this figure is likely to vary due to:

   a. Addition or deduction of CABD system in this Sub-contract;

b. Connection of the CABD drop-in cables to other Subscription TV networks or re-connection of CABD drop-in cables back to CABD system;

c. Addition of video signals from CCTV cameras on the CABD system;

d. Reception and distribution of DTTB signals in addition to analogue ones from 2007 onwards.

ELE23.7.030.9 ROUTINE HALF-YEARLY INSPECTION, TESTING AND MAINTENANCE

The Sub-contractor shall visit the installation at least once every six months to carry out tests, repairs and adjustment. All environmentally sensitive devices shall be inspected, cleaned, adjusted and calibrated. A test sequence shall be carried out in accordance with the manufacturer's instructions.

ELE23.7.040.9 FINAL INSPECTION, TESTING AND MAINTENANCE

1. At the final inspection, the Sub-contractor shall, in addition to the routine half-yearly inspection and testing, adjust all the electronic equipment to the optimum state of operational efficiency. All mechanical equipment and control panels shall be inspected for rusting or corrosion such that touching-up or re-painting shall be carried out as necessary;

2. A complete performance test of the whole installation shall be carried out and any defects in operation, materials and workmanship so developed shall be rectified.

ELE23.7.050.9 TAKING RECORDS IN LOG-BOOK

The Sub-contractor shall have their maintenance staff completing the site/installation record 'Log-Book' after each visit. The log books shall be provided by the Contract Manager and can be completed in either English or Chinese.

ELE23.7.060.9 CONTRACT MANAGER TO BE INFORMED

No replacements of installation or parts of installation shall be carried out at any time unless the Contract Manager has previously been notified and has signified their approval.

ELE24.1 GENERAL REQUIREMENTS

ELE24.1.010.9 INFORMATION FURNISHED WITH TENDER

1. The Tenderer shall furnish the following information, as applicable, with his Tender, which will be considered incomplete without such information:
    a. Name of manufacturer, country of manufacture, type and catalogue number, and full technical performance details, of all major items of equipment offered;
    b. Voltage of operation, and current consumption;
    c. Type and size of wiring;
    d. Illustrated brochures showing all major items of equipment and their installation requirements;
    e. A list of spares and tools included in the offer;
    f. Details of any special works required to be carried out by others.

ELE24.1.020.9 AS-FITTED DRAWINGS

The provisions shall follow the details in ELE1.10.030.

ELE24.1.030.9 ROBUST DESIGN

All equipment shall be of robust design, having a durable nature and of pleasant appearance all to the satisfaction of the Contract Manager.

ELE24.1.040.9 SCREENING

All equipment shall be properly screened and/or shielded against any possible external frequency interference where necessary.

ELE24.1.050.9 DOORPHONE SYSTEM VOLTAGE

1. The Doorphone System shall be operated at not more than 50 V d.c. Where battery is used, an automatic charger shall be provided to maintain the charge, and tapping off from the battery to obtain different voltage levels shall not be allowed;
2. All system components, other than electronic circuits, shall preferably be operated at a single voltage level.

ELE24.1.060.9 SUPPRESSION OF ELECTROMAGNETIC EMISSION

The whole system should be suitably suppressed to fall within the limits allowed by BS EN 55014-1 for electromagnetic emission.

ELE24.1.070.9 WORKS BY OTHERS

The following works interfacing with the security system will be provided by other contractors:

1. Lift Installation
    a. CCTV cameras in lift cars and the associated video cables in lift shaft will be installed by the Lift Sub-contractor. The video cables connected to lift car cameras will be terminated at a connection unit at high level of the entrance lift lobby or otherwise as shown on the Drawings;

b. Volt free contacts will be provided by the Lift Sub-contractor in an interface box in ground floor meter room or otherwise as shown on the Drawings for each lift. The contacts shall consist of the following:

i. Two N.O. contacts for lift alarm, to be closed when the lift emergency alarm push button is pressed;

ii. One N.O. contact to be assigned to each lift landing floor, to be closed only when the lift is at the floor which the contact is assigned to. At any one time, only one of these contacts will be closed;

iii. Two N.O. contacts for lift travel directions, one to be closed when the lift is going up and the other to be closed when the lift is going down. Simultaneous closing of the two contacts will not occur.

All terminals for the dry contacts shall be properly labelled to indicate their functions. Subject to the CM's approval, it is acceptable that digital signals are used in lieu of the above dry contact signals, should an agreement be reached between the Sub-contractor and the Lift Sub-contractor. In this case, the details of communication protocol, data format and the hardware interface shall be clearly defined by the two parties and submitted to the CM for approval.

2. Building Works

The door and guard counter will be provided by the Main Contractor. The Sub-contractor shall coordinate with the Main Contractor on their construction details and make necessary allowance for the installation work.

ELE24.1.080.9 DOCUMENTATION

1. For each equipment offered, tenderers shall supply with the tender full and complete technical information in English sufficiently detailed to enable a technical appraisal of the equipment to be made. Submissions without sufficient information may be discounted;

2. Apart from the documents stipulated in Section ELE1.10, the Sub-contractor shall, within one month prior to equipment delivery, supply the number of equipment handbook in English language as stated in sub-clause (4) giving full details on:

a. Principle of operations;

b. Details of installation and setting-up procedures;

c. Maintenance and operation instructions;

d. Schematic and block diagrams;

e. Circuit diagrams with details down to component levels with their respective descriptions;

f. Printed circuit board layout;

g. Calibration procedures;

h. Full parts list; and

i. If microprocessors are used, all program storage devices (ROM's, EPROM's etc.) shall be supplied with comprehensive part and version numbers for ordering of replacement; additionally, the method of generation/ duplication of the data in the storage device shall be given.

3. Should any Original Equipment Manufacturer (OEM) products be included, the documents as specified in sub-clause (2) above shall also be provided;

4. Three sets of the manufacturer's operations and maintenance manuals in English shall be provided with each equipment ordered, up to a maximum of six sets per model of equipment. The following table indicates the number of documents required:

No. of equipment per model	Sets of manufacturer's operation and maintenance manuals required
1 - 2	3 (at least 1 original)
3 - 5	4 (at least 2 originals)
6 or more	6 (at least 3 originals)

5. The Sub-contractor shall supply "As-fitted" drawings showing the positions of all items of equipment installed and the routing of interconnecting cables;

6. The Sub-contractor shall not use confidentiality as a reason for withholding the supply of relevant documentation required by Contract Manager. The Contract Manager's representative will if required certify that all sensitive material in handbooks will not be released to any organisation outside Contract Manager. Any charges for such material supplied shall be included within the Contract. The Sub-contractor should make sure that all his overseas/local principals understand such obligation when submitting tender;

7. The Contract Manager shall be granted the right of duplicating the documents stated above for internal use;

8. The Contract Manager shall be kept informed of any recommended modifications during the operational life of the equipment.

ELE24.1.090.9 EXECUTION OF THE WORK

The Sub-contractor shall verify to the satisfaction of the Contract Manager that they are licensed for carrying out type III security work under the Security and Guarding Services Ordinance Cap. 460 and are competent to complete the works, otherwise they shall employ a competent contractor, who has the required licence, to carry out the works. For the latter case, the Sub-contractor shall submit the proposed contractor's relevant information related to the licence, technical capability, working experience on security system to the Contract Manager for approval. Whenever necessary, the Sub-contractor shall also submit document and drawings for the completed projects to the Contract Manager for consideration. Inspection of the completed projects and visit of the proposed contractor's office and workshop may be conducted, if deemed necessary.

ELE24.2 EQUIPMENT OF SECURITY SYSTEM

ELE24.2.1 CCTV VIDEO CAMERA

ELE24.2.1.010.A GENERAL

1. The video camera shall be of internet protocol (IP) type. The IP camera shall be equipped with RJ-45 10/100Mbps self-adaptive Ethernet port for network communication. The IP camera shall be Open Network Video Interface Forum (ONVIF) / Internet Server Application Programming Interface (ISAPI) compliant to enhance interoperability;
2. The colour digital video signal shall conform to the ITU-T H.264 / MPEG-4 Advanced Video Coding (AVC) and / or ITU-T H.265 / MPEG-H Part 2 High Efficiency Video Coding (HEVC) and / or Motion JPEG video compression standard;
3. Each video camera shall house the lens, image pickup devices, electronic circuitry and sync pulse generation circuit. The camera imaging devices shall be of the solid state charge-coupled device (CCD) sensor or complementary metal-oxide semiconductor (CMOS) sensor;
4. The construction of the camera body shall be rugged and compact. The camera shall be capable to operate directly from 220V a.c. mains or operate at a lower d.c. or a.c. supply voltage, e.g. 12V d.c. or 24V a.c. mains or Power over Ethernet (PoE) complying with the IEEE 802.3af or 802.3at;
5. The image transfer mechanism of the CCD sensor shall be either interline transfer (IT) or frame interline transfer (FIT); or CMOS sensor shall be using progressive scan technique. The dimension of the sensor shall not be less than 1/2.8". In general, the resolution shall be 4 mega pixels (4MP) to 0.3 mega pixels (0.3MP) adjustable and the frame rate shall be not less than 25fps@4MP;
6. The signal to noise ratio shall not be less than 50dB and the dynamic range shall not be less than 60dB;
7. The video camera shall be provided with gamma correction circuitry;
8. The video camera shall be well-shielded against radio frequency pickup;
9. The colour video camera shall be provided with automatic white balance control;
10. The camera shall be with wide dynamic range (WDR), backlight compensation (BLC) and highlight compensation (HLC) technology to provide clear image in the environment of strong brightness contrast;
11. The minimum illumination such that the camera is capable to capture a visible and clear image shall be 0.01 lux at F1.6;
12. The video camera shall be equipped with electronic shutter speed control mode (either manual or fully automatic) covering the range from 1/8 to 1/10,000 second;
13. For pan-tilt-zoom camera, its built-in motor shall be computer controlled and shall move quietly when seeking a preset location or at variable speeds when tracking a target during manual operation. The pan travel and tilt shall be 360° continuous and 90° respectively. Auto-pan function shall be included. Not less than 4 times optical zoom and 16 times digital zoom shall be provided;

14. For dome-type camera, the quality of the image capture through that cover shall not be sacrificed under normal lighting condition;

15. For outdoor camera, the camera shall be capable to operate at an ambient temperature of -10°C to 55°C. The camera shall be equipped with infrared light source illumination such that it is capable to capture a visible and clear image or video recording at 0 lux in dark environment. The working distance of the infrared light source shall not be less than 30 metres. Provision shall also be allowed for adjusting the direction and angle of outdoor camera to prevent direct facing the sunlight.

ELE24.2.1.030.X DELETED

ELE24.2.1.040.X DELETED

ELE24.2.1.050.X DELETED

ELE24.2.1.060.X DELETED

ELE24.2.1.070.X DELETED

ELE24.2.1.080.A CAMERA MOUNTING

1. Each camera shall be provided with a camera mounting which mechanically couples the camera to a wall or ceiling or parapet or pole so that the camera assembly can be suitably and stably located;

2. The mounting design shall allow free motion of the pan and tilt movements of the camera. The design of the mounting shall also take into account of the structural or architectural support where the camera mounting is fixed;

3. The mounting shall provide a field-adjustable mechanism and a suitable mechanical joint so that the camera assembly can be swung or tilted to the appropriate surveillance direction and locked into this particular position;

4. The colour of the camera mounting shall preferably be the same as that of the camera casing.

ELE24.2.1.090.N LENS

1. All video camera shall be equipped with auto-iris lenses;

2. If the lens is motorised for remote control, the response time of the following adjustment shall not be more than:

   a. full range iris control : 1.5 seconds;

   b. full range focus control (1 m to infinity) : 11 seconds;

   c. zoom control : speed of zoom shall be such as to double the field of view in 2.5 seconds.

   Operation of motorised drives for these controls shall not cause any radio frequency radiation or interference to the video signal, e.g. patterning, noise streaks, etc;

3. All video camera shall be equipped with fixed focal length lens unless otherwise specified. If motorized varifocal lens is required, the focal length shall be at least in the range of 2.8mm to 12mm.

ELE24.2.1.100.N CAMERA CONSTRUCTION

1. All indoor and outdoor cameras shall be fitted with integral protective casing. The casing shall accommodate the camera provided, complete with lens and other accessories. The outdoor camera casing shall be sturdy and tamper-proof and comply with IEC 62262 – IK10 impact-resistant casing. Notwithstanding, with the aid of tools, operation and maintenance staff shall gain ready access to the camera and other accessory of the cameras or casing for maintenance and cleaning purposes;
2. All power, control and video cables entering or leaving the camera externally shall be protected by a conduit;
3. The environmental protection rating of indoor camera shall be at least IP42; whereas, outdoor camera shall be at least IP66.

ELE24.2.1.110.N CAMERA WITH PAN AND TILT FUNCTION

1. Where specified on Drawings, camera with pan and tilt function shall be provided. The mechanism shall be capable of panning and tilting a camera and lens combination, as a minimum the following ranges:
   a. Pan : up to 360°
   b. Tilt : up to + 45° to -45° from the horizontal plane
2. Upon maximum load condition, the pan and tilt speed shall not be less than 7 degrees and 5 degrees per second respectively.

ELE24.2.2 LED VIDEO MONITOR

ELE24.2.2.010.A GENERAL

1. The LED video monitor shall be capable to handle both digital and analogue television / video signals. It shall be of either LCD panel lit with LED backlight or self-illuminated OLED panel;
2. The LED colour video monitor shall meet, but not be limited to, the following performance requirements:

(a)	Screen Size	24 inch (minimum viewable not less than 23.8”) or otherwise specified on the Drawings
(b)	Horizontal and Vertical Viewing Angle	150° or larger
(c)	Native Resolution	1920 (H) x 1080 (V) or better
(d)	Brightness	Not less than 250 cd/m2
(e)	Contrast Ratio	1000 : 1 or better
(f)	Input Terminal	HDMI, VGA
(g)	Power Source	220V AC + 10%, 50/60 Hz
(h)	Support Languages for On-screen instruction	English and Traditional Chinese

3. The video monitor shall be supplied with mounting hardware for desk mount, ceiling mount, wall mount and floor standing to suit the installation requirements.

ELE24.2.3 VIDEO DISTRIBUTION AMPLIFIER

ELE24.2.3.010.X DELETED

ELE24.2.3.020.X DELETED

ELE24.2.3.030.X DELETED

ELE24.2.4 NETWORK VIDEO RECORDER (NVR)

ELE24.2.4.010.A TECHNICAL REQUIREMENTS

1. The network video recorder (NVR) shall be designed for professional video, audio surveillance and alarm monitoring applications including recording, playback and signal transmission simultaneously. The NVR shall be Open Network Video Interface Forum (ONVIF) / Internet Server Application Programming Interface (ISAPI) compliant to enhance interoperability;
2. The NVR shall support recording of not less than 16 video inputs from IP camera;
3. The NVR shall compress and store the images received in its internal removable hard disks with a total data storage capacity not less than 28 days and minimum 4TB for 16 camera inputs simultaneously and which can be expandable for longer time continuous recording. The incoming bandwidth (bitrate) of NVR shall be not less than 96Mbps. The NVR shall be able to record at a minimum resolution of at least 1080 horizontal lines with at least 25 frames per second for each channel under the condition of at least 16 input channels simultaneously;
4. The NVR shall support displaying of live video images from connected cameras either in full screen, 2x2, 3x3 or 4x4 multiplexed screen modes and displaying recorded images . The NVR shall support 1080p and other High Definition video format including 1920x1080p, 1920x1080i, 1280x720p, 720x576p and 720x576i. Compression technique of H.264 and / or H.265 shall be provided. The decoding capacity of the NVR shall be capable of displaying at least one full sized 8MP stream at a time or four 1080p cameras across the board;
5. The NVR shall operate in multiplex manners including simultaneous local live viewing, recording, playback and network transmission without causing any adverse effect to the performance of each other in any circumstances. The NVR shall allow independent configuration of resolution, frame rate, bit rate and image quality for each channel, and support pause, play reverse, speed up, speed down, skip forward & skip backward when playback;
6. The network transmission of video signal from NVR to the networked PC at remote site shall comply with Transmission Control Protocol / Internet Protocol (TCP/IP) and the NVR shall support 10/100/1000Mbps Ethernet interface;
7. The NVR shall be equipped with alarm inputs to perform pre-selected function (i.e. image captured from the camera with the alarm being triggered, shall be popped up and displayed in full at the main monitor). The system operation shall automatically resume to normal after the pre-set time period;
8. The number of alarm inputs shall match with the number of video inputs;
9. The NVR shall allow the user to define the duration for event recording with a pre-event recording period not less than 3 seconds and for post-event within a range from minimum 1 to 99 seconds adjustable;

10. The NVR shall allow continuous recording and shall overwrite the oldest recorded images under a first in first out approach when all the hard disks are full. The DVR shall also allow an adjustable pre-set recording days of storage from 7 to 30 days;
11. The NVR shall be able to preserve the last setting used in system preferences and automatically resumed operation on resumption of power after interruption;
12. The NVR shall function as a standalone unit without the use of a personal computer for operation of live view or playback of video images. The status of the NVR shall be monitored on front panel or display monitor and control of NVR shall be operable through the front panel controls for the following:
    a. Indicate time and system operation condition;
    b. Start and stop recording;
    c. Control pause, stop, playback, fast forward / reverse and playback speed;
    d. Access on-screen search functions by event, date and time;
    e. Access / select the menu function on-screen;

f. Pan / tilt / zoom control of CCTV camera.13. The NVR shall be equipped with at least 2 nos. of spot monitor outlet(s) independent of the main monitor (tower guard). The main monitor shall be able to display up to 16 cameras on a single screen simultaneously either under playback or real time display condition. The spot monitor(s) shall only be able to display one selected camera or to display up to 16 cameras sequentially with one at each time. Alternatively, if spot monitor outlets are not built-in in the NVR, the Sub-contractor shall provide decoder for connection of 2 nos. of spot monitors;

14. The NVR shall provide alarm signal for the events including triggering from external alarm, detectors, video motion detection, video signal loss from camera, power interruption, hardware failure and hard disk overheat warning signal;
15. The NVR shall provide indication on screen whether the input video signal from each camera is under recording or not;
16. The network video recording system shall be able to search alarm for playback according to events. The alarms shall be logged and reported;
17. The NVR shall provide not less than 20 x 16 masking grids on each camera input for selection of area for video motion detection. The sensitivity level of the video motion detection shall also be configurable;
18. All images exported from the NVR can also be viewed on a networked PC at the remote sites through LAN or Internet via a proprietary software player provided by the NVR Manufacturer at no extra cost;
19. The proprietary software player shall be compatible for operation on a PC with Windows 10 or the latest version of Windows or other operating system to the satisfaction of the CM and also have a multi-site video reception software allowing for connection up to 16 nos. of networked NVRs at different sites under any pre-selected grouping of cameras for viewing on one screen of a designated networked PC simultaneously;
20. The NVR shall have multi-level login hierarchy for access by administrator, supervisor and operator at local or remote site to the system for setting of the operation configuration and normal operation of the NVR;
21. A standard USB style connector of latest version shall be provided at the NVR for interfacing with the USB flash drive, DVD writer or external hard disk for video backup functionality;

22. The backup video data file copied from the NVR can be viewed on any other PC via the proprietary player as mentioned in item 18 and 19 above which shall be free licence to the Authority;
23. The NVR shall incorporate digital watermark recording function. Letter issued by the NVR Manufacturer certifying the reliability / authentication of watermarking feature shall be provided under the Sub-contract;
24. The NVR shall be integrated with a built-in real-time clock capable of configuring the system's time and date for display. On-screen display shall include the date, time, camera location, hard disk currently under recording mode and site description name up to 12 alpha-numeric characters;
25. Date shall be displayed by 8 digits composite with year (4 digits), followed by month (2 digits) and day (2 digits) under the format of YYYYMMDD;
26. System time shall be synchronized among IP camera, NVR and PC. Time shall be displayed in international time by 6 digits composite with hour, minute and second under 2 digits each under the format of hhmmss;
27. All alpha-numeric characters displayed on screen shall be white in colour and edging with thick black colour lines;
28. NVR shall provide with HDMI and VGA output ports for cable connections to other video equipment;
29. 3-core 2 m long PVC insulated and PVC sheathed power cable shall be provided with the NVR. One end of the power cable shall be properly connected to the supply terminals inside the NVR while the other end of the cable shall be connected with a 13A 3-pin plug;
30. Operation manual both in English and Chinese shall be provided for each NVR. Each NVR shall be under individual packing with all accessories, hard copy of the operation manual and CD-ROM corresponding to the proprietary video software player as mentioned in items 18 and 19 for the system operation and backup;
31. The NVR shall have the mask function for every channel. When the area of a channel is masked, the image of the area then cannot be viewed by the monitor but can be recorded by the NVR;
32. Once the video images exported from NVR are being edited, these video images shall not be read at the proprietary remote client software to ensure the video integrity. The message “This is NOT the original images” or equal and equivalent with the agreement from the CM or his representatives shall also be shown on the screen;
33. Time-clock shall be avoided to display on individual channel screen but they must be stamped on the recorded films;
34. Fixed font size characters display on the screen shall be provided whenever in full screen, 2x2, 3x3 or 4x4 multiplexed screen modes.

ELE24.2.6 QUAD MULTIPLEXER

ELE24.2.6.010.X DELETED

ELE24.2.7 TELEPHONE SET

ELE24.2.7.010.9 GENERAL

1. The telephone set shall be a model certified by OFCA as in conformance with the relevant OFCA's standard. The telephone set shall have the following feature:
    a. Hands-free speaker phone;
    b. 28 Telephone memory;
    c. One touch redial;
    d. Wall mounting;
    e. Tone / pulse dialling.
2. The telephone set shall be submitted to the Contract Manager for approval.

ELE24.2.8 CABLES

ELE24.2.8.010.9 GENERAL

1. Singlecore cables shall conform to BS EN 50525-2-31 and the conductor size shall be not less than 1.0 mm^2. Multicore cables to be installed inside buildings shall be of copper conductor/PVC insulated/PVC sheathed non-armoured type with tinned copper drain wire and colour identification for cores. The conductor size shall be not less than 0.5 mm diameter Contract Manager's approval is required prior to the installation of cables;
2. Multicore cables to be installed underground shall be of copper conductors/PVC insulated/PVC inner sheathed/steel wire armoured/PVC sheathed type with colour identification for cores. The conductor size shall be not less than 0.5 mm diameter Contract Manager's approval is required prior to the installation of cables;
3. Non-armoured cables shall be installed in trunking/conduit systems and armoured cables shall be installed in underground galvanised steel/PVC ducts outside the building boundaries. A system of trunking/conduits and underground galvanised steel/PVC ducts shall be provided by the Sub-contractor for the Doorphone System installation as shown on the drawings, the Sub-contractor shall also be responsible for any additional provision to complete the installation;
4. Multicore cables shall be terminated at fixed terminals. Where cable termination blocks are used, they shall be of suitable size for the conductors;
5. Movable parts shall be connected to the system by means of flexible cables;
6. Labels shall be provided at visitor's panels, indicating panels, control panels, cable termination/junction boxes etc. to identify the function (e.g. door lock release) of the respective core of the outgoing cables;
7. The colour code of the wiring for the doorphone system shall comply with BT CW 1293 or IEC 60708-1.

ELE24.2.8.020.9 VIDEO CABLES

1. Video cables shall be of the coaxial type with a single central core of annealed copper. The dielectric shall be polythene with a shield of copper braid or tape. The cable shall be insulated with an overall sheath of PVC;
2. The attenuation characteristic of the cable shall be better than:
    a. 1.1 dB/100 m at 1 MHz;
    b. 3.8 dB/100 m at 10 MHz;
    c. 13.5 dB/100 m at 100 MHz.
3. Unless total conformance to a relevant recognised international standard, which is subject to Contract Manager's approval, is achieved, the cable shall have the following characteristics:
    a. Strand diameter not to be less than 0.58 mm;
    b. Dielectric diameter not to be less than 3.71 mm;
    c. Outer conductor diameter not to be less than 4.39 mm;
    d. Nominal overall diameter not to be greater than 6.2 mm;
    e. Capacitance not to be more than 67 pF/m;
    f. Bending radius not to be less than 60 mm;
    g. Weight not to be less than 55 kg/km;
    h. Characteristic impedance to be 75 ohm ± 3 ohm;
    i. Return loss ratio to be better than 20 dB at 10 MHz;
    j. Insulation resistance to be not less than 30 M ohm per km.

ELE24.2.8.030.9 CONTROL CABLES

1. Control cables shall be of the multicore type. Each core shall be made up of stranded annealed copper conductors with PVC insulation. The whole cable shall be screened with copper tape or copper braid and shall have an overall sheath of PVC;
2. The cable shall satisfy the following minimum characteristics:
    a. At least 7 strands per conductor.
    b. Strand diameter not to be less than 0.2 mm;
    c. Conductor resistance to be less than 90 ohm/km;
    d. Insulation resistance to be better than 20 Mohm/km measured between cores or between core and screen.

ELE24.2.8.040.9 RADIO FREQUENCY CABLES

The radio frequency cable shall comply with BS EN 50117-1 and BS EN 50117-2-1 and BS EN 50117-2-2 and BS EN 50117-2-3 and BS EN 50117-3 and BS EN 50117-4.

ELE24.2.8.050.9 OPTICAL FIBRE CABLES

The optical fibre cable shall be of multimode type with minimum 4 cores of 62.5μm diameter.

ELE24.2.8.060.N LOCAL AREA NETWORK (LAN) CABLES

The Category 6 UTP copper cables compliant with IEC 11801-1 Class E, ANSI/TIA 568.C2 shall be provided for the IP camera system.

ELE24.2.8.070.N HIGH-DEFINITION MULTIMEDIA INTERFACE (HDMI) CABLES

The HDMI cable shall be of premium high-speed HDMI cable. The cable shall be suitable for reliable transfer of 4K@60Hz resolution video. The cable bandwidth support is 18Gbps and is optimized for HDMI version 2.0.

ELE24.2.9 SEMICONDUCTOR DEVICES

ELE24.2.9.010.9 GENERAL

Unless otherwise specified or a particular application requires the use of other types, semiconductor devices shall be of silicon type, and shall have instantaneous electrical characteristics capable of handling the transient power, voltage and current which the devices may encounter in the circuit. The continuous power, voltage and current ratings of the semiconductor devices shall be not less than 1.5 times the respective maximum value at which the devices are intended to operate. Power devices shall be mounted on adequately sized heat sinks.

ELE24.2.10 CAPACITORS

ELE24.2.10.010.9 GENERAL

Capacitors shall have a nominal working voltage of not less than 1.5 times the maximum voltage at which they are intended to operate. The values of the nominal working voltage and capacitance shall be marked on the body of the capacitor.

ELE24.2.11 RESISTORS

ELE24.2.11.010.9 GENERAL

Resistors shall have resistance values better than ± 5% tolerance and, continuous power rating of not less than 1.5 times the maximum power which the resistors shall dissipate. The values of resistance and tolerance shall be marked on the body of the resistors.

ELE24.2.12 PRINTED CIRCUIT BOARDS

ELE24.2.12.010.9 GENERAL

All electronic circuits shall be fabricated on printed circuit boards. Printed circuit boards shall be of fibre glass material and all conducting parts shall be tin plated. Connections between circuit boards and from circuit boards to outgoing circuits shall be of plug-in type to facilitate easy replacement. Direct soldering of outgoing cable onto printed circuit boards shall not be allowed.

ELE24.2.13 MAGNETIC DOOR CONTACT

ELE24.2.13.010.9 GENERAL

1. Magnetic door contact shall be equipped with completed concealed magnetic switch and shall be recessed mounted into the door;
2. The design shall offer years of positive fail-safe separating power when door is opened even after years of being held closed. When the door is closed, high contact force shall be developed to ensure proper contact;
3. The magnetic door contact shall be U.L. listed for the application.

ELE24.2.14 EQUIPMENT RACK

ELE24.2.14.010.A GENERAL

1. Equipment rack made of 1.2 mm sheet steel shall be provided in meter room or equipment room or other areas as shown on the Drawings to house the security equipment. There shall be lockable panels at the front and back of the rack. The front panel shall be glass. The rack shall be modular in design such that the trays and sliding shelves can be added or deleted if required;
2. The rack shall consist at least the following types of basic modules:
    a. Ventilation fan module;
    b. Power distribution panel;
    c. Cable trays;
    d. Illuminating lamp.
3. The size of rack shall be suitable for standard 483 mm rack mounted equipment with standard rack aperture;
4. The rack shall be painted with stove enamel paint of Approved colour;
5. Security equipment such as network video recorder (NVR), patch panel, router, ethernet switch, amplifiers, cable accessories etc., situated in a common location shall be housed in a single equipment rack. A spare space for the installation of one additional NVR in the future shall be provided in the equipment rack housing NVR.

ELE24.2.15 UNINTERRUPTED POWER SUPPLY

ELE24.2.15.010.A GENERAL

1. The Sub-contractor shall provide the following Uninterrupted Power Supply (UPS) systems for continual and uninterrupted power supply of security systems and other equipment as shown on the Drawings:
    a. Central UPS system for backup power supply duration of not less than two (2) hours in case of mains failure for the following systems and equipment of domestic block:
        i. CCTV and intercom system for temporary refuge space;
        ii. Local CCTV system;
        iii. Doorphone system;
        iv. Local alarm and door monitoring system;

v. Lift car CCTV system including CCTV camera and LED video monitor, etc.;

vi. Exit route & roof lighting indication panel;

vii. Lift alarm indication panel.

b. Central UPS system for backup power supply duration of not less than two (2) hours in case of mains failure for the following systems and equipment of Estate Management Office (EMO):

i. Central CCTV System;

ii. Central Alarm and Door Monitoring System;

iii. Local CCTV system;

iv. Local security alarm system.

2. The UPS system shall consist of UPS equipment, external maintenance bypass switch, MCB distribution board and all necessary cable wirings and accessories to form a complete working system as shown on the Drawings;

3. The Sub-contractor shall submit the sizing calculation for the kVA rating of the UPS and the battery capacity required to the CM for approval. In any case, the UPS equipment shall have a capacity of providing back-up power of duration not less than two (2) hours with 30% spare capacity.

ELE24.2.15.020.9 TECHNICAL REQUIREMENT OF UPS EQUIPMENT

1. The UPS shall be of static online double-conversion type conforming to IEC 62040. It shall consist of rectifier/charger, batteries, inverter and internal static transfer switch;

2. The UPS shall operate in three different operating modes:-

a. Normal mode

Under normal operation, the rectifier/charger unit shall convert the incoming a.c. mains power supply to d.c. power. The rectifier/charger unit output shall feed the inverter and charge up the batteries simultaneously. The inverter shall convert the d.c. power into a.c. mains power which feeds the load;

b. Discharging mode

Upon failure of the incoming a.c. mains supply, the inverter and the batteries shall continue to supply power to the load without interruption or disturbance. The UPS shall continuously run in this discharging mode until the batteries fully discharge or the incoming a.c. mains supply returns to normal at which the UPS returns to normal mode;

c. Bypass mode

The UPS shall automatically transfer the load via the internal static transfer switch to the incoming a.c. mains supply by-passing the rectifier/charger unit, batteries and inverter without any interruption when the UPS is overloaded or faulty.

3. The UPS shall include the following control and monitoring facilities on display panel of UPS:-

a. Mains on/off switch;

b. ‘Bypass Mode’ manual on/off switch;

c. Alarm reset/buzzer mute switch;

d. Indicating lights for load %, battery charge %, "UPS On" and "Mains Available";

e. Audio and visual alarms for "Mains Failed", "On Battery", "On Internal Static Transfer Switch", "Low Battery" and "UPS Fault".

4. The overall efficiency of the UPS, output to input, shall not be less than 88% when the UPS is operating at 50 - 100% rated load;

5. The UPS shall comply with the energy efficiency requirements for power quality as stipulated in the BEC;

6. The UPS shall be constructed in heavy duty metal enclosures and designed for floor or rack mounted to suit the site condition;

7. The UPS shall be natural air cooled or forced air ventilated to ensure that all components operate within their environmental ratings;

8. The UPS equipment shall be equipped with a device to protect batteries from over-discharging;

9. The UPS equipment shall allow minimum 30% spare capacity for future expansion.

ELE24.2.15.030.9 TECHNICAL REQUIREMENT OF UPS BATTERY

1. The batteries shall be valve regulated sealed lead acid batteries complying with IEC 60896-22, maintenance free with a design life of minimum 10 years rated at 20°C;

2. The batteries, after fully discharged, shall be fully charged in less than 10 hours.

ELE24.2.15.040.9 TECHNICAL REQUIREMENT OF EXTERNAL MAINTENANCE BYPASS SWITCH

1. External maintenance bypass switch shall be provided as shown on Drawings to allow maintenance personnel to manually isolate the UPS equipment from the load for maintenance purpose and connect the load directly to the incoming a.c. mains supply via external bypass connection using manual changeover switch;

2. The external maintenance bypass switch shall be of changeover switch manually controlled at mains voltage, either double-pole or four-pole type and tested to IEC 60947-3. The changeover switch shall be capable of making, breaking and carrying continuously the rated current and making on fault without overheating, damage or deterioration;

3. The external maintenance bypass switch shall be housed inside a lockable metal box which shall be operated by maintenance staff only.

ELE24.2.16 NETWORK SWITCH

ELE24.2.16.010.N GENERAL

1. Network switch shall be used for the switching of digital video transmission based on Internet Protocol;

2. Power over Ethernet (PoE) power supply shall be provided so that the network switch can provide power to the PoE type equipment;

3. The network switch shall provide Ethernet ports. Each port shall support 10/100/1000 Mbps connection speed. For cameras running on PoE, switch port shall be built-in with 802.3af and / or 802.3at PoE support by optional PoE inline adapter;

4. 10% spare Ethernet ports shall be allowed in each network switch for future expansion use.

ELE24.2.17 VIDEO ENCODER / DECODER

ELE24.2.17.010.N GENERAL

1. The digital video encoder / decoder shall use of compression technology conforming to the ITU-T H.264 / MPEG-4 Advanced Video Coding (AVC) and / or ITU-T H.265 / MPEG-H Part 2 High Efficiency Video Coding (HEVC) and / or Motion JPEG video compression standard;
2. It shall be capable of streaming video images from camera input at minimum 25 fps under all conditions of motion with the image, at the resolution of 4MP;
3. The digital video encoder shall be a video transmitter capable of digitally encoding a full motion video with the selected compression technology;
4. The digital video decoder shall be a video decoder capable of accepting digitally encoded digital stream and converting it into video format;
5. The digital video encoder / decoder shall be provided with HDMI input / output.

ELE24.3 INSTALLATION REQUIREMENTS

ELE24.3.2 DOORPHONE SYSTEM

ELE24.3.2.010.9 GENERAL

1. The doorphone system shall be of digital selection and display type complete with secret code door lock release feature. The system shall provide high fidelity communication between the visitors at the main entrance and the occupants in a particular flat of whom the visitors intend to visit. The system shall enable the occupant to remotely release the entrance door lock to allow the visitors to enter the building by operating a switch on the handset located within the flat;
2. The doorphone system shall only permit communication and control between the selected flat and the doorphone panel/door lock at the main entrance of the building. All flats which are not selected shall be cut off from the system, voice transmission to and from these flats and operation of the door lock release through the handsets in these flats shall be inhibited intrinsically by the system;
3. For linked blocks, the visitor panel shall be provided in the main entrance of the joint entrance lobby as shown on the drawings. In addition to the requirements as detailed in ELE24.3.2.030, a set of block selection feature shall be provided in the visitor panel. Once the block is selected in the panel, the operation sequence of the system shall follow the details in ELE24.3.2.060;
4. The operation of the doorphone system shall not be affected by any fault or incorrect wiring in any handset or prolonged removal of the handpiece of a handset from its base unit. If a handpiece is removed from its base unit without being called by a visitor from the doorphone panel, this handset shall be disconnected from the system and the services to other handsets shall be maintained. Once the disconnected handset is put back to the base unit properly, the service to this handset shall resume. If there is any faulty or incorrect wiring connection for a handset due to installation mistake or unauthorised alteration, the system shall be able to detect this condition and disconnect this handset automatically and maintain services to other handsets.

ELE24.3.2.020.9 ELECTRO-MAGNETIC LOCK

1. This clause shall be read in conjunction with the Drawings for electro-magnetic lock installation details;
2. The main entrance and side entrance shall be provided with electro-magnetic locks which shall have no mechanical moving parts. The lock shall be UL listed as a releasing device for exit door;
3. The lock shall provide instantaneous unlocking with no residual magnetism upon interruption of power supply;
4. The magnet core shall be permanently sealed by epoxy resin in a metal casing to form an integral magnet assembly. For recess-mounted application, the magnet assembly shall be secured to the door frame in such a way that loosening or undoing of any or all fixing screws on the magnet assembly shall not result in the assembly itself being pulled out from the recess aperture when the door is being opened by force;
5. The lock shall be fail-safe type. When power is cut off, the lock shall be automatically released to allow door opening. The lock shall also be automatically unlocked in case of mains power failure despite standby power supply is available;

6. The lock shall be equipped with a built-in lock status sensing device with dry contact output to positively indicate that the door is secured;
7. Installation of the electro-magnetic lock shall be in accordance with the standard details shown on the Drawings and all required mounting hardware / accessories shall be either supplied or approved by the manufacturer of electro-magnetic lock. The installation method shall be endorsed by the manufacturer of electro-magnetic lock as appropriate for their product in case the actual details differ from manufacturer's own standard methods;
8. The lock shall operate at low voltage of d.c. 12V and consume low current of not more than 400 mA. When locked, the traction force shall not be less than 226.8 kg. Even if the lock is forced open by excessive force, it shall not be damaged and shall be re-locked immediately afterwards;
9. Other provisions for the electro-magnetic lock shall include:
    a. Bypass key
        i. There shall be a keyswitch at the bottom of the doorphone panel and combination lock panel outside the entrances. Upon turning the keyswitch, power for the electro-magnetic lock shall be cut off and free access shall be allowed;
        ii. 5 sets of keys for the entrance door lock shall be provided by the Sub-contractor at the completion of the works to the Contract Manager.
    b. Door release
        i. A door release button shall be provided at the inside of the building and adjacent to each main and side entrance such that by pressing this button, the corresponding electro-magnetic lock shall be released for an adjustable period of 1 to 30 seconds. The lock shall be relocked after the expiry of the timer period. The button shall be fitted on a stainless steel plate and flushed mounted with the surface of stainless steel plate. The button borderlines shall be self-illuminated in green colour when the door is locked and change to red when the door is unlocked. The signals to change the illumination colour of button borderlines shall be derived from the output of the built-in lock status sensing device in the electro-magnetic lock;
        ii. Another door release button shall be provided at the guard counter for releasing the door lock of the main entrance by the tower guard. The lock shall be relocked after an adjustable period of 1 to 30 seconds;
        iii. The door release button shall be vandal resistant and suitable for operation under extreme humid condition. The button shall be submitted to the Contract Manager for approval.
    c. Emergency door release
        i. An emergency door release shall be provided adjacent to each main and side entrance on the inside of the building. Upon actuation of an emergency door release, power to the corresponding electro-magnetic lock shall be cut directly, not through a control circuit. The entrance shall then serve as an emergency exit. At the same time an alarm signal shall be indicated at the tower guard counter and sent to the security control room through the central alarm and door monitoring system, if available, for reporting of emergency;

ii. Emergency door release shall be of direct operation type equipped with resettable frangible element. The release shall comprise an electrical contact which will operate automatically upon displacing the resettable frangible element at the operating face of the release. Cover of the release shall be locked in position with a special tool and the frangible element shall be clipped firmly into place. The release shall be equipped with transparent hinged protective cover which shall be proprietary product for the emergency door release. The release and its mounting box shall be of pleasing appearance and styling, constructed by non-corrodible materials and finished in green colour. The release shall be engraved with the following labels in Chinese and English, "Emergency Door Release" and "緊急開門掣". All characters and letters on release shall be in white colour;

iii. A permanent operation instruction plate shall be provided above the emergency door release.

d. Safety measure

The circuit for controlling the supply to the electro-magnetic lock shall be designed such that the failure of any electronic components shall cause all the electro-magnetic door locks to be released.

e. Spare parts

A spare and complete set of mounting accessories such as washers, roll pins, centre bolts and lock nuts in labelled packing shall be handed over to the Contract Manager for each electro-magnetic lock at the completion of the works.

ELE24.3.2.030.9 DOORPHONE PANEL

1. At each main entrance of the domestic block positioned as shown on the Drawings, the Sub-contractor shall supply and install a vandal proof panel with stainless steel faceplate comprising, but not limited to:

a. A set of numerical floor number selection push buttons (from 0 - 9), and an alphabetical "G" button for ground floor where necessary;

b. A set of numerical, or alphabetical as specified, flat number selection push buttons;

c. A "Combination Lock" push button for the selection of secret code combination door lock;

d. A 5 x 7 dot matrix yellow L.E.D. display unit of sufficient digits to display the particular floor and flat number being selected. All L.E.D. in the display unit shall have equal and steady brightness. The display shall be right hand justified;

e. Self-illuminated operating instruction displayed in English and Chinese for the following:

PLEASE WAIT	請等候
PLEASE TALK	請通話
PLEASE ENTER	請進入
NO ANSWER	無答覆
INCORRECT INPUT, PRESS "CLEAR", INPUT AGAIN	輸入錯誤，按「取消」，重新輸入

f. Voice message generator for giving audible instructions in either Cantonese or both Cantonese and English as directed by the Contract Manager for the following status:

PLEASE WAIT	請等候
PLEASE ENTER	請進入
NO ANSWER	無答覆
WRONG NUMBER, PLEASE PRESS THE CLEAR BUTTON AND TRY AGAIN	輸入錯誤 , 請按取消掣 重新輸入

The voice message generator shall provide high quality audible instruction using digital data compression technique. The voice message generator shall provide 5 individual pre-recorded messages for a total time period (for 5 messages) of not less than 90 seconds. The generator shall accept 5 digital control inputs to output the 5 individual pre-recorded messages. The length of individual message shall be variable from 0 to 90 seconds. All messages shall be approved by the Contract Manager prior to being programmed into the memory of the generator. The voice output level shall be adjustable and the maximum level shall not be less than 60 dB at a distance of 1 metre from the panel.

g. A set of high fidelity and sensitivity two way communication unit. The output shall be clearly audible of at least 60 dB at a distance of 0.5 metre from the panel;

h. A "Clear" push button switch for resetting of incorrect entry of floor / flat number;

i. A push button for communication with the guard counter if specified on the Drawings;

j. A CCTV camera;

k. All push buttons shall be vandal resistant and weatherproof. Keypads shall be vandal resistant and weatherproof. All push buttons with numerical or alphabetical figures shall be back-lit by LED through plastic insert forming the figures. The figures shall be flushed with the surface of push button without protruding edge. The colour of the insert shall be red unless otherwise specified on the Drawings. The LED, with a life span of 35,000 hours minimum, shall be on throughout the operation of the panel. Keypad and push buttons shall be submitted to the Contract Manager for approval;

l. A Block selection feature shall be provided for linked block design;

m. Braille instructions as specified on the Drawings.

2. The Sub-contractor shall submit drawings for the arrangement of the "Doorphone Panel" to the Contract Manager for approval prior to manufacture.

ELE24.3.2.040.9 DOORPHONE CONTROL UNIT

The doorphone control unit shall be totally enclosed containing all necessary components and accessories for satisfactory doorphone operation. The control unit shall be located in ground floor meter room where an a.c. supply in the form of a 13A connection unit.

ELE24.3.2.050.9 HANDSET

1. Each flat shall be provided with one handset positioned as shown on the Drawings. The handset shall be submitted to Contract Manager for approval prior to ordering;
2. Two separate and independent push buttons shall be provided integral with the handset, one for remotely releasing the main entrance door lock and the other for interfacing to the lighting control system for corridor lighting. The buttons shall be marked permanently with respective graphic symbols for easy identification of their functions. The graphic symbol for door lock release shall be in green colour and for corridor lighting in red colour. The buttons shall separate from each other by a minimum distance of 100 mm. The button for lighting control shall be at the lower portion of the handset and be operable without the need to lift the hand-piece for lighting control only;
3. All contacts and other equipment inside the handset shall be of durable type;
4. The handset shall be equipped with independent buzzer / speaker for the call tone and the buzzer / speaker shall be distinct from the loudspeaker at the handset. The call tone shall be of pleasant type and shall be clearly audible anywhere in the flat.

ELE24.3.2.055.9 LIGHTING CONTROL INTERFACE PANEL

1. The push button for lighting control on each handset shall be connected to a lighting control interface panel in the telecom/meter room on the respective floor;
2. Relays with single pole normally open (NO) contact and operated by DC control voltage derived from the doorphone system shall be provided in the lighting control interface panel. Pressing and releasing of a push button shall result in closing and opening of a corresponding NO contact in the interface panel. The output terminals of the NO contacts (one for each flat) shall be located in a segregated compartment in the interface panel for interfacing to the lighting control system. LED indicating lights shall be provided on the hinged cover of the interface panel to show the status of each push button. All relays, terminals and LED lights shall be properly labelled for easy identification;
3. The relays provided in the interface panel shall satisfy the following technical requirements:
    a. Contact: min. rated load 1A, max. switching voltage 250VAC;
    b. Coil operating voltage: 12 or 24 DC (to be drawn from the doorphone system);
    c. Insulation resistance: 100 MΩ (at 500V DC);
    d. Dielectric strength: 1000Vrms 1 minute between open contacts;
    e. 2000Vrms 1 minute between contact and coil;
    f. Mounting: by plug and socket;
    g. Conformance: UL or equivalent standard.
4. The interface panel shall be a metal enclosure properly earthed and finished in epoxy powder coating. A sample shall be submitted to Contract Manager for Approval and the approved sample can be utilized in the actual installation.

ELE24.3.2.060.9 OPERATION SEQUENCE

The operation sequence of the doorphone system shall be as follows:

1. The "Please Select" indicator shall be illuminated when the system is at "normal" condition. For linked blocks, a block selection feature shall be provided for selecting appropriate block at the first place. When a visitor presses the appropriate floor number key on the floor selection key board followed by the flat number key on the other flat selection key board, the selected floor and flat number shall display on the screen immediately after the depression of each key, when any floor from ground floor to ninth floor is to be selected, the sequence shall not necessitate the entry of a "O" preceding the floor number. Depression of any button on the doorphone panel shall be accompanied by a beep tone;

2. An intermittent call tone shall be initiated at the handset of the selected flat. Simultaneously, a "Please Wait" voice message shall be generated at the doorphone panel and the illuminated signal on the instruction display shall change to "Please Wait" until the handset in that selected flat is picked up by the occupant. At the moment, the illuminated signal shall change to "Please Talk", then intercommunication between the occupant and the visitor can take place;

3. If the hand-piece is not picked up within a predetermined period, which is adjustable from 1 to 30 seconds, the call tone shall stop. A "No Answer" voice message shall be generated at the doorphone panel and the illuminated signal shall change from "Please Wait" to "No Answer" and after 3 seconds the system and illuminated signal shall automatically revert back to "Please Select" as normal;

4. The two way intercommunication between the occupant and the visitor shall be limited to a predetermined period ranging from 20 to 120 seconds. When the pre-determined period expires, the inter communication between the two parties shall be automatically cut off and the system shall revert back to its normal conditions;

5. Before the hand-piece is being put back to its normal position, pushing the door release push button on the hand-piece shall remotely release the electrical door lock at the main entrance door. A "Please Enter" voice message shall be generated at the doorphone panel and the illuminated signal shall change from "Please Talk" to "Please Enter". The communication shall be terminated after an adjustable period of 1 to 30 seconds after the release of the door lock. The lock shall then be reverted to locked state after the door is closed again. If the door is not opened by the visitor after a predetermined period adjustable from 1 to 30 seconds, the lock shall then revert to the locked state;

6. After the termination of the communication link and the reverting of the door lock to its locked stated, the illuminated indication on the instruction display shall revert to "Please Select" as normal;

7. When the selection of floor or flat number is not completed within a preset time period which is adjustable from 1 to 15 seconds, the system shall revert to normal condition;

8. The display shall be blanked when the number of a non-existent floor/flat is entered, a "Wrong Number" voice message shall be generated at the doorphone panel and the illuminated signal on the instruction panel shall change to "Incorrect Entry". The system shall reset to its normal condition by pressing the "Clear" button or after a predetermined period adjustable from 1 to 30 seconds;

9. When the handset is not connected to the entrance panel, i.e. when the flat number is not pressed at the entrance panel by any visitor, operation of the door release button at any hand-piece shall not release the lock of the main entrance door;

10. The door lock shall be such that in case the electric push button inside the entrance door or the secret digital code door lock release is not operative the door can still be opened by operating a keyswitch at the bottom of the doorphone panel and combination lock panel outside the entrances. The door lock shall revert to its normal closing state when the door is closed;

11. When the "Clear" button is pressed at any stage during the operation of the doorphone panel, the system shall switch off the display, terminate any established communication link and revert to the "normal" condition.

ELE24.3.2.070.9 COMBINATION LOCK SYSTEM

1.

   a. Combination lock system for the main entrance and side entrance doors shall be built in the control unit of the doorphone system;

   b. Correct entry of the code at any combination lock control panel shall only cause the electro-magnetic lock of the corresponding entrance to be released;

   c. The combination lock system shall allow connection of up to 5 combination lock control panels for 5 side entrances in additional to the combination lock control panel at the main entrance. All the combination lock control panels can be operated at the same time without affecting each other.

2. For the main entrance, the combination lock system shall be accessed and controlled through the doorphone panel. If the "Combination Lock" button is pressed, the floor selection buttons shall serve as a combination lock control panel;

3. For each side entrance, a combination lock control panel shall be provided;

4.

   a. The four-digit secret code for releasing lock shall be kept in the non-volatile memory. The secret code shall be easily changeable by adjusting a set of selector switches or push buttons housed in the control unit in the meter room. Code changing by re-connecting jumpers is not acceptable;

   b. The code shall be adjustable to any combination of the four digits from 0 to 9. An instruction procedure for code changing shall be fixed inside the door of the enclosure. Security measures shall be provided against illegal changes of the secret code.

5. The combination lock control panel for the side entrance shall be constructed with 1.5 mm thick stainless steel faceplate and 1.2 mm thick stainless steel housing enclosure comprising:

   a. A keypad fitted with a set of numerical push buttons (from 0-9). The keypad and push buttons shall be vandal resistant and weatherproof. All push buttons shall be back-lit by LED through plastic insert forming the numerical figures. The figures shall be flushed with the surface of push button without protruding edge. The colour of the insert shall be red unless otherwise specified on the Drawings. The LED, with a life span of 35,000 hours minimum, shall be on throughout the operation of the panel. Keypad and push buttons shall be submitted to the Contract Manager for approval;

   b. A "clear" push button for resetting of incorrect entry;

   c. Operating status / instruction L.E.D. indicators with instructions in English and Chinese for the following:

      i. SYSTEM ON 系統正常

      ii. PLEASE ENTER 請進入

      iii. INCORRECT ENTRY 錯輸入

   d. Voice message generator to give audible instructions in either Cantonese or both Cantonese and English as directed by the Contractor Manager for the following status:

i.	Please enter	請進入
ii.	Wrong number, please press the clear button and try again	輸入錯誤 , 請按取消掣 重新輸入

The voice message generator shall be of the same specification as that used in the doorphone panel;

e. Braille instructions as specified on the Drawings.

Each pressing of the button shall have a 'beep' sound.

6. The enclosure for the secret code setting devices shall be fabricated from sheet steel with a thickness not less than 1.2 mm. All inside and outside surfaces of the enclosure shall be treated with anti-rust protective coating followed by an Approved painting;

7. The door lock shall be released only when the entry of a pre-assigned 4-digit code in proper sequence within a 10 seconds period otherwise a timer will activate causing the code already entered to reset. When the door is unlocked, the corresponding visual and audio instructions shall be activated. The unlocked period shall be adjustable from 1 to 30 seconds. The L.E.D. matrix display at the main entrance doorphone panel shall only display "*" during the code entry and before the door is released. When incorrect codes are entered, the visual and audio instructions for "Incorrect Entry" shall be activated and the system shall reset to its normal condition by pressing the "Clear" button or after a predetermined period adjustable from 1 to 30 seconds.

ELE24.3.2.080.9 WIRING INSTALLATION

The wiring from the equipment enclosure on each floor to the doorphone handset in each domestic flat shall be carried out by the Sub-contractor in concealed conduit wiring system as shown on the Drawings. The wiring from the meter room to each domestic flat through the concealed conduits shall be multicore cables with number of cores not less than four.

ELE24.3.2.090.9 STANDBY POWER SUPPLY

The Doorphone System shall be provided with standby power supply to enable the system to operate for a period of not less than four hours at average power consumption of 20 calls per hour subsequent to a mains failure. The stand-by power shall be of nickel cadmium or nickel-metal hydride type battery complete with trickle charger and with minimum nominal capacity of not less than 10AH. The battery shall be automatically recharged when the permanent supply restores.

ELE24.3.2.100.9 DOORPHONE SYSTEM FOR SSF COURT ENTRANCE GATES

1. When it is specified on the Drawings, the main and side entrance gates of SSF development shall be provided with doorphone system. The system shall consist of electro-magnetic lock, doorphone panel and two way communication unit at main entrance gate, two way communication units and door release buttons at guard counters of domestic blocks, and electro-magnetic lock and combination lock panel at side entrance gate as shown on the Drawings. The equipment shall be suitable for operation under outdoor condition;

2. The electro-magnetic lock shall be suitable for outdoor application and the technical specification of electro-magnetic lock shall comply with ELE24.3.2.020 except the following:

a. For ELE24.3.2.020 sub-clause 7, the installation of the electro-magnetic lock shall be coordinated with the design of entrance gate and the installation details shall be submitted to the Contract Manager for approval. All required mounting hardware / accessories shall be supplied or approved by the manufacturer of electro-magnetic lock. The installation method shall be endorsed by the manufacturer of electro-magnetic lock as appropriate for their product in case the actual details differ from manufacturer's own standard methods. The electro-magnetic lock shall be of weatherproof construction;

b. For ELE24.3.2.020 sub-clause 9(b)(i), the door release button shall be vandal resistant and weatherproof with ingress protection of at least IP55 to BS EN 60529 or IEC 60529. The button shall be submitted to the Contract Manager for approval;

c. For ELE24.3.2.020 sub-clause 9(c), the provision of emergency door release is not required.

3. For each main entrance gate, a doorphone panel with built-in two way communication unit shall be provided. The doorphone panel shall be suitable for operation under outdoor condition and provided with stainless steel weather shield. The panel shall be constructed with 1.5mm thick stainless steel faceplate and 1.2mm thick stainless steel housing enclosure comprising:

a. A keypad fitted with a set of numerical push buttons (from 0-9);

b. A "clear" push button for resetting of incorrect entry;

c. Operating status / instruction L.E.D. indicators with instructions in English and Chinese for the following:

i.	SYSTEM ON	系統正常
ii.	PLEASE ENTER	請進入
iii.	INCORRECT ENTRY	錯輸入
iv.	PLEASE WAIT	請等候
v.	PLEASE TALK	請通話
vi.	NO ANSWER	無答覆

d. Voice message generator to give audible instructions in either Cantonese or both Cantonese and English as directed by the Contractor Manager for the following status:

i.	Please enter	請進入
ii.	Wrong number, please press	輸入錯誤 , 請按取
	the clear button and try again	消掣重新輸入
iii.	Please wait	請等候
iv.	No answer	無答覆

The voice message generator shall provide high quality audible instruction using digital data compression technique. The voice message generator shall provide 5 individual pre-recorded messages for a total time period (for 5 messages) of not less than 90 seconds. The generator shall accept 5 digital control inputs to output the 5 individual pre-recorded messages. The length of individual message shall be variable from 0 to 90 seconds. All messages shall be approved by the the Contract Manager prior to being programmed into the memory of the generator. The voice output level shall be adjustable and the maximum level shall not be less than 60 dB at a distance of 1 metre from the panel;

e. A set of high fidelity and sensitivity two way communication unit between main entrance doorphone panel and guard counter of individual domestic block. The output shall be clearly audible of at least 60 dB at a distance of 0.5 metre from the panel;

f. Push buttons for selection of communication with the guard counters of individual domestic blocks;

g. All push buttons shall be vandal resistant and weatherproof. Keypads shall be vandal resistant and weatherproof. All push buttons shall be back-lit by LED through plastic insert forming the figures. The figures shall be flushed with the surface of push button without protruding edge. The colour of the insert shall be red unless otherwise specified on the Drawings. The LED, with a life span of 35,000 hours minimum, shall be on throughout the operation of the panel. Keypad and push buttons shall be submitted to the Contract Manager for approval;

h. Braille instructions as specified on the Drawings;

i. Each pressing of the button shall have a 'beep' sound.

4. The operation sequence of the doorphone panel shall be as follows:

a. The "System On" indicator shall always be illuminated when the system is at normal condition;

b. When a visitor presses a guard counter selection push button, an intermittent call tone shall be initiated and an “INCOMING CALL” indication light shall light up at the handset of the selected guard counter. Simultaneously, a "Please Wait" voice message shall be generated at the doorphone panel and the illuminated signal "Please Wait" shall be illuminated on the instruction display until the handset in that selected guard counter is picked up by the security guard. At the moment, the illuminated signal shall change from "Please Wait" to "Please Talk" and the “INCOMING CALL” indication light at the handset of the guard counter shall turn off, then intercommunication between the security guard and the visitor can take place;

c. If the handset is not picked up within a predetermined period, which is adjustable from 1 to 120 seconds, the call tone shall stop and the “INCOMING CALL” indication light shall turn off. A "No Answer" voice message shall be generated at the doorphone panel and the illuminated signal shall change from "Please Wait" to "No Answer" and after 3 seconds the system shall automatically revert back to normal and illuminated signal "No Answer" shall turn off. An alarm signal for the unattended call of respective block shall also be generated to the central alarm and door monitoring system via the local alarm and door monitoring system of the respective domestic block;

d. The two way intercommunication between the security guard and the visitor shall be limited to a predetermined period ranging from 20 to 120 seconds. When the pre-determined period expires, the inter communication between the two parties shall be automatically cut off and the system shall revert back to its normal conditions;

e. After the handset is picked up and before the handset is put back to its normal position within the pre-determined intercommunication period, pushing the door release push button on the handset shall remotely release the electrical door lock at the main entrance gate. A "Please Enter" voice message shall be generated at the doorphone panel and the illuminated signal shall change from "Please Talk" to "Please Enter". The communication shall be terminated after an adjustable period of 1 to 30 seconds after the release of the door lock. The lock shall then be reverted to locked state after the door is closed again. If the door is not opened by the visitor after a predetermined period adjustable from 1 to 30 seconds, the lock shall then revert to the locked state;

f. After the termination of the communication link and the reverting of the door lock to its locked state, the illuminated indication "Please Enter" on the instruction display shall turn off;

g. When the handset is not connected to the entrance panel, i.e. when the guard counter selection push button of domestic blocks is not pressed at the entrance panel by any visitor, operation of the door release button at any handset shall not release the lock of the main entrance gate;

h. The door lock shall be such that in case the door release button inside the entrance gate or the secret digital code door lock release is not operative the gate can still be opened by operating a keyswitch at the bottom of the doorphone panel and combination lock panel outside the entrances. The door lock shall revert to its normal closing state when the door is closed;

i. When the "Clear" button is pressed at any stage during the operation of the doorphone panel, the system shall switch off the display, terminate any established communication link and revert to the "normal" condition.

5. For each side entrance gate, a combination lock control panel shall be provided. The combination lock control panel shall be suitable for operation under outdoor condition and provided with stainless steel weather shield. The panel shall be constructed with 1.5mm thick stainless steel faceplate and 1.2mm thick stainless steel housing enclosure comprising:

   a. All the facilities for side entrance combination lock control panel as specified in ELE24.3.2.070 sub-clause 5.

6. The specification of combination lock system at doorphone panel of main entrance gate and combination lock panel of side entrance gate of SSF development shall be the same as the main entrance and side entrance doors of domestic block specified in ELE24.3.2.070. Setting of the four-digit secret codes for releasing lock of entrance gates shall be same as that for domestic blocks, in which the individual secret code of any domestic blocks shall be able to release lock of entrance gates.

ELE24.3.3 LOCAL CLOSED CIRCUIT TELEVISION MONITORING SYSTEM

ELE24.3.3.010.A GENERAL

1. Closed circuit television systems shall be installed at the various locations of each block as indicated on the Drawings; public signage related to CCTV surveillance shall be provided and installed in accordance with the details shown on the Drawings;
2. If the distance between the NVR and the LED video monitor is too large (exceeds 7 meters) for a direct connection by HDMI cable, a pair of HDMI extenders shall be used as shown on the Drawing or as indicated in Project Specific Specification.

ELE24.3.3.020.A DOORPHONE PANEL

1. IP CCTV camera shall be installed within the doorphone panel to capture the view of the visitors. The view shall be displayed at:
   a. Monitors at the guard counter;
   b. Tenants' television sets through the CABD installation.
2. The camera shall be built in the doorphone panel. Lighting other than those originally included in this sub-contract shall not be required for the camera to transmit clear and satisfactory pictures at night time. The capture angle of the IP CCTV camera shall be adjustable on Site;
3. Super wide angle lens integral with the camera shall be used. The camera and the integral lens shall have the angular field of view not less than 110° horizontal.

ELE24.3.3.030.A LIFT

1. IP CCTV camera installed by others within each lift of the building shall be connected to the local CCTV monitoring system. The view shall be displayed at:
   a. Monitors at the guard counter;
   b. Tenants' television sets through the CABD installation.
2. Lift floor number generator:
   a. Lift floor number generator shall be provided for each lift. The lift floor number generator shall superimpose the following characters on the CCTV picture captured from the lift car:
      i. Lift floor numbers;
      ii. An up or down arrow showing lift travelling direction;
      iii. Lift alarm button activated.
   b. The image with superimposed characters shall be restricted for display at the monitor connected to the NVR at Security Counter only. The characters shall be positioned at one corner of the screen not interfering with other alphanumeric display, and clearly legible under all background conditions;
   c. The characters to be generated shall be based on the status of the lift provided by Lift Sub-contractor in the form of either normally open volt free contacts or digital signals. Interface shall be through an interface box located at the ground floor meter room or otherwise at locations as shown on the Drawings. The following types and quantities of data will be provided:
      i. Lift landing floor number, one for each landing floor;

ii. Lift travelling directions, one for up and one for down;

iii. Lift alarm activated status, one.

d. Closing of a particular contact or change of state of a digital signal shall cause the generation of the corresponding set of characters it represents on the CCTV picture and the characters shall be removed as soon as the signal resets. When multiple closures of the same type of contacts are detected simultaneously, a fault signal (such as a blinking asterisk) shall be generated in lieu of the floor number or the directional arrow to indicate the fault condition. In case of digital signals, detection of contradictory signals shall also activate the same fault condition;

e. The lift floor number generator shall conform to the following technical requirements:

Item	Technical Requirements
i. Video input	Composite 1Vp-p/ 75 Ohms
ii. Video output	Composite 1Vp-p/ 75 Ohms
iii. Control input	Minimum 64 N.O. contacts
iv. Character	Height 23 scanning line min.; Width 0.7 ms min.; Position selectable at each of the four corners on the screen; Brightness and greyscale adjustable.

f. The Sub-contractor shall be responsible to decode the data signal of lift IP camera into video signal for superimposition with lift floor number generator signal, and also transmission to CABD installation. The Sub-contractor shall be responsible to encode the lift images with superimposed characters into data signal for connection to network switch and NVR.

ELE24.3.3.040.A MAIN ENTRANCE / GUARD COUNTER

1. IP CCTV camera shall be installed at the main entrance of each domestic block to capture the view of the guard counter / visitor;
2. The view shall be displayed at central CCTV system;
3. The camera lens shall be super wide angle type. The camera and the integral lens shall have the angular field of view not less than 110° horizontal.

ELE24.3.3.050.A SIDE ENTRANCE

IP CCTV camera shall be installed at each side entrance of the block. The view shall be displayed at:

1. Monitors at the guard counter;
2. Central CCTV system.

The camera shall be the same as that installed for main entrance / guard counter CCTV system as specified in ELE24.3.3.040.

ELE24.3.3.055.A ROOF EXIT

IP CCTV camera shall be installed at the roof exit staircase to monitor the staircase area leading from the top domestic floor to the roof exit gate. The view shall be displayed at:

1. monitors at the tower guard counter;

2. Centralized CCTV system.

The camera shall be surface mounted under the ceiling. Super wide angle lens integral with the camera shall be used. The camera and the integral lens shall have the angular field of view not less than 110° horizontal.

ELE24.3.3.056.A G/F STAIRCASE EXIT AND OTHER STAIRCASE EXITS

IP CCTV camera shall be installed for each staircase exit to capture the view of G/F staircase exit and other staircase exits at specific floors as shown on the Drawings. The view shall be displayed at:

1. Monitors at the guard counter;
2. Central CCTV system.

The camera shall be the same as that installed for roof exit CCTV system as specified in ELE24.3.3.055. For outdoor cameras, including those which are mounted under outdoor canopy, camera protective casing as specified in ELE24.2.1.100 shall be provided.

ELE24.3.3.057.N EXTERNAL AREA

1. Outdoor IP CCTV camera shall be installed as shown on Drawings to capture the view of the external area;
2. The view shall be displayed at central CCTV system;
3. The camera lens shall be super wide angle type. The camera and the integral lens shall have the angular field of view not less than 110° horizontal.

ELE24.3.3.060.A RECORDING

1. The scenes captured by the above closed circuit television system except the camera inside the doorphone panel shall be recorded by a NVR installed at each building;
2. Video signal from cameras viewing guard counter and side entrances, should be presented for interface with the future central CCTV monitoring system in case the project does not include an Estate Management Office.

ELE24.3.4 LOCAL ALARM AND DOOR MONITORING SYSTEM

ELE24.3.4.010.9 LOCAL SYSTEM

1. A mimic panel made of 1.5 mm thick stainless steel plate with alarm buzzer and indicating light emitting diode (L.E.D.) showing the locations of the entrance doors and staircase exit doors at ground floor and other specific floors as shown on the Drawings shall be installed at the guard counter. The layout of the building ground floor and other specific floors as shown on the Drawings shall be engraved on the panel. An additional mimic panel shall be provided with indicating L.E.D. showing the locations of the staircase exit doors at roof level. The operation of the alarm and door monitoring system shall be as follows:
    a. Opening of any door shall cause the corresponding L.E.D. on the mimic panel to light up. Opening of the staircase exit door shall also cause the buzzer to sound intermittently. The L.E.D. and the buzzer if sounded shall go out if the door is closed afterward;

b. In case any main / side entrance door and staircase exit door has been opened for an adjustable period of 0 (immediate alarm) to 10 minutes without being re-closed and reset or any roof exit gate has been opened for an independently adjustable period of 0 (immediate alarm) to 10 minutes without being re-closed and reset, the corresponding L.E.D. shall flash and the buzzer shall sound continuously. A local indicating light shall be illuminated and a local buzzer shall also be sounded. An alarm signal shall be sent to the centralized alarm and door monitoring system for alarm reporting to the security control room;

c. The buzzer in the mimic panel shall be able to be muted by pressing the "Acknowledged" push button on the panel;

d. Pressing the "Reset" push button on the mimic panel after re-closing the door shall reset the local alarm;

e. In the event that any alarm has not been reset for an adjustable period of 1 to 10 minutes, an alarm signal shall be sent to the central alarm and door monitoring system for reporting the alarm to the security control room in the Estate Office;

f. Activation of the emergency door release for door opening shall cause a signal to be sent to the central alarm and door monitoring system;

g. Upon the activation of the guard counter panic alarm push button, L.E.D. on the mimic panel shall light up and an alarm signal shall be sent to the central alarm and door monitoring system;

h. Pressing of the "Test" push button on the mimic panel shall cause all the L.E.D. to light up and the buzzer shall sound;

i. When the doorphone system for SSF court entrance gate is specified, in the event that any call from doorphone panel at main entrance gate of SSF development is not picked up by the security guard of the respective block for an adjustable period of 1 to 120 seconds, an alarm signal for the respective block shall be sent to the central alarm and door monitoring system via the local system for reporting the alarm to the security control room in the Estate Office;

j. In the event that any call from intercom slave station at temporary refuge space is not picked up by the security guard for an adjustable period of 1 to 120 seconds, an alarm signal shall be sent to the central alarm and door monitoring system for reporting the alarm to the security control room in the Estate Office.

2. In case interconnection is required to an existing central security system, the Sub-contractor shall ensure that the equipment provided for this system is compatible with the existing Central Security System for the interface requirements as stipulated in this Specification. The Sub-contractor shall be responsible for the verification of compatibility.

ELE24.3.4.020.9 INTERFACING WITH THE CENTRAL SECURITY SYSTEM

The details of interfacing requirement with central security system are specified in the Project Specific Specification.

ELE24.3.4.030.9 TELEPHONE SET

The requirements of provision of telephone sets are specified in the Project Specific Specification.

ELE24.3.5 CENTRAL SECURITY SYSTEM

ELE24.3.5.010.A GENERAL

1. Central Security System or Second Tier Security System shall be installed in the security control room located in the Estate Management Office (EMO). These systems shall oversee the security system in individual building within the whole estate;
2. The Central Security System shall consist of the following:
   a. Central alarm and door monitoring system in security control room;
   b. Central CCTV system in security control room;
   c. A Local Area Network (LAN) providing connectivity between:
      i. The local CCTV and alarm systems of all domestic blocks;
      ii. Central alarm and door monitoring system;
      iii. Central CCTV system;
      iv. Similar systems in other blocks as specified in Project Specific Specification and Drawings.
   d. As shown in Project Specific Specification and on the Drawings, for those blocks that cannot be connected to the above LAN due to the obstruction by a barrier, such as a public road inaccessible for cabling work, or other site constraint that disallow cabling work, the connection to those blocks shall be provided by broadband lines subscribed from a Broadband Internet Service Provider (BISP). Each Broadband line shall conform to the following, unless otherwise specified:
      i. Minimum 8 Mbps bandwidth for both uploading and downloading;
      ii. With or without Internet access;
      iii. Single fixed IP;
      iv. IP access right within estate between PC and NVR;
      v. All Transmission Control Protocol (TCP) and User Datagram Protocol (UDP) ports of broadband line shall be opened.
   e. Telephone set at EMO and guard counters of domestic block and other location as specified in Project Specific Specification and Drawings.
3. The LAN mentioned in sub-clause 2 above shall conform to the following network standards on a backbone of Cat. 6 UTP or optical fiber in case the cable run between buildings exceeds 90m:

   100 Mbps: Ethernet IEEE 802.3u, 100BASE-TX, 100BASE-FX.
4. The schematic of LAN, if shown on the Drawings, is for indicative purpose only. The Sub-contractor shall be responsible for the final design of the LAN and submit a detailed proposal, with a fully developed schematic, performance analysis and the technical specifications of all the hardware / software required, for the CM's Approval. The system shall comprise all necessary components, such as switches, hubs, repeaters, bridges and routers, to form a fully functional network;

5. If broadband connection services are required, the Sub-contractor shall be responsible for the subscription and maintaining of the services at the EMO and the blocks, where the services are needed, for the entire period starting from testing and commissioning phase of the Works till the expiry of Maintenance Period. The details of the broadband connection services and the BISP shall be approved by the CM;

6. For all communication via Broadband Line, adequate data security shall be provided. All routers accessible from the Internet shall be configurable to run in Virtual Private Network (VPN) mode. The VPN routers shall be so selected that the data throughput shall be adequate for satisfactory transmission of CCTV images with no loss frame from the local systems to the central system with both firewall and VPN activated. The Sub-contractor shall verify the selection of the VPN routers in the performance analysis as stipulated in sub-clause 3 above;

7. The IP addresses and sub-netting arrangement of all the network devices on the LAN shall be submitted to the CM for approval. The Sub-contractor shall adopt the LAN IP format 192.168.xxx.xxx and subnetting Class C with subnet mast set at 240 unless otherwise specified. The third octet number shall be assigned by the CM;

8. At the end of testing and commissioning of the central security system, the Sub-contractor shall prepare the following network data records for future maintenance and management of the system:

    a. Network address list for all networked devices (with TCP/IP address of each network device, subnet setting, WAN IP address if any, etc.);

    b. Network map (includes hardware location, device IP addresses and cable number / reference, etc.);

    c. Network Equipment List (Equipment name, manufacturer name, Model no., Serial no., includes NVR, Ethernet Switch, Router, Personal Computer, LED video monitor, HDMI extender, Cat. 6 cable, fibre optic cable, patch panel etc.);

    d. Network hardware configuration (configuration information includes configuration files and protocol information, user name, password, etc. for each network device);

    e. User manual for all networking and networked devices.

9. The Sub-contractor shall provide hard copy and soft copy of the data record as specified in sub-clause (8) above. Hard copy for data described in sub-clauses (8)(a), (8)(b), (8)(c) & (8)(d) shall be attached to the T & C report and these hard copies together with data described in sub-clause (8)(e) shall be included the O & M manual. Soft copy of the all the data records shall be burned onto CD-ROM or DVD-ROM and also stored in a protected sector of the hard drive in the PC of the central security system. A network map shall also be provided in each equipment rack housing the network devices, this map shall be fixed on the front glass panel in a secure manner and facing inward;

10. The Sub-contractor shall provide customized hands-on training on the operation and management of the central security system. The training shall include the system overview, the operation of hardware and the use of application software. The Sub-contractor shall allow two training courses each for up to 20 personnel nominated by the CM. One training course shall be arranged after the completion of the installation and the second upon the expiry of the Maintenance Period. The Sub-contractor shall provide all necessary training tools, materials and handouts. The Sub-contractor shall submit details of the training, such as the programme, the duration and the contents, for the CM's approval.

ELE24.3.5.020.A CENTRAL ALARM AND DOOR MONITORING SYSTEM

1. General

   a. The central alarm and door monitoring system shall be provided for monitoring alarm signals from individual buildings for the whole estate. The central alarm and door monitoring system shall consist of the following:

      i. Alarm transmitter and necessary network device at each domestic block;

      ii. A central station consisting personal computer, printer, network devices and accessories at the security control room in estate office;

      iii. Software for processing the alarms / events.

   b. The communication between the transmitters at each local blocks and personal computer in EMO shall be through the LAN or Broadband Line connection;

   c. The total numbers of alarm signals required for the whole estate are specified in Project Specific Specification.

2. Alarm Transmitter

   a. The alarm transmitter shall have a minimum of 30 alarm inputs;

   b. Upon receipt of an alarm, the transmitter shall send the alarm status to the central station at the security control room to report the emergency event;

   c. The alarm transmitter shall test the alarm reporting function by reporting to the central station regularly at an adjustable time interval of ½ to 24 hours;

   d. The alarm transmitter shall accept the following signals through the dry contacts:

      i. Unattended prolonged opening or emergency opening of main / side entrance door;

      ii. Unattended prolonged opening of staircase exit door;

      iii. Emergency opening of roof staircase exit door;

      iv. Panic alarm at guard counter;

      v. Power failure to the control units;

      vi. Signals from spare dry contacts;

      vii. Lift alarm signals;

      viii. For SSF development, prolonged unattended call from doorphone panel at main entrance gate(s) of respective block;

      ix. Prolonged unattended call from intercom slave station at temporary refuge space.

3. Central station

   The personal computer shall be of Approved registered trade name. The personal computer shall operate on Windows 10 or the latest version of Windows or other operating system approved by the CM and with standard USB style connector of latest version, minimum 8GB RAM memory, 1TB hard drive, DVD writer and the following peripheral hardware and software:

   a. Peripheral Hardware

      i. LED video monitor, 24 inch screen size;

      ii. Keyboard and optical mouse;

      iii. Laser jet colour printer;

iv. All necessary network devices.

b. Software

i. Alarm processing and display system for all alarm signals from the whole estate plus 100% other future alarm signals;

ii. All the texts / words shown on the screen for the information of and use by the guard supervisor shall be in Chinese. All the inputs required to be made by the guard supervisor shall be simple and user friendly to the approval of the CM;

iii. Only licensed original software shall be used in each system.

4. Software function

The software for processing and displaying the alarm in the central station shall have the following functions:

a. Alarm and event monitoring overview

The system shall be able to show a summary of all alarms and events and list the alarms and events in chronological sequence. The listed details shall include at least the following:

i. Time of alarm / event;

ii. Date of alarm / event;

iii. Name of building;

iv. Nature of alarm / event.

b. Password control

The system shall be able to protect from use by unauthorized person by means of password control. The system shall provide different password for individual user. There shall be one master password for a user who has the authority to assign authority to individual user.

c. Mimic map display

In order for the security guard to easily identify the exact location of an alarm, the system shall store sets of mimic map including:

i. The floor plans of each building with security doors and staircase exit doors within an estate with details of location of individual alarm detection points. All alarm detection points shall be properly labelled;

ii. Site layout plan in which a street map showing the location of all the buildings of an estate. The plan shall be properly labelled and easily updated in future.

These mimic map / plans shall be shown in at least 5 different colours.

d. History and reports

The system shall store the history of alarms and events received by the system for at least 31 days. The history shall be able to be retrieved by defining one or more of the parameters below:

i. Building name;

ii. Operator;

iii. Nature of event;

iv. Duration;

v. Type of action taken by the guard supervisor.

e. Remote terminal

The system shall have the ability to download information to another personal computer through LAN or Broadband Internet.

f. Database back-up

The system shall have facilities to back-up the data stored in the system on rewritable DVD.

g. Capacity for future expansion

i. The system shall have capacity and facilities for expanding the alarm / event monitoring systems such that the no. of alarm / event signals can be doubled in future;

ii. Under normal condition, the alarm / event monitoring overview screen shall be presented. This screen shall show all the current and past alarm and event data. The outstanding alarms shall be in red colour. The reset of the alarm circuit shall cause the colour of the corresponding alarm text changed to white and at the same time, a text indicating the reset of the alarm circuit shall be shown. Events other than alarm shall be shown in white colour;

iii. Upon receipt of an alarm signal from the transmitter, the alarm shall be shown up on the monitor in the form of mimics. Initially, the site layout plan shall be shown with the block having alarm changed to red colour and flashed intermittently. The buzzer shall sound continuously. After the signal is accepted by the guard supervisor, the floor plan of the block shall be displayed with the location of alarm point changed to red colour and flashed intermittently. Simple instructions with nature of alarm and action required to be shown at the bottom of the screen;

iv. After the instructions are acknowledged by the guard supervisor, an action screen listing all the possible actions to be carried out by the guard supervisor shall be shown. The confirmation of the actions carried out by the guard supervisor shall be time tagged and stored in the system;

v. Should there be another alarm occur while the previous alarm is being processed, there shall be a window on the screen indicating the nature of the latest incoming alarm / event and the number of outstanding alarms on queue. This allows the guard supervisor to judge the urgency of the situation;

vi. By returning to the alarm / event monitoring overview screen the guard supervisor may select the most important alarm or event and process it accordingly;

vii. The history of the alarms and events can be produced by the printer at the command of the guard supervisor.

ELE24.3.5.030.A CENTRAL CCTV SYSTEM

1. General

a. The CCTV images captured by each local CCTV system shall be transmitted to the EMO via LAN or Broadband Internet as specified in Project Specific Specification and Drawings;

b. The Sub-contractor shall programme and set up the NVR in each domestic block to transmit the video images to the personal computer in EMO;

c. The Central CCTV system shall consist of the following components, to be provided by the Sub-contractor unless otherwise specified:

i. Cameras at the local CCTV systems;

ii. NVR's at the local CCTV systems;

iii. LAN and Broadband Internet connection;

iv. Central station (a personal computer with accessories) at security control room in EMO.

2. Central Station

The personal computer shall be of Approved registered trade name. The personal computer (PC) shall operate on Windows 10 or any latest version of Windows or other operating system subject to the Contact Manager's approval. The PC shall be equipped with standard USB style connector of latest version, minimum 8GB RAM memory, 1TB hard driver, DVD writer and the following peripheral hardware and software:

a. Peripheral Hardware

i. LED video monitor, 24 inch screen size;

ii. Keyboard and optical mouse;

iii. Laser jet colour printer (shared with the central alarm and door monitoring system);

iv. All necessary network devices.

b. Software

i. Remote end CCTV monitoring software to be provided by the NVR suppliers and installed and set up by the Sub-contractor;

ii. The central CCTV video management and control function shall include but not limited to live view of CCTV channels, playback, record and store file, remotely configure the device parameters, control pan / tilt / zoom, get alarm information, respond and control motions of cameras.

ELE24.3.6 CENTRAL SECURITY SYSTEM SIGNALS TERMINATION BOX

ELE24.3.6.010.9 TERMINATION

All the video and panic alarm signals which all required to be interfaced with the central CCTV system shall be terminated properly to sockets in a separate metal housing at G/F of the meter room. The Sub-contractor shall collect the video transmitters and modems from the Estate Office and complete the Central Security System.

ELE24.3.7 CABLING AND CONNECTIONS

ELE24.3.7.010.9 CABLE

1. Video and radio frequency cables shall be run in concealed conduit separated from power and control cables unless otherwise shown on the Drawings. If surface wiring of video and radio frequency cables has to be performed, they shall maintain a distance of at least 100 mm from power conductors;

2. Internal wiring within console or equipment racks shall be neatly run and held fixed in cable ducts by non-rusting cleats or cable ties;
3. The installation and handling of the cables shall be undertaken at all times by adequate staff suitably trained and supplied with all the necessary equipment and tools. The arrangement of the cables and all method of laying shall be Approved by the Contract Manager and shall be an orderly manner, free from unnecessary bends and crossing and will permit the removal of any one cable without undue disturbance to adjacent cables.

ELE24.3.7.020.9 CONNECTION

1. Connection of cables between an equipment and a wall-mounted adaptor box; or between the equipment rack or console and the cable conduit or trunking shall be protected by flexi-conduit to BS EN 61386-1 or IEC 61386-1;
2. Cable connections to an equipment or control panel shall, as far as possible, be provided with plug-socket configuration. Where direct entry of a cable through a metallic cover or panel of an equipment rack is unavoidable, the hole through the metallic cover or panel shall be protected by rubber grommets to avoid cuts;
3. Jointing of cables shall be avoided. Where a joint is considered acceptable by the Contract Manager all cables shall be jointed by properly designed connectors or inside joint boxes;
4. The Sub-contractor shall provide 75 ohms BNC type video connectors for all cable connections to video equipment or connection panel of control consoles;
5. Handsets of the doorphone system in individual flats shall be connected to the main trunk cable through a termination box located in the meter room on each floor. A printed circuit board shall be provided in the termination box for the purpose of cable connection and termination. All terminal blocks and other system components such as diodes and resistors shall be mounted on this printed circuit board. Interconnections between incoming terminals, outgoing terminals and other system components shall be achieved by copper tracks etched on the printed circuit board and jumper wires shall not be used. Labels shall be printed on the printed circuit board to show the identity of each component, the function and associated flat number of each terminal. A sample of a fully completed printed circuit board together with a labelled circuit diagram shall be submitted for approval prior to manufacturing.

ELE24.3.8 EARTHING

ELE24.3.8.010.9 GENERAL

1. All consoles, operator panels, equipment chassis, camera housing, monitor housing that are constructed from metal shall be suitably earthed against electric shock;
2. If the system design or equipment configuration requires the signal circuit common (applicable to video, radio frequency or control circuitries) to be earthed to minimise interference and/or electromagnetic pick-up, these shall be earthed at a single point to avoid hum loops;
3. Earthing arrangements shall be in accordance with the Electrical CoP.

ELE24.3.9 CCTV AND INTERCOM SYSTEM FOR TEMPORARY REFUGE SPACE

ELE24.3.9.010.9 GENERAL

1. The following CCTV and intercom system shall be provided for temporary refuge space (TRS) in accordance with the Code of Practice for Fire Safety in Buildings 2011 (the Code) issued by Buildings Department:
    a. A closed-circuit television and direct intercom system, both backed up by uninterrupted power supply (UPS) system, shall be provided to every temporary refuge space for communication with the local guard counter and / or management office of the building or other location as specified;
    b. The height of the intercom slave station shall not be less than 900mm and not more than 1200mm above the floor level;
    c. The closed-circuit television and direct intercom system shall be linked to a monitor and a panel respectively at the local guard counter and / or management office or other location as specified showing or indicating the temporary refuge spaces at which persons with a disability are waiting for rescue.
2. An operation instruction plate of CCTV and intercom system shall be provided at the local guard counter and / or management office or other location as specified. The Sub-contractor shall submit details of operation instruction plate to the Contract Manager for approval prior to manufacture.

ELE24.3.9.020.9 INTERCOM SYSTEM

1. The intercom system shall comprise a master station located at the local guard counter and / or management office or other location as specified and a slave station at each temporary refuge space respectively;
2. The master station shall conform to the following technical requirements:
    a. The master station shall be a vandal proof panel with minimum 1.5mm thick stainless steel faceplate and designed for desk-top mounting. The housing shall be made of minimum 1.2mm thick stainless steel;
    b. Each master station shall comprise:
        i. A floor selection panel;
        ii. A handset unit.
    c. A floor selection panel shall be provided to incorporate the following controls / indicators:
        i. Heavy duty Press-ON / Press-OFF floor selection buttons;
        ii. Floor selection indication light;
        iii. A heavy duty spring-loaded slave station "CALL" button;
        iv. A buzzer volume control button;
        v. A power supply status indicator;
        vi. A lamp test button;
        vii. A buzzer alarm.
    d. The master station shall be capable of communicating with any one of the connected slave stations. Direct communication between the slave stations is not required.

3. The slave station shall conform to the following technical requirements:

    a. Each slave station shall be a vandal proof panel with minimum 1.5mm thick stainless steel faceplate and designed for recessed-mounting. The base box shall be made of minimum 1.5mm thick galvanised steel;

    b. Each slave station shall comprise:

        i. A microphone and loudspeaker two way communication unit for hands free operation in a noisy environment such as fire alarm bell being activated;

        ii. A heavy duty spring-loaded "CALL" button for communication with local guard counter and / or management office or other location as specified;

        iii. A LED indication lamp “PLEASE WAIT” displayed in English and Chinese;

        vi. A LED indication lamp “PLEASE TALK” displayed in English and Chinese;

        v. All push buttons shall be vandal-proof type. The push buttons shall be flush mounted with its edge at least 1mm protruded from the surface of stainless steel plate. Push buttons shall be submitted to the Contract Manager for approval;

        vi. Braille instructions as specified on the Drawings.

4. The Sub-contractor shall submit drawings for the arrangement of the master station and slave station to the Contract Manager for approval prior to manufacture;

5. The operation of intercom system shall be as follows:

    a. To initiate a call at the master station, the operator shall press the floor selection button on the master station once. The respective floor indication light shall light up in RED colour automatically. When the "CALL" button at the master station is pressed, a high note call alarm shall be heard at the selected slave station and the “PLEASE TALK” indication lamp shall light up at the selected slave station. Communication between the operator at the master station and the persons with disability at the slave station can be made via the corresponding microphone and loudspeaker unit. On completion of the call, the system shall be reset by pressing the selected floor selection button again and the respective floor indication light at master station shall change to YELLOW colour in order to retain the indication of completed call. The YELLOW floor indication light can be turned off by pressing the selected floor selection button again;

b. To initiate a call at the slave station, the person with disability shall press the "CALL" button on the slave station once. The "PLEASE WAIT" indication lamp shall light up at the slave station. When the master station is being called by a slave station, the buzzer alarm at the master station shall sound and the corresponding floor indication light shall flash in RED colour and the operator can answer the call by pressing the floor selection button; the "PLEASE WAIT" indication lamp shall stop light up and the "PLEASE TALK" indication lamp shall light up at the selected slave station. The respective floor indication light at master station shall light up in RED colour automatically. Communication between the operator at the master station and the persons with disability at the slave station can be made via the corresponding microphone and loudspeaker unit. On completion of the call, the system shall be reset by pressing the selected floor selection button again and the respective floor indication light at master station shall change to YELLOW colour in order to retain the indication of completed call. If the master station is being called by the same slave station again at this stage, the buzzer alarm at the master station shall sound and the corresponding floor indication light shall flash in RED colour and the operator can answer the call by the same operation sequences as mentioned above. The YELLOW floor indication light can be turned off by pressing the selected floor selection button again;

c. If the call from slave station is not picked up within a predetermined period, which is adjustable from 1 to 120 seconds, an alarm signal for the unattended call shall also be generated to the central alarm and door monitoring system via the local alarm and door monitoring system;

d. The master station shall be so designed that it can communicate with only one slave station at a time. When the master station is engaged with one slave station, call from other slave station shall cause the corresponding floor indication light to flash only without activating the buzzer alarm. The operator shall follow the same procedure as described above in answering the waiting calls.

ELE24.3.9.030.A CCTV SYSTEM

1. The CCTV system shall be a local CCTV monitoring system. It shall comprise of the following:
   a. IP CCTV camera at each temporary refuge space;
   b. A monitor located at the local guard counter and / or management office or other location as specified;
   c. NVRs;
   d. Video multiplexing device for display of CCTV images of all TRS from all NVRs on single monitor via time interlace mode;
   e. Interfacing unit with intercom system for pop-up of CCTV images at TRS during communication.
2. The CCTV images captured by the IP CCTV camera at TRS shall be transmitted to the central CCTV system via LAN or Broadband Internet as specified in Project Specific Specification and Drawings;
3. The operation of CCTV system shall be as follows:
   a. Under normal condition, there shall be a view mode selector at the local guard counter and / or management office or other location as specified for the operator to select viewing of CCTV images in two different modes:
      i. display of CCTV images from selected single NVR in 4x4 screen mode;

ii. sequential display of 4x4 screen CCTV images of all TRS from all NVRs in view mode.

Under normal condition, all CCTV images are not recorded by the NVR.

b. When the operator initiates the communication with a particular slave intercom station or answers the call from a slave intercom station by pressing the floor selection button at master intercom station of intercom system, the CCTV image of the selected slave intercom station shall be automatically pop-up and displayed on the monitor. At the same time, when the operator initiates the communication at the master intercom station by pressing the floor selection button or when the persons with disability initiates the communication at the slave intercom station by pressing the "CALL button", the NVR will be triggered to start recording of the CCTV image of the TRS at selected floor;

c. On completion of the call, the operator will reset the intercom system by pressing the selected floor selection button once again and the floor indication light at master intercom station shall change to YELLOW. The CCTV system shall then resume to the view mode under normal condition automatically but the recording of the CCTV images of the TRS at selected floor shall still continue. The operator shall press the selected floor selection button again to turn off the YELLOW indication light and stop recording of the CCTV images of the TRS at selected floor.

4. The Sub-contractor shall provide all necessary video multiplexing devices for display of all CCTV camera images on a single monitor and interfacing devices for the interface with intercom system as described in the above operation sequence. The Sub-contractor shall submit drawings for the arrangement of the CCTV system to the CM for approval prior to manufacture;

5. The equipment of the CCTV system shall comply with the specification in ELE24.2;

6. The IP CCTV camera shall be similar to that used for lift CCTV system except that the camera shall be surface mounted under the ceiling. Super wide angle lens integral with the camera shall be used. The camera and the integral lens shall have angular field of view not less than 110° horizontal.

ELE24.3.9.040.9 WIRING INSTALLATION

Except for the installation in fireman's lift lobby area with guard counter, the wiring installation of CCTV and intercom system shall meet the minimum fire resisting cable requirements for audio / visual advisory systems as listed in Appendix 8 of Code of Practice for Minimum Fire Service Installations and Equipment and Inspection, Testing and Maintenance of Installations and Equipment issued by Fire Services Department.

ELE24.4 TESTING, COMMISSIONING, ACCEPTANCE AND MAINTENANCE

ELE24.4.1 PERFORMANCE TESTS, ADJUSTMENTS, COMMISSIONING AND ACCEPTANCE

ELE24.4.1.010.9 GENERAL

The Sub-contractor shall carry out complete performance tests for all equipment and system installed by him, make all necessary adjustments, commission the installations, and submit the test reports, all to the satisfaction of the Contract Manager who may request the Sub-contractor to repeat all or some of the tests in the presence of his representatives before the installation will be accepted.

ELE24.4.2 TEST

ELE24.4.2.010.A TEST FOR DOORPHONE PANEL

During works completion of the doorphone panel on Site, the Sub-contractor shall perform the functional tests of the doorphone system to the satisfaction of the CM or his representatives:

1. Functional test of all push buttons in the visitor panel shall be conducted;
2. Functional test of the selection of flats and the two-way communication between the panel and the selected flats shall be conducted. After pressing the selected floor and flat, the correct pilot light shall be illuminated and the communication between the visitor panel and addressed flat's handset shall be functioned;
3. During the system communication, the sound quality, sound output level, sensitivity of microphone, and door releasing button of the handset shall be checked;
4. The picture displayed in the video monitor receiving from the CCD video camera in the visitor panel shall have good quality.

ELE24.4.2.020.9 ELECTRICAL TESTS

1. The electrical installation associated with the installation shall be tested to comply with the Electrical CoP and I.E.E. Wiring Regulations, latest edition;
2. Essential performance parameters of all active components of the system as detailed in this Particular Specification including CCTV, amplifier, quad unit, UPS etc. shall be tested to the satisfaction of the Contract Manager. The Sub-contractor shall, at his own cost, deliver the equipment together with test report as required by the Contract Manager or his representative for bench testing and subsequently to the site;
3. The testing procedures recommended by the manufacturer for CCD cameras shall be submitted for Approval;
4. After completion of the installation and before acceptance, the system shall be tested by the Sub-contractor in the presence of the Contract Manager or his representative. All operational functions and performance parameters as specified shall be clearly demonstrated and verified.

ELE24.4.2.030.A TEST FOR CCTV AND INTERCOM SYSTEM FOR TEMPORARY REFUGE SPACE

1. Before delivery of the equipment for CCTV and intercom system to Site, the Sub-contractor shall perform the functional tests of the CCTV and intercom system at the Sub-contractor's workshop in Hong Kong. All tests shall be witnessed by the CM and carried out to the satisfaction of the CM and all test results shall be submitted to the CM for record purpose. During works completion, the Sub-contractor shall again perform the functional tests of the CCTV and intercom system to the satisfaction of the CM. The scope of functional tests shall include:
    a. Functional test of all push buttons in the master and slave stations;
    b. Functional test of the selection of slave stations and the two-way communication between the master station and the selected slave stations;
    c. During the system communication, the sound quality, sound output level and sensitivity of microphone shall be checked under fire alarm bell being activated;
    d. The CCTV camera images displayed in the video monitor shall have good quality. Functional test of interfacing of CCTV and intercom system and the selection of different viewing modes ((1) display of CCTV images from selected single NVR in 4x4 screen mode and (2) sequential display of 4x4 screen CCTV images of all TRS from all NVRs in view mode) shall be conducted.
2. The Sub-contractor shall provide training on the operation and maintenance of the CCTV and intercom systems in accordance with a proposed training programme approved by the CM. The training shall be conducted during normal working hours for the estate management staff. The Sub-contractor shall record one training session in 720p or better resolution video and hand over 2 copies of the video record to the CM.

ELE24.4.3 SCOPE OF WORK DURING MAINTENANCE PERIOD

ELE24.4.3.010.A GENERAL

The scope of work shall include:

1. To carry out all repairs necessary to maintain the Security System installation in good working order at all times;
2. To provide all transport, labour and materials, including cleaning materials, tools and all testing instruments required for the maintenance service;
3. To despatch competent and specially trained workmen to attend any requirement for an emergency inspection within 1 hour during office hours or 2 hours if outside office hours after receiving the report of a fault. The system shall be repaired and restored to normal within 24 hours. In the event that it being impossible to perform the requirement within the time stipulated, the Sub-contractor shall explain immediately to the CM or his representatives the reason for such non-conformance;
4. To despatch competent and specially trained workmen once monthly during normal working hours i.e. 0800 hours to 1700 hours, or as otherwise stated in the Schedule of Installations to inspect, clean and when necessary, align, adjust and maintain the whole installation, and to sign a "Maintenance Record Book" in the way described as follows:

a. On arrival at the estate, the workmen shall report to the Estate Office and sign a "Maintenance Record Book" which will be kept by the Officer-in-Charge of the estate. At the time of signing, they shall note any message written in the book concerning the performance of any parts of the Security System on the estate, and shall take such action as may be required. They shall inspect the installation on the estate at the time of this regular inspection and make any repairs, replacements or adjustments which may be required, irrespective of whether or not such repair or adjustment is noted in the book;

b. When leaving the estate, the workmen shall report to the Office-in-Charge and enter in the "Maintenance Record Book" a brief report on any repairs, replacements or adjustments, which have been carried out or on the fact that they have found the system operating satisfactorily.

5. Throughout the Maintenance Period, the Sub-contractor shall be responsible for the updating of the firmware of the NVR and the software of the NVR remote client as and when requested by the CM. After each firmware and software update, the Sub-contractor shall test the system and do all adjustment of system settings as necessary to make sure the system is back to full operational conditions and functionalities and record all the details in "Maintenance Record Book";

6. To provide quarterly reports on the condition of the system:

a. To provide repairs and replacement parts at no additional cost to the Authority such as mechanical, electrical and electronic parts of the installation which the CM or the Sub-contractor in his judgement may consider necessary for the correct operation of the installation. Provided always that any renewals or repairs necessitated by reason of negligence or misuse of the equipment or by reason of any other cause beyond the Sub-contractor's control, with the exception of ordinary wear and tear, shall be carried out by the Sub-contractor if so required by the CM at an additional cost to be negotiated by both parties. Replacements shall be obtained from the manufacturer's spare parts list. Alternative components shall not be used without prior Approval by the CM;

b. Should the Sub-contractor find it necessary to remove any system parts to his workshop for repair, the Sub-contractor shall install at the time of removal replacement parts of the equipment during the period of repair, free of cost to the Authority.

ELE24.4.3.020.A QUARTERLY SERVICING

The Sub-contractor shall carry out, at three months intervals, routine servicing and preventive maintenance to maintain the security systems in proper working condition within the Maintenance Period. The Sub-contractor shall conduct the inspection, servicing and maintenance works and submit a report to the CM after each inspection, as stated below:

1. Security door lock:

a. Check and clean the door contact;

b. Clean and check the proper operation of the electro-magnetic door lock and the conditions of all physical mounting and alignment;

c. Check that the entrance door with electro-magnetic door lock can be released when the emergency door release for door release is activated;

d. Check that the entrance door with electro-magnetic door lock is unlocked in case of mains power failure.

2. Doorphone system:

a. Check for and repair / replace the push buttons;

b. Check the condition of electronic components and printed circuit board;

c. Check the operation of L.E.D. matrix display and other indicators for proper operation;

d. Check that the functional operation of the systems meets with the specification requirements.

3. Local closed circuit television system:

   a. Clean the lens and camera;

   b. Check the focus of camera;

   c. Adjust the angle of view of the camera;

   d. Check views of the camera on the monitor and in particular take note of the resolution of the picture;

   e. Check and adjust the contrast and brightness of the monitor;

   f. Clean the screen of the monitor;

   g. Check the operation of NVR;

   h. Check hard disk storage of NVR;

   i. Check accuracy and correctness of date / time / location setting;

   j. Check the quality of video image recorded in night time.

4. Local alarm and door monitoring system:

   a. Check that the functional operation of the system in particular the time delay setting meets with the specification requirements;

   b. Test the indicators and buzzer;

   c. Check the condition of the battery and charger.

5. Central alarm and door monitoring system:

   a. Check that the functional operation of the system meets with the specification requirements by means of simulating alarms at the building;

   b. Clean the floppy disk drive, if provided;

   c. Check the data storage and back up if necessary;

   d. Clean and check the proper operation of the printer.

6. Central CCTV system:

   a. Check that the functional operation of the system and the alarm reporting operation meets with the specification requirements;

   b. Check the views of the cameras on the monitor and in particular take note of the resolution of the picture;

   c. Check and adjust the contrast and brightness of the monitor;

   d. Clean the screen of the monitor;

   e. Check the operation of all network devices (routers, network hubs / switches etc.) at the local systems and the central system (i.e. at domestic blocks and EMO);

   f. Check the operation of the Broadband Line connections.

7. CCTV and Intercom system for Temporary Refuge Space:

   a. Check and repair / replace the push buttons as necessary;

b. Check the condition of electronic components and printed circuit boards;

c. Check the operation of L.E.D. indicators for proper operation;

d. Check the functional and operation of the systems for compliance with the specification requirements;

e. Clean the lens and camera;

f. Check the focus of camera;

g. Adjust the angle of view of the camera;

h. Check views of the camera on the monitor and in particular take note of the resolution of the picture;

i. Check and adjust the contrast and brightness of the monitor;

j. Clean the screen of the monitor;

k. Check the operation of CCTV image distribution and control device;

l. Check the sound quality, sound output level and sensitivity of microphone of the Intercom System.

8. Uninterrupted Power Supply (UPS):

a. Operation checks of all alarms, indications, controls and protection facilities of UPS equipment;

b. Check the condition of batteries;

c. Functional check of external maintenance bypass switch..

ELE25.1 GENERAL REQUIREMENTS

ELE25.1.010.9 GENERAL

This Particular Specification is in addition to, and is to be read in conjunction with, the relevant sections of the latest issue/amendment of the General PA Specification. The installation shall comply with the above specifications where relevant.

ELE25.1.020.9 SCHEMATIC DIAGRAM

The proposed schematic diagrams for the systems given in the Drawings are intended to serve as guidelines only and may not be taken as the final design. If any deviations are proposed or expected, tenderer shall enclose details of the proposed alternatives with their tenders for consideration.

ELE25.1.030.9 INFORMATION TO BE SUPPLIED WITH TENDER

Tender shall be accompanied by specifications, catalogues, literatures etc. in English language for each item of equipment offered.

ELE25.1.040.9 SAMPLES OF EQUIPMENT

Tenderer may be required to submit sample of any equipment proposed to the Contract Manager for bench acceptance testing before installation.

ELE25.1.060.9 EXECUTION OF WORKS

1. The Sub-contractor shall employ a contractor on the “List of Approved Suppliers of Materials and Specialist Contractors for Public Works” for “Audio Electronics Installation” to carry out the works for the public address system. The name of the specialist contractor shall be included on the Schedule of Information to be supplied by Tenderer at the time of tender submission. Subsequent to the acceptance of tender, the afore-mentioned contractor shall not be changed unless otherwise approved by the Contract Manager;
2. The “List of Approved Suppliers of Materials and Specialist Contractors for Public Works” for “Audio Electronics Installation” may be found on the website of the Development Bureau, the Government of the HKSAR.

ELE25.2 THE PUBLIC ADDRESS SYSTEM

ELE25.2.020.9 FUNCTIONALITY OF THE PUBLIC ADDRESS SYSTEM

The System will be used for making announcement and playing background music to the selected areas of the commercial centre. The system shall allow:

1. Announcement to be made from the console by means of a hand-held microphone with on-off switch;
2. Background music to be played by means of a CD player with MP3 playback function and/or a radio tuner at the console; and
3. Speeches and music programmes fed from remote signal input points (RSIPs), as specified in Project Specific Specification and/or Drawings, to be broadcasted.

ELE25.2.030.9 COMPONENTS OF THE PUBLIC ADDRESS SYSTEM

The system shall comprise the following items, each to be complete with necessary accessories:

1. A hand-held type microphone with built-in "ON/OFF" talk switch completes with mike hanger and coiled cable of 1 m to 1.5 m long;
2. An AM/FM radio tuner;
3. A CD player with MP3 playback function;
4. An input selection panel - the input selection panel shall perform the input switching function as detailed in ELE25.3.050 below;
5. One mixer preamplifier - the mixer preamplifier shall accept all system inputs. Individual volume control shall be provided for each system input;
6. The quantities and power ratings of power amplifiers to be used for the system shall be clearly stated by the tenderer in his tender. The total load connected to each individual power amplifier shall not be more than 90% of its rated power;
7. A speaker selector shall allow speaker zones to be selected individually or collectively in any combinational manner, plus the all-call function. Details of speaker zones are given in Project Specific Specification and/or Drawings;
8. A volume control panel shall allow individual step volume control of each speaker zone. Details of speaker zones are given in Project Specific Specification and/or Drawings;
9. A monitor panel with two monitoring circuits;
10. A steel equipment cabinet rack for holding items (1) to (9) above;
11. 3W ceiling mount speakers, number to be given in Project Specific Specification and/or Drawings;
12. Wide range horn speakers, number and wattage to be given in Project Specific Specification and/or Drawings;
13. Column speakers, number and wattage to be given in Project Specific Specification and/or Drawings; and
14. Remote signal input circuits where each circuit consists of a number of remote signal input points connected in parallel. Details to be given in Project Specific Specification and/or Drawings.

ELE25.2.040.9 REMOTE SIGNAL INPUT POINT (RSIP)

All remote signal input point (RSIP)'s shall be connected to the equipment rack by microphone cables. A cannon socket shall be provided for each RSIP and installed in the manner as described in ELE25.4.030.

ELE25.2.050.9 PORTABLE PUBLIC ADDRESS SYSTEM

The portable system shall comprise the following equipment items, each to be complete with necessary accessories:

1. 2 hand-held type microphones each complete with a tiltable mount adaptor and a suitable floor stand of adjustable height. The length of cable required for each microphone shall be 10 m;
2. A portable mixer power amplifier (or a portable mixer-preamplifier plus a portable power amplifier) with at least 2 microphone inputs, 1 magnetic phono input, and 1 auxiliary input. A line level output is also required. Minimum output power of the amplifier is given in the Project Specific Specification and/or Drawings;
3. 2 Nos. speaker columns each complete with a suitable height floor stand support. Output power of the speakers is given in the Project Specific Specification and/or Drawings;
4. A 10 m long extension microphone cable shall be provided for connecting the line output of the amplifier to any one of the RSIPs of the Public Address System. The cable end for connecting to the RSIP shall be terminated with a cannon plug;
5. A 10 m long extension speaker cable shall be provided for each speaker column for connecting the speaker to the power amplifier;
6. The Sub-contractor shall supply a trolley with heavy duty casters. All the above equipment except the speakers and their accessories shall be mounted on it. The sub-contractor shall submit a shop drawing to the Contract Manager for Approval prior to fabrication.

ELE25.3 EQUIPMENT FUNCTIONAL REQUIREMENTS AND PERFORMANCE CHARACTERISTICS

ELE25.3.010.9 GENERAL

1. Unless otherwise specified herein, all equipment items to be supplied shall comply with the functional requirements and performance characteristics specified in Section 4 of the General PA Specification;
2. In case of any discrepancy between this specification and the General PA Specification the former shall take precedence;
3. The Monitor Panel, the Input Selection Panel and the Volume Control Panel for the Public Address System shall be made of 1.5 mm thick stainless steel plate or 3.2 mm thick anodized aluminium plate. All labels shall be engraved. Drawings of the panel layout shall be submitted for Approval prior to fabrication;
4. The requirements of sub-clause (3) shall apply also to the front panel of the Speaker Selector for the Public Address System if this item is custom made.

ELE25.3.020.9 AM-FM RADIO TUNER

1. A quartz synthesizer AM/FM tuner with auto-scan tuning shall be provided. It shall be equipped with at least 12 preset tunings with 6 for FM channels and 6 for AM channels. The tuning circuit of the tuner shall be stable enough to maintain unattended operation over long period;
2. The tuner shall be capable of receiving radio programmes in AM band of 530 to 1,605 kHz and FM band of 88 to 108 MHz;
3. The tuner shall be complete with band selector and volume control, and shall also satisfy the following minimum performance characteristics:
    a. Sensitivity shall be better than l00uV for AM (l,000 kHz) and l0uV for FM (26 dB quieting, 40 kHz deviation);
    b. Signal-to-noise ratio shall be greater than 40dB for AM and 65 dB for FM;
    c. Selectivity shall be not lower than 6 kHz for AM and 250 kHz for FM at – 3 dB point;
    d. Total harmonic distortion shall not exceed 2% for AM (5 mV, 400 Hz) and 1% for FM (1 kHz);
    e. FM intermodulation distortion shall not exceed 0.3%;
    f. FM frequency response shall not vary by more than 3dB over the frequency range 30 - 15,000 Hz;
    g. Output level shall be not less than 450 mV.

ELE25.3.030.9 CD PLAYER

1. This shall be a multi-CD player with MP3 playback function. It shall be of rugged design suitable for long hours playback of background music;
2. It shall comprise of a front access USB socket for audio file play back;

3. The multi-CD player shall have the series playback function so that after one disc finishes, the other shall start playing automatically;
4. It shall satisfy the following minimum performance characteristics:
   a. Frequency response : 20 to 20,000Hz ± 2 dB;
   b. Harmonic distortion : Less than 0.02% at 1 kHz;
   c. Signal to noise ratio : Better than 98 dB.

ELE25.3.040.9 MICROPHONES

All microphones shall be of unidirectional (cardioid) dynamic type.

ELE25.3.050.9 INPUT SELECTION PANEL

1. The panel shall comprise of push-button switches, illuminated indicators and the associated control circuitry to facilitate the selection of the following inputs.
   a. Tuner;
   b. CD player with MP3 playback function;
   c. Console microphone (selected by the microphone "ON/OFF" switch);
   d. Remote signal input point;
   e. Spare.
2. The microphone input shall have priority over all other inputs and is selected by its "ON/OFF" switch. The control circuitry shall be able to select the microphone input automatically when the microphone is switched to "ON" position and back to the previous selected input source when it is switched off;
3. Only one input shall be selected at any one time;
4. The input selection panel and the volume control panel mentioned in ELE25.3.070 should preferably be installed in a single panel mounted on the console.

ELE25.3.060.9 MONITOR PANEL

1. The panel, required for the Public Address System, shall consist of two monitoring circuits - Circuit A for monitoring the outputs of all power amplifiers and Circuit B for monitoring the zone outputs of the volume control panel. The number of zones is given in Project Specific Specification and/or Drawings;
2. All the facilities specified in Clause 4.2.9(b) of the General PA Specification, except item (ii), shall be provided for the Monitor Circuits A & B;
3. A master power ON/OFF switch with lamp indication shall be provided on the panel for the whole Public Address System.

ELE25.3.070.9 VOLUME CONTROL PANEL

1. The panel, required for the Public Address System, shall have a number of sets of rotary switches and auto-transformer circuits for varying the output voltage of the speaker lines individually. The number of sets is given in Project Specific Specification and/or Drawings;
2. For each control circuit, a minimum of six control steps giving attenuation right from full speaker line output (0 dB) to a value of not less than 15 dB shall be provided.

ELE25.3.080.9 EQUIPMENT CABINET

1. Equipment cabinet for the Public Address System shall be a steel cabinet rack of standard 19 inch (483 mm) EIA type;
2. The cabinet rack shall be made of mild sheet steel of at least 1.2 mm thick, complete with two layers of stoved enamel or one layer of epoxy powder paint, and coloured grey;
3. Provision of a front locking door for the rack is optional. However, it shall have a detachable back panel (or cover) to facilitate easy servicing. The back panel (or cover) shall be either fixed by screws or fitted with hinge and lock. Blank panels shall be provided to fill up gaps and spaces on the rack front;
4. It shall be complete with a blower fan unit to assure good ventilation;
5. Drawing of the cabinet rack and proposed equipment mounting layout shall be submitted for Approval prior to fabrication.

ELE25.3.090.9 CEILING SPEAKER

1. Ceiling mount speakers for the Public Address System shall be suitable for flush-mounting on false ceiling;
2. Input power rating of the ceiling mount speaker shall be at least 3W and equipped with matching transformer. The transformer shall be complete with at least l W, 2 W and 3 W tappings with insertion loss of not exceeding l dB;
3. The ceiling mount speaker shall have aluminium or metallic alumited punching grille and complete with a metal enclosure. The area of punching shall be not less than 10% of the total area of the metal grille;
4. If there is no false ceiling, surface type ceiling speaker shall be provided.

ELE25.3.100.9 HORN SPEAKER

Wide range horn speakers of outdoor type shall be provided for the Public Address System. Input power rating of the horn speaker is given in the Project Specific Specification and/or Drawings.

ELE25.3.110.9 COLUMN SPEAKER

1. Column speaker shall be of weatherproof type suitable for outdoor application for the both fix mounting and portable PA Systems. Enclosure shall be made of non-rusting metallic material;
2. Input power rating of the column speaker is given in the Project Specific Specification and/or Drawings...

ELE25.4 INSTALLATION REQUIREMENTS

ELE25.4.010.9 GENERAL

Unless otherwise specified in this specification or on the Drawings, all signal cables shall be provided in concealed conduit wiring system. Speaker and microphone cables shall be installed in separate conduits. Voltage of control cables sharing the same conduit with microphone cables shall be d.c. 24V or lower. Microphone cables shall mean all microphone cables carrying line or lower level audio signals.

ELE25.4.020.9 MOUNTING OF CEILING SPEAKER

1. The ceiling speakers shall be linked to the BESA boxes at conduit outlets by flexible conduits (with PVC oversheath and dome covers);
2. The Sub-contractor shall provide mounting brackets and necessary mounting materials for the ceiling speakers;
3. Mounting of the ceiling speakers, including mounting brackets, shall be carried out by the Sub-contractor;
4. Cutting of openings on the false ceiling for the speakers will be carried out by the Main Contractor, however information of which shall be provided by the Sub-contractor;
5. The tenderer shall enclose details of the installation method, together with complete information on exact dimensions of the ceiling speaker and mounting bracket, size of ceiling opening required, total mechanical loading of speaker including mounting bracket, etc. in his tender for consideration;
6. Proper connector, such as terminal block, shall be provided inside the speaker enclosure for the speaker cable to facilitate easy removal of the loudspeaker unit.

ELE25.4.030.9 MOUNTING OF REMOTE SIGNAL INPUT POINT (RSIP) CONNECTORS

If RSIP is required, the Cannon Socket for the RSIP of the Public Address System shall be flush mounted or a stainless steel plate. The plate shall be fixed inside a drip-proof stainless steel box complete with hinged cover and lock. The size of the box shall not be more than 180 x 180 x 100 (D) mm and it shall be fixed onto a BS 4662 box provided by others.

ELE25.4.040.9 AM-FM RADIO TUNER

The FM signal for the AM-FM Radio Tuner shall be obtained from the Communal Aerial Broadcast Distribution System socket outlet at the position as shown on the Drawings.

ELE25.5 TESTING, COMMISSIONING, ACCEPTANCE AND MAINTENANCE

ELE25.5.010.9 PERFORMANCE TEST, ADJUSTMENTS, COMMISSIONING AND ACCEPTANCE

The Sub-contractor shall carry out complete performance tests for all equipment and systems installed by him, make all necessary adjustments, commission the installations, and submit test reports, all to the satisfaction of the Contract Manager who may request the Sub-contractor to repeat all or some of the tests in the presence of his representatives before the installation is accepted. At the end of the maintenance period, the Sub-contractor shall repeat the tests to the satisfaction of the Contract Manager.

ELE25.5.020.9 ELECTRICAL TEST

The electrical installation associated with the installation shall be tested to comply with latest edition of the Electrical CoP and I.E.E. Wiring Regulations.

ELE25.5.030.9 SCOPE OF WORK DURING MAINTENANCE PERIOD

The scope of work shall include:

1. To carry out all repairs necessary to maintain the Public Address System installation in good working order at all times;
2. To provide all transport, labour and materials, including cleaning materials, tools and all testing instruments required for the maintenance service;
3. To despatch competent and specially trained workmen to attend any requirement for an emergency inspection and repair within 24 hours of receiving the report of a fault;
4. To despatch competent and specially trained workmen once monthly during normal working hours i.e. 0800 hours to 1700 hours, to inspect, clean and when necessary, align, adjust and maintain the whole installation, and to sign a "Maintenance Record Book" in the way described as follows:
    a. On arrival at the estate, the workmen shall report to the Estate Office and sign a "Maintenance Record Book" which will be kept by the Officer-in-Charge of the estate. At the time of signing, they shall note any message written in the book concerning the performance of any parts of the Public Address System on the estate, and shall take such action as may be required. They shall inspect the installation on the estate at the time of this regular inspection and make any repairs, replacements or adjustments which may be required, irrespective of whether or not such repair or adjustment is noted in the book;
    b. When leaving the estate, the workmen shall report to the Officer-in-Charge and enter in the "Maintenance Record Book" a brief report on any repairs, replacements or adjustments which have been carried out or on the fact that they have found the system operating satisfactorily.
5. To provide half-yearly reports on the condition of the system. The report should include, but not be limited to, the number of calls attended, the number and types of system parts replaced;
6.

a. To provide repairs and replacement parts at no additional cost to the Authority such as mechanical, electrical and electronic parts of the installation which the Contract Manager or the Sub-contractor in his judgement may consider necessary for the correct operation of the installation. Provided always that any renewals or repairs necessitated by reason of negligence or misuse of the equipment or by reason of any other cause beyond the Sub-contractor's control, with the exception of ordinary wear and tear, shall be carried out by the Sub-contractor if so required by the Contract Manager at an additional cost to be negotiated by both parties;

b. Replacements shall be obtained from the manufacturer's spare parts list. Alternative components shall not be used without prior Approval by the Contract Manager;

c. Should the Sub-contractor find it necessary to remove any system parts to his workshop for repair, the Sub-contractor shall install at the time of removal replacement parts of the equipment during the period of repair, free of cost to the Contract Manager.

ELE26.1 SCOPE OF WORK

ELE26.1.010.A PROVISION OF CARPARK CONTROL AND MANAGEMENT FACILITIES

The Sub-contractor shall provide the following carpark control and management facilities as shown on the Drawings:

A. For Public Rental Housing (PRH) Development

1. Carpark control and management facilities for ingress and egress of carpark:
    a. Automatic Carpark Control System (ACCS) and revenue collection provision;
    b. _____nos. of short range or long range proximity cards and _____nos. of blank magnetic stripe paper tickets;
    c. Vehicle Image and Licence Plate Recognition System (VLRS);
    d. Intercom System;
    e. Car counting system and "FULL" sign;
    f. Carpark CCTV System at Entrance and Exit Control Points and at strategic locations in the car parking control area as shown on the Drawings;
    g. Interfaces with the Octopus clearing system;
    h. System Interfaces to exchange electronic data with a HA data hub server via broadband network with fixed IP (4G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP);
    i. Real-time parking availability system with carpark vacancy display board and data interface with the parking vacancy information system of the Transport Department (TD) to indicate the number of vacant hourly parking spaces with and without electric vehicle (EV) charging facilities respectively via broadband network with fixed IP (4G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP).

B. For Subsidized Sale Flats (SSF) Development with Housing Authority (HA) Standalone Carpark

1. Carpark control and management facilities for ingress and egress of SSF development:
    a. Automatic Carpark Control System (ACCS) and revenue collection provision;
    b. _____nos. of short range or long range proximity cards and _____nos. of blank magnetic stripe paper tickets;
    c. Intercom System;
    d. Carpark CCTV System at Entrance and Exit Control Points and at strategic locations in the car parking control area as shown on the Drawings.
2. Carpark control and management facilities for ingress and egress of HA Carpark:
    a. Automatic Carpark Control System (ACCS) and revenue collection provision;
    b. _____nos. of short range or long range proximity cards and _____nos. of blank magnetic stripe paper tickets;
    c. Vehicle Image and Licence Plate Recognition System (VLRS);
    d. Intercom System;

e. Car counting system and "FULL" sign erected at HA area near main vehicular access;

f. Carpark CCTV System at Entrance and Exit Control Points and at strategic locations in the car parking control area as shown on the Drawings;

g. Interfaces with the Octopus clearing system;

h. System Interfaces to exchange electronic data with a HA data hub server via broadband network with fixed IP (4G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP);

i. Real-time parking availability system with carpark vacancy display board and data interface with the parking vacancy information system of the Transport Department (TD) to indicate the number of vacant hourly parking spaces with and without electric vehicle (EV) charging facilities respectively via broadband network with fixed IP (4G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP).

C. For SSF Development with HA Open Carpark

1. Carpark control and management facilities for ingress and egress of SSF development:

   a. Automatic Carpark Control System (ACCS) and revenue collection provision;

   b. _____nos. of short range or long range proximity cards and _____nos. of blank magnetic stripe paper tickets;

   c. Intercom System;

   d. Carpark CCTV System at Entrance and Exit Control Points and at strategic locations in the car parking control area as shown on the Drawings.

2. Carpark control and management facilities for ingress and egress of HA Carpark:

   a. Automatic Carpark Control System (ACCS) and revenue collection provision;

   b. _____nos. of short range or long range proximity cards and _____nos. of blank magnetic stripe paper tickets;

   c. Intercom System;

   d. Car counting system and "FULL" sign erected at HA area near main vehicular access;

   e. Carpark CCTV System at hourly parking pay stations and at strategic locations in the car parking control area as shown on the Drawings;

   f. Interfaces with the Octopus clearing system;

   g. System Interfaces to exchange electronic data with a HA data hub server via broadband network with fixed IP (4G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP).

ELE26.1.020.A ENTRANCE CONTROL POINTS

Unless otherwise specified, the Sub-contractor shall provide the following components at the entrance control point(s) at the ingress of carpark and/or SSF development as located on the Drawings:

1. Entrance Control Unit;

2. Floor-mounted drop gate barrier completed with automatic raising arm;

3. Underground presence and passage loop detectors;

4. Cameras for CCTV System and accessories completed with weatherproof housings including mounting poles and brackets;
5. Vehicle's height detector with mounting pole and bracket;
6. Cameras and Floodlight for VLRS and accessories completed with weatherproof housings including mounting poles and brackets (not required for ingress of SSF development);
7. HA's "FULL" sign erected at HA area near the main vehicular access of PRH / SSF;
8. HA's Carpark vacancy display board erected near the main vehicular access of PRH / SSF;
9. Incorporated Owners (IO)'s magnetic ticket validator unit (only required for ingress of HA Carpark inside SSF Development).

ELE26.1.030.A EXIT CONTROL POINTS

Unless otherwise specified, the Sub-contractor shall provide the following components at the exit control point(s) at the egress of carpark and/or SSF development as located on the Drawings:

1. Exit Control Unit;
2. Floor-mounted drop gate barrier completed with automatic raising arm;
3. Underground presence and passage loop detectors;
4. Cameras for CCTV and accessories completed with weatherproof housing including mounting pole and bracket;
5. Cameras and Floodlight for VLRS and accessories completed with weatherproof housing including mounting pole and bracket (not required for egress of SSF development);
6. IO's magnetic ticket dispenser unit (only required for egress of HA Carpark inside SSF Development).

ELE26.1.040.A CARPARK CONTROL CENTRE

Unless otherwise specified, the Sub-contractor shall provide the following components at the carpark control centre(s) as located on the Drawings:

1. ACCS Workstation;
2. Revenue collection provision;
3. VLRS Computer Unit (not required for ingress and egress of SSF development and HA Open Carpark inside SSF development);
4. Manual button for barrier control (not required for HA Open Carpark without HA control drop gate inside SSF development);
5. Master station of intercommunication system;
6. Equipment rack to keep CCTV system equipment and network video recorders.

ELE26.1.045.N HA OPEN CARPARK

Unless otherwise specified, the Sub-contractor shall provide the following components at the entrance control point(s) at the ingress of carpark and/or SSF development as located on the Drawings:

1. Cameras for CCTV System and accessories completed with weatherproof housings including mounting poles and brackets;
2. HA's "FULL" sign erected at HA area near the main vehicular access of PRH / SSF;

3. Incorporated Owners (IO)'s magnetic ticket validator/dispenser unit (only required for ingress/egress of HA Carpark inside SSF Development);
4. Hourly parking pay station with the following components:
    a. Octopus card reader/validator;
    b. Magnetic strip paper ticket dispenser/validator;
    c. Slave station of the intercom system;
    d. Thermal printer;
    e. Backlit LCD colour visual instruction display panel.

ELE26.1.050.A WIRING CONNECTION

The Sub-contractor shall provide all necessary cable wiring for data, communication and power connection between the entrance control point, the exit control point, the hourly parking pay station and the carpark control centre, at both above-ground and under-ground.

ELE26.1.060.9 EXECUTION OF THE WORK

1. The Sub-contractor shall verify to the satisfaction of the Contract Manager that they are licensed for carrying out type III security work under the Security and Guarding Services Ordinance Cap. 460 and are competent to complete the works, otherwise they shall employ competent sub-sub-contractor(s), who have the required licence, to carry out the works relating to security. For the latter case, the Sub-contractor shall submit the proposed sub-sub-contractors' relevant information related to the licence, technical capability, working experience on security system to the Contract Manager for approval. Whenever necessary, the Sub-contractor shall also submit documents and drawings for the completed projects to the Contract Manager for consideration. Inspection of the completed projects and visit of the proposed contractor's office and workshop may be conducted, if deemed necessary;
2. The Sub-contractor shall be an Octopus authorized contractor, or otherwise employ an Octopus authorized contractor as its sub-sub-contractor to provide the ACCS. All system hardware and software related to the Octopus clearing system shall be approved by the Octopus Cards Limited. The Sub-contractor shall provide copies of approval certificates to the Contract Manager for vetting;
3. The Sub-contractor or its sub-sub-contractor for the ACCS shall have at least five carpark systems satisfactorily completed for more than 6 months, in the past three years;
4. For Sub-contract of the latter phase of a housing estate, the Sub-contractor shall ensure the ACCS and VLRS to match with the ACCS and VLRS of the earlier completion phases in the same estate.

ELE26.2 SYSTEM DESCRIPTION

ELE26.2.010.A AUTOMATIC CARPARK CONTROL SYSTEM

1. The Automatic Carpark Control System (ACCS) shall include the following components as indicated on the Drawings:

   A. For Public Rental Housing (PRH) Development

   a. Carpark control and management facilities for ingress and egress of carpark:

      i. Entrance Control Unit(s);

      ii. Exit Control Unit(s);

      iii. ACCS Workstation;

      iv. Revenue collection facilities;

      v. Automatic drop gate barriers;

      vi. Loop detectors;

      vii. Height detectors;

      viii. All necessary wiring and accessories.

   B. For SSF Development with HA Standalone Carpark

   a. Carpark control and management facilities for ingress and egress of SSF development:

      i. Entrance Control Unit(s);

      ii. Exit Control Unit(s);

      iii. ACCS Workstation;

      iv. Revenue collection facilities;

      v. Automatic drop gate barriers;

      vi. Loop detectors;

      vii. Height detectors;

      viii. IO's magnetic ticket validator/dispenser unit(s) at ingress/egress of HA Carpark;

      ix. All necessary wiring and accessories.

   b. Carpark control and management facilities for ingress and egress of HA carpark:

      i. Entrance Control Unit(s);

      ii. Exit Control Unit(s);

      iii. ACCS Workstation;

      iv. Revenue collection facilities;

      v. Automatic drop gate barriers;

      vi. Loop detectors;

      vii. Height detectors;

      viii. All necessary wiring and accessories.

C. For SSF Development with HA Open Carpark

a. Carpark control and management facilities for ingress and egress of SSF development:

i. Entrance Control Unit(s);

ii. Exit Control Unit(s);

iii. ACCS Workstation;

iv. Revenue collection facilities;

v. Automatic drop gate barriers;

vi. Loop detectors;

vii. Height detectors;

viii. IO's magnetic ticket validator/dispenser unit(s) at ingress/egress of HA Carpark;

ix. All necessary wiring and accessories.

b. Carpark control and management facilities for ingress and egress of HA carpark:

i. ACCS Workstation;

ii. Revenue collection facilities;

iii. Hourly parking pay station(s);

iv. All necessary wiring and accessories.

2. The ACCS shall be able to handle the following types of parking modes:

a. Hourly or Concessionary Parking - operated by Octopus cards, or during the suspension of Octopus Card System, by magnetic stripe paper tickets;

b. Season/Monthly Parking - operated by proximity cards;

c. Complimentary Parking - operated by either magnetic strip paper tickets or manual control.

3. The ACCS shall be of fully automatic type. Under normal operation, no operator is required. Only in the suspension of the Octopus Card System, an operator at the ACCS Workstation is required to handle the cashier work. The magnetic stripe paper ticket dispenser at the Entrance Control Unit shall be disabled if Octopus Card System is provided and works properly;

4. The ACCS shall possess an anti-passback function for all season/monthly proximity cards. When any proximity card has been accepted by an Entrance Control Unit, the card cannot be re-used again at any Entrance Control Unit of the ACCS until the card has been accepted by an Exit Control Unit of the ACCS. Same principle shall be applied to the Exit Control Unit.

ELE26.2.020.A VEHICLE IMAGE AND LICENCE PLATE RECOGNITION SYSTEM

1. The Vehicle Image and Licence Plate Recognition System (VLRS) shall capture and store the image of incoming and outgoing vehicles and automatically detect, recognize and verify alphabetical and numerical characters on images of vehicle licence plates taken by infrared cameras at low level at entrance / exit control points. The system shall be able to recognise all kinds of vehicle licence plate formats issued by local authority;

2. The VLRS shall comprise all necessary equipment including infrared cameras with weatherproof casing, VLRS computer, LED video monitor (24" or above) and well developed software for the system to perform to the CM's satisfaction. The overall accuracy of the licence plate recognition shall be up to 95% at any time. Cameras shall be provided at all entrance and exit control points;

3. When vehicles of Octopus Card / Magnetic Stripe paper ticket users enter the carpark, the infrared cameras at entrance control point shall take images of the incoming vehicles and their licence plates. The VLRS computer shall store and link up the data with the respective Octopus Cards / Magnetic Stripe paper tickets. The infrared cameras at the exit control point shall also take images of the leaving vehicles and their license plates. The VLRS shall compare and verify whether a licence plate taken at exit has been recorded at entrance with respect to the respective Octopus Card prior to automatically raising up the exit barrier arm. If the verification process fails, an alarm shall be initiated at the carpark control centre to alert the operator;

4. When vehicles of proximity card users enter the carpark, the infrared cameras at entrance control point shall take images of the incoming vehicles and their license plates. The VLRS shall compare them with the stored data of a pre-defined list of authorized vehicles and verify their validity prior to automatically raising up the entrance barrier arm. When vehicles of proximity card users exit the carpark, the infrared camera at exit control point and the VLRS computer shall do the same. Once the verification process fails, an alarm shall be initiated at the carpark control centre to alert the operator;

5. The VLRS can be by-passed, disabled or isolated completely from the ACCS inside carpark control centre by simple means whenever required at any time.

ELE26.2.030.A OPERATION AT ENTRANCE CONTROL POINT

A. For PRH Development

1. Three types of incoming vehicles – vehicles with height below 2 m, vehicles with height 2 m or above and motorcycle shall be identified by presence detection loop and height sensors and then the ACCS Workstation automatically decide on which rate to be charged according to the pre-set fee structure;

2. For season and monthly parking, when a proximity card is detected, the card information shall be transferred to the ACCS Workstation for checking and the VLRS shall activate illumination and take image of the front car licence plate from the infrared camera and image read shall be compared with the pre-defined vehicle number. If the car licence plate number is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop;

3. For hourly parking, when an Octopus Card is detected or a magnetic stripe paper ticket is drawn, the type of vehicle and the Card information shall be transferred to the ACCS Workstation and the VLRS shall activate illumination and takes image of the front car licence plate from the infrared camera and image read shall be stored in the VLRS Workstation. The LCD display panel in the Entrance Control Unit shall display the information such as time and date of entry and remaining money value of Octopus Card. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of entry to the hourly parker if a request button is being pressed. The barrier arm shall be raised and then lowered automatically after the vehicle has passed the passage detection loop;

4. The function of the magnetic stripe paper ticket dispenser shall be disabled when the Octopus card system is in operation;

5. When any data or information found invalid, the reason of invalidity shall be shown on the LED monitor at the ACCS Workstation. An alarm signal shall pass to the ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The card reader shall be reset and ready for tapping of another new card.

B. For SSF Development with HA Standalone Carpark

1. Three types of incoming vehicles – vehicles with height below 2 m, vehicles with height 2 m or above and motorcycle shall be identified by presence detection loop and height sensors at ingress of SSF development and HA carpark respectively and then the IO and HA ACCS Workstations automatically decide on which rate to be charged according to the pre-set fee structure;

2. For season and monthly parking, the operation is as follows:

   a. At ingress of SSF development, when a proximity card is detected at the Entrance Control Unit, the card information shall be transferred to the IO's ACCS Workstation for checking. If the card information is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop;

   b. At ingress of HA's carpark, when a proximity card is detected at the Entrance Control Unit, the card information shall be transferred to the HA's ACCS Workstation for checking and the VLRS shall activate illumination and take image of the front car licence plate from the infrared camera and image read shall be compared with the pre-defined vehicle number. If the car licence plate number is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop.

3. For hourly parking at HA carpark and loading & unloading area, the operation is as follows:

   a. At ingress of SSF development, the driver uses the intercom at Entrance Control Unit to communicate with SSF development's estate management office (EMO). EMO then activates the magnetic ticket dispenser at Entrance Control Unit by a control button inside the EMO and the driver gets the magnetic strip paper ticket (ticket A) from the ticket dispenser. When ticket A is drawn, the LCD display panel in the Entrance Control Unit shall display the information such as time and date of entry. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of entry to the hourly parker if a request button is being pressed. The barrier arm shall be raised and then lowered automatically after the vehicle has passed the passage detection loop;

   b. Before access to HA's carpark, the driver is requested to insert the magnetic stripe paper ticket (ticket A) into IO's magnetic ticket validator unit installed at ingress of HA's carpark. When ticket A is detected, the LCD display panel in the IO's magnetic ticket validator unit shall display the information such as time and date of exit and parking fee paid at EMO. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of exit and the parking fee paid by the hourly parker at EMO if a request button is pressed. If free parking period is not exceeded, ticket A will be accepted and the Octopus card reader at HA's Entrance Control Unit will be activated;

c. At ingress of HA's carpark, when an Octopus Card is detected or a magnetic stripe paper ticket is drawn at HA's Entrance Control Unit, the type of vehicle and the card information shall be transferred to the HA's ACCS Workstation and the VLRS shall activate illumination and takes image of the front car licence plate from the infrared camera and image read shall be stored in the VLRS Workstation. The LCD display panel in the Entrance Control Unit shall display the information such as time and date of entry and remaining money value of Octopus Card. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of entry to the hourly parker. The barrier arm shall be raised and then lowered automatically after the vehicle has passed the passage detection loop.

4. At ingress of SSF development, when any data or information found invalid, the reason of invalidity shall be shown on the LED monitor at the IO's ACCS Workstation. An alarm signal shall pass to the IO's ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The card reader shall be reset and ready for tapping of another new card;

5. At ingress of HA's carpark, when any data or information found invalid, the reason of invalidity shall be shown on the LED monitor at the HA's ACCS Workstation. An alarm signal shall pass to the HA's ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The card reader shall be reset and ready for tapping of another new card;

6. The IO's magnetic ticket validator/dispenser shall be compatible with HA's entrance and exit control units to fulfil the required functions. The interface of IO's magnetic ticket validator and HA's entrance control unit can be by-passed, disabled or isolated completely from ACCS inside HA carpark control centre by simple means whenever required at any time.

C. For SSF Development with HA Open Carpark

1. Three types of incoming vehicles – vehicles with height below 2 m, vehicles with height 2 m or above and motorcycle shall be identified by presence detection loop and height sensors at ingress of SSF development and then the IO's ACCS Workstation automatically decide on which rate to be charged according to the pre-set fee structure;

2. For season and monthly parking, when a proximity card is detected at Entrance Control Unit located at ingress of SSF development, the card information shall be transferred to the IO's ACCS Workstation for checking. If the card information is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop;

3. For hourly parking at HA carpark and loading & unloading area, the operation is as follows:

   a. the driver uses the intercom at Entrance Control Unit to communicate with SSF development's EMO. EMO then activates the magnetic ticket dispenser at Entrance Control Unit by a control button inside the EMO and the driver gets the magnetic strip paper ticket (ticket A) from the ticket dispenser. When ticket A is drawn, the LCD display panel in the Entrance Control Unit shall display the information such as time and date of entry. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of entry to the hourly parker if a request button is being pressed. The barrier arm shall be raised and then lowered automatically after the vehicle has passed the passage detection loop;

b. Before access to HA's open hourly carpark, the driver is requested to insert the magnetic stripe paper ticket (ticket A) into IO's magnetic ticket validator/dispenser unit installed near hourly parking pay station. When ticket A is detected, the LCD display panel in the IO's magnetic ticket validator/dispenser unit shall display the information such as time and date of exit and parking fee paid at EMO. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of exit and the parking fee paid by the hourly parker at EMO if a request button is pressed. If free parking period is not exceeded, ticket A will be accepted and the Octopus card reader at HA's hourly parking pay station will be activated;

c. When the driver parks at HA carpark, the driver parks the car and registers the starting time of parking by using Octopus card at the HA Octopus card reader in hourly parking pay station. When an Octopus Card is detected, the card information shall be transferred to the HA's ACCS Workstation. The LCD display panel in the hourly parking pay station shall display the information such as time and date of entry and remaining money value of Octopus Card. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of entry to the hourly parker.

4. At ingress of SSF development, when any data or information found invalid, the reason of invalidity shall be shown on the LED monitor at the IO's ACCS Workstation. An alarm signal shall pass to the IO's ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The card reader shall be reset and ready for tapping of another new card;

5. At HA's hourly parking pay station, when any data or information found invalid, the reason of invalidity shall be shown on the LED monitor at the HA's ACCS Workstation. An alarm signal shall pass to the HA's ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The card reader shall be reset and ready for tapping of another new card;

6. The IO's magnetic ticket validator/dispenser shall be compatible with HA's entrance and exit control units to fulfil the required functions. The interface of IO's magnetic ticket validator and HA's hourly parking pay station can be by-passed, disabled or isolated completely from ACCS inside HA carpark control centre by simple means whenever required at any time.

ELE26.2.040.A OPERATION AT EXIT CONTROL POINT

A. For PRH Development

1. The presence of a leaving vehicle is detected by the presence detection loop;

2. For season and monthly parking, when a season/monthly proximity card is detected, the card information shall be transferred to the ACCS Workstation for checking and the VLRS shall activate illumination and take image of the front car licence plate from the infrared camera and image read shall be compared with the pre-defined vehicle number. If the car licence plate number is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop;

3. For hourly parking, when an Octopus Card/magnetic stripe paper ticket is detected, the card information shall be transferred to the ACCS Workstation and the corresponding vehicle licence plate number taken by the VLRS shall be retrieved and compared. If the car licence plate number is verified, appropriate amount shall be deducted from the Card as hourly parking fees. The LCD display panel in the Exit Control Unit shall display the information such as time and date of exit and the remaining money value of Octopus Card and parking fee paid and an automatic cutting-off thermal printer shall issue receipt indicating the date and time of exit and the parking fee paid to the hourly parker if a request button is pressed. The barrier shall be raised and then lowered automatically after the vehicle has passed the passage detection loop;

4. When any date or information found invalid, the reason of invalidity shall be shown on the LED monitor at the ACCS Workstation. An alarm signal shall pass to the ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The card reader shall be reset and ready for tapping of another new card.

B. For SSF Development with HA Standalone Carpark

1. The presence of a leaving vehicle is detected by the presence detection loop;

2. For season and monthly parking, the operation is as follows:

   a. At egress of HA's carpark, when a season/monthly proximity card is detected, the card information shall be transferred to the HA's ACCS Workstation for checking and the VLRS shall activate illumination and take image of the front car licence plate from the infrared camera and image read shall be compared with the pre-defined vehicle number. If the car licence plate number is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop;

   b. At egress of SSF development, when a season/monthly proximity card is detected, the card information shall be transferred to the IO's ACCS Workstation for checking. If the card information is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop.

3. For hourly parking at HA carpark, the operation is as follows:

   a. At egress of HA's carpark, the driver pays the hourly parking fee by using Octopus card at the HA's Octopus card reader in HA's carpark/shroff office or by cash in carpark shroff office. When an Octopus Card/magnetic stripe paper ticket is detected, the card information shall be transferred to the HA's ACCS Workstation and the corresponding vehicle licence plate number taken by the VLRS shall be retrieved and compared. If the car licence plate number is verified, appropriate amount shall be deducted from the Card as hourly parking fees. The LCD display panel in the Exit Control Unit shall display the information such as time and date of exit and the remaining money value of Octopus Card and parking fee paid and an automatic cutting-off thermal printer shall issue receipt indicating the date and time of exit and the parking fee paid to the hourly parker. The barrier shall be raised and then lowered automatically after the vehicle has passed the passage detection loop;

   b. After the parking fee is paid, the IO's magnetic ticket dispenser unit installed at egress of HA's carpark will be activated to issue another magnetic stripe paper ticket (ticket B) to the driver, which is used to leave SSF development directly within free parking period. When ticket B is drawn, the LCD display panel in the IO's magnetic ticket dispenser unit shall display the information such as time and date of entry. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of entry to the hourly parker if a request button is being pressed;

c. The driver shall leave the SSF development directly within free parking period. Otherwise, the driver shall pay the parking fee and validate the magnetic stripe paper ticket B for egress at EMO if free parking period is exceeded. At egress of SSF development, when ticket B is detected, the LCD display panel in the Exit Control Unit shall display the information such as time and date of exit and parking fee paid at EMO. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of exit and the parking fee paid by the hourly parker at EMO if a request button is pressed. The barrier shall be raised and then lowered automatically after the vehicle has passed the passage detection loop.

4. For hourly parking at loading & unloading area, the driver shall leave the SSF development directly within free parking period. Otherwise, the driver shall pay the parking fee and validate the magnetic stripe paper ticket A for egress at EMO if free parking period is exceeded. At egress of SSF development, when ticket A is detected, the LCD display panel in the Exit Control Unit shall display the information such as time and date of exit and parking fee paid at EMO. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of exit and the parking fee paid by the hourly parker at EMO if a request button is pressed. The barrier shall be raised and then lowered automatically after the vehicle has passed the passage detection loop;

5. At egress of SSF development, when any date or information found invalid, the reason of invalidity shall be shown on the LED monitor at the IO's ACCS Workstation. An alarm signal shall pass to the IO's ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The card reader shall be reset and ready for tapping of another new card;

6. At egress of HA's carpark, when any date or information found invalid, the reason of invalidity shall be shown on the LED monitor at the HA's ACCS Workstation. An alarm signal shall pass to the HA's ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The card reader shall be reset and ready for tapping of another new card;

7. The IO's magnetic ticket validator/dispenser shall be compatible with HA's entrance and exit control units to fulfil the required functions. The interface of IO's magnetic ticket validator and HA's hourly parking pay station can be by-passed, disabled or isolated completely from ACCS inside HA carpark control centre by simple means whenever required at any time.

C. For SSF Development with HA Open Carpark

1. The presence of a leaving vehicle is detected by the presence detection loop;

2. For season and monthly parking, when a season/monthly proximity card is detected, the card information shall be transferred to the IO's ACCS Workstation for checking. If the card information is verified, the barrier arm will be raised. The barrier arm shall be lowered automatically after the vehicle has passed the passage detection loop;

3. For hourly parking at HA carpark, the operation is as follows:

   a. When the driver leaves the HA carpark, the driver pays the hourly parking fee by using Octopus card at the HA's Octopus card reader in hourly parking pay station. When an Octopus Card is detected, the card information shall be transferred to the HA's ACCS Workstation. Appropriate amount shall be deducted from the Card as hourly parking fees. The LCD display panel in the hourly parking pay station shall display the information such as time and date of exit and the remaining money value of Octopus Card and parking fee paid. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of exit and the parking fee paid to the hourly parker;

b. After the parking fee is paid, the IO's magnetic ticket validator/dispenser unit installed near hourly parking pay station will be activated to issue another magnetic stripe paper ticket (ticket B) to the driver, which is used to leave the court directly within free parking period. When ticket B is drawn, the LCD display panel in the IO's magnetic ticket validator/dispenser unit shall display the information such as time and date of entry. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of entry to the hourly parker if a request button is being pressed;

c. The driver shall leave the SSF development directly within free parking period. Otherwise, the driver shall pay the parking fee and validate the magnetic stripe paper ticket B for egress at EMO if free parking period is exceeded. At egress of SSF development, when ticket B is detected, the LCD display panel in the Exit Control Unit shall display the information such as time and date of exit and parking fee paid at EMO. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of exit and the parking fee paid by the hourly parker at EMO if a request button is pressed. The barrier shall be raised and then lowered automatically after the vehicle has passed the passage detection loop;

4. For hourly parking at loading & unloading area, the driver shall leave the SSF development directly within free parking period. Otherwise, the driver shall pay the parking fee and validate the magnetic stripe paper ticket A for egress at EMO if free parking period is exceeded. At egress of SSF development, when ticket A is detected, the LCD display panel in the Exit Control Unit shall display the information such as time and date of exit and parking fee paid at EMO. An automatic cutting-off thermal printer shall issue receipt indicating the date and time of exit and the parking fee paid by the hourly parker at EMO if a request button is pressed. The barrier shall be raised and then lowered automatically after the vehicle has passed the passage detection loop;

5. At egress of SSF development, when any date or information found invalid, the reason of invalidity shall be shown on the LED monitor at the IO's ACCS Workstation. An alarm signal shall pass to the IO's ACCS Workstation to arouse the operator's attention. The barrier shall not be activated. The card reader shall be reset and ready for tapping of another new card;

6. At egress of HA's carpark, when any data or information found invalid, the reason of invalidity shall be shown on the LED monitor at the HA's ACCS Workstation. An alarm signal shall pass to the HA's ACCS Workstation to arouse the operator's attention. The card reader shall be reset and ready for tapping of another new card;

7. The IO's magnetic ticket validator/dispenser shall be compatible with HA's entrance and exit control units to fulfil the required functions. The interface of IO's magnetic ticket validator and HA's hourly parking pay station can be by-passed, disabled or isolated completely from ACCS inside HA carpark control centre by simple means whenever required at any time.

ELE26.2.050.B ACCS WORKSTATION AND REVENUE COLLECTION PROVISION

A. For PRH Development

1. The ACCS Workstation and revenue collection provision shall include the following:

a. Central data station / cashier computer completed with a fully developed carpark management software and central database;

b. LED video monitor (24" or above);

c. Uninterrupted power supply unit (UPS) - for a back-up period of not less than 15 minutes for the computers for ACCS, VLRS and Octopus;

d. Magnetic stripe paper ticket coding and printing device;

e. Octopus Card reader / validator;

f. Clearing institution (Octopus) communication interface;

g. Data point for broadband connection with fixed IP (4G USB modem with fixed IP may be accepted subject to the CM's approval in case of unavailability of broadband network with fixed IP);

h. Cash drawer;

i. Fee indicator;

j. Receipt printer;

k. Report printer.

2. The ACCS Workstation shall be capable of handling the following activities:

   a. Processing of hourly parking and concessionary parking for transient parkers using Octopus Card / Magnetic Stripe paper ticket;

   b. Processing of Season / Monthly parking for long term parkers using Proximity Card;

   c. Processing of complimentary parking for special parkers using Magnetic Stripe paper ticket;

   d. Automatic fee calculation;

   e. Record of malfunctions of equipment and every transaction;

   f. Daily accounting record and statistics;

   g. Information on parking spaces;

   h. Instant cash audit function;

   i. Instant proximity card / magnetic stripe ticket checking;

   j. Anti-pass-back control;

   k. Independent control of the barriers;

   l. Activation of the "FULL" sign;

   m. Automatic printout and alarm message in case of faulty operation;

   n. Manual adjustment of hourly parking space vacancy information indicated on the carpark vacancy display board and transmitted to TD in case of malfunction of car counting system.

3. The ACCS Workstation shall link up with the VLRS and all other components to monitor and proceed with the operations of the ACCS through an Ethernet network. It shall provide overall control of car parking activities, identification of possible reconciliation discrepancies from clearing institution and data collected, and comprehensive and efficient financial and statistical report generation;

4. The ACCS Workstation shall be able to allow reading, checking, debiting and archiving against usage of Octopus Cards, and process the access / exit requests at the Carpark and store the transaction information in the central database;

5. The ACCS Workstation shall be so designed as to permit season / monthly proximity cards to be issued with simple operation of command code on the terminal keyboard. The proximity card shall be coded from the machine terminal that the parkers are free to enter and exit the carpark for a defined period of time, and the system shall be able to examine the validity of the ticket at the entrance and exit reader;

6. The ACCS Workstation and the management software shall be able to handle several transactions in parallel and simultaneously;
7. The ACCS Workstation shall be able to monitor not less than six kinds of alterable fee rates with respect to different kinds of vehicles and settings of grace periods. Different fee structures shall be preset and altered at the control keyboard and be viewable at the LED video monitor;
8. Monthly carpark user can make payment in the carpark shroff office by cashProvision shall also be allowed for addition of pay collection system using paywave;
9. Hourly carpark user can make payment simply by Octopus at the egress or in the carpark shroff office by cash in case of magnetic stripe paper tickets. Provision shall also be allowed for addition of pay collection system using paywave;
10. To enable payment for hourly carpark user to leave the carpark when shroff office is closed after office hour (for carpark at grade with 150 parking spaces or less), revenue collection provision is provided at the estate control room;
11. During ACCS breakdown, device shall be provided for keying in the Octopus cards number to the ACCS system or allow the use of the card reader device to retrieve hourly carpark user the entering time to carpark in collection of revenue prior to the system resume normal.

B. For SSF Development with HA Standalone Carpark

(I) ACCS Workstation and revenue collection provision at IO's EMO

1. The ACCS Workstation and revenue collection provision shall include the following:
   a. Central data station / cashier computer completed with a fully developed carpark management software and central database;
   b. LED video monitor (24" or above);
   c. Uninterrupted power supply unit (UPS) - for a back-up period of not less than 15 minutes for the computers for ACCS;
   d. Magnetic stripe paper ticket coding and printing device;
   e. Cash drawer;
   f. Fee indicator;
   g. Receipt printer;
   h. Report printer.
2. The ACCS Workstation shall be capable of handling the following activities:
   a. Processing of hourly parking and concessionary parking for transient parkers using Magnetic Stripe paper ticket;
   b. Processing of Season / Monthly parking for long term parkers using Proximity Card;
   c. Processing of complimentary parking for special parkers using Magnetic Stripe paper ticket;
   d. Automatic fee calculation;
   e. Record of malfunctions of equipment and every transaction;
   f. Daily accounting record and statistics;
   g. Information on parking spaces;
   h. Instant cash audit function;

i. Instant proximity card / magnetic stripe ticket checking;

j. Anti-pass-back control;

k. Independent control of the barriers;

l. Automatic printout and alarm message in case of faulty operation.

3. The ACCS Workstation shall link up with all other components to monitor and proceed with the operations of the ACCS through an Ethernet network. It shall provide overall control of car parking activities, identification of possible reconciliation discrepancies from clearing institution and data collected, and comprehensive and efficient financial and statistical report generation;

4. The ACCS Workstation shall be able to process the access / exit requests at the Carpark and store the transaction information in the central database;

5. The ACCS Workstation shall be so designed as to permit season / monthly proximity cards to be issued with simple operation of command code on the terminal keyboard. The proximity card shall be coded from the machine terminal that the parkers are free to enter and exit the carpark for a defined period of time, and the system shall be able to examine the validity of the ticket at the entrance and exit reader;

6. The ACCS Workstation and the management software shall be able to handle several transactions in parallel and simultaneously;

7. The ACCS Workstation shall be able to monitor not less than six kinds of alterable fee rates with respect to different kinds of vehicles and settings of grace periods. Different fee structures shall be preset and altered at the control keyboard and be viewable at the LED video monitor;

8. Hourly carpark user can make payment simply in IO EMO by cash in case of magnetic stripe paper tickets;

9. Provision shall be allowed for future addition of Octopus payment system.

(II) ACCS Workstation and revenue collection provision at HA's shroff office or remote office

1. The ACCS Workstation and revenue collection provision shall include the following:

a. Central data station / cashier computer completed with a fully developed carpark management software and central database;

b. LED video monitor (24" or above);

c. Uninterrupted power supply unit (UPS) - for a back-up period of not less than 15 minutes for the computers for ACCS, VLRS and Octopus;

d. Magnetic stripe paper ticket coding and printing device;

e. Octopus Card reader / validator;

f. Clearing institution (Octopus) communication interface;

g. Data point for broadband connection with fixed IP (4G USB modem with fixed IP may be accepted subject to the CM's approval in case of unavailability of broadband network with fixed IP);

h. Cash drawer;

i. Fee indicator;

j. Receipt printer;

k. Report printer.

2. The ACCS Workstation shall be capable of handling the following activities:
    a. Processing of hourly parking and concessionary parking for transient parkers using Octopus Card / Magnetic Stripe paper ticket;
    b. Processing of Season / Monthly parking for long term parkers using Proximity Card;
    c. Processing of complimentary parking for special parkers using Magnetic Stripe paper ticket;
    d. Automatic fee calculation;
    e. Record of malfunctions of equipment and every transaction;
    f. Daily accounting record and statistics;
    g. Information on parking spaces;
    h. Instant cash audit function;
    i. Instant proximity card / magnetic stripe ticket checking;
    j. Anti-pass-back control;
    k. Independent control of the barriers;
    l. Activation of the "FULL" sign;
    m. Automatic printout and alarm message in case of faulty operation;
    n. Manual adjustment of hourly parking space vacancy information indicated on the carpark vacancy display board and transmitted to TD in case of malfunction of car counting system.
3. The ACCS Workstation shall link up with the VLRS and all other components to monitor and proceed with the operations of the ACCS through an Ethernet network. It shall provide overall control of car parking activities, identification of possible reconciliation discrepancies from clearing institution and data collected, and comprehensive and efficient financial and statistical report generation;
4. The ACCS Workstation shall be able to allow reading, checking, debiting and archiving against usage of Octopus Cards, and process the access / exit requests at the Carpark and store the transaction information in the central database;
5. The ACCS Workstation shall be so designed as to permit season / monthly proximity cards to be issued with simple operation of command code on the terminal keyboard. The proximity card shall be coded from the machine terminal that the parkers are free to enter and exit the carpark for a defined period of time, and the system shall be able to examine the validity of the ticket at the entrance and exit reader;
6. The ACCS Workstation and the management software shall be able to handle several transactions in parallel and simultaneously;
7. The ACCS Workstation shall be able to monitor not less than six kinds of alterable fee rates with respect to different kinds of vehicles and settings of grace periods. Different fee structures shall be preset and altered at the control keyboard and be viewable at the LED video monitor;
8. Monthly carpark user can make payment in the carpark shroff office by cash. Provision shall also be allowed for addition of pay collection system using paywave;
9. Hourly carpark user can make payment simply by Octopus at the egress or in the carpark shroff office by cash in case of magnetic stripe paper tickets. Provision shall also be allowed for addition of pay collection system using paywave;

10. To enable payment for hourly carpark user to leave the carpark when shroff office is closed after office hour (for carpark at grade with 150 parking spaces or less), revenue collection provision is provided at the estate control room;

11. During ACCS breakdown, device shall be provided for keying in the Octopus cards number to the ACCS system or allow the use of the card reader device to retrieve hourly carpark user the entering time to carpark in collection of revenue prior to the system resume normal.

C. For SSF Development with HA Open Carpark

(I) ACCS Workstation and revenue collection provision at IO's EMO

1. The ACCS Workstation and revenue collection provision shall include the following:

   a. Central data station / cashier computer completed with a fully developed carpark management software and central database;

   b. LED video monitor (24" or above);

   c. Uninterrupted power supply unit (UPS) - for a back-up period of not less than 15 minutes for the computers for ACCS;

   d. Magnetic stripe paper ticket coding and printing device;

   e. Cash drawer;

   f. Fee indicator;

   g. Receipt printer;

   h. Report printer.

2. The ACCS Workstation shall be capable of handling the following activities:

   a. Processing of hourly parking and concessionary parking for transient parkers using Magnetic Stripe paper ticket;

   b. Processing of Season / Monthly parking for long term parkers using Proximity Card;

   c. Processing of complimentary parking for special parkers using Magnetic Stripe paper ticket;

   d. Automatic fee calculation;

   e. Record of malfunctions of equipment and every transaction;

   f. Daily accounting record and statistics;

   g. Information on parking spaces;

   h. Instant cash audit function;

   i. Instant proximity card / magnetic stripe ticket checking;

   j. Anti-pass-back control;

   k. Independent control of the barriers;

   l. Automatic printout and alarm message in case of faulty operation.

3. The ACCS Workstation shall link up with all other components to monitor and proceed with the operations of the ACCS through an Ethernet network. It shall provide overall control of car parking activities, identification of possible reconciliation discrepancies from clearing institution and data collected, and comprehensive and efficient financial and statistical report generation;

4. The ACCS Workstation shall be able to process the access / exit requests at the Carpark and store the transaction information in the central database;

5. The ACCS Workstation shall be so designed as to permit season / monthly proximity cards to be issued with simple operation of command code on the terminal keyboard. The proximity card shall be coded from the machine terminal that the parkers are free to enter and exit the carpark for a defined period of time, and the system shall be able to examine the validity of the ticket at the entrance and exit reader;
6. The ACCS Workstation and the management software shall be able to handle several transactions in parallel and simultaneously;
7. The ACCS Workstation shall be able to monitor not less than six kinds of alterable fee rates with respect to different kinds of vehicles and settings of grace periods. Different fee structures shall be preset and altered at the control keyboard and be viewable at the LED video monitor;
8. Hourly carpark user can make payment simply in IO EMO by cash in case of magnetic stripe paper tickets;
9. Provision shall be allowed for future addition of Octopus payment system.

(II)ACCS Workstation and revenue collection provision at HA's remote office

1. The ACCS Workstation and revenue collection provision shall include the following:
    a. Central data station / cashier computer completed with a fully developed carpark management software and central database;
    b. LED video monitor (24" or above);
    c. Uninterrupted power supply unit (UPS) - for a back-up period of not less than 15 minutes for the computers for ACCS, VLRS, Octopus and hourly parking pay station;
    d. Magnetic stripe paper ticket coding and printing device;
    e. Octopus Card reader / validator;
    f. Clearing institution (Octopus) communication interface;
    g. Data point for broadband connection with fixed IP (4G USB modem with fixed IP may be accepted subject to the CM's approval in case of unavailability of broadband network with fixed IP);
    h. Cash drawer;
    i. Fee indicator;
    j. Receipt printer;
    k. Report printer.
2. The ACCS Workstation shall be capable of handling the following activities:
    a. Processing of hourly parking and concessionary parking for transient parkers using Octopus Card / Magnetic Stripe paper ticket;
    b. Processing of Season / Monthly parking for long term parkers using Proximity Card;
    c. Processing of complimentary parking for special parkers using Magnetic Stripe paper ticket;
    d. Automatic fee calculation;
    e. Record of malfunctions of equipment and every transaction;
    f. Daily accounting record and statistics;
    g. Information on parking spaces;

h. Instant cash audit function;

i. Instant proximity card / magnetic stripe ticket checking;

j. Anti-pass-back control;

k. Activation of the "FULL" sign;

l. Automatic printout and alarm message in case of faulty operation.

3. The ACCS Workstation shall link up with all other components to monitor and proceed with the operations of the ACCS through an Ethernet network. It shall provide overall control of car parking activities, identification of possible reconciliation discrepancies from clearing institution and data collected, and comprehensive and efficient financial and statistical report generation;

4. The ACCS Workstation shall be able to allow reading, checking, debiting and archiving against usage of Octopus Cards, and process the access / exit requests at the Carpark and store the transaction information in the central database;

5. The ACCS Workstation shall be so designed as to permit season / monthly proximity cards to be issued with simple operation of command code on the terminal keyboard. The proximity card shall be coded from the machine terminal that the parkers are free to enter and exit the carpark for a defined period of time, and the system shall be able to examine the validity of the ticket at the entrance and exit reader;

6. The ACCS Workstation and the management software shall be able to handle several transactions in parallel and simultaneously;

7. The ACCS Workstation shall be able to monitor not less than six kinds of alterable fee rates with respect to different kinds of vehicles and settings of grace periods. Different fee structures shall be preset and altered at the control keyboard and be viewable at the LED video monitor;

8. Monthly carpark user can make payment in the carpark shroff office by cash (or future pay collection system e.g. paywave);

9. Hourly carpark user can make payment simply by Octopus (or future pay collection system e.g. paywave) at the egress or in the carpark shroff office by cash in case of magnetic stripe paper tickets;

10. To enable payment for hourly carpark user to leave the carpark when shroff office is closed after office hour (for carpark at grade with 150 parking spaces or less), revenue collection provision is provided at the estate control room;

11. During ACCS breakdown, device shall be provided for keying in the Octopus cards number to the ACCS system or allow the use of the card reader device to retrieve hourly carpark user the entering time to carpark in collection of revenue prior to the system resume normal.

ELE26.2.060.9 CAR COUNTING SYSTEM

Vehicles entering and leaving the carpark shall be counted in order to determine when it is full. The number of season/monthly proximity cards should be automatically deducted from the total number of available spaces in the carpark. Season/monthly proximity card holders entering or leaving the carpark will be counted under a separate category which will not affect the total car parking bays assigned to hourly parkers. When the spaces available for hourly parking are full, the carpark "FULL" Sign Box in English and Chinese characters at the carpark entrance lane and a "FULL" message at the LCD of Entrance Control Unit shall illuminate. The Entrance Control Unit shall not allow any entry of hourly parking vehicle. Management software shall be able to set tolerance to the total number of available spaces for hourly parking in the carpark in order to allow the entry of Taxi/Drop-off vehicles without charges within an adjustable period of time.

ELE26.2.070.A INTERCOM SYSTEM

1. The intercom system shall comprise master station(s) located at the carpark control centre and a slave station at each of the Entrance Control Unit(s), the Exit Control Unit(s) and hourly parking pay station(s) respectively;
2. The master station shall be designed for desk-top mounting and shall be capable of communicating with any one of the connected slave stations. Direct communication between the slave stations is not required;
3. To initiate a call at the master station, the operator shall press the slave selection button on the master station once. The respective slave station indicator shall light up automatically. When the "CALL" button at the master station is pressed a high note call alarm shall be heard at the selected slave station and communication between the operator at the master station and the visitor/parker at the slave station can be made via the corresponding microphone and loudspeaker unit. On completion of the call, the system shall be reset by pressing the selected slave station selection button again;
4. When the master station is being called by a slave station, the buzzer alarm at the master station shall sound and the corresponding slave station indication light shall flash and the operator can answer the call by pressing the slave selection button;
5. The master station shall be so designed that it can communicate with only one slave station at a time. When the master station is engaged with one slave station, call from other slave station shall cause the corresponding slave station indication light to flash only without activating the buzzer alarm. The operator shall follow the same procedure as described above in answering the waiting calls.

ELE26.2.080.A CARPARK CCTV SYSTEM

1. The carpark CCTV system shall be provided at the entrance and exit control points for monitoring and recording the traffic condition and over the car-parking area for carpark surveillance. It comprises the following equipment:
    a. 1 no. camera (colour) each at every entrance control point and every exit control point at middle level;
    b. cameras (colour) at strategic locations over the car-parking area as shown on Drawings;
    c. 24" LED video monitors as mentioned in ELE24.2.2;
    d. 16-channel colour Network Video Recorders (NVR) as mentioned in ELE24.2.4.

2. The Sub-contractor shall install LED video monitors on the working bench and NVRs inside a lockable equipment rack at the carpark control centre for the completion of the System;

3. For open carpark, the Sub-contractor shall supply and install CCTV cameras of fixed type encased in weatherproof casing suitable for outdoor use, cables and wirings and all necessary auxiliary devices and equipment in order to complete the system. The Sub-contractor shall supply and install all necessary mounting poles and devices for mounting of CCTV cameras and accessories. Depending on the site condition, the CCTV cameras over the open carpark can be mounted on the lamp poles of the landscape lightings;

4. The traffic condition at the entrance and exit control points and the parking condition over the car parking area can be monitored through the LED video monitors and recorded by the NVRs;

   Easy reading from recorded CCTV system as a proof to indicate the entering time of the hourly carpark user in case the ACCS is in total failure for the purpose of revenue collection prior to the system resume normal.

5. A proper signage shall be affixed on a prominent location to notify the public about the installation of CCTV system at the entrance control point(s);

6. The CCTV system including CCTV cameras, LED video monitors and NVRs for ACCS shall be an independent set of system separated from the CCTV system for car-parking area for carpark surveillance.

ELE26.2.090.9 INTERFACING REQUIREMENTS WITH OCTOPUS CLEARING SYSTEM

1. In case due connection to the HA data hub server as mentioned in ELE26.2.100 is not available at the time of handover, the Sub-contractor shall design and provide a system software for interfacing and exchanging electronic data with the Octopus Clearing System until the interfacing works mentioned in ELE26.2.100 is satisfactorily completed within the Maintenance Period. These electronic data include:

   a. Octopus Full/Interim Blacklist File (in Octopus proprietary format) from Octopus Clearing System for the ACCS to validate the Octopus card used;

   b. Octopus Data Exchange File(s) (in Octopus proprietary format) of the hourly income collected through Octopus devices.

2. The Sub-contractor shall be responsible for liaising with Octopus for the proper implementation of the interfaces, including the interface channel, frequency etc..

ELE26.2.100.9 INTERFACING REQUIREMENTS WITH HA DATA HUB SERVER

1. The ACCS shall be automated with system interfaces to exchange electronic data with a HA's data hub server via broadband network with fixed IP (4G USB modem with fixed IP may be accepted subject to CM’s approval in case of unavailability of broadband network with fixed IP). The Sub-contractor is responsible for implementing the processes to perform the following system interfaces between ACCS and the data hub server:

   a. Getting licensee information (in ASCII format) from the data hub server to control the entry and exit of season / monthly parking licensees at the carpark.

      The process is to get an interface file from the data hub server daily and import it into the ACCS for updating the monthly parking licensees authorized to facilitate proximity card validation. The licensee information from the data hub server includes:

      i. Carpark stock identifier;

ii. Vehicle number;

iii. Licence identifier;

iv. Valid period from;

v. Valid period to.

b. Getting carpark information (in ASCII format) from the data hub server to update the number of carpark spaces allowed for parking on each parking space type.

The process is to get an interface file from the data hub server daily and import it into the ACCS for updating parking space information. The output file will be provided by change trigger mechanism. The parking space information from the data hub server includes:

i. Carpark stock identifier;

ii. Type of parking space;

iii. Number of parking spaces for monthly letting;

iv. Number of parking spaces for hourly parking;

v. Number of parking spaces for HD's self use;

vi. Number of parking spaces for other use;

vii. Effective date.

c. Providing information (in ASCII format) of the total income collected through Octopus for reporting to HA, and sending it to the data hub server.

The process is to produce and send an interface file to the data hub server daily for reporting the total hourly income collected through Octopus. The total hourly income information to be sent to the data hub server includes:

i. Carpark stock identifier;

ii. Octopus card device identifier;

iii. Transaction date and time;

iv. Total hourly income amount collected through Octopus.

d. Providing information (in ASCII format) of the detailed transactions for reporting to HA, and sending it to the data hub server.

The process is to produce and send an interface file to the data hub server daily for reporting the detailed transactions. The information to be sent to the data hub server includes:

i. Carpark stock name;

ii. Transaction reference (ACCS reference);

iii. Transaction type;

iv. Vehicle number;

v. Type of vehicle;

vi. Carpark entry method;

vii. Transaction start date and time;

viii. Entry gate (device) ID;

ix. Transaction end date and time;

x. Exit gate (device) ID;

xi. Parking charge amount;

xii. Free parking start date and time;

xiii. Free parking end date and time;

xiv. Free parking amount;

xv. Amount collected;

xvi. Payment method;

xvi. Octopus card identification number;

xvii. Smartcard identification number (if applicable).

e. Providing statistical information (in ASCII format) for management reporting to HA, and sending it to the data hub server.

The process is to produce and send an interface file to the data hub server monthly for management reporting. The information to be sent to the data hub server includes:

i. Carpark stock name;

ii. Records of hourly parking:

- Number of day passes sold;
- Amount of revenue collected for the sale of day passes;
- Number of other hourly parking tickets sold;
- Amount of revenue collected for the sale of other hourly parking tickets;
- Number of tickets issued for free parking;
- Amount of revenue waived for the free parking tickets issued.

iii. Records of redemption of discount parking coupons:

- Number of hourly parking coupons sold;
- Number of hourly parking coupons redeemed;
- Amount of discount for reimbursement.

iv. Records of monthly tickets sold:

- Number of reserved monthly tickets sold;
- Amount of revenue collected for the sale of reserved monthly tickets;
- Number of floating monthly tickets sold;
- Amount of revenue collected for the sale of floating monthly tickets.

v. Records of concessionary parking for disabled persons:

- Number of concessionary hourly tickets sold;
- Amount of revenue collected for the sale of concessionary hourly tickets;
- Number of concessionary monthly tickets sold;
- Amount of revenue received for the sale of concessionary monthly tickets.

vi. Records of letting of part-time parking:

- Number of part-time parking monthly tickets sold;
- Amount of revenue collected for the sale of part-time parking monthly tickets.

vii. Records of granting free parking for special vehicles (e.g. rehabilitation bus):

- Number of tickets issued to special vehicles for free parking;
- Number of hours waived due to free parking by special vehicles;
- Amount of revenue waived due to free parking by special vehicles.

viii. Records of granting privileged parking:

- Number of privileged parking tickets issued;
- Number of hours waived for privileged parking tickets issued;
- Amount of revenue waived for privileged parking tickets issued.

ix. Records of impounding, towing, storage charges, auction and others:

- Number of charging cases for impounding, towing, storage charges, auction and others;
- Amount of revenue collected for these charging cases.

x. Number of parking spaces reserved for disabled persons (as at month-end position);

xi. Obtaining waivers for letting to non-residents (for carparks in SSF courts only) [An indicator shows "Yes" or "No"]

xii. Records of monthly parking charging rates (if any):

- Monthly rate for full-time reserved covered parking space for private car;
- Monthly rate for full-time floating covered parking space for private car;
- Monthly rate for full-time reserved open parking space for private car;
- Monthly rate for full-time floating open parking space for private car.

xiii. Records of hourly parking charging rates (if any):

- Hourly normal rate for private car;
- Abolition of hourly reduced rate for private car [An indicator shows "Yes" or "No"];
- Hourly reduced rate for private car;
- Abolition of day-pass reduced rate for private car [An indicator shows "Yes" or "No"];
- Day-pass rate for private car;
- Adoption of hourly ascending scale for private car [An indicator shows "Yes" or "No"];
- Hourly rate under ascending scale for private car;
- Hourly rate for motor-cycle;

- Hourly rate for light goods vehicle;
- Abolition of hourly double charge rate for light goods vehicle [An indicator shows "Yes" or "No"];
- Hourly double charge rate for light goods vehicle;
- Abolition of hourly reduced rate for light goods vehicle [An indicator shows "Yes" or "No"];
- Hourly reduced rate for light goods vehicle.

f. Providing the Octopus Data Exchange File(s) (in Octopus proprietary format) of the hourly income collected through Octopus devices to the data hub server, for central submission to the Octopus Clearing System by the HA.

The process is to send all transaction file(s) collected daily on the Octopus Card device(s) to the data hub server;

g. Getting the Octopus Full Blacklist File / Interim Blacklist File (in Octopus proprietary format) from the data hub server for updating the Octopus Card devices.

The HA will get the Octopus Full Blacklist File / Interim Blacklist File from the Octopus Clearing System. The process is to get interface file(s) from the data hub server and update the Octopus Card devices.

2. The Sub-contractor shall develop all programs and / or scripts in ACCS to perform the system interface processes and automate these processes such that the interfaces can be performed with minimum human operation. The automation shall include:

   a. To generate the file to the data hub server;

   b. To connect to the data hub server by broadband network / 4G USB modem;

   c. To provide Secure File Transfer Protocol (SFTP) username and password for authentication;

   d. To make SFTP file transfer request to the data hub server to send / get the files as binary data;

   e. To disconnect the SFTP session;

   f. To import the file from the data hub server to update ACCS;

   g. To log the progress of the automated processes during execution, and save the log in ACCS;

   h. To display message in ACCS to show the result of the processes after execution.

3. The system interfaces shall be performed using web services through broadband network with fixed IP (4G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP);

4. The system interface processes shall be automated to run daily at regular timeslot. When required, ad-hoc execution of the automated processes shall be allowed;

5. The system interface files and the logs from the executed processes shall be kept in the ACCS for an adjustable period up to three months;

6. The Sub-contractor shall provide the user guide for operating and administering the system interfaces. The user guide shall include but not limited to:

   a. How to set the daily schedule of the automated processes for regular execution;

   b. How to launch the automated processes manually for ad-hoc execution;

   c. How to inspect the result of the automated processes after execution;

d. The exception handling procedures when the execution of any automated process failed which include the reporting channel(s) for the failure, the steps to manually dispatch and receive the electronic data with alternative means (e.g. flash static memory, DVD-R, e-mail attachment, etc.) in case broadband network / 4G USB modem connection to the data hub server cannot be established, the steps to manually perform the failed system interface process, etc.;

e. How to change the system interface parameters, such as the login username and password, the carpark stock identifier, the destination broadband network / 4G USB modem connection to the data hub server, etc.

7. The Sub-contractor is responsible for liaising with and providing assistance to HA staff for implementation of the system interfaces. The implementation will consist of the following tasks:

   a. To set up broadband network / 4G USB modem connection;

   b. To develop SFTP requests from ACCS;

   c. To develop programs and / or scripts in ACCS to automate the system interface processes;

   d. To prepare user guide for operating and administering the system interfaces;

   e. To participate in the acceptance testing of the system interfaces to prove that all automated system interface processes work properly, information to / from the data hub server is correct, and information from the data hub server is properly updated in ACCS;

   f. To provide proper training for the operation and administration of the system interfaces to the operators.

ELE26.2.110.9 DATA REQUIREMENTS FOR ACCS

The Sub-contractor shall maintain a set of database for the ACCS comprising the following:

1. Carpark geographical zone - It shall maintain the geographical zone and the charging rate that the Carpark locate;

2. Carpark time table - It shall maintain the operating hours of the Carpark which specifies the opening time and closing time of the Carpark. It shall support the complicated charging scheme such as "Day parking" and "Night parking";

3. Carpark quota table - It shall maintain the quota of parking spaces available in the Carpark for controlling the entry of hourly parking;

4. Carpark charging rate table - It shall maintain the various charging rates of the Carpark. It is applicable to monthly parking spaces, hourly parking spaces and other miscellaneous income, such as Towing fee, impounding charge, etc.;

5. Carpark payment method - It shall maintain the payment methods that supported by the Carpark, e.g. Octopus, cash, free parking coupon, etc. Methods currently in use shall be allowed to change easily and new methods can be added;

6. Carpark entry method - It shall maintain the entry methods supported by the Carpark. The proposed methods include proximity card (for season/monthly parking) and Octopus Card/ Magnetic Stripe Paper Ticket (for hourly parking). Methods currently in use should be allowed to change easily and new methods can be added;

7. Carpark facility - It shall maintain the facilities provided by the Carpark. The information shall include:

a. Type of parking space;

b. Number of parking spaces for monthly letting;

c. Number of parking spaces for hourly parking;

d. Number of parking spaces for HD's self use;

e. Number of parking spaces for other use.

8. Detailed parking transaction - It stores all the detailed information regarding the entry, exit and revenue collected from the vehicle. Relevant data should include:

   a. Carpark stock identifier;

   b. Vehicle number;

   c. Type of vehicle;

   d. Carpark entry method;

   e. Transaction reference (ACCS reference);

   f. Parking charge amount;

   g. Transaction start date and time;

   h. Entry gate (device) ID;

   i. Transaction end date and time;

   j. Exit gate (device) ID;

   k. Free parking amount;

   l. Free parking start time and end time;

   m. Payment method;

   n. Other relevant information (e.g. the octopus card identification, Smartcard/Licensee identification, etc. if any);

   o. Payment period start time and end time (for monthly parking).

9. Customer (licensee) - It shall store all personal information of a licensee who registers in ACCS for monthly parking; Personal information shall include but not limited to Carpark stock identifier, Vehicle number, Smartcard/Licence identifier, Valid period from, Valid period to, Driver name, contact number, Vehicle types, Parking charges, Image of vehicle, Image of driver and etc.;

10. Customer car information - It shall maintain the information of customer car.

ELE26.2.120.A REAL-TIME PARKING AVAILABILITY SYSTEM

1. The real-time parking availability system shall be wired type;

2. LED-typed carpark vacancy display board at the carpark entrance lane and data interface with the parking vacancy information system of TD shall be provided to indicate the number of vacant hourly parking spaces with and without EV charging facilities respectively;

3. Wired type ultrasonic sensors shall be installed for each hourly parking space to identify the number of vacant parking spaces with and without EV charging facilities.

ELE26.2.130.9 DATA REQUIREMENTS FOR TRANSMISSION TO PARKING VACANCY INFORMATION SYSTEM OF THE TRANSPORT DEPARTMENT

1. The real-time information for the number of vacant hourly parking spaces with and without EV charging facilities shall be transmitted to the parking vacancy information system of TD via broadband network with fixed IP (4G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP). All relevant cost of broadband network including any service fee required during Maintenance Period shall be borne by the Sub-contractor;
2. The Sub-contractor is responsible for implementing the processes to provide data file containing the parking vacancy information (in JSON format in accordance with the structure specified by TD) to TD's data hub server for central monitoring of the parking vacancy information system of TD. The Sub-contractor shall design and provide a system software for interfacing and exchanging electronic data of parking vacancy information with TD;
3. The Sub-contractor shall be responsible for liaising with TD for the proper implementation of the interfaces, including the interface channel, frequency etc..

ELE26.2.140.N DATA REQUIREMENTS FOR TRANSMISSION TO PARKING VACANCY INFORMATION SYSTEM OF THE ENVIRONMENTAL PROTECTION DEPARTMENT

1. The real-time information for the number of vacant hourly parking spaces with EV charging facilities shall be transmitted to the parking vacancy information system for EV–Charging Easy APP to EPD on EPD's request via broadband network with fixed IP (4G USB modem with fixed IP may be accepted subject to the CM's approval in case of unavailability of broadband network with fixed IP). All relevant cost of broadband network including any service fee required during Maintenance Period shall be borne by the Sub-contractor;
2. The Sub-contractor is responsible for implementing the processes to provide data file containing the parking vacancy information for EV–Charging Easy APP (in format in accordance with the structure specified by EPD) to EPD's data hub server for displaying of the parking vacancy information for EPD's APP. The Sub-contractor shall design and provide a system software for interfacing and exchanging electronic data of parking vacancy information with EPD;
3. The Sub-contractor shall be responsible for liaising with EPD for the proper implementation of the interfaces, including the interface channel, frequency etc..

ELE26.3 MATERIALS AND EQUIPMENT

ELE26.3.010.A GENERAL

1. The system installations shall be suitable for use under Hong Kong climatic condition with relative humidity and ambient temperature as shown below:
   a. Relative Humidity : up to 0.99 saturation;
   b. Ambient Temperature : peak from minus 5℃ to plus 40℃ for 4 hours continuously with an average from 0℃ to plus 35℃ over 24 hours period.
2. All equipment provided shall be compatible with the system installation;
3. All equipment shall be entirely suitable for use in the intended locations. The material finishes and construction of the equipment shall be such that it can withstand the possibility of vandalism, tampering and impact from vehicles;
4. Unless otherwise Approved, all cabinets exposed to weather shall be corrosion-resistant, constructed of not less than 1.5 mm thick grade 304 stainless steel or better, or heavy gauge aluminium alloy with epoxy coating, or equivalent;
5. Alternative design proposal for various items of equipment hereinafter specified will be considered but subject to the submission of detailed technical information enclosed in the tender;
6. All carpark control equipment shall have not less than one year proven reliability and in-service record established in local application, and evidence shall be produced to the satisfaction of the CM upon request;
7. Unless otherwise Approved, the specification for CCTV video camera, LED video monitor, video distribution amplifier, network video recorder, cables, equipment rack, etc. shall be referred to ELE24.2 and the specification for UPS equipment (except the manual bypass switch which is not required for ACCS) and battery shall be referred to ELE24.2.15.020 and ELE24.2.15.030.

ELE26.3.020.C CENTRAL DATA STATION / CASHIER COMPUTER

1. The central data / cashier computer shall comprise a main computing unit of sufficient processing speed to suit the intended purpose, standard USB style connector of latest version, a DVD-RW, a colour LED video monitor (24" or above) with built-in speakers, a mouse and a keyboard;
2. The central data / cashier computer shall contain duplex hard-disks of equal capacity of no less than 2 TB arranged in RAID 1 (mirroring) for data storage so that failure of any one hard-disk can be replaced by a new one without any permanent loss of data. History of financial transactions for two years shall be kept and easily be retrieved. Provision shall be incorporated in the system for short and long term data storage such that the archived data can be analyzed to produce results and reports on carpark occupancy, parking frequency, malfunctions etc.;
3. The central data / cashier computer shall be completed with a fully developed carpark management software and central database;
4. The central data / cashier computer shall operate under a platform of Windows 10 or the latest version of Windows or other operating system subject to the CM's approval;
5. The central data / cashier computer shall be ready for broadband network / 4G USB modem connection;

6. The central data / cashier computer shall be backed up by UPS for a duration of not less than 15 minutes to prevent data loss in the event of power failure;
7. All softwares included shall be in free or full user licenses with no expiry date. Full set of system recovery diskettes, back up diskettes for the softwares shall be provided.

ELE26.3.030.A VLRS COMPUTER

1. The VLRS computer shall comprise a main computing unit of sufficient processing speed to suit the intended purpose, standard USB style connector of latest version, a hard-disk of no less than 2 TB, a DVD-RW, a colour LED video monitor (24" or above) with built-in speakers, a mouse and a keyboard;
2. The VLRS computer shall contain high speed photo image processing and capture card with frame grabber function and be completed with a fully developed vehicle licence plate recognition software;
3. The image recognition speed shall be within 0.5 second and the optical character recognition (OCR) accuracy shall be at least 95% at anytime;
4. The VLRS computer shall operate under a platform of Windows 10 or the latest version of Windows or other operating system subject to the Contact Manager's approval;
5. The VLRS computer shall be able to recognise licence plates from black and white images taken by the infrared cameras and to record high resolution colour images taken by the CCTV cameras for manual functions;
6. The VLRS computer shall be backed up by UPS for a duration of not less than 15 minutes to prevent data loss in the event of power failure;
7. All softwares included shall be in free or full user licenses with no expiry date. Full set of system recovery diskettes, back up diskettes for the softwares shall be provided.

ELE26.3.040.A ENTRANCE CONTROL UNIT

Entrance Control Unit shall be completed with a factory manufactured floor-mounted weatherproof stainless steel enclosure and as indicated on Drawings, comprise the following components:

1. A short range or long range proximity card reader shall be provided as specified in the Project Specific Specification for season/monthly parking. The installation details of proximity card reader shall be as follows:
    a. Short range proximity card reader – installed at not less than 900mm and not greater than 1,150mm above ground level;
    b. Long range proximity card reader – completed with mounting pole and bracket installed at 2 meters (subject to site condition) above ground level.
2. An Octopus card reader installed at not less than 900 mm or greater than 1,150 mm for hourly parking (not required for ingress of SSF development);
3. A magnetic stripe paper ticket dispenser with button labelled "Press Button for Hourly Ticket" in both English and Chinese characters installed at not less than 900 mm or greater than 1,150 mm for hourly parking covered with a proper blank-off plate in case the ticket dispenser is not in use;
4. A slave station of the intercom system;
5. A min. 7” backlit LCD colour visual instruction display panel;

6. An automatic cutting-off thermal printer for issuing receipts showing date and time of entry at the Octopus card reader and a button labelled "Press Button for Receipt" in both English and Chinese characters near the printer;
7. Allow for future addition of fee collection system e.g. paywave.

ELE26.3.050.A EXIT CONTROL UNIT

Exit Control Unit shall be completed with a factory manufactured floor-mounted weatherproof stainless steel enclosure and as indicated on Drawings, comprise the following components:

1. A short range or long range proximity Card Reader shall be provided as specified in the Project Specific Specification for season/monthly parking. The installation details of proximity card reader shall be as follows:
   a. Short range proximity card reader – installed at not less than 900mm and not greater than 1,150mm above ground level;
   b. Long range proximity card reader – completed with mounting pole and bracket installed at 2 meters (subject to site condition) above ground level.
2. An Octopus Card Reader installed at not less than 900 mm or greater than 1,150 mm for hourly parking *(not required for egress of SSF development)*;
3. A magnetic stripe paper ticket validator installed at not less than 900 mm or greater than 1,150 mm for hourly parking;
4. A slave station of the intercom system;
5. A min. 7" backlit LCD colour visual instruction display panel;
6. An automatic cutting-off thermal printer for issuing Octopus payment receipts showing parking fee paid and date and time of exit at the Octopus card reader and a button labelled "Press Button for Receipt" in both English and Chinese characters near the printer;
7. Allow for future addition of fee collection system e.g. paywave.

ELE26.3.055.N IO'S MAGNETIC TICKET VALIDATOR/DISPENSER UNIT AT HA'S CARPARK INSIDE SSF DEVELOPMENT

IO's magnetic ticket validator/dispenser unit at HA's carpark inside SSF development shall be completed with a factory manufactured floor-mounted weatherproof stainless steel enclosure and as indicated on Drawings, comprise the following components:

1. A magnetic stripe paper ticket validator/dispenser installed at not less than 900 mm or greater than 1,150 mm for hourly parking;
2. A min. 7" backlit LCD colour visual instruction display panel;
3. An automatic cutting-off thermal printer for issuing payment receipts showing parking fee paid and date and time of exit/entry and a button labelled "Press Button for Receipt" in both English and Chinese characters near the printer.

ELE26.3.060.A AUTOMATIC DROP GATE BARRIER

1. Automatic drop gate barrier shall be of straight rising arm type. Articulated arm shall be accepted if the headroom of the covered entrance / exit is not enough to allow the arm from 90 degree movement;
2. The arm shall be made from an Approved weather resistant material suitably treated to prevent corrosion. It shall be sufficiently strong to withstand vandalism. It shall be so fabricated that it will shear off under impact by a vehicle in order to minimize damage to the arm and prevent damage caused to the mechanism and the cabinet;

3. The arm when at low position shall be of an appropriate length to suit the corresponding width of the drive way and operation. The gap between the end of the arm and the edge of the driveway shall not exceed 200mm in width. The gap wider than 200mm may be acceptable subject to the CM's approval. The clearance from the drive way finished level to the top of arm when the barrier is raised shall be adjusted to suit the site condition;
4. When the barrier is at low position, the clearance between the bottom of the barrier and the drive way finished level shall be not less than 800 mm or greater than 1200 mm;
5. On receipt of an open signal from a card reader or ticket dispenser the barrier arm shall be raised and shall then be lowered on receipt of a closing signal from the passage loop detector. The barrier shall be raised again upon receiving another signal from a reader or dispenser;
6. Provision shall be made to enable the barrier to be manually operated (i) by holding down a Manual Control Barrier Button at carpark control centre, and (ii) by turning off the key switches at the corresponding Entrance / Exit control units in case of emergency;
7. The barrier shall have a "store vend" function which allows its barrier arm to reverse its downward motion immediately when a following vehicle has been accepted by an entrance control unit or an exit control unit.

ELE26.3.070.9 LOOP DETECTOR

1. Loop detector shall be inductive detection type suitable for placing in a slot cut on the drive way. The cables shall be waterproof and the slots shall be sealed with epoxy or an Approved sealant;
2. Loop detectors shall be installed as either presence detection loop or passing detection loop;
3. A presence detection loop shall pass an electric signal to the system when a vehicle is detected passing over it or stopped on it. The detector(s) at the entrance shall be capable of detecting any back-out vehicle;
4. A passing detection loop shall pass an electric signal to the system when a vehicle has passed over it. No electric signal shall be induced when a vehicle stops on it;
5. The loop detector provided shall be capable of detecting the presence and passing of three type of vehicles – vehicles with height below 2 m, vehicles with height 2 m or above and motorcycle;
6. Preventive measures of Electromagnetic Interference for detection loop shall be provided where applicable;
7. When no vehicle is detected passing over the loop detector within 30 seconds subsequent to the raising of a barrier arm, a signal shall pass to the ACCS Workstation to arouse operator's attention.

ELE26.3.080.9 HEIGHT DETECTOR

Height detector shall be weatherproof and of infrared type and used to detect the height of a vehicle stopping on the loop detector so as to differentiate different types of vehicles in order to determine automatically various fee rates for hourly parking and to facilitate car counting.

ELE26.3.090.9 PROXIMITY CARD

1. When short range proximity card for season/monthly parking is specified in the Project Specific Specification, the short range proximity card shall be made of durable plastic with size to ISO/IEC7810 ID-1. The card shall be a type commonly used in the automatic carpark control system. The reading range shall be not less than 5cm;
2. When long range proximity card for season/monthly parking is specified in the Project Specific Specification, the long range proximity card shall be made of durable plastic with size of credit card. The card shall be a type commonly used in the automatic carpark control system. It shall be built-in with battery with lifetime of at least 4 years. The reading range shall be not less than 3 meters. The card reader shall enable frequency offset/hopping for operation on different frequencies such that multiple readers can be operated in close vicinity of each other without interference;
3. The Housing Authority logo and the name of the corresponding estate shall be clearly shown on the proximity cards.

ELE26.3.100.9 MAGNETIC STRIPE PAPER TICKET

Magnetic stripe paper ticket for hourly parking shall be made of durable paper and of magnetic operated type with the size same as the proximity card. They shall be capable of being printed with the date and time and encoded to enable the system to read.

ELE26.3.110.9 "FULL" SIGN

1. The "Full" sign box shall be housed in a cabinet made of not less than 1.5mm thick stainless steel;
2. The characters on the sign shall be in both English ("FULL") and Chinese ("滿") and arranged in bright LED matrix unless otherwise Approved. The shorter length on the effective illuminated area shall be not less than 250mm;
3. The Sub-contractor shall submit detailed drawings and samples of materials regarding the construction of illuminated signs for Contract Manager's Approval prior to the fabrication and installation;
4. The sign shall illuminate on receiving a signal from the central data station/cashier computer.

ELE26.3.120.9 INTERCOM SYSTEM MASTER AND SLAVE STATIONS

1. The master station(s) shall be designed for desk-top mounting;
2. Each master station shall comprise:
    a. A slave station selection panel;
    b. A microphone unit; and
    c. A built-in loudspeaker.
3. The number of master station(s) to be provided shall be sufficient for connection with each entrance and exit control points plus at least two spare ways;
4. A slave selection panel shall be provided to incorporate the following controls/indicators:
    a. 4 heavy duty Press-ON/Press-OFF slave station selection buttons;
    b. 4 slave station selection indicators;
    c. A heavy duty spring-loaded slave station "CALL" button;

d. A loudspeaker volume control;

e. A power supply status indicator;

f. A lamp test button; and

g. A buzzer alarm.

5. The slave stations shall be incorporated in the Entrance Control Unit and the Exit Control Unit. The slave station shall be integrated into the Control Units as a factory fitted product. Each slave station shall be completed with the following:

   a. A loudspeaker for hands free operation in a noisy environment;

   b. A heavy duty spring-loaded "CALL" button; and

   c. A buzzer alarm.

ELE26.3.130.9 CARPARK VACANCY DISPLAY BOARD

1. The carpark vacancy display board shall be housed in a cabinet made of not less than 1.5mm thick stainless steel with transparent plastic cover for showing the display board. The cabinet shall have an ingress protection of at least IP54 to BS EN 60529 or IEC 60529;
2. The display board shall display the number (in Arabic numeral format) of vacant hourly parking spaces with and without EV charging facilities using bright LED matrix (in green colour) unless otherwise approved;
3. Dot size of LED matrix shall be not less than 3mm and dot pitch shall be not more than 4mm. The LED display area shall be not less than 160mm(H) x 300mm(W) for each module;
4. The characters of description in both English and Chinese (“EV Hourly Parking Spaces/時租電動車位” and “Normal Hourly Parking Spaces /時租普通車位”) shall be provided on the front plate of display board above the LED display. The height of the characters shall not be less than 120mm;
5. The Sub-contractor shall submit detailed drawings and samples of materials regarding the construction of carpark vacancy display board for CM's approval prior to the fabrication and installation;
6. The number of vacant hourly parking spaces shall be updated upon receiving signal from real-time parking availability system or manual adjustment by the ACCS workstation.

ELE26.3.140.A CARPARK VACANCY DETECTION ULTRASONIC SENSOR

1. The ultrasonic sensor shall be all-in-one type with built-in red / green / amber colour LED indicator showing the following status:

   a. Red – Not available;

   b. Green – Available and can be parked;

   c. Amber – Available for disabled or other reserved purpose.

2. The ultrasonic sensor shall be installed above front of the parking space as shown on the Drawings and use ultrasonic pulse to detect presence of vehicle. The detection range shall be 200mm to 3000mm adjustable on Site;

3. The ultrasonic sensor shall be wired type. Ingress protection rating shall be at least IP65 for outdoor application. The Sub-contractor shall provide all necessary wiring, cable containment, power provisions and interfacing units e.g. zone controllers to connect the ultrasonic sensors to the ACCS workstation to perform the functions of real-time parking availability system. The communication protocol shall be through RS485 or Ethernet;
4. Each zone controller shall be able to communicate with not less than 30 nos. of ultrasonic sensor. The zone controller shall collect the information of each single sensor, process them and send the corresponding real time information to the ACCS workstation via RS485 or Ethernet. The Sub-contractor shall at his own cost to provide sufficient zone controllers to ensure proper signal transmission between ultrasonic sensors and ACCS workstation in view of the distance limitation of signal transmission between sensors, zone controllers and workstation shall not be exceeded;
5. The Sub-contractor shall allow spare provisions of all necessary interfacing units, and spare capacity of ACCS workstation and real-time parking availability system etc. to cater for connection of not less than 50% additional ultrasonic sensors in future additional hourly parking spaces.

ELE26.3.150.9 AUTOMATIC CUTTING-OFF THERMAL PRINTER

1. The printer shall be of kiosk type and adopt the printing method of direct thermal print and equipped with cutter;
2. The print speed shall not be less than 180mm/s and the resolution shall be more than 200 dots per inch (dpi).

ELE26.3.160.N HOURLY PARKING PAY STATION

Hourly parking pay station shall be completed with a factory manufactured weatherproof stainless steel enclosure and as indicated on Drawings, comprise the following components:

1. Octopus card reader/validator(s) installed at not less than 900 mm or greater than 1,150 mm for hourly parking;
2. A magnetic stripe paper ticket dispenser/validator with button labelled "Press Button for Hourly Ticket" in both English and Chinese characters installed at not less than 900 mm or greater than 1,150 mm for hourly parking covered with a proper blank-off plate in case the ticket dispenser is not in use;
3. A slave station of the intercom system;
4. An automatic cutting-off thermal printer for issuing receipts showing date and time of entry, and the parking fee paid and date and time of exit at the Octopus card reader. Pre-warning signal shall be transmitted to ACCS workstation in case of the thermal printer out of paper;
5. A min. 7” backlit LCD colour visual instruction display panel. The LCD display panel shall display the information such as time and date of entry and remaining money value of Octopus Card when an Octopus Card is detected when the driver parks at the hourly parking space and display the information such as time and date of exit and the remaining money value of Octopus Card and parking fee paid when the Octopus Card is detected when the driver leaves the hourly parking space;
6. Signage showing operation sequence of hourly pay station. Built-in LED illumination shall be provided for reading of signage at night;
7. Allow for future addition of fee collection system e.g. paywave.

ELE26.4 TESTING AND COMMISSIONING

ELE26.4.010.9 TESTS

The Sub-contractor shall carry out the following tests for the installation in the presence of the Contract Manager:

1. Test of earth loop impedance of all relevant metallic parts of the equipment in compliance with the Electrical COP;
2. Continuous operation of the barrier and operating time as specified;
3. Testing and demonstration of all functions of the ACCS, VLRS, Car counting System, Octopus Card clearing, data exchange with HA's data hub server, intercom system and carpark CCTV system as mentioned in the Specification.

ELE26.4.020.9 TEST RECORD

The Sub-contractor shall record all the tests and submit to the Contract Manager for Approval.

ELE26.4.030.9 TRAINING

1. The Sub-contractor shall provide not less than 40 hours training of the operation and maintenance for the carpark control and management facilities with a proposed training programme approved by the Contract Manager. The training shall be conducted during normal working hours for the estate management staff. The Sub-contractor shall record in 720p video or better throughout one training session and hand over 2 copies of DVD-videos of the record to the Contract Manager;
2. The Sub-contractor shall provide sufficient copies of detailed training manuals for operation and maintenance for the estate management staff;
3. The Sub-contractor shall provide 2 sets of the recovery disks for system restoration and e-copies of operation and maintenance manuals to the Contract Manager before handover.

ELE26.5 MAINTENANCE

ELE26.5.010.9 GENERAL

1. The Sub-contractor shall provide free maintenance including labour and materials to the system installation for the entire Maintenance Period after completion of the installation;
2. During the Maintenance Period, the Sub-contractor shall attend to all faults and complaints, remedy all defects, replace all malfunction items and maintain the complete installation in a clean, tidy and functional condition to the satisfaction of the Contract Manager.

ELE26.5.020.9 24-HOUR ON-CALL SERVICE DURING MAINTENANCE PERIOD

1. The Sub-contractor shall provide 24-hour on-call service at any time during the Maintenance period. The Contract Manager may instruct the Sub-contractor, in the Maintenance Period via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and Approved by the Contract Manager, to attend the reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel, who shall arrive at site and shall carry out any necessary inspection testing and repair work as soon as practicable and under all weather conditions;
2. The Sub-contractor shall submit to the Contract Manager for this purpose at least two names of English speaking representatives, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for Approval. Prior Approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers etc. during the Maintenance Period at least two weeks before the change is effected;
3. The Sub-contractor shall attend to emergency calls within three (3) hours of receiving such calls out of normal working hours and a maximum time limit of two (2) hours during normal working hours. For other repair calls, they shall carry out repair work within twenty four (24) hours;
4. The maintenance and servicing works, as described above, form part of the Main Works described in Clause 8.3(2)(c) of the General Conditions of Main Contract.

ELE26.5.030.9 PREVENTIVE MAINTENANCE

1. The Sub-contractor shall provide quarterly maintenance inspection and service to the ACCS, VLRS, Car Counting System and intercom system such as checking overall functioning of the system, cleaning of roller and magnetic heads, lubricating the mechanical part, adjusting inductive detection loops etc. The Sub-contractor shall submit a proposed maintenance programme, including the scope of maintenance activities, to the Contract Manager for Approval within 14 days after the commencement of the maintenance period. An inspection report should be submitted to the Contract Manager after each quarterly inspection;
2. The specification for maintenance inspection and service to the carpark CCTV System shall be referred to ELE24.4.3;
3. Upon request by the Contract Manager within the Maintenance Period, the Sub-contractor shall also provide free service to modify the computer programme to facilitate alteration of the system, such as change of tariff structure;

4. Four weeks before expiry of the maintenance period, the Sub-contractor shall carry out a hand/take-over inspection with the party taking up the on-going maintenance of the system in the presence of the representatives of the Contract Manager. Defects found should be rectified by the Sub-contractor to the satisfaction of the Contract Manager;

5. At the end of the Maintenance Period, the Sub-contractor shall execute all work of inspection, examination, and overhaul as required, to the complete installation to the satisfaction of the Contract Manager.

ELE28.7.050.9 GENERAL 10
ELE28.7.060.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY 10

ELE28.1 LABELS AND NOTICES

ELE28.1.010.9 INSCRIPTION OF LABELS AND ENGRAVING

1. The labels shall be in both English and Chinese characters;
2. The labels shall be legible and durable such as by method of inscription or silk printing with transparent covering. Other methods giving legible and durable label are also acceptable;
3. Samples shall be submitted to the Contract Manager for approval prior to ordering.

ELE28.1.020.9 MATERIAL FOR LABELS

1. Labels shall be made of white plastic material with required letterings in red colour, unless otherwise specified;
2. Where equipment is fitted with labels provided by the manufacturer of the equipment, these labels may be used in lieu of the plastic material, provided that they are of equivalent quality and Approved.

ELE28.1.030.9 FIXING OF LABELS

Labels shall be fixed to switchgear and distribution board by screws. Where drilling and tapping of the equipment is impracticable, Approved adhesive means may be used subject to prior Approval.

ELE28.1.060.9 ENGRAVING FOR ELECTRICAL ACCESSORIES

1. Inscription is not required on front plate of control switches feeding fixed electrical appliances in domestic blocks;
2. For other building and/or occupied non-domestic premises, the front plate of each control switch, feeding a fixed electrical appliance, such as a wash boiler, water heater, cooker, wall-mounted fan, wall-mounted radiator, incinerator, exhaust fan, room cooler, etc., shall be engraved according to the appliance being controlled;
3. Details of the inscription shall be submitted for Approval;
4. Additional engraving to other electrical accessories will be as specified on the Drawings.

ELE28.1.070.9 LABELS AND WARNING NOTICES

1. Labels and warning notices as required by the Electricity Ordinance and the Electrical CoP shall be provided where appropriate;
2. Labels may be fixed in other positions specified or directed by the Contract Manager;
3. The following warning notices in English and Chinese shall be provided at the positions where appropriate:
    a. A label having a minimum size of 65 mm x 50 mm marked with the words "DANGER - HIGH VOLTAGE 危險 - 高壓" in lettering not less than 5 mm high to be fixed on every container on enclosure of ancillary equipment for discharge lighting installations operating at voltages exceeding "Low Voltage";

b. Where terminals or other fixed live parts between which a voltage exceeding 250 volts exists are housed in separate enclosures or items of equipment which, although separated, can be reached simultaneously by a person, a notice shall be secured in a position such that anyone, before gaining access to such live parts, is warned of the maximum voltage which exists between those parts.

ELE28.1.080.9 TREATMENT OF ELECTRIC SHOCK POSTER

The sub-contractor shall supply and fix an anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness inside each main switch room and mount it with a "Treatment of Electric Shock" poster which may be obtained from the Labour Department free of charge. If the poster is not obtained from Labour Department, the sub-contractor shall ensure the poster supplied will have the same quality and size.

ELE28.2 SPARE FUSES IN SWITCH ROOMS

ELE28.2.010.9 FUSE REQUIREMENTS

The Sub-contractor shall provide in each switchroom of this project one complete set of spare fuses for each rating of fuse-switches or switchfuses installed.

ELE28.2.020.9 MOUNTING

Each set of spare fuses shall be hung on a wooden board with brass hooks. The wooden board shall be smoothed on both front and edges, painted and labelled.

ELE28.2.030.9 HAND-OVER

All the boards with fuses provided under this project shall be handed over to the Housing Manager.

ELE28.3 FIXINGS

ELE28.3.010.9 SCREWS AND BOLTS

1. Machine screws and nuts shall be to ISO/885;
2. Hexagon bolts, screws and nuts shall be to BS EN ISO 4016, BS EN ISO 4018 and BS EN ISO 4034;
3. Wood screws shall be to BS 1210 with countersunk head unless otherwise specified;
4. Bolts, nuts and washers shall be manufactured from non-ferrous materials;
5. Holes for bolts, screws and other fixings shall be drilled or stamped, and no larger than required for clearance of the bolt, screw, etc..

ELE28.3.020.9 PLUGS

1. Proper methods of fixing, such as expanding plugs of adequate size or other purpose-designed fixing devices approved by Contract Manager shall be used;
2. Screws shall not be fixed to wooden plugs unless otherwise specified.

ELE28.4 INSULATING MATERIALS

ELE28.4.010.9 INSULATING TAPES

Insulating tapes for low voltage applications shall comply with IEC 60454-3-1 pressure sensitive adhesive tape type F-PVCp (plasticized PVC) and have a minimum thickness of 0.21 mm.

ELE28.4.020.9 RESTRICTED MATERIALS

Non-impregnated paper, fabric, wood or press-hemp shall not be used for insulating purposes. Where synthetic resin bonded insulating boards are used, all cut edges shall be sealed with an Approved varnish.

ELE28.5 OPENINGS IN BUILDING STRUCTURE

ELE28.5.010.9 SLEEVES

1. Provide PVC sleeves for openings in walls within a fire compartment;
2. Provide galvanised mild steel sleeves for openings in walls and slabs connecting the fire compartment with other fire compartments/public areas.

ELE28.5.020.9 MAIN CONTRACTORS WORK

The holes, sleeves and slots reserved through walls/slabs/beams will be cleared and cleaned by the Main Contractor before hand-over to the Sub-contractor for use.

ELE28.5.030.9 SUB-CONTRACTOR'S WORK

The nails appertaining to concealed electrical boxes shall be cleared by the Sub-contractor subsequent to work completion and prior to execution of final painting work by the Main Contractor.

ELE28.5.040.9 WATERPROOFING

Where any work pierces the waterproofing including waterproof structure, the method of installation shall be as Approved.

ELE28.6 SHEET METALWORK

ELE28.6.010.9 CONSTRUCTION

Sheet metal boxes, meter chambers etc. shall be manufactured from plain steel sheets. The thickness of steel sheet shall be as specified in the relevant Worksection subject to a minimum of 1.0 mm. Where necessary, suitable stiffeners shall be provided to give adequate rigidity.

ELE28.6.020.9 PROTECTION AGAINST CORROSION

Protection against corrosion shall be achieved by means of hot-dip galvanising, anti-rust painting or enamel, or the use of stainless steel.

ELE28.6.030.9 STAINLESS STEEL SHEET

If stainless steel sheet is specified, it shall be to BS EN 10088-2, Symbol F9 for matt finish and F8 for polished finish.

ELE28.7 PAINTING METALWORK

ELE28.7.010.9 SCOPE

1. Exposed metal parts of the installation as specified in the Contract or as directed by the Contract Manager shall be painted by the Sub-contractor;
2. Wherever necessary, parts of the installation may be painted by the Main Contractor under the instruction of the Contract Manager. Under such circumstances, the Sub-contractor shall ensure that painting provided by the Main Contractor shall not cause any detrimental effects to the electrical installation.

ELE28.7.050.9 GENERAL

1. The Sub-contractor shall comply with the requirements on materials and workmanship for painting as specified in Worksection FIN7 of HKHA Architectural Works Specification unless otherwise specified;
2. Metalwork to be painted shall be cleaned, prime coated with the appropriate primer and completed with two coats of synthetic paint in accordance with the manufacturer's recommendation.

ELE28.7.060.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the country / place of manufacture and authenticity of the paints delivered to Site.

ELE29.1 GENERAL

ELE29.1.010.A SCOPE

This specification covers the supply, installation, testing and commissioning, maintenance of standby diesel generating sets and associated accessories. The scope shall also include all necessary design and provisions of acoustic treatment associated with the installation for compliance with the Noise Control Ordinance, exhaust air pipes for compliance with the requirements in section 44 of the Building (Construction) Regulation (B(C)R) and all necessary submissions to the Authorities (such as EPD and BD/ICU) in connection with the installation and operation of generating sets.

ELE29.1.020.9 PURPOSE

A standby diesel generating set shall be provided as an emergency supply to comply with the Fire Services Department requirements and meet essential loads as specified or shown on the Drawings.

ELE29.1.030.9 FACTORY ASSEMBLY

1. Each generating set shall be a factory-assembled packaged unit and shall comprise a diesel engine directly coupled to an alternator, mounted on a common steel baseframe. Each generating set shall be provided with a control cubicle housing all control equipment. The generating set shall comply with all parts of ISO 8528 and the requirement of this specification;
2. The factory of generating set assembly shall comply with audited quality management system requirements of ISO 9001 and the certification shall be produced to the Contract Manager upon request.

ELE29.1.040.9 FS CODE OF PRACTICE

Standby diesel generating sets shall comply in all respects with Part V, Section 5.8 of The 'Code of Practice for Minimum Fire Service Installations and Equipment' issued by Fire Services Department (hereinafter referred to as F.S. Code of Practice). The generating sets shall be of proven reliability established in local application and evidence shall be produced to the satisfaction of the Contract Manager upon request.

ELE29.1.050.9 COMPATIBILITY OF COMPONENTS

The manufacturer of the various components to be used with the generating set shall be as recommended by the manufacturer to ensure compatibility of the components.

ELE29.1.060.9 COMPONENTS

The Sub-contractor shall ensure and verify to the satisfaction of the Contract Manager that all components employed in this installation conform to the relevant International and local Standards.

ELE29.1.070.9 OPERATING CONDITIONS

The generating set shall be capable of continuously operating under the appropriate site conditions which shall normally be a temperature range of 5℃ to 40℃, relatively humidity 100% and the altitude of the actual site.

ELE29.1.080.9 IN-SERVICE RECORDS

Prior to the time of material submission for Approval, the generating set including its major components shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the Contract Manager.

ELE29.2 OUTPUT AND RATING

ELE29.2.010.9 OUTPUT

The generating set shall be of 380V, 50Hz, 3 phase, 4 wire output.

ELE29.2.020.9 ACCURACY OF OUTPUT

Unless otherwise specified, the generating set shall comply with the operating limits of performance class G3 in accordance with ISO 8528-5.

ELE29.2.030.9 RATING

1. The generating set shall have a prime power rating sufficient to satisfy both the steady and transient states of the electrical loads detailed in this Specification and Drawings. The power output shall be rated as prime power in accordance with ISO8528-1 and the permissible average power output during a 24 hour period shall not exceed 70% of the prime power unless otherwise agreed by the engine manufacturer;
2. The generating set shall be capable of meeting the basic electrical load requirements and also the starting kVA and starting kW as shown on the drawings. The Sub-contractor shall verify the actual amount of electrical loads connected to the generating set and prove that the generating set selected can satisfy this specification under both starting and steady conditions for such connected loads;
3. Power rating shall be net, excluding all accessories and shall be taken as at ambient temperature 40℃ and at sea-level;
4. The Sub-contractor shall supply, install and commission a generating set of rating, 0.8 power factor lagging, not less than the minimum rating as specified in the drawings taking into account all de-rating factors as recommended by the generator manufacturer;
5. A sign made of at least 1.5 mm thick stainless steel plate shall be provided for each generator set and affixed in a prominent position inside the emergency generator room and main switch room to indicate the essential loading of fire service installations and fireman's lift(s) connected to the generator. The English and Chinese characters of the sign shall be at least 8 mm and 15 mm high respectively and the details are as follows:

EMERGENCY GENERATOR
應急發電機
LOADING OF FIRE SERVICE INSTALLATIONS AND
FIREMAN'S LIFT(S)
消防裝置及消防升降機負荷
XXXX kVA/XXXX kW
WARNING: DO NOT OVERLOAD THE GENERATOR
警告：切勿引致發電機過量負荷

ELE29.2.040.9 TIMING OF LOADS APPLICATION

1. The generating set shall be designed for cold starting and be capable of supplying power for the full rated essential load in not more than 15 seconds from initiation of the starting procedure;
2. Unless otherwise specified, all essential loads other than non-fireman's lifts, will be started simultaneously. After an adjustable period up to 45 seconds, the non-fireman's lifts will be started sequentially to travel to the ground floor one at a time before the next non-fireman's lift is started and remains stationary.

ELE29.2.050.9 EXCESSIVE REGENERATIVE POWER AND NON-LINEAR LOADS

1. There will be high current harmonics from the variable voltage variable frequency controlled lift motors, light fittings with electronic ballasts, pump motors with soft starters, etc. and precautions shall be taken in the design of the generating set to guard against any adverse effects so caused;
2. The Sub-contractor shall provide appropriate dummy loads to absorb excessive regenerative power from the lifts as detailed on drawings, if necessary.

ELE29.3 DESIGN

ELE29.3.010.9 MANUFACTURER'S RECOMMENDATIONS

The complete installation shall be in accordance with the manufacturer's recommendation and to the satisfaction of the Contract Manager. Any design deviating from the manufacturer's recommendation shall be verified by the manufacture before being submitted to the Contract Manager for approval.

ELE29.3.020.9 SAFETY

All moving parts and bare exhaust manifolds and pipes shall be properly and completely guarded and/or insulated in accordance with the relevant International Standards and local regulations. The guards shall be of such design that will guard against the serviceman from coming into contact with any part which is likely to cause injury to personnel. All guards shall be detachable.

ELE29.3.030.9 SPACE FOR MAINTENANCE

Adequate space (not less than 600 mm) all round the set shall be provided for maintenance and cleaning.

ELE29.3.040.9 VENTILATION

Ventilation to the Approval of the Director of Fire Services shall be provided for both combustion and cooling air. If fans are necessary to provide this air they shall be provided by the Sub-contractor and shall operate at all times while the generator set is running.

ELE29.3.050.9 AIR SUPPLY AND DISCHARGE

The air supply and discharge shall be direct to outside air without any possible obstructions, i.e. no fire, smoke or regulating dampers shall be fitted, and shall not cause a public nuisance. However, silencers shall be provided at the air inlet and outlet apertures of the generator room as shown on the Drawings. Added pressure loss constituted by the silencers shall be kept to a minimum, and shall not affect the proper operation of the generator set.

ELE29.3.060.9 EXHAUST SYSTEM

Exhaust of combustion products shall be discharged through the exhaust system to the location as shown on the Drawings. The Sub-contractor shall ensure that the exhaust system meets the relevant requirements of the Air Pollution Control Ordinance. The Sub-contractor shall also ensure and verify, to the satisfaction of the Contract Manager, that the bends and the length of the exhaust pipe will not build up back pressure causing low efficiency and loss of engine power; otherwise, pipe bore will have to be increased.

ELE29.3.070.A EXHAUST AIR PIPES

Exhaust air pipes outside the generator room shall be mounted with stainless steel brackets. Should the exhaust air pipe be defined as a chimney or a flue per section 44 of the B(C)R, the design and construction of exhaust air pipes shall comply with the requirement of "Fire Safety and Heat Transmission", "Structural Design" and "Construction and Corrosion Protection" specified in PNAP APP-8. Shop drawings showing the details of mounting and fixing of cladding shall be submitted for Approval prior to material ordering and fabrication. Adequate fall and drain point shall be provided for the exhaust pipe so that no water can enter into the engine through the exhaust outlet. The exhaust pipe outlet shall also be fitted with a stainless steel wire mesh to prevent ingress of birds or debris.

ELE29.4 ENGINE

ELE29.4.010.9 TYPE AND DESIGN

The engine shall be a four stroke, multi-cylinder, direct injection, naturally aspirated or turbo-charged, water-cooled diesel engine and shall be of industrial type complying with ISO 8528-2. The shaft speed shall not exceed 25rev/s. The fuel used shall be diesel fuel complying with EPD's requirement. The engine shall be designed to comply with the Air Pollution Control Regulations such that the emissions there from will not create an air pollutant nuisance.

ELE29.4.020.9 COOLING SYSTEM

The engine cooling system shall comprise a set-mounted radiator with engine or electric driven cooling fan, water circulating pump, water temperature regulating device, etc., and in addition to the operating conditions specified in ELE29.1.070, shall be suitable for operating at ambient temperatures up to 50°C.

ELE29.4.030.9 SPEED GOVERNOR

The engine speed governor shall provide governing in accordance with the relevant requirements for Performance Class G2 of ISO 8528-2.

ELE29.4.040.9 FILTERS

Filters shall be provided for the fuel oil and lubricating oil systems as well as the air intake and shall be of replacement element.

ELE29.4.050.9 EXHAUST CONNECTORS

The engine exhaust shall be provided with flexible connectors and tubular absorption type silencer.

ELE29.4.060.9 AUTOMATIC SAFETY CUT-OUT DEVICES

Automatic safety cut-out devices shall be provided for engine overspeed, high cooling water temperature and low lubricating oil pressure. An electric fuel stop solenoid valve as well as a manual fuel shut-off valve shall be provided.

ELE29.4.070.9 INSTRUMENT PANEL

An instrument panel, incorporated with lubricating oil pressure and temperature gauges, cooling water temperature gauge, tachometer and individual fault indicating lamps for low lubricating oil pressure, high-cooling water temperature & engine overspeed, shall be provided. Fuel level gauge shall be provided on the panel when the fuel tank is not located in the same room with the generating set. The panel with supporting stand shall be floor mounted on plinth adjacent to the generating set and properly isolated from vibration.

ELE29.4.080.9 STARTER UNIT

The engine shall be equipped with a D.C. electric starter motor, fly-wheel, flexible couplings, etc. to form a complete working unit.

ELE29.5 ALTERNATOR

ELE29.5.010.9 TYPE

The alternator shall be of salient pole, self-exciting, self-regulating, brushless type and shall comply with ISO 8528-3. The alternator shall be of basic continuous rating (BR) based on duty type S1 according to IEC 60034-1.

ELE29.5.020.9 PROTECTION

The alternator shall be screen protected and drip proof in accordance with IEC 60034-5 to degree IP21. Anti-condensation heaters of 220V shall be provided, connected to the mains, and shall be arranged to be switched off when the alternator is in operation. All exposed moving parts shall be provided with protection screens.

ELE29.5.030.9 INSULATION SYSTEM

The insulation system shall be IEC 60085 Class F or Class H.

ELE29.5.040.9 TERMINAL BOX

A terminal box of sufficient size shall be provided for cabling.

ELE29.5.050.9 RADIO INTERFERENCE SUPPRESSION

The alternator shall be fully equipped for radio interference suppression to BS EN 55014-1 or BS EN 55011 or BS EN 61000-6-4.

ELE29.6 BASEFRAME AND FUEL TANK

ELE29.6.010.9 BASEFRAME

The baseframe of the generating set shall be of prefabricated, structural steel type of all welded construction. The baseframe shall be provided with lifting points for transportation.

ELE29.6.020.9 INTEGRAL FUEL TANK

1. Whenever specified, a fuel tank shall be integral within the base frame and shall be complete with filler, vent, drain, feed and return connections, fuel content gauge, flexible fuel lines between tank and engine connections;
2. The capacity of the tank shall be sufficient for sustaining operation of the connected loads for a period of not less than 6 hours but shall have a minimum capacity of 490 litres. If the minimum tank capacity required exceeds 500 litres, the tank shall be installed in a separate fuel tank room in accordance with FSD's requirement.

ELE29.6.025.9 SEPARATE FUEL TANK

1. Unless otherwise specified, a separate fuel tank shall be installed inside the standby generator room and shall complete with cover, drip tray, fuel hand pump, fuel content gauge, vent pipe, control valves, fuel supply and return pipes between the tank and engine connections, etc.;
2. The capacity of the tank shall be sufficient for sustaining operation of the connected loads for a period of not less than 6 hours but shall have a minimum capacity of 490 litres. If the minimum tank capacity required exceeds 500 litres, the tank shall be installed in a separate fuel tank room in accordance with FSD's requirement;
3. A Surveyor's Report shall be submitted to certify that the fuel tank has been properly constructed, installed and tested and the fuel tank is in sound condition and is suitable for the storage of fuel oil without any leakage;
4. The tank shall be fabricated from mild steel plates welded on to a mild steel frame. Mild steel flat bars shall be welded on the inside of the tank to stiffen the tank when required;
5. All parts of the exterior surfaces of the tank shall be thoroughly cleaned to remove all rust, mill scale, grease and other foreign matters to achieve a bright, rust free and dry surface and then painted with one cost of zinc rich primer, one coat of epoxy based under coat and two finishing coats of approved paint. The interior surface of the tank shall be thoroughly dried out and applied with a thick coat of linseed oil to prevent rusting;
6. A semi-rotary double acting hand pump shall be provided for the fuel tank and consist of 25 mm diameter inlet, outlet and flexible oil resistant inlet pipe of adequate length to suit Site condition;
7. The Sub-contractor shall submit shop drawings showing all installation details of the fuel tank, pipe routing and associated builder’s works for approval before commencement of works.

ELE29.6.030.9 FUEL LEVEL SWITCH

The fuel tank shall be fitted with two stages fuel level switches to alert the caretaker when the remaining fuel capacity falls to a level adequate for 7.5 hours and 6.5 hours continuous running of the fire services equipment. In addition, if non-fire services equipment is connected to the generator power supply, the fuel level switches shall also shut down this non-fire services equipment when the remaining fuel capacity falls to a level adequate for 6.5 hours continuous running of the fire services equipment. The fuel level switch shall comply with the following requirements:

For Immersed Type Level Sensor:

1. The fuel level switch shall be suitable for measurement of fuel level in the integral tank;
2. The fuel level switch shall consist of two major components - a fuel level sensor and a switch unit. The fuel level sensing element shall be installed in a tube of stainless steel and places inside the fuel tank. The switch unit shall be mounted on the tank and with the fuel level sensor to form an integral set. The unit shall be housed inside a casing made of cast iron or aluminium alloy and shall be capable of detecting the signal from the sensor and transmitting it to control the on/off operation of the non-fire services equipment supply;
3. The level switch shall be manufactured to IEC 60079 Explosive Atmospheres or BS EN 60079 Explosive Atmospheres;
4. The level switch shall be at least of Group IIA and Temperature Class T1 in accordance with IEC 60079-0 or BS EN 60079-0;
5. The electrical components of the level switch installed in the vapour space above fuel and inside the fuel tank shall be of the type of protection of Ex ia which is suitable for installation in Zone 0 Hazardous Area as classified in IEC 60079-10-1 or BS EN 60079-10-1;
6. The electrical components of the level switch installed outside of the fuel tank shall be of the type of protection of Ex ib or Ex d which are all suitable for installation in Zone 1 Hazardous Area;
7. A copy of certificate to prove the apparatus rating shall be submitted for checking;

For Ultrasonic Type Level Sensor:

8. The fuel level switch shall consist of two major components - a fuel level sensor and a control unit;
9. The level sensor shall have non-contacting liquid level transmitter utilising ultrasonic pulses technology for measurement and suitable for the application of fuel tank;
10. The control unit shall connect with the fuel level sensor and contain a digital display showing fuel level information and system alarms. The control unit shall be equipped with output relays for external interface to control the on/off operation of the non-fire services equipment supply. The control unit shall be housed inside the control cubicle as stipulated in ELE29.10;
11. The fuel level switch shall be manufactured to IEC 60079 Explosive Atmospheres or BS EN 60079 Explosive Atmospheres;
12. The fuel level sensor shall be at least of Group IIA and Temperature Class T1 in accordance with IEC 60079-0 or BS EN 60079-0;
13. The electrical components of the fuel level switch installed in the vapour space above fuel and inside the fuel tank shall be of the type of protection of Ex ia which is suitable for installation in Zone 0 Hazardous Area as classified in IEC 60079-10-1 or BS EN 60079-10-1;

14. A copy of certificate to prove the apparatus rating shall be submitted for checking.

ELE29.6.040.9 CONTROL REQUIREMENT

The fuel level switches and the associated control shall be capable to control on/off operation of the non–fire services equipment supply as shown on Drawings. When the remaining fuel capacity falls, at or below a level adequate for 7.5 hours continuous running of the fire services equipment, the alarm connecting to the FS alarm panel shall be activated. When the remaining fuel capacity further falls, at or below a level adequate for 6.5 hours continuous running of the fire services equipment, the corresponding alarm connecting to the FS alarm panel shall also be activated and a signal shall be provided to trip the non-fire services equipment if connected to generator power supply, automatically.

ELE29.6.050.9 VERIFICATION OF FUEL LEVEL SETTINGS

1. A test report shall be submitted to substantiate that the fuel capacity inside the fuel tank according to each level settings as mentioned in ELE29.6.040 are accurately shown on the fuel level sensor;
2. The accuracy of the fuel level settings shall be demonstrated to FSD's officer during FSD's inspection;
3. For demonstration in sub-clause 2, the integral fuel tank shall be emptied for refilling in the presence of the FSD's officers to demonstrate the readings of the fuel level sensors be consistent with various settings and the capacity of fuel inside.

ELE29.7 STARTING SYSTEM

ELE29.7.010.9 SPECIFICATION

Engine starting shall be electric. The starting system shall be of 12V or 24V and shall comprise batteries, charger, contactors, wiring, etc.

ELE29.7.015.9 TYPE OF BATTERIES

The batteries shall be of nickel-cadmium type with plastic cases complied with IEC 60623. The batteries shall be suitable for engine starting application.

ELE29.7.020.9 MOUNTING OF BATTERIES

The batteries shall be mounted on a hardwood floor stand adjacent to the starter motor. A double pole D.C. battery switch shall be provided between the batteries and the starter. When the switch is turned to 'open' positing, the "auto-starting of generator disabled" alarm, as stated in Clause ELE29.12.020, shall be activated.

ELE29.7.030.9 CAPACITY OF BATTERIES

The batteries shall have sufficient capacity for 4 operations of engine cranking each 15 seconds duration with 5 seconds intervals between each operation without permanent damage nor reduction in the rated life.

ELE29.7.040.9 BATTERY CHARGER

The battery charger shall be of trickle/boost type and shall be connected to the essential power supply socket/connection unit located at the generator room. The battery charger shall have sufficient capacity to maintain the batteries in fully charged condition at all times. The charger shall be capable of automatically recharging the discharged batteries to 75% of its rated capacity within 6 hours. Current limiting device shall be provided to limit the charging current as recommended by the battery manufacturer.

ELE29.8 ENGINE EXHAUST SYSTEM

ELE29.8.010.9 SCOPE OF SYSTEM

The engine exhaust system comprising silencers, flexible connectors, rain hoods, expansion joints, hangers, pipes & accessories etc., shall be provided as shown on the Drawings.

ELE29.8.020.A EXHAUST AIR PIPES

1. Exhaust air pipes shall be black steel pipes to BS EN 10255 medium grade for pipe diameters up to and including 150 mm, or comply to BS EN 10216 or BS EN 10217 for larger pipe diameters and jointed by welding. Pipes shall be adequately supported and provided with flexible / expansion joints to allow for expansion / contraction and for vibration isolation;
2. Should the exhaust air pipe be defined as a chimney or a flue per section 44 of the B(C)R, it shall comply with all requirements in PNAP APP-8, which include but not limited to the following:
    a. Its design and construction including the position where exhaust air pipe terminates shall comply with the fire safety requirements set out in section 44(2) to (4) of the B(C)R;
    b. The structural design for installation and material of exhaust air pipes shall be in accordance with the Code of Practice for the Structural Use of Steel 2011 (Steel Code). Calculation and justification certified by a Registered Structural Engineer or an equivalent competent personal shall be submitted to CM for checking;
    c. For construction and corrosion protection of exhaust air pipes, the relevant parts of the Steel Code, BS EN 1856-1:2009 and BS 5854:1980 should be followed, and justification certified by a Registered Structural Engineer or an equivalent competent personal which shall be submitted to CM for checking.

ELE29.8.030.9 SIZING OF EXHAUST AIR PIPE

The exhaust pipe shall be sized so that the back pressure created will not exceed the amount recommended by the manufacturer and the output power of the engine will not be derated.

ELE29.8.040.A LAGGING EXHAUST AIR PIPES

1. The exhaust pipes outside the generator room, where exposed, shall be lagged with non-combustible and non-water-absorption type insulating materials complying with BS 476. The lagging shall be protected by a stainless steel cladding of 2 mm thick constructed in sections;
2. The thermal insulation material provided shall have a thickness of not less than 50 mm and maintain the external cladding temperature not exceeding 50℃. Calculation to substantiate the adequacy of insulation thickness and to verify compliance with the requirement of “Fire Safety and Heat Transmission” specified in PNAP APP-8 shall be submitted to CM for checking;
3. The exhaust pipe in the generator room shall also be properly lagged in order to protect against any harmful thermal effects to personnel in carrying out operation and maintenance. The lagging shall be protected by a stainless steel cladding of 0.8 mm thick constructed in sections;

4. Each section of the cladding shall be removable for replacement of the insulating materials;
5. No flanged joint shall be used and the end product of the cladding shall be of a plain surface stainless steel pole;
6. Asbestos shall not be used for lagging.

ELE29.9 AIR DUCTWORK

ELE29.9.010.9 SCOPE

Air ducts, if required, shall be provided to connect the radiator to the metal louvre provided by others at the generator room as shown on the Drawings.

ELE29.9.020.9 CONSTRUCTION

Air ducts shall be constructed of 1 mm thick galvanised mild steel sheets and shall be adequately sized to deliver the required cooling air through the radiator.

ELE29.9.030.9 SUPPORTS

Air ducts shall be adequately supported and provided with connection flanges and flexible connections for vibration isolation.

ELE29.9.040.9 SILENCERS

Silencers shall be provided to attenuate the noise from the generating set through the intake and exhaust air louvers. The silencer shall consist of an outer casing fabricated from galvanised steel sheet not less than 1.6 mm thick and a number of splitters made from 0.8 mm perforated galvanised steel sheets which divide the silencer into separate longitudinal airways. All acoustic infill materials shall be inert, non-combustible, vermin proof, non-hygroscopic, wrapped in an acoustically transparent polyester membrane and sealed with polyester sealant to the approval of FSD.

ELE29.10 CONTROL CUBICLE

ELE29.10.010.9 CONSTRUCTION

1. The control cubicle shall be constructed of sheet steel not less than 2 mm thick;
2. The cubicle shall preferably be floor mounted;
3. If set mounted, the cubicle shall be effectively isolated from vibration to prevent damage;
4. Gaskets shall be fitted on doors and removable covers and shall be continuous without joints around corners;
5. The cubicle shall be treated with an Approved rust inhibitive priming coat and then two stoved finish coats of gloss paint of an Approved colour.

ELE29.10.020.9 PROTECTION DEVICES

The cubicle shall contain programmable controller (if provided), delay timers, indicators, etc. necessary fulfil the operation requirements as stipulated in ELE29.11. The dry contacts for detection of main supply voltage should be obtained from the main switchboard cubicle and the lift supply switchboard respectively. The automatic voltage regulator unit shall be contained within the generator set.

ELE29.10.030.9 FRONT PANEL

The following shall be provided on the front panel of the control cubicle unless prior Approval has been obtained for some instruments/indicators to be located on the instrument panel in ELE29.4.070:

1. Hour run meter;
2. Auto/off/manual selector switch;
3. "Start" & "Stop" push buttons for manual operation;
4. Battery charger ammeter and voltmeter;
5. "Mains On" indicating lamps - 3 phase;
6. "Generator On" indicating lamps - 3 phase;
7. "Engine Fault" indicating lamp & audible alarm;
8. "Fail to Start" indicating lamp & audible alarm;
9. "Auto Starting of Generator Disabled" indicating lamp & audible alarm;
10. "Fuel level at or below 7.5 hours operation of fire services equipment" indicating lamp & audible alarm;
11. Either (a) or (b) of the following:
    a. "Fuel level at or below 6.5 hours operation of fire services equipment and non–fire services equipment supply tripped" indicating lamp & audible alarm (applicable for non-fire services equipment connected to generator power supply as approved by FSD); or
    b. "Fuel level at or below 6.5 hours operation of fire services equipment" indicating lamp & audible alarm.
12. Reset push button;
13. "Simulate mains failure" key switch;

14. Lamp Test Button;
15. Fuel level display of fuel level control unit (for ultrasonic type fuel level switch only).

ELE29.10.040.9 ALARMS

Remote visible & audible alarms shall also be provided as shown on the Drawings

ELE29.10.050.9 ANTI-CONDENSATION HEATERS

The control cubicle shall be provided with thermostat controlled anti-condensation heaters, connected to the mains.

ELE29.10.060.9 CONTROLLER

Programmable controller if provided in the control cubicle to control the automatic start and stop of the engine shall comply with the following requirements:

1. The controller shall have local job reference and shall operate satisfactorily for at least 12 months;
2. Details of the controller including operation instruction, software for programming and the data set in the controller, etc. shall be included in the O&M manual and soft copy of programme together with data loaded in the controller shall be submitted upon project completion;
3. One set of all necessary computer interfacing connection cable & associated accessories shall be provided;
4. Training on data entry and configuration of a new controller suitable for replacement shall be provided to the maintenance staff before expiry of the defects liability period. A video in DVD disc showing the details shall be submitted upon completion of the training.

ELE29.11 OPERATION

ELE29.11.010.9 GENERAL

The operation of the generating set shall be fully automatic and shall comply with the requirements stipulated in the F.S. Code of Practice. Manual start/ testing facilities shall be provided.

ELE29.11.020.9 WORK BY OTHERS

One pair of normally open dry contacts will be provided by others at the location as shown on the Drawings for the purpose of giving a signal to override all automatic shut down features on fault.

ELE29.11.030.9 APPROVAL OF CONTROL CIRCUIT

The control circuit shall be submitted for Approval.

ELE29.11.040.9 PURPOSE

The generator set shall be provided as the standby supply for the essential loads of the building as shown on the Drawings.

ELE29.11.050.9 PROVISIONS OF OPERATION

The essential loads shall normally be fed from the mains supply and be switched automatically to the generating set through a changeover contactor in accordance with the following provisions:

1. A mains sensing device shall be provided to detect condition of the mains supply at the mains supply incoming terminals of the changeover switch, located in the main cubicle switchboard and at other location as shown drawings;
2. When failure of one or more phases of the mains supply or a reduction of voltage to less than 70% of normal is detected, a timing device having an adjustable setting from 0.5 to 2.0 seconds shall be initiated;
3. If the mains failure persists for the pre-set period, the generator set starting sequence shall be initiated automatically;
4. Within 15 seconds from the commencement of the starting sequence, the set shall be stabilised at its rated speed and full load transfer shall take place automatically;
5. Should the generating set fail to start after a period of 15 seconds, the sequence shall be interrupted for a period of 5 seconds and a further attempt to start, of 15 seconds duration, shall then be made. If it again fails to start, the starting sequence shall be locked out, an audio visual alarm given as described in ELE29.12 and it shall remain in this locked out condition until manually reset;
6. If the mains supply is restored during the starting period, the starting sequence shall not be interrupted but the operation of load transfer shall be prevented. After starting, the set shall continue to run on no-load for an adjustable period of 0 - 15 minutes and then stop if no further mains failure;
7. Subsequent failure of the mains supply while the set is running on no-load under provision (6) above shall, after expiration of the 0.5 - 1.0 second delay, cause load transfer to take place;

8. On restoration of the mains supply the set will continue to run and supply essential loads for an adjustable period of 0 - 10 minutes. Thereafter automatic transfer of essential load to mains supply shall take place as soon as the adjusted period has expired;

9. At the end of the adjustable period in provision (8) above the set shall continue to run on no-load for an adjustable period of 0 - 30 minutes;

10. If the mains supply fails again during the adjustable period specified in provision (8) above the control timer setting of the adjustable period (0 - 10 minutes) shall be cancelled in order to prevent the sequence of load transfer. When the mains power is restored again, the operating sequence will start again from sub-clause (8) above;

11. If the mains fails again during the adjustable period specified in provision (9) above the essential loads shall be connected automatically back to the set and the operating sequence will continue as if the connection had been made in the manner as described in provision (7) above;

12. In order to give a signal for lift control, the Sub-contractor shall provide one pair of normally open voltage free contacts terminated inside an adaptable box in each lift machine room. The contacts shall be closed upon load transfer to the generating set.

ELE29.11.060.9 REMOTE SHUT-OFF VALVE

1. A remote shut-off valve shall be installed in the supply pipe linking the fuel tank to the engine. The actuation of such a valve shall also actuate the audio and visual alarm outside the generator room and the 'auto starting of generator disabled' alarm as stated in ELE29.12.020;

2. The pull handle of the remote shut-off valve shall be housed inside a breakglass unit installed at the entrance of the generator room;

3. An operation instruction notice, made of white plastic material engraved with the the following wordings in English and Chinese characters of at least 5 mm high in red colour, shall be provided and affixed adjacent to the breakglass unit.

GENERATING SET EMERGENCY STOP SWITCH

IN CASE OF EMERGENCY

BREAK GLASS AND
PULL HANDLE TO FULL EXTENT

發電機停機掣

如須要緊急停機
打碎玻璃並盡拉此手掣

ELE29.12 AUDIO AND VISUAL ALARMS

ELE29.12.010.9 ENGINE OVERSPEED PROTECTION

1. In the event of a fault arising from engine overspeed, high water temperature or low oil pressure, the set shall initiate a 2-stage engine protective device;
2. The first stage shall be arranged to initiate both audio and visual alarm at the control cubicle and also at the remote indicator above the door outside the generator room as shown on the Drawings;
3. The audio alarm shall be cancelled by an acknowledge push button. The second stage shall be arranged to shut down the engine;
4. The setting of the two stages, for each system being monitored, shall be as specified by the manufacturer.

ELE29.12.020.9 STARTING FAILURE PROTECTION

1. However, for failure of starting under the condition as stated in ELE29.11.050 (5), the local and remote audio and visual alarms shall initiate immediately at the control cubicle and the remote indicator above the door outside the generator room. The indicator shall be of colour RED;
2. In addition, remote audio and visual alarms above the door outside the generator room to indicate "generating set supply disabled" by the following shall be provided:
    a. Pressing of the emergency stop switch of the generating set;
    b. Tripping of the main MCCB/ACB or any outgoing MCCBs of the switchboard cubicle inside the generator room;
    c. Switching off of the main MCCB/ACB or any outgoing MCCBs of the switchboard cubicle inside the generator room;
    d. Turning the "manual/auto" switch to "manual" or "off" position;
    e. Switching off of the battery supply switch;
    f. Actuation of remote shut-off valve.
3. The indicator shall be of colour RED.

ELE29.12.030.9 VOLTAGE FREE CONTACTS FOR FIRE CONTROL MAIN PANEL

The following pairs of voltage-free contacts, terminated inside a surface mounted box next to the Fire Control Main Panel, shall be provided from the Generator Room via concealed conduit system:

1. A pair of normally close dry contacts which shall be opened only when the generating set is running;
2. A pair of normally close dry contacts which shall be opened only when the generating set fails to start;
3. A pair of normally close dry contacts which shall be opened when the generating set supply is disabled under conditions as stated in ELE29.12.020 (2);
4. A pair of normally close dry contacts which shall be opened when the generating set is on fault;
5. A pair of normally close dry contacts which shall be opened when the generating set having fuel level at or below 7.5 hours operation of fire services equipment;
6. Either (a) or (b) of the following:

a. A pair of normally close dry contacts which shall be opened when the generating set having fuel level at or below 6.5 hours operation of fire services equipment and non-fire services equipment tripped (applicable for non-fire services equipment connected to generator power supply as approved by FSD); or

b. A pair of normally close dry contacts which shall be opened when the generating set having fuel level at or below 6.5 hours operation of fire services equipment.

ELE29.12.035.9 VOLTAGE FREE CONTACTS FOR LIFT CONTROL PANEL

The following pair of voltage-free contacts, terminated inside a surface mounted box near one of Lift Control Panels inside Lift Machine Room, shall be provided from the Generator Room via fire resistant cables in concealed conduit system to facilitate the subsequent control mechanism by Lift Sub-contractor for the activation of lift homing upon absence of normal power supply:

1. A pair of normally open dry contacts which shall be closed only when the generator supply is available based on both conditions as stated below are fulfilled

   a. The generating set is running; and

   b. The contactor or circuit breaker of essential power supply of lift cubicle switchboard is closed.

ELE29.12.040.9 OPERATION

Whenever the generating set is started, an audio and visual alarm, at the control cubicle and at the remote indicator above the door outside the generator room, shall be actuated and shall remain in operation until reset manually. The indicator light shall be of colour AMBER. The voltage-free contacts next to the Fire Control Main Panel, as mentioned in ELE29.12.030, shall be actuated to indicate that the generating set is running.

ELE29.12.050.9 TYPE OF INDICATOR LIGHTS AND METAL ENCLOSURE

The above remote indicator shall be mounted on a Grade 304 stainless steel enclosure with a thickness of not less than 1.2 mm and installed outside the generator room. The indicator lights shall be of flashing type.

ELE29.13 INSTALLATION

ELE29.13.010.9 COMPLIANCE WITH INSTRUCTIONS

The generating set shall be installed in accordance with the instructions of the manufacturer.

ELE29.13.020.9 SUBMISSION FOR APPROVAL

Details of the installation shall be submitted for Approval.

ELE29.13.030.9 VIBRATION ISOLATION

1. Suitable vibration isolators shall be provided to prevent the transmission of vibration to the building structure;
2. The completed installation, when in operation, shall not cause any noticeable or objectionable vibration to any part of the building structure or unacceptable level of structure-borne noise in accordance with the Noise Control Ordinance;
3. In the event that undue vibration or excessive structure-borne noise occurs, the Sub-contractor shall rectify the installation or replace the equipment as necessary at his own expense to the satisfaction of the Contract Manager.

ELE29.13.040.9 PAINTING

1. All exposed ferrous metal surfaces of the generating set, pipes and accessories, air ducts, etc. shall, where applicable, be treated with a primer coat of rust resistant paint, followed by two coats of high gloss enamel;
2. Painting of the generating set shall be done at the place of manufacture, before despatch;
3. Touching up, when required on site, shall be carried out to the satisfaction of the Contract Manager.

ELE29.14 ELECTRICAL WORK

ELE29.14.010.9 GENERAL

1. All electrical work shall comply with the relevant sections of this specification;
2. All cables used at the engine shall be heat and oil resisting cables suitable for this purpose;
3. The earthing system & neutral connection for the generating set shall be as shown on the Drawings;
4. All exposed metal work inside the generator room shall be effectively bonded and earthed in accordance with the Electrical CoP;
5. The Sub-contractor shall ensure that the part of the installation which comprises of the essential loads shall be protected in accordance with the Electrical CoP when the installation is fed by the generating set. Protection shall include overcurrent and earth fault as detailed in this Section;
6. The Sub-contractor shall also provide a reverse power sensing device which shall initiate a visual indicator on the control panel and actuate the connection of the dummy load if the reverse power exceeds the regenerative power absorption limit of the generating set.

ELE29.14.020.9 OVERCURRENT PROTECTION

1. The rating and the tripping characteristics of the air circuit-breaker/MCCB in the switchboard cubicle shall be coordinated with the characteristics of the generating set to provide proper protection of the generating set and its associated power cables;
2. The Sub-contractor shall ensure, and verify to the satisfaction of the Contract Manager, that the essential loads, when fed by the generator, are also protected against short circuit in accordance with the Electrical CoP under that particular fault level of the generating set.

ELE29.14.030.9 EARTH FAULT PROTECTION

1. The Sub-contractor shall supply and install an earthing system independent of any other earthing system for the neutral connection and earthing of the generator;
2. The Sub-contractor shall ensure that the generating set installation is solidly and effectively earthed in accordance with the Electrical CoP, and BS 7430;
3. When the plant is subject to vibration, or where circumstances necessitate, the earthing connections shall be made of flexible copper conductor having a green-and-yellow PVC sheath;
4. Earth fault protection shall be provided at the switchboard cubicle inside the generator room to disconnect the supply from the generator to the connected installation within 5 seconds when earth fault occurs at any part of the connected installation other than the final circuits.

ELE29.14.040.9 INTERFACING WITH SWITCHBOARD CUBICLE

1. The Sub-contractor shall coordinate the interfacing signal required between the generating set control panel and the switchboard cubicles for the control and protection of the generating set;

2. The generator set starting sequence in the event of mains failure shall be initiated from the signals provided from voltage sensing devices used for detection of supply incoming terminals located in the main cubicle switchboard, lift cubicle switchboards and at other location as shown in drawings;
3. For current signals to be connected from the switchboard cubicles, the Sub-contractor shall ensure the current transformers be properly selected with adequate burden and accuracy to suit the requirement of control equipment of the generating set;
4. The signal cables shall be coded with ferrules and clearly shown on the control wiring diagram;
5. The signal cables shall be of 1-core PVC surface mounted. The size of cable shall be provided according to the requirement of the generator control equipment but in any case shall not be less than 1.5 mm^2.

ELE29.15 PROVISION OF TECHNICAL INFORMATION

ELE29.15.010.9 LANGUAGE

All technical information provided shall be in English.

ELE29.15.020.9 SUBMISSIONS FOR APPROVAL

Within six weeks from the date of acceptance of tender the Sub-contractor shall forward the following drawings etc. for all items of work to the Contract Manager for approval:

1. Confirmation by the manufacturer that the size of the generating set offered satisfies the specified loads, with relevant supporting document for verification;
2. A general arrangement drawing of the generating set and controls with leading dimensions, weights, foundation details, oil and water drains, air intake and exhaust arrangement, etc.;
3. Complete schematic and wiring diagrams of the electrical systems;
4. One set of instruction manuals which shall cover the following aspects:
    a. Data Sheet which shall include the basic technical data appertaining to the engine, alternator, battery, etc.;
    b. Description which shall give a brief description of the equipment supplied including instrumentation, lifting arrangement, operation of control circuitry, etc.;
    c. Installation which shall state the basic principles to be observed when installing the plant;
    d. Commissioning;
    e. Operating Instructions which shall cover starting, stopping, protective circuits, automatic controls, battery charging, etc. method of adjustment, safety precaution requirements and performance parameters including the relevant nominal values and acceptable limits, etc. shall be detailed;
    f. Maintenance Instructions, which shall include the schedules for maintenance and the maintenance procedures for servicing, major overhaul and corrective maintenance. This section shall also give the guidance with respect to selection of fuel oil, lubricating oil, use of water treatment additives and anti-freeze as necessary;
    g. Fault finding guidance;
    h. Spares ordering information which shall give details of each item of plant and ancillaries including the name and address of the manufacturer and type and model serial number, etc..

ELE29.15.030.9 ADDITIONAL COPIES

Subject to the Approval of the above information submitted, the Sub-contractor shall supply the Contract Manager with a further three sets of all the information required above except item in ELE29.13, bound in durable hard covers.

ELE29.15.040.9 PRE SHIPMENT TEST EVIDENCE

The Sub-contractor shall submit, in triplicate, before shipment, test certificates for all plant, equipment and major components of the generating set.

ELE29.15.060.9 DISPLAY OF INSTRUCTIONS AND SCHEMATIC WIRING DIAGRAM

1. Detailed instructions for operation, manual testing and shut down of the generating set and the schematic wiring diagram shall be clearly displayed in a separate anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness adjacent to the control panel in each generator room;

2. A warning sign shall be provided with a prominent red notice on white ground, of durable material, with a size of not less than 300 x 300 mm inscribed in English and Chinese characters as follows:

DANGER 危險
THIS GENERATING SET IS AUTOMATICALLY CONTROLLED AND MAY START WITHOUT WARNING
此發電機組乃自動操作並會隨時起動

Lettering shall be at least 25 mm high. The notice shall be displayed adjacent to each generating set.

ELE29.16 ACCEPTANCE TESTING AND COMMISSIONING

ELE29.16.010.9 TESTING STANDARDS

1. The generating set shall be tested and maintained in accordance with this Section, the F.S. Code of Practice, the relevant F.S.D. circular letters and the standard forms for commissioning tests and routine monthly tests prepared by the Housing Department;

2. The engine shall be tested in accordance with ISO 3046-1, ISO 3046-3 and ISO 15550 and the alternator shall be tested in accordance with IEC 60034-1 and IEC 60034-2-1. The test report shall consist of measurements in ISO 15550 Table 6 - List A, items A1 – barometric pressure, humidity and ambient temperature, A2 – engine speed or cycle frequency & A5 – fuel consumption only and in Table 7 - List B – brake power and specific fuel consumption and IEC 60034-1 – basic tests or routine check tests. The results of earlier basic tests on a similar machine shall be provided to the satisfaction of Contract Manager upon request.

ELE29.16.020.9 FACTORY TESTING

1. The assembled generating set shall be conducted with a factory acceptance test (FAT) at the place of manufacture according to the acceptance test requirement of ISO 8528-6, before despatch. The tests shall also comprise insulation resistance tests, starting load acceptance capability test, voltage dip test, starting system test, fuel consumption test and full connected load test. Certified records of the above full operation tests and the manufacturers' test reports of engine and alternator at time of delivery to factory for assembly shall be submitted to the Contract Manager before installation of the set;

2. The Sub-contractor shall directly employ an independent Generator Inspection Body (GIB) to witness the FAT at the place of assembling generating set. The GIB shall be one of the following:

    a. an organisation / company listed under Hong Kong Inspection Body Accreditation Scheme (HKIAS) operated by the Hong Kong Accreditation Service (HKAS) or an inspection body recognized by the country where the generator set is assembled and recognized by HKAS under Mutual Recognition Arrangement (MRA); or

    b. an organisation / company listed under Hong Kong Certification Body Accreditation Scheme (HKCAS) operated by the Hong Kong Accreditation Service (HKAS) or an accreditation body recognized by the country where the generator set is assembled and recognized by HKAS under Multilateral Recognition Arrangement (MLA); or

    c. a consultant company listed under the Architectural and Associated Consultants Selection Board's (AACSB) List of Building Services Engineering Consultants.

3. The selected GIB shall appoint a competent person (CP) to witness the FAT. The CP shall possess the following qualifications as minimum:

    a. The CP shall possess not less than 10 years' experience in conducting testing and commissioning for electrical installations;

    b. The CP shall also be a direct employee of the GIB for the past consecutive 6 months at the time of witness; and

c. The proof of qualifications of the CP together with evidences to support the compliance with this clause shall be submitted to CM's approval. The Sub-contractor shall obtain CM's approval for the proposed GIB and CP before conducting the FAT.

4. The GIB shall witness every FAT of all the generator sets supplied under the Sub-contract. The generator manufacturer shall prepare and submit the test report to the CM for approval;

5. The GIB shall ensure every single test result of the FAT, including those in failed attempts, be properly and accurately recorded in the FAT test report prepared by the generator manufacturer. The GIB, upon completion of the FAT, shall sign on each item of the test report as a witness. The completed test report shall be submitted to the CM before dispatch of generator set from factory;

6. The Sub-contractor and the generating set manufacturer shall declare no conflict of interest with the GIB and the CP;

7. The Sub-contractor shall bear all costs and expenses including transportation, accommodation, etc. in relation to the appointment of the GIB and the CP;

8. The Sub-contractor shall seek CM's approval if there is any subsequent change of the GIB or the CP during the course of services.

ELE29.16.030.9 SCOPE OF TESTING

When the installation is completed, commissioning of the installation and performance tests shall be carried out for all equipment's and systems at site and witnessed by an authorised representative of the Contract Manager. The on-site tests shall include insulation resistance test, electrical circuit protection test, control function test, load acceptance capability test, dummy load test, on-load test, noise & vibration test and phase sequence test.

ELE29.16.040.9 TESTING OPERATIONS

The acceptance testing shall include the satisfactory operation of the following:

1. The normal supply shall be switched off in order to start the generating set;

2. When the generating set is ready to accept the Fire Services Installation load, each fire service installation shall be switched on until all installations are in operating conditions. A "simultaneous running" test shall then take place and shall last for a continuous period of one hour;

3. After one hour of testing the generating set shall be examined and all instruments, safety devices, etc. shall indicate "normal" running of the generator;

4. Noise measurement shall be made during the test to ascertain that the noise level emitted during the period of generator operation shall not exceed the limits imposed by Environmental Protection Department and in accordance with the Noise Control Ordinance.

ELE29.16.050.9 LABOUR AND MATERIALS

The Sub-contractor shall provide all labour, apparatus, instruments, tools, fuel, water, lubricants, cable connections etc. required for the testing and commissioning and shall fill up the fuel tank after testing to ensure that the set is in proper order prior to the handover of the installation to the Contract Manager.

ELE29.16.060.9 ACCURACY OF INSTRUMENTS

1. All instruments required for testing of the installation shall be supplied by the Sub-contractor;

2. The instruments used shall be of accurate type and calibrated;
3. The Sub-contractor may be required to produce calibration records and to verify the declared accuracy;
4. The Contract Manager may reject any instrument which, in his opinion, is not suitable for the test and the Sub-contractor shall replace the instruments when required.

ELE29.17 MAINTENANCE AND FINAL TESTING

ELE29.17.010.9 ROUTINE MAINTENANCE

Routine maintenance work shall include:

1. Regular monthly visits to inspect, clean, lubricate and necessary adjustments to maintain optimum operating conditions;
2. All repairs and replacements necessary to maintain optimum operating conditions;
3. Immediate answering of all emergency calls both during and out of working hours, and attendance at site within one (1) hours after receiving emergency calls from any place other than the outlying islands (Note: With the opening of the North Lantau Expressway, Lantau Island is not considered as an Outlying Island if it can be accessed by vehicle.) and within two (2) hours from receipt of such calls from outlying islands;
4. Recording all site attendances, on arrival and departure, whether regular service visit or emergency breakdown call, together with details of the work carried out, in the Emergency Generator record book held at the estate office. Note comments inserted in the record book and take suitable action accordingly;
5. On-load testing all sets once monthly for a period of not less than 30 minutes as below:
    a. Coordinate with the Building Management in advance and take every necessary step to ensure the testing can be carried out effectively with minimum disturbance to the tenants;
    b. Obtain necessary keys such as those of the generator rooms, switch rooms, and lift machine room, etc. from the estate office and have them returned after use;
    c. Before changing over the essential load to the generating set supply, discharge all passengers from all lifts including the fireman's lifts. During the changing over operation, ensure that no passenger is using any of the lifts. However, such lifts shall be in normal operation during the on-load testing of generating set;
    d. Simulate the normal supply failure by switching off the normal supply switches at the upstream of the changeover contactors of the essential supply at the main switch cubicle and of the fireman's lift supply inside the lift machine room. The generating set shall be automatically started up to supply the essential load of fireman's lifts and essential lighting and power. After testing, the electrical system shall be switched back to normal condition.
6. During this on-load testing period, all operating conditions shall be checked and recorded. Following the on-load testing, functional tests shall be carried out on all automatic and manual starting devices and safety controls. The monthly running and functioning tests shall be in accordance with the F.S. Code of Practice;

7. Annual on-load testing shall be performed on all generating set once every 12-months. During the testing, all connected load, including fireman's lifts, essential lighting and power and other fire services installations shall be operated on the generator set supply for a period of not less than 30 minutes. The procedures as stated in (1) to (6) above shall be followed. The Sub-contractor shall coordinate with the Main contractor in advance to arrange annual on-load testing together with F.S. & Water Pump Sub-contractor for on-load running of the fire services installation. The testing shall be in accordance with the requirement as stipulated in the Fire Services COP.

ELE29.17.020.9 MANUFACTURERS RECOMMENDATIONS

1. The Sub-contractor shall also provide the following maintenance as recommended by the manufacturer and to the satisfaction of the Contract Manager:
   a. Necessary maintenance for period longer than one month;
   b. Necessary maintenance on an hour run basis.
2. Fully detailed maintenance and testing instructions shall be provided in a permanent form adjacent to the sets.

ELE29.17.030.9 MAINTENANCE OF BATTERIES

Care and maintenance, if necessary, of any batteries shall be based on the relevant Standard but shall incorporate the manufacturer's specific recommendations for operation under Hong Kong conditions.

ELE29.17.040.9 PROVISION AND COMPLETION OF LOG BOOK

A log book shall be provided, be retained in the generator room and be kept up to date, recording, at the time of occurrence, all operations, faults occurrences and corrective actions taken, routine servicing, maintenance and periodic operation, etc. including dates, times, hour meter readings, worker/supervisors names and signatures, etc. for the set, batteries, compressors, etc.

ELE29.17.050.9 FINAL TESTING

At the end of the Maintenance Period the Sub-contractor shall repeat the tests including the insulation resistance test, electrical circuit protection test, control function test and the annual on-load test to the satisfaction of the Contract Manager.

ELE29.17.060.9 LABOUR AND MATERIALS

The Sub-contractor shall provide all labour, apparatus, instruments, tools, fuel, water, lubricants, fuses, lamps etc., during maintenance and final testing to ensure that the set is in proper order after each operation during the Maintenance Period including filling fuel tanks after each testing.

ELE30.1 TESTING

ELE30.1.010.9 GENERAL

1. Inspection and testing shall be carried out on all new installations and alterations to an existing installation in accordance with the requirements of this Section;
2. During the construction stage, the Sub-contractor shall submit test report for conduit continuity test executed prior to concreting of the concealed steel conduit work as specified in the ELE11.3.010;
3. The Sub-contractor shall be responsible for the electrical conductivity testing on samples of aluminium window frames submitted by Main Contractor on Site;
4. The Sub-contractor shall ensure the bonding for extraneous conductive parts is sound and the result complies with the Electrical CoP and BS 7671 by proper measurement with records at good time. For those parts for equipotential bonding system found not electrical conductive, the Main Contractor and the Sub-contractor shall be responsible for rectification of their own works at early as possible;
5. Upon the completion of the sample flats and the sample wing, the Sub-contractor shall carry out the equipotential bonding test to extraneous conductive parts as directed by Contract Manager and to his satisfaction. Test results shall be submitted to the Contract Manager for record purposes;
6. The whole installation shall be tested on completion by the Sub-contractor in compliance with the relevant clauses in this Section. In particular, the earth fault loop impedance shall be tested when the permanent electricity supply is available. The test reports, which shall be verified and endorsed by the Supervising Engineer and registered electrical worker of appropriate grade in accordance with ELE1.8.020, together with the Inspection and Completion Certificates as prescribed in the Electrical CoP for the whole installation shall be submitted to the Contract Manager for Approval before acceptance of the installation;
7. The Sub-contractor shall take account of the accuracy of the instruments when verifying the compliance of the installation. Appropriate safety margin shall be achieved on Site to ensure that the safe and proper functioning of the installation is within the specified safety and performance limits.

ELE30.1.020.9 INSTRUMENTS

1. In addition to PRE.BS1.630 which specifies the provision of a set of measuring instruments for BSPASS and Contract Manager's Representatives' use, which will be under the custody of the CMR, the Sub-contractor shall provide all necessary instruments used for measurement and testing of the installation. The instruments shall be capable of carrying out the measurement and testing with the necessary accuracy. Except for dummy resistive load bank given in sub-clause (1)(r) below, the instruments shall be calibrated with traceability to internationally or nationally recognized standards. Each instrument shall carry an indelible identification and, except where calibration is specified not necessary, be attached with a label showing the due date for calibration. The instruments shall include, but are not limited to, the following:
    a. Low resistance ohmmeter;
    b. Insulation resistance tester;
    c. Earth-fault loop impedance tester;
    d. Earth electrode resistance tester;

e. RCCB tester;

f. Voltmeter;

g. Clamp-on ammeter;

h. Measuring tape;

i. Vernier calliper;

j. Frequency meter;

k. Sound Level Meter;

l. Lux meter;

m. Luminance meter;

n. Equipment for measurement of total harmonic distortion;

o. Multi-function electronic meter for measurement of current, voltage, power factor, kW, kVA, kVAr and KWh;

p. Primary current injection tester;

q. Secondary current injection tester;

r. Phase sequence tester / meter;

s. Dummy resistive load bank;

t. Digital stop watch;

u. Thermometer;

v. Pressure gauge.

2. Upon requested by the Contract Manager, the Sub-contractor shall submit calibration certificates or other evidence of calibration and records of calibration results for inspection. The Contract Manager may reject any instrument(s) which in his opinion are not suitable for the measurement or testing, and the Sub-contractor shall replace them with Approved types immediately when required.

ELE30.1.030.9 VISUAL INSPECTION

A visual inspection should be made to verify the electrical equipment as installed is correctly selected, erected and there is no apparent damage. The visual inspection should include a check on items as stipulated in the Electrical CoP Code 21A.

ELE30.1.040.9 TESTING SEQUENCE

Where relevant, the following items are to be tested preferably in the sequence indicated below:

1. Continuity of protective conductors, including main and supplementary equipotential bonding;
2. Continuity of ring final circuit conductors;
3. Insulation resistance;
4. Polarity;
5. Earth electrode resistance;
6. Earth fault loop impedance;
7. Functions of all protective devices;
8. Functions of all items of equipment.

ELE30.1.045.9 TESTING ARRANGEMENTS

1. The details and arrangements for each of the aforesaid tests shall refer to relevant clauses stipulated in Code 21B of the Electrical CoP;
2. In the event of any test indicating failure to comply, that test and those preceding, the results of which may have been influenced by the fault indicated, shall be repeated after the fault has been rectified.

ELE30.1.160.9 RECORDING OF TEST RESULTS

The test results of electrical work shall be recorded in the format be approved by CM. The test reports, together with Work Completion Certificates shall be certified by registered electrical worker of appropriate grade and registered electrical contractor, as prescribed in the Electrical CoP for the whole installation shall be submitted before acceptance of the installation.

ELE30.1.170.9 LIGHTNING PROTECTION SYSTEM

Every lightning protection system shall be tested in accordance with ELE14.

ELE30.1.180.9 FIRE SERVICE (F.S.) INSTALLATION

1. All plants, equipment and systems included in the scope of the Sub-contract and classified as fire services installations under F.S. Regulations/Code of Practices shall be installed, tested, certified and maintained in accordance with the relevant F.S. Regulations/Fire Services COP. The fire services installations included in the scope of the Sub-contract shall consist of, but are not limited to, the following:
    a. Emergency Lighting;
    b. Exit Signs and Directional Signs;
    c. Emergency Generator;
    d. Ventilation/air conditioning control system (as shown on the Drawings or Specifications).
2. The emergency lighting shall include all essential lighting points along the escape route within the building such as lift lobbies, staircase, corridor, etc. and self-contained emergency lighting inside the switch/service/plant rooms, non-domestic premises etc. as shown on the Drawings;
3. For the F.S. installations mentioned above, the Sub-contractor shall produce Completion Certificates (i.e. FSI/501a) upon completion of installation and Maintenance Certificates (FS 251) at the end of the Maintenance Period in accordance with F.S. Regulations/Fire Services COP. These certificates shall be duly signed by an appropriate Registered F.S. Contractor. The Maintenance Certificate shall be submitted to FSD and copied to the Contract Manager within 14 days after a final acceptance test has been carried out. The Maintenance Certificate together with a list of fire services installation and equipment shall also be copied, framed and displayed in a prominent area of each building concerned under the direction of the Contract Manager.

ELE30.1.190.9 EMERGENCY GENERATOR INSTALLATION

Testing, commissioning and maintenance of the standby diesel generating sets shall be carried out as specified in ELE29.

ELE30.2 MAINTENANCE

ELE30.2.010.9 24-HOUR ON-CALL SERVICE DURING MAINTENANCE PERIOD

1. The Sub-contractor shall provide 24-hour on-call service at any time during the Maintenance Period;

2. The Contract Manager may instruct the Sub-contractor, in the Maintenance period via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and Approved by the Contract Manager, to attend to reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel, who shall arrive at site, carry out any necessary inspection, testing and repair work for service resumption within the time stipulated under the Performance Pledge of the Employer as listed below and under all weather conditions. In the event that it being impossible to perform the requirement as stipulated in the Performance Pledge, the Sub-contractor shall explain immediately to the Contract Manager or his or her representatives the reason for such non-conformance;

   Performance Pledge of the Employer

Description	Requirements
Arrival for maintenance during office hours	Within 1 hour
Arrival for maintenance after office hours	Within 2 hours
Resumption of power supply	Within 8 hours after inspection for power interruption that affects more than one domestic flat and/or the common areas of the domestic block

3. The Sub-contractor shall submit to the Contract Manager, for this purpose, at least two names of English speaking representatives, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for Approval;

4. Prior Approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers, etc., during the Maintenance Period at least two weeks before the change is effected;

5. The maintenance and servicing works, as described above, form part of the Main Works described in Clause 8.3(2)(c) of the General Conditions of Main Contract.

ELE30.2.020.9 SUB-CONTRACTORS OBLIGATIONS

During the Maintenance Period, the Sub-contractor shall attend to all faults and complaints, remedy all defects, replace all malfunctional items and maintain the complete installation in a clean, tidy and functional condition to the satisfaction of the Contract Manager unless otherwise specified.

ELE30.2.030.9 REPLACEMENT OF DEFECTIVE BULBS / TUBES / FUSES

1. For all domestic buildings during the Maintenance Period, the defective lamp bulbs / fluorescent tubes and fuses shall be replaced by others;

2. For all other non-domestic buildings during the Maintenance Period, the defective lamp bulbs / fluorescent tubes and fuses shall be replaced by the Sub-contractor;

3. In all cases, the Sub-contractor shall replace defective lamps within their life expectancy as specified in the Contract.

ELE30.2.040.9 EMERGENCIES

If any work is, in the opinion of the Contract Manager, required to avoid danger or to restore supply and the Sub-contractor is not available immediately and/or fails to arrive on site within the time required, the Contract Manager may instruct any other contractor, workman or person to carry out the work immediately and the responsibility of the Sub-contractor to fulfil the contractual obligations shall not be relieved under such circumstances, in which case the Sub-contractor shall be liable for all the cost incurred as if such work has to be carried out by the Sub-contractor.

ELE30.2.050.9 ELECTRICITY SHUT-DOWN

Should shut-down of electricity to buildings be required for the execution of the work, the duration should be kept to a minimum and prior agreement of the Contract Manager shall be sought except for emergency operation.

ELE30.2.060.9 PREVENTIVE MAINTENANCE

At the end of the Maintenance Period, the Sub-contractor shall execute all work of inspection, examination, and overhaul as required, to the complete installation, other than the installation inside domestic flats, to the complete satisfaction of the Contract Manager.

ELE30.2.070.9 REPAIR, CORRECTIVE AND POST-FAULT MAINTENANCE

1. The Sub-contractor shall carry out all repair, corrective and post-fault maintenance as soon as practicable after receiving instruction from the Contract Manager;
2. Such work shall be carried out by the Sub-contractor at his own cost if the necessity for the work shall, in the opinion of the Contract Manager, be due to the use of materials or workmanship not in accordance with the contract, or due to failure on the part of the Sub-contractor to comply with any obligation expressed or implied in the Contract;
3. If, in the opinion of the Contract Manager, the necessity of such work is due to other causes for which the Sub-contractor is not responsible, the value of the work will be ascertained by the Contract Manager and paid for;
4. Post-fault maintenance of switching devices, distribution boards and switchboards shall be carried out in accordance with BS 6423.

ELE30.2.080.9 FINAL INSPECTION

1. At the end of the Maintenance Period, the Sub-contractor shall carry out the visual inspection of the whole electrical system except the installations inside the domestic flats, and shall submit the inspection reports to the Contract Manager for record;
2. Should the inspection results indicate that the equipment or system not in full compliance with this specification, the Sub-contractor shall carry out, at his own expense, any alterations, replacements, or adjustment, as may be required to correct the faulty work;
3. The Contract Manager's decision as to what constitutes a satisfactory inspection shall be final.

ELE31.3.040.9 TESTING AND COMMISSIONING 12

ELE31.2 EQUIPMENT & MATERIALS

ELE31.2.010.9 VENTILATION FANS

1. This section should be read in conjunction with Section B3 and C3 of the General AC Specification;
2. Fan capacities, heads, working pressures, minimum efficiencies and motor powers indicated are for reference and tendering purposes only. Any modifications to the system or any of its components such as fans, ductwork, motors, cables, switchgear etc. which may be required to meet the scheduled duties and space limitations shall be carried out at the Sub-contractor's expenses, except where modification is brought about by the written instruction of the Contract Manager. Notwithstanding this, no modification to any system shall be carried out where such modification may result in a reduction in system performance and efficiency, without the prior approval of the Contract Manager;
3. Sound power rating curves shall be certified by the manufacturer for the complete fan and drive assemblies and tested in accordance with BS EN ISO 5136 or Parts 1 to 4 of BS ISO 13347 or other equivalent standard;
4. The Sub-contractor shall be responsible for checking the actual data before ordering of equipment. It shall be supported with full fan duty calculations.

ELE31.2.020.9 DUCTWORK

1. General:
   a. Ductwork shall generally comply with Section B2 and C2 of the General AC Specification;
   b. Duct sizes given on the Drawings are clear internal dimensions and allowance shall be made for both internal and external insulation where applicable;
   c. All ductwork shall be fabricated as far as practicable according to site dimensions taken by the Sub-contractor. The Sub-contractor shall make suitable provision to accommodate any discrepancies that may occur between the Drawings and site dimensions. The Sub-contractor shall also note the obligations pertaining to coordination of services on site;
   d. The air leakage limit on ductwork shall conform and be tested to the requirements as stipulated in the AC Energy Code;
   e. This Specification and the Drawings only indicate the extent and general arrangement of the ducting system. If any departure from the Drawings is deemed necessary, details of such departure and reasons shall be submitted by the Sub-contractor to the CM for approval. Approved departures shall be made at no extra cost. Preferential changes arising from the Sub-contractor's processing and / or fabrication methods where approved shall be made at no extra cost.
2. Material:

   Unless otherwise specified on the Drawings or elsewhere in this Specification, air ducts shall be fabricated from hot dipped galvanised steel sheet to BS EN 10327 and any damage to the galvanised finish shall be made good with three coats of aluminium zinc rich paint or other approved corrosion resistant paint to the satisfaction of the CM in addition to painting as specified. Uninsulated ductwork running exposed to view shall be painted as specified in relevant sections of the General AC Specification and in white or another colour as directed by the CM.

3. Construction and standard:

   a. All sheet metal ductwork described in this part of Specification and shown on the Drawings shall be constructed to the recommendation of the Building Engineering Services Association in the latest editions of their Publication DW/144 and the additional requirements of this part of Specification;

   b. Circular and flat-oval ductwork shall be spirally-wound and shall be suitable for medium pressure applications;

   c. Pressure rating of rectangular ductwork shall be classified as per DW/144 according to the associated fan duty or as specified in other parts of this Specification;

   d. Where ductwork passes through or connects to concrete and / or masonry walls and air shafts, ducts shall be collar flushed with metal angle flushing pieces, effectively sealed air tight and neatly finished. The annular space around the duct shall be caulked tight with approved gasket or sealant;

   e. Flanged joints shall be provided for duct connections to plants and where removable sections are required to provide access for cleaning and maintenance;

   f. Where duct bends or joints occur in ceiling spaces and flanges may foul ceiling suspension members, slip joints may be used and the duct stiffened locally, if necessary, to avoid duct vibration;

   g. Test holes shall be provided where necessary for effective balancing and testing. Test holes shall be 25 mm diameter and fitted with removable sealed cap. Test points shall be provided for all dampers and equipment to enable fan duties and other items to be assessed and for commissioning of the system. Location of test holes shall be at a point of minimum turbulence;

   h. Regulating dampers or split dampers shall be provided in every branch-off;

   i. All intake and discharge openings to the building shall be fitted with 10 mm grid stainless steel wire mesh. This requirement is additional to any grilles or louvres indicated on the Drawings;

   j. Open ends of ducts shall be covered with plastic sheets during erection to prevent ingress of dirt and rubbish. All ductwork shall be cleaned internally before the system is tested, commissioned and put into operation;

   k. Side inspection and access panels for the purpose of cleaning duct interior shall be provided. The cleaning point shall in general be installed at a maximum distance of 4 metres between centres in fully accessible locations and subject to CM's approval. Stainless steel drain points complete with plugs and caps shall be provided at all low points of the air ducts.

4. Identification

   a. All ductwork shall be legibly marked with black or white letters and triangles of at least 150 mm side to show the type of service and the direction of air flow.

      Services shall be shown as follows:

Supply air	SA
Exhaust air	EA

ELE31.2.030.9 DUCTWORK ACCESSORIES

1. General:

   Ductwork accessories shall generally comply with Section B2 and C2 of the General AC Specification.

2. Volume control dampers:

   The Sub-contractors shall provide all necessary volume control dampers whether shown on the Drawings or not so that airflow rates specified can fully be achieved. Ductwork regulating dampers shall be of the opposed blade type with low pressure drop and noise regeneration characteristics.

3. Access doors and panels:

   a. Access doors shall be hinged type and of double skin sandwich construction each having a cam-lock action retaining lock and complete with gaskets. Multiple screw fixings shall not be acceptable. Access openings shall be adequately reinforced. Insulation thickness in the door shall be equal to that of the duct or cabinet into which it is installed;

   b. Access doors shall not be removable unless no larger than 300 mm x 300 mm or essential for access or maintenance purpose, in which case approval shall be sought from the Contract Manager;

   c. Access doors shall be provided at all fire/smoke dampers, silencers, fans, duct probe type smoke detectors and where necessary for maintenance and other purposes whether or not they are specifically shown on the Drawings.

4. Turning vanes:

   Wherever DW/144 requires the use of bend splitters, proprietary tuning vanes and square bends shall be provided whether detailed on the Drawings or not. Turning vanes shall be of aerofoil using proprietary vane rails.

ELE31.2.040.9 GRILLES AND DIFFUSERS

1. This section shall be read in conjunction with Section B3 and C3 of the General AC Specification;
2. All air supply, return, exhaust and dummy fittings shall be provided according to the types and duties shown on the Drawings;
3. All aluminium or steel louvres, grilles, diffusers, unless otherwise stated, shall have phosphate treatment with baked enamel finish to colours approved by the Contract Manager;
4. Before any diffusers, grilles, etc. are ordered or manufacture of fittings commences, confirmation must be obtained from the Contract Manager in respect of the exact finishes of fittings required. Samples of every type of grilles, diffusers, etc. shall be submitted to the Contract Manager for approval before orders are placed;
5. Supply grilles and diffusers shall be of aluminium construction with concealed fixings and shall incorporate rear opposed blade volume control damper with front accessible adjustment screw. Grilles shall have horizontal and vertical adjustable blades to suit the particular application;
6. Exhaust/return grilles shall be of aluminium construction with concealed fixings and square neck connection as indicated on the Drawings. The vanes shall be of extruded aluminium sections fixed at an inclined angle of 45 degrees. An opposed blade damper with front accessible adjustment screw shall be fitted to the neck for volume control.

ELE31.2.050.9 FILTERS

1. Filters shall in general comply with Section B1 and C1 of the General AC Specification;
2. Filter media shall be of FSD approved type;

3. Washable panel fitter shall have the minimum efficiency reporting value (MERV) by ANSI/ASHRAE Standard 52.2 and initial resistance at 2.5 m/s face velocity as shown below. The filter shall operate to a final resistance of 150, 100 or 75 Pa for 50, 25 or 12.5 mm thick panels respectively.

   MERV and Initial resistance of washable panel filter

Thickness	MERV Not Less Than	Initial Resistance Not Exceeding
50 mm	5	50 Pa
25 mm	4	30 Pa
12.5 mm	3	25 Pa

ELE31.2.060.9 ACTIVATED CARBON/CHEMICAL FILTERS (FOR REFUSE COLLECTION POINT/JUNK COLLECTION POINT, REFUSE STORAGE & MATERIAL RECOVERY CHAMBERS AND REFUSE CHUTES)

1. General:

   a. The activated carbon/chemical filters shall be Underwriters Laboratories (UL) Class 1 listed and FSD approved;

   b. The filter unit shall consist of housing, modules and filtering media. The complete unit shall be manufactured by the same manufacturer with well-proven experience in construction of similar filter units;

   c. All filtering media shall be recognised by FSD as complying with the non-combustible requirement;

   d. Four sets of spare module with filtering media and pre-filter shall also be provided at completion stage.

2. Housing:

   a. Housing shall be constructed of AISI type 304 stainless steel sheet. Extruded luminous filter slide tracks shall be bolted to vertical formed channel supports at 610 mm intervals across the width of the housing;

   b. Filter tracks shall include nylon pile seal to match with the sealing face of all filters. Doors, on both sides, shall be hinged with stainless steel hinges and pins, and shall include permanently attached positive locking door latches. Gaskets shall be provided to prevent air leakage around doors and between the doors and the filters;

   c. Housing shall consist of two sections, first section for housing 50 mm pre-filters, second section for housing modules;

   d. The Sub-contractor is responsible for calculating the actual size of filter sections required for sizing of housing. The Sub-contractor shall also size the filter sections with face air velocity across the filter section not more than 2.5 m/s.

3. Modules:

   Modules shall be constructed of disposable paperboard or ABS (acrylo-nitrile butadiene styrene terpolymer) grade DFA-R thermoplastic. Modules shall have V-shape cross sections containing media. The modules shall be nominally 152 mm x 610 mm x 457 mm overall. Perforated plastic portion shall have 53% open area. Modules shall carry an Underwriters Laboratories (UL) Class 2 listing when filled with media. The modules shall be disposable, no separate handling of media to reduce the time of maintenance.

4. Filtering media:

a. Media in the modules shall be mixture of 50% Medium A and 50% Medium B. Media should be able to absorb organic and inorganic gases;

b. Medium A:

i. Medium A shall consist of manufactured, generally spherical, porous pellets (nominal pellet diameter is 3 mm). Pellets shall be formed from a combination of powered activated alumina and other binders, suitably impregnated with potassium permanganate (minimum 4%) to provide optimum absorption and oxidation of a wide variety of gaseous contaminants. The potassium permanganate shall be applied during pellet formation, such that the pellet volume is totally available for reaction. The media shall be inorganic, non-toxic, non-flammable and shall not support bacterial or fungal growth;

ii. Medium shall meet the following removal capacities:

- Hydrogen sulphide: 8.0% minimum by weight
- Sulphur dioxide: 3.5% minimum by weight
- Nitric oxide: 2.5% minimum by weight
- Nitrogen dioxide: 1.0% minimum by weight

iii. Medium shall operate normally at temperature -20°C to 51°C with 10 to 95% R.H. Medium shall have a scrubbing efficiency of not less than 99.95% at air velocities of 0.3 to 2.5 m/s.

c. Medium B:

Medium B shall be manufactured from a combination of coconut shells, bituminous coal and contain elemental sulphur less than 0.005%. The hardness of medium shall be 97 determined by ASTM D3802-79. The absorptive capacity for carbon tetrachloride shall be minimum 50% according to ASTM D3467-04.

d. Amount of media provided in the modules shall be capable of removing offensive smell in the exhaust air such that replacement of media is required not more than once every six months.

5. Pre-filter:

a. Pre-filter shall be 50 mm thick washable panel type with average efficiency of 20% tested in accordance with ASHRAE 52.1 or ASHRAE 52.2. Pre-filter shall be of FSD approved type;

b. Air resistance when clean shall not exceed 80 Pa. Design final resistance shall be 150 Pa.

6. Replacement of Filters:

Dirty filters will be cleaned or replaced by others during the Maintenance Period.

ELE31.2.070.9 ACTIVATED CARBON/CHEMICAL FILTERS (FOR REFUSE STORAGE & MATERIAL RECOVERY ROOMS)

1. The activated carbon/chemical filters for refuse storage & material recovery rooms shall be 50 mm thick panel type with proven local job installation records and approved by the Contract Manager;

2. Filter shall be housed in the same galvanised steel cabinet that houses the exhaust fan or as otherwise specified. Filter track shall be provided to facilitate secure filter fixing and easy filter removal.

ELE31.3 SYSTEM REQUIREMENTS

ELE31.3.010.A VENTILATION FAN CONTROL

1. Where a supply fan is specified in addition to an exhaust fan for a room, the operations of the two fans shall be interlocked;
2. Exhaust fans for refuse storage & material recovery rooms (RS&MRRs) shall be group controlled by battery backup type 24 hour time switches installed in a weatherproof enclosure in the refuse storage & material recovery chamber (RS&MRC) at ground floor as shown on the Drawings. The enclosure shall be constructed from minimum 1.5 mm thick sheet steel, rust proofed and epoxy powder painted or baked enamel finished for the inside and outside surfaces. The enclosure opening shall be rolled up with curled edges in order to stop water ingress slip into inner side of the panel. The front panel shall be of double-door construction. The outer doors of the front panel shall be hinged permitting not less than 110 degree opening, inserted with a durable clear transparent panel sealed by rubber gaskets, and fitted with watertight handle. The dimensions of the clear transparent panel shall be as large as practicable to view all the components and operational features inside. The edges of the door shall be fitted with neoprene rubber gaskets which at closing position, shall be tightly rested on the curled edges of the panel opening. The enclosure shall have an index of protection not less than IP42 to BS EN 60529 or IEC 60529;
3. For ventilation fans for refuse chute, refuse storage & material recovery chambers (RS&MRCs), pump rooms and lift machine rooms, the ventilation fan(s) in each room shall be operated by manual control and a battery backup type 24 hour time switch;
4. In addition, thermal control device shall be used to control the ventilation fans in lift machine rooms and roof fresh water booster pump rooms;
5. A by-pass switch shall be provided for the manual control of each time switch;
6. The time switch shall be submitted for approval prior to installation;
7. Local control panels:
    a. Local control panels shall be provided for individual or each group of fans for (RS&MRCs), refuse collection point (RCP) and where specified;
    b. The whole enclosure of the local control panels shall be constructed from minimum 1.5 mm thick sheet steel, rust proofed and epoxy powder painted or baked enamel finished for all inside and outside surfaces. The panel opening shall be rolled up with curled edges in order to stop water ingress slip into inner side of the panel. The panel door shall be hinged permitting not less than 90 degree opening and recessed in the panel with indication lights, selector switches, isolating switches etc. fitted on. The back sides of the panels shall be fitted with insulation boards to prevent direct exposure of live parts when opened. At closing position, the panel doors shall be fastened onto the panel by stainless steel screws. The panels shall be of a robust design, capable of withstanding the mechanical, electrical and thermal stresses under all working conditions including fault conditions. The enclosure shall have an index of protection not less than IP42 to BS EN 60529 or IEC 60529;

c. For panel installed at RS&MRCs, RCP and pump rooms, in addition to the requirements in item b above, the front panel of the local control panel shall be of double-door construction. The outer doors of the front panel shall be hinged permitting not less than 110 degree opening, inserted with a durable clear transparent panel sealed by rubber gaskets, and fitted with watertight handle. The dimensions of the clear transparent panel shall be as large as practicable to view all the components and operational features inside. The edges of the outer doors shall be fitted with neoprene rubber gaskets which at closing position, shall be tightly rested on the curled edges of the panel opening. The inner doors of the front panel shall be hinged permitting not less than 90 degree opening and recessed in the panel with indication lights, selector switches, isolating switches etc. fitted on. The back sides of the inner panels shall be fitted with insulation boards to prevent direct exposure of live parts when opened. At closing position, the inner doors shall be fastened onto the panel by stainless steel screws;

d. Panels shall include all necessary components and accessories to form a complete assembly. Components and accessories shall be firmly fixed in position in the panel and shall be assembled in such a way that it shall be possible to remove or replace any component parts and to carry out cable connections from the front;

e. Permanently engraved labels in both English and Chinese shall be provided on the panel for identifying each piece of instrument and equipment such as push buttons, signal lights etc.. The labels shall be engraved with white lettering on a black background. In addition to the aforesaid, each control panel shall have an identity label showing its designation as indicated on the Drawings;

f. Panels having equipment requiring three phase feed shall be complete with HRC fuses and individual on-load door interlocked isolators. Panels having equipment requiring only a single phase feed may be isolated by means of a switch mounted within the panel but in such circumstances every item inside shall be fully shrouded and the panel door shall be provided with barrel lock and keys. Alternatively, the Sub-contractor can propose alternative means of isolation, switching and/or emergency switching which satisfies safety requirements of users, occupants and maintenance personnel for approval by the Contract Manager;

g. Control panel for each refuse storage & material recovery chamber shall at least include the following operational features:

   i. Local start/stop push buttons and manual/off/auto switch;

   ii. Status and alarm indicating lamps (supply healthy, on, trip, overload, etc.);

   iii. Panel-mount time switch with a removable clear plastic front cover and its by-pass switch;

   iv. Isolating switch interlocked with the panel door, or isolating switch with door lock.

h. Control panel for each refuse collection point shall at least include the following operational features:

   i. Local start/stop push buttons;

   ii. Status and alarm indicating lamps (supply healthy, on, trip, overload, etc.);

   iii. Isolating switch interlocked with the panel door, or isolating switch with door lock.

i. The Sub-contractor shall submit full details of each type of control panel for approval before fabrication.

8. Motors under automatic control shall be provided with a warning notice, which shall be a prominent red notice on white background of durable material, displayed adjacent to each fan or each pair of fans, and inscribed in English letters and Chinese characters of at least 15 mm high as follows:

DANGER
THIS MOTOR IS AUTOMATICALLY CONTROLLED AND MAY START WITHOUT WARNING – ISOLATE BEFORE INSPECTION
危險
此機乃自動操作 – 維修前請先關掣

9. In each refuse storage & material recovery chamber, motorised shut-off dampers shall be provided to the intake air external louvres and interlocked with the exhaust fan operation as shown on Drawings;

10. In refuse collection point, a prominent notice of durable material shall be provided and inscribed in English and Chinese characters of at least 25 mm high as follows:

PLEASE KEEP DOOR OPEN WHEN EXHAUST FAN IS IN OPERATION
抽氣扇運行時請保持房門開啟.

ELE31.3.020.9 EXTRACTION SYSTEM FOR VEHICLE EXHAUST

1. Extraction fan shall be of centrifugal type and shall meet the demands and duties for conveying vehicle exhaust gases. Construction shall be compatible with both petrol and diesel engine emissions and capable of withstanding high temperature (at least 125℃ continuously) and corrosive nature of the exhaust gases. The induction motor to IP 44 shall be directly coupled to the fan and shall be designed to give long and continuous service;

2. The whole system shall be designed for use by heavy refuse collection vehicles of up to 24 tonnes gross vehicle weight with engine capacity of 15,000 c.c.;

3. The extraction unit shall be fitted with chained cap adaptors to suit the vehicles using the refuse collection point. The following accessories are to be provided:

   a. 12 m length of minimum 100 mm diameter crush proof metallic flexible hose;

   b. High and low point inlets to suit the overhead and under-chasis exhaust discharges of the vehicles;

   c. Exhaust funnels to fit tail pipe from 63.5 mm to 127 mm in diameter;

   d. Hose brackets, plugs and fitted kit as required.

4. Hose reel shall be of electric motor driven type with waterproof control panel at low level to the approval of the Contract Manager.

ELE31.3.030.9 NOISE AND VIBRATION CONTROL

1. General:

   a. The Sub-contractor shall supply and install noise and vibration control equipment to ventilation fans, ductwork silencers, flexible duct connections and acoustical enclosures to noise generated equipment where specified and where necessary;

b. The Sub-contractor shall be responsible for checking and calculating the noise level generated by the ventilation equipment and providing suitable acoustic treatment to comply with the Noise Control Ordinance, requirements of Environmental Protection Department, the Drawings and General AC Specification. Such calculations shall be submitted to the Contract Manager for approval;

c. All noise absorbing materials shall be inert, non-hygroscopic, verium proof and fire retardant. All materials installed outside building or uncovered shall be suitable for outdoor use;

d. For evaluation of vibration standard and measuring techniques, BS ISO 3334 shall be applied;

e. When ductwork or conduit crosses structural movement joints, flexible connection must be installed;

f. The Sub-contractor shall be responsible for ensuring that all penetrations in walls, floors and ceilings provided for ducts, conduits, etc. are isolated and sealed around the penetrations. In all cases, masonry and other structure surrounding the plant shall not be in direct contact with the equipment;

g. The Sub-contractor shall be responsible for selecting vibration isolators, ductwork supports, ductwork acoustic insulation, silencers etc. where appropriate and taking into account the manufacturers' recommendations to ensure that the noise and vibration generated from the system could be effectively isolated in accordance with the requirements in Section B8 and C8 of the General AC Specification;

h. Suspended equipment shall be supported on Type "F" spring and double deflection neoprene hangers;

i. Flexible connectors shall also be provided at ductwork connections to the ventilation equipment and at all building movement joints.

2. Duct silencers/sound attenuators:

a. Duct silencers/sound attenuators where shown on the drawings shall be provided for all ducted ventilation fans. Additional attenuators shall be provided where necessary to meet relevant statutory requirements;

b. Duct silencers/sound attenuators shall be factory constructed and tested;

c. The duct silencers/sound attenuators shall be selected in accordance with the requirements of the General AC specification. The maximum pressure drop across the selected silencer shall not exceed 50 Pa;

d. All acoustic infill materials shall be inert, non-combustible, vermin proof, non-hygroscopic, wrapped in an acoustically transparent polyester membrane and sealed with polyester sealant to the approval of FSD;

e. All attenuators shall be fitted with end plates and packed in sealed bags at factory prior to shipment.

3. Acoustic enclosures:

a. The Sub-contractor shall supply and install ventilation fan acoustic enclosures where shown on the Drawings and where necessary to satisfy the noise criteria specified. The arrangement shall be submitted to the Contract Manager for approval prior to installation;

b. Construction of the enclosures shall generally be in accordance with the General AC Specification. Enclosure panel thickness shall be as recommended by the acoustic specialist but not less than 25 mm. Access panel shall be provided so that all removable and serviceable parts can be accessed for maintenance;

c. All acoustic infill materials shall be inert, non-combustible, vermin proof and non-hygroscopic. The infill shall be wrapped in an acoustically transparent polyester membrane and sealed with polyester sealant to the approval of FSD except where detachment of fibres into the air stream is prevented by solid double wall construction.

ELE31.3.040.9 TESTING AND COMMISSIONING

1. All tests shall be carried out in accordance with this Specification and the following documents where applicable:
   a. Section A9 of the General AC Specification;
   b. Testing and Commissioning Procedure for Air conditioning, Refrigeration, Ventilation and Central Monitoring & Control System Installation in Government Buildings of the Hong Kong Special Administrative Region published by Architectural Services Department, Hong Kong;
   c. Relevant CIBSE Commissioning Code;
   d. Relevant British Standard or British Standard Code of Practice.
2. All costs associated with the testing and commissioning procedures including materials, labour, instruments and provisions of all necessary test points shall be borne by the Sub-contractor. Such costs shall also include the cost of making good any defects arising out of such tests and having the work re-tested. In the case of off-site, all other incidental costs shall also be included;
3. Testing and commissioning shall also be required for all temporary works;
4. All tests shall be carried out to the satisfaction of the CM and shall be witnessed by the CM and / or his representative;
5. At least two months prior to the testing or commissioning of any system or process, the Sub-contractor shall furnish the following information to the CM for approval:
   a. Type of instrument to be used;
   b. Manufacture of instrument;
   c. Calibration methods for instrument;
   d. Operating instructions for instrument;
   e. Accuracy and tolerances of instrument;
   f. Proposed formats of testing and commissioning reports;
   g. Schedule and programme of testing and commissioning activities.
6. The Sub-contractor shall submit in triplicate the testing and commissioning reports / certificates for each system to the CM on work completion.

ELE33.1 SCOPE OF WORKS AND GENERAL REQUIREMENTS

ELE33.1.010.9 GENERAL

1. The works under this part of the Sub-contract shall include the whole of the materials and the labour as prescribed or as necessary for the design, supply and installation of the entire grid-connected photovoltaic system (hereinafter refer to as PV System) and training of personnel nominated by the Contract Manager. The photovoltaic (PV) modules shall be installed at the location(s) as shown on the Drawings or described hereafter;
2. The PV System shall include not only the plant and equipment shown on the Drawings or specified, but also include all the incidental sundry components, software and licences necessary for the complete execution of the works and for the proper operation and maintenance of the PV System;
3. The Sub-contractor shall employ a specialist contractor with proven experience in the design, installation and maintenance of PV system of a scale similar to that required by this Specification to carry out the works. Local qualified technical service team shall be available for maintenance and backup service after completion of works;
4. Manufacturers of major components of the PV System including PV modules and inverters shall be implementing quality and environmental management systems in accordance with ISO 9001 and ISO 14001 or other internationally recognized standards in the design, procurement and manufacturing processes.

ELE33.1.020.9 SCOPE OF WORK

The scope of works shall include:

1. Design, supply and installation of the PV System complete with PV modules as described in sub-clause (2) below, solar conversion systems, monitoring & management systems, interconnection & power distribution wirings and all other necessary equipment and accessories;
2. Provision of a total capacity of _____kWp (rated at Standard Testing Conditions according to IEC 60904) mono-crystalline silicon PV modules at the following location(s) (i.e. PV sub-system(s)) with respective capacities (kWp) as shown inside brackets:
   a. Upper roof of Block __ (____kWp);
   b. ……;
   c. ……;
   d. ……;
   e. ……

   The Sub-contractor should seek the CM's approval to install an alternative type of PV modules, other than mono-crystalline silicon PV modules, which shall comply with the specified capacity (kWp) mentioned above and ELE33.2;

3. Submission of schematic wiring diagrams of the PV System and all necessary equipment, which have been accepted by Power Company, for the CM's approval. Shop drawings indicatingsizes of PV modules, their mounting details, orientation, spacing and a calculation to demonstrate the monthly and annual power output profiles of the system shall be provided for the CM's approval before fabrication and installation;
4. Providing all necessary design drawings and technical data of the offered equipment including the synchronisation and de-coupling procedure of the PV System prior to installation;
5. Liaison with the power supply company for assessment and approval of the PV System design and equipment, and grid connection of the PV System. The Sub-contractor shall allow sufficient time in his programme for all necessary submissions and testing, and make modifications to the PV System as required by the power supply company before connection to the grid;
6. Payment of charges levied by the power supply company for the assessment of the PV System and connection to the grid for joining Feed-in Tariff (FiT) Scheme;
7. Testing, commissioning and putting the PV System into operation, and facilitating to join FiT Scheme to the satisfaction of the CM;
8. Except general cleansing of photovoltaic modules, the Sub-contractor shall provide servicing and maintenance of all equipment of the PV System including regular calibration of sensors and measurement equipment as recommended by the manufacturers during the Maintenance Period. Temporary replacement shall be provided for sensors / equipment removed for off-site calibration;
9. Provision of half-yearly maintenance servicing as required in ELE33.6. 050;
10. Provision of training to the CM's Representatives, estate management staff or other personnel as instructed by the CM for a total duration of six working days, on the testing & commissioning, operation and maintenance of the PV System. The training shall be conducted in three sessions, one before and one after commissioning of the PV System, and the remaining session shall be at the end of the Maintenance Period. Each training session shall be approved by the CM to cover any or all of the following topics:
    a. Testing & commissioning procedures;
    b. Operation and maintenance of the complete system including PV modules, Solar-energy Conversion System (SCS), etc.;
    c. Use of all software programmes of the monitoring & management system(s) and SCS for daily operation and monitoring of the PV System and the analysis of data collected.

ELE33.1.030.A STANDARDS

The International System of Units (SI) shall be used. The PV System shall be designed and installed in compliance with the Specification and the latest editions of the following standards and codes, including all latest amendments:

1. General Requirement for Electronic Contracts Specification No. ESG01 issued by the Electronics Division, Electrical and Mechanical Services Department;
2. Technical Guidelines on Grid Connection of Renewable Energy Power Systems issued by the Electrical and Mechanical Services Department;
3. BS EN 50618: Electric cables for photovoltaic systems;
4. BS EN 61140: Protection against electric shock. Common aspects for installation and equipment;

5. EN-ISO 4892: Plastics — Methods of exposure to laboratory light sources;
6. IEC 60364-7-712: Low Voltage Electrical Installations - Part 7-712: Requirements for Special Installations or Locations – Solar Photovoltaic (PV) Power Supply Systems;
7. IEC 60754: Test on gases evolved during combustion of materials from cables;
8. IEC 60891: Photovoltaic devices - Procedures for temperature and irradiance corrections to measured I-V characteristics;
9. IEC 60904-1: Photovoltaic devices Part 1: Measurement of photovoltaic current-voltage characteristics;
10. IEC 60904-2: Photovoltaic devices Part 2: Requirements for photovoltaic reference devices;
11. IEC 60904-3: Photovoltaic devices Part 3: Measurement principles for terrestrial photovoltaic (PV) solar devices with reference spectral irradiance data;
12. IEC 60904-4: Photovoltaic devices Part 4: Photovoltaic reference devices – Procedures for establishing calibration traceability;
13. IEC 60904-5: Photovoltaic devices – Part 5: Determination of the equivalent cell temperature (ECT) of photovoltaic (PV) devices by the open-circuit voltage method;
14. IEC 60904-7: Photovoltaic devices – Part 7: Computation of the spectral mismatch correction for measurement of photovoltaic devices;
15. IEC 60904-8: Photovoltaic devices – Part 8: Measurement of spectral responsivity of a photovoltaic (PV) device;
16. IEC 60904-8-1: Photovoltaic devices – Part 8: Measurement of spectral responsivity of multi-junction photovoltaic (PV) devices;17. IEC 60904-9: Photovoltaic devices – Part 9: Classification of solar simulator characteristics;
18. IEC 60904-10: Photovoltaic devices – Part 10: Methods of linear dependence and linearity measurement;
19. IEC 61034: Measurement of smoke density of cables burning under defined conditions;
20. IEC 61215-1: Terrestrial photovoltaic (PV) modules – Design qualification and type approval – Part 1: test requirements;
21. IEC 61215-1-2: Terrestrial photovoltaic (PV) modules – Design qualification and type approval – Part 1-2: special requirements for testing of thin-film cadmium telluride (CdTe) based photovoltaic (PV) modules;
22. IEC 61215-1-3: Terrestrial photovoltaic (PV) modules – Design qualification and type approval – Part 1-3: special requirements for testing of thin-film amorphous silicon based photovoltaic (PV) modules;
23. IEC 61215-1-4: Terrestrial photovoltaic (PV) modules – Design qualification and type approval – Part 1-4: special requirements for testing of thin-film Cu(In, Ga)(S, Se)2 based photovoltaic (PV) modules;
24. IEC 61215-2: Terrestrial photovoltaic (PV) modules – Design qualification and type approval – Part 2: test procedures;
25. IEC 61558: Safety of transformers, reactors, power supply units and combinations;
26. IEC 61683: Photovoltaic systems – Power conditioners – Procedure for measuring efficiency;
27. IEC 61701: Photovoltaic (PV) modules - Salt mist corrosion testing;
28. IEC 61724-1: Photovoltaic system performance – Part 1: Monitoring;

29. IEC 61727: Photovoltaic (PV) systems – Characteristics of the utility interface;
30. IEC 61730-1: Photovoltaic (PV) module safety qualification Part 1: Requirements for construction;
31. IEC 61730-2: Photovoltaic (PV) module safety qualification Part 2: Requirements for testing;
32. IEC 61829: Photovoltaic (PV) array – On-site measurement of current - voltage characteristics;
33. IEC TS 61836: Solar photovoltaic energy systems – Terms, definitions and symbols;
34. IEC 62109-1: Safety of power converters for use in photovoltaic power systems – Part 1: General requirements;
35. IEC 62109-2: Safety of power converters for use in photovoltaic power systems - Part 2: Particular requirements for inverters;
36. IEC 62116: Utility-interconnected photovoltaic inverters - Test procedure of islanding prevention measures;
37. IEEE 519: Standard for harmonic control in electrical power systems;
38. IEEE 1547 & P1547: Standard for interconnection and interoperability of distributed energy resources with associated electric power system interfaces;
39. ISO 9050: Glass in building — Determination of light transmittance, solar direct transmittance, total solar energy transmittance, ultraviolet transmittance and related glazing factors;
40. UL 1703: Standard for Flat-plate photovoltaic modules and panels;
41. UL 1741: Standard for Safety inverters, converters, controllers and interconnection system equipment for use with distributed energy resources;
42. VDEW Guideline for operating in-plant generating units in parallel with the power company's low voltage main.

ELE33.1.040.9 SUBMISSION FOR TENDER ASSESSMENT

The following information shall be submitted in the "Information to be Supplied by Tenderer" for tender assessment purpose:

1. Technical information of the proposed equipment for the PV System;
2. Schematic diagrams of the PV system;
3. A schedule of spare parts and tools required for servicing the installation after the expiry of the 2-year Maintenance Period;
4. The proposed specialist contractor for the design, supply, installation and maintenance of the PV System including his job references with details of system rating, installation completion dates, etc.

ELE33.1.050.9 INFORMATION TO BE SUBMITTED BEFORE INSTALLATION AND UPON COMPLETION

1. The Sub-contractor shall submit the following information for the Contract Manager's approval prior to the commencement of installation work on site:
    a. 3 copies of complete set of detailed shop drawings and calculation including the sizes and types of the proposed PV modules, mounting details, connection diagram, heat dissipation of equipment and simulated monthly and annual power output profiles of the PV System taking into account any shadowing effect due to nearby modules/structures/buildings;

b. 3 copies of shop drawings and specifications of the equipment/materials.

c. 3 sets of method statement of installation;

d. 3 copies of Manufacturer's Certificates of Origin, sensor / measurement equipment calibration certificates, test reports, reports for wind load withstanding capabilities of the PV modules and other relevant documents showing compliance with the Specification;

e. 3 sets of draft certificates of product warranty specified in ELE33.2.030 & ELE33.3.030;

f. 1 set of approved materials and accessories samples to be kept in the site office.

2. The Sub-contractor shall submit the PV System design and equipment for approval by the power supply company and shall program the submissions in such way as to allow sufficient time for both the power supply company and the Contract Manager to check and approve the design and equipment before installation;

3. The Sub-contractor shall submit upon completion of installation work on site:

a. 2 sets of all equipment/system software in CD-ROMs or DVDs and relevant software licences;

b. 3 sets of approved operation and maintenance manual including servicing and maintenance requirements recommended by equipment manufacturers, test reports with all equipment settings, name(s) of staff responsible for 24 hour on call service, schedule of spare parts and tools with indicative unit prices, etc. in both hard copy and electronic "pdf" format;

c. 3 sets of training manual in both hard copy and electronic "pdf" format.

ELE33.1.060.9 ARCHITECTURAL REQUIREMENTS

The design of the PV System shall take into consideration the various architectural characteristics including but not limited to the following:

1. The PV System shall be designed to fit into the designated areas with due regard for the visual appeal and green image;

2. The shapes, sizes, surface finishes and colours of the PV System elements, which constitute the main aesthetic characteristics of the PV System, shall be proposed by the Sub-contractor for approval by the Contract Manager.

ELE33.1.070.9 STRUCTURAL REQUIREMENTS

1. The supports and holding frames for the PV modules shall be of hot-dip galvanized steel and fixed by stainless steel bolts and nuts with spring washers supplied and installed by the Sub-contractor who shall also be responsible for the corresponding calculations to demonstrate the structural adequacy. The structural calculations shall be endorsed by a Registered Structural Engineer employed by the Sub-contractor and be submitted for approval by the Contract Manager prior to installation of the PV System supports / holding frames;

2. The supports / holding frames shall be designed and installed in such a way that any of the PV modules can be replaced without the need of dismantling any structural member or adjacent module;

3. Flat concrete plinths shall be provided by the Main Contractor above structural beams/columns for fixing of the PV module supports / holding frames by the Sub-contractor. The Sub-contractor shall be responsible for providing relevant information to the Contract Manager for the design of the concrete plinths.

ELE33.2 PHOTOVOLTAIC MODULES AND DC SOURCE CIRCUITS

ELE33.2.010.9 GENERAL REQUIREMENTS

1. The design and choice of photovoltaic (PV) modules and their mounting angle and/or direction shall be made in such way as to maximize the possible solar energy gain at their respective fixing locations;
2. The Sub-contractor shall design, supply and install PV modules, array combiners, circuit breakers, fuses, connectors, power cables, conduits, and other necessary equipment and accessories for integration with the solar conversion system(s) and monitoring & management system(s) to complete the PV System;
3. The Sub-contractor shall review the Drawings and conduct site visit to evaluate any possible shadowing effect due to nearby modules/structures/buildings, and to design the PV arrays and circuits in such way as to avoid/minimize interruption of power output from the PV strings due to shading between 9:00 a.m. and 3:00 p.m;
4. The PV arrays shall also be designed to avoid/minimize possible glare to occupants of nearby buildings;
5. The Sub-contractor shall submit for Approval his proposed lightning protection system to protect personnel and the PV System from lightning stroke and transient over-voltage;
6. Mounting holes on the PV modules shall be fully utilized for fixing the PV modules onto the supports and holding frames as recommended by the manufacturer using stainless steel bolts and nuts with spring washers. All mounting holes on the PV modules shall be of factory-made. Nevertheless, each PV module shall be fixed to the supports and holding frames by at least eight points. Should there be less than eight factory-made mounting holes on the PV module, additional panel fixing clamps shall be provided to ensure not less than eight points for fixing each PV module. The adoption of these fixing clamps should be endorsed by the manufacturer. The fixing method shall facilitate subsequent removal and reinstallation whenever necessary;
7. The Sub-contractor shall submit loading calculation (including wind load) endorsed by a Registered Structural Engineer to substantiate that the proposed PV module assembly (including the supports and holding frames, bolts and nuts with spring washers and fixing clamps for fixing PV module onto the supports and holding frames at the mounting points) can withstand any adverse weather conditions likely occurring in Hong Kong for CM's approval as required in ELE33.1.070 & ELE33.2.020;
8. Manufacturer(s) of the offered PV modules shall have proven experience in the production of the respective products and have an annual production capacity of 25MW or above. Manufacturer(s) shall also be member(s) of the PV Cycle Association.

ELE33.2.020.A TECHNICAL REQUIREMENTS

1. Mono-crystalline silicon PV modules complying with the following requirements shall be provided:
    a. PV module shall consist of tempered / heat-strengthened glass panel with solar factor greater than 0.91, solar cells and back supporting sheet with proper binding agent;

b. The front glass panel of PV module shall be appropriately treated to ensure solar light reflection of not more than 4% as determined by ISO 9050. For locations where specified in the Drawings and / or where the PV modules will produce glare to nearby building occupants upon completion of works, the front glass panels shall be of textured surface;

c. PV cells shall be of dark colour with optimised surface treatment;

d. PV module shall be sealed to protect against ingress of moisture and to ensure UV stability and electrical isolation;

e. The solar conversion efficiency of PV module shall be not less than 20% at Standard Testing Conditions in accordance with IEC 61215 and with a power tolerance not exceeding ± 3%;

f. The temperature coefficient for the power output of PV module shall not exceed -0.40% per ℃.;

g. The guaranteed performance of PV module shall be not less than:

i. linear degradation to 80% of the rated power output for 25 years.

h. PV modules assembly (including the supports and holding frames, bolts and nuts with spring washers and fixing clamps for fixing PV modules onto the supports and holding frames at the mounting points) shall be capable of withstanding the wind load at the location of installation, estimated according to the latest edition of the Code of Practice on Wind Effects in Hong Kong published by the Buildings Department;

i. Testing for wind load withstanding capability of PV modules such as wind tunnel test etc., if required by the Buildings Department / ICU, shall be in accordance with relevant national / international standards;

j. Wiring connection for PV modules shall be located at the back of each module using manufacturer's factory assembled cable connector.

2. Exposed wiring cables shall be of low smoke zero halogen and UV resistant type complying with IEC 61034, IEC 60754 and EN-ISO 4892 or other relevant national / international standards, suitable for an operation temperature of up to 90℃ and complete with weatherproof type prefabricated plug and socket cable connectors. Wiring cables in conduit or the like shall also be suitable for operation up to 90℃;

3. All array combiners / junction boxes to be installed in external areas shall be of weatherproof type to IP55 minimum and shall complete with surge arresters. Detailed arrangement and sample of the junction boxes shall be submitted to the CM for approval;

4. Sizing of DC source circuit conductors and over-current protection devices shall take into account appropriate de-rating factors (e.g. peak module operating temperatures, grouping of conductors in conduit, etc.). Over-current device shall have trip rating not greater than the de-rated ampacity of the conductor that it protects;

5. The overall loss in the PV array DC source circuits due to losses across conductors, all fuses / circuit breakers, blocking diodes, termination points and other factors such as normal dust accumulation on PV modules shall be limited to not more than 10%.

ELE33.2.030.A WARRANTY

1. The Sub-contractor shall provide the following within 4 weeks from the date of completion of the Works:

a. A certificate of product warranty from each of the manufacturers of the Approved PV modules in favour of the Employer to warrant that their said respective products shall be free from any defect, failure, imperfection or fault and be capable of carrying out its functions for the respective periods of warranty as specified below:

Warranty aspects	Period of warranty
i. Free from any defect, failure, imperfection or fault	Ten years
ii. Capable of carrying out the power output and performance in accordance with ELE33.2.020 sub-clause 1(g)	Twenty-five years

2. Each of the periods of warranty stated above shall commence from the date of completion of the Works as certified by the CM in the certificate of completion but in the event of there being more than one certificate of completion, then from the date of completion of the Section of the Works in which the respective PV modules are situated as certified by the CM in the certificates of completion issued pursuant to Clause 53 of the General Conditions of the Main Contract. The Sub-contractor shall submit the content and format of the manufacturers' certificate(s) of product warranty for Approval as required in ELE33.1.050.

ELE33.3 SOLAR CONVERSION SYSTEMS

ELE33.3.010.9 GENERAL REQUIREMENTS

1. Solar-energy Conversion Systems (SCS) comprising grid connection type PV inverters, isolation transformer, AC and DC circuit breakers, sensor, wiring and other required equipment shall be provided for the PV System as shown on the Drawings. The installation shall comply with the prevailing requirements of the power supply companies. Separate SCS shall be installed to serve the PV sub-systems on the roofs of individual blocks and to provide a balanced 3-phase AC supply;
2. The SCS and other required equipment shall be located in the PV control rooms of individual blocks as shown on the Drawings. The Sub-contractor shall coordinate with other parties concerned and provide all necessary equipment, materials, protection / monitoring devices, control and wiring, etc. for integration of the PV System with the building power distribution system;
3. Where equipment are exposed to weather and subject to vandalism, proper enclosure complete with venting and weather sealing shall be provided to protect the equipment;
4. The Sub-contractor shall also supply and install equipment, such as energy meters and harmonic meters, etc. as required by the power supply company, to measure / monitor the generated solar power.

ELE33.3.020.A TECHNICAL REQUIREMENTS

1. Grid connection type SCS inverter shall comply with UL1741 or IEC62109, IEC61727 and IEC62116 or other equivalent international standards on grid connection requirements, and be capable of continuous operation over the range of voltage, current, and power output of the PV array connected;
2. SCS inverter shall have a "Mean Time Between Failure Index" of minimum 10 years and have separate provisions for power on / off, system reset and for communication with other equipment and monitoring system. The SCS inverter shall have a power management system to automatically control the power supply to the connected load;
3. SCS inverter shall possess the following:
    a. True sinusoidal output voltage of low harmonic distortion;
    b. Maximum Power Point Tracking (MPPT) function which shall be accurate and stable, and the adaptation efficiency shall be higher than 99%;
    c. Anti-islanding function;
    d. Capability of automatic adaptation to the solar power generation of PV modules so that no range selection by the installer shall be required.
4. The following protection shall be incorporated in SCS inverter:
    a. Continuous self-diagnosis by internal microprocessor;
    b. Monitoring of the grid and the PV string voltages;
    c. Monitoring of temperature of power switches and the output isolation transformer;
    d. Prevention of injection of direct current into the grid;

e. Supervision of all power stage transistors which shall be automatically switched off within a few milliseconds under fault condition. Fast response over-current detection for all transistors shall be used to guarantee maximum reliability in operation.

5. SCS inverter shall be self-commutated utilizing power electronics in a circuit topology suitable for meeting the specification with 3-phase or single-phase AC output. If three identical single-phase SCS inverters are offered for each PV sub-system, the design shall be such that supply currents are balanced over the three phases. The rating of each offered SCS inverter shall be capable of handling the available DC power input and other design requirements;

6. Characteristics of SCS inverter:

   a. Controller Type: Step-down converter;

   b. Bi-directional Sine-wave Inverter: IGBT-based pure-sinewave BI-modal inverter;

   c. Nominal output voltage: 380V 3-phase or 220V 1-phase; ± 6%;

   d. Utility service: Grounded wye;

   e. Output frequency: 50Hz (49.5 – 51Hz);

   f. Inverter efficiency: Minimum 97% EURO efficiency;

   g. Power factor shall be unity (1) at rated output;

   h. The total harmonic distortion (THD) of the normalized output current shall not exceed 5% at the point of the output of the PV system;

   i. Losses in the READY or STANDBY modes shall not be more than 10% of the total useful power output;

   j. Voltage fluctuation at the supply point due to the variation of PV system input shall not exceed 1%;

   k. Voltage fluctuation at the connection point of the Grid during synchronization operation shall be limited to below 3%;

   l. The negative phase sequence voltage at the supply point shall not exceed 1.3% of the positive sequence voltage in a 3-phase supply system;

   m. Voltage ride through capability to IEEE1547;

   n. Voltage-Reactive power and Voltage-Active power control mode to IEEE1547.

7. SCS inverter shall include the following modes of operation:

   a. On;

   b. Off;

   c. Standby.

8. SCS inverter shall automatically go to the standby mode if a fault occurs. If the fault is cleared, the SCS inverter shall automatically restart after a programmed time delay. The hardware protection shall include the following:

   a. AC surge protection;

   b. DC surge protection;

   c. Over-current protection and PV string isolation;

   d. Over-voltage and under-voltage protection.

9. The instrumentation and control of SCS inverter shall include the following:

   a. MPPT;

b. Automatic start-up when there is sufficient solar power;

c. Automatic turn-off when there is insufficient solar power.

10. SCS inverter shall possess connectivity in Modbus Protocol and provide the following signals for monitoring:

    a. Inverter On / Off / Standby;

    b. Power supply Normal / Fault;

    c. DC input current, voltage and instantaneous power;

    d. Instantaneous AC output current and voltage per phase, supply frequency, instantaneous output power and harmonics;

    e. MPPT status.

11. If any of the signals stipulated in sub-clauses (10.c) and (10.d) above is / are not available, separate meter(s) shall be provided to fulfil such requirements;

12. Anti-islanding protection shall be provided to ensure there is no supply of solar power to the building electrical distribution system in case of abnormality. The SCS shall be automatically disconnected from the electrical distribution system of the building concerned in the event that the utility supply voltage and / or frequency deviate outside the allowable limits persistently for a pre-determined period as agreed by both the CM and the power supply company, or when there is a fault or malfunction of the SCS. The SCS shall be completely isolated within 0.2 second or such period as required by the power supply company upon occurrence of the said abnormality / fault;

13. Overall circuit loss of the SCS other than those through the SCS inverters shall be not more than 2%;

14. Isolation Transformer

    Isolation transformers in compliance with IEC 61558 or equivalent shall be provided to avoid direct current flowing into the grid;

15. Sensors

    Sensors for global irradiation and PV module operating temperature shall be provided for PV System diagnostic. The sensors shall be connected to a sensor gateway (virtually a Pulse to Modbus Converter) which can transform pulses to signals in Modbus protocol for connecting to the data gathering unit;

16. PV string cables, PV array cables and PV DC main cables shall be reinforced or double-insulated cables to BS EN 50618 or equivalent. DC connectors to IEC 61140 Class II or equivalent shall be used to protect against electric shock.

ELE33.3.030.X DELETED

ELE33.4 MONITORING & MANAGEMENT SYSTEMS

ELE33.4.010.9 GENERAL

1. The data of energy generation from the grid-connected PV sub-system on each block shall be monitored and recorded. A monitoring system consists of multi-function electronic meter as specified in ELE4.4.5.040, sensor gateway, SCS inverter, data gathering unit (DGU), communication network and necessary accessories shall be provided for the PV sub-system of each individual block;
2. The data collected by DGU on each block shall be transmitted to the central monitoring & management workstation of the Smart Meter Monitoring and Energy Information Display System in the Estate Management Office (EMO) as specified in ELE35.2. The operation data of each PV sub-system shall be collected for analysis and the energy information shall be displayed on the LED TV display panel at the main entrance lobby of each domestic block as specified in ELE35.3;
3. The Sub-contractor shall provide all necessary equipment, wiring and accessories to complete and interconnect the SCS inverter, sensor gateway and multi-function electronic meter at each PV sub-system to the DGU via RS485 in Modbus protocol for data collection;
4. Provisions shall be allowed to prevent interruption of signal/data transmission of the monitoring & management systems through underground cables under adverse weather conditions.

ELE33.4.020.9 INDIVIDUAL MONITORING SYSTEM

1. Measurement equipment with good accuracy and reliability shall be provided and appropriately sited to collect the following data for performance monitoring:
   a. Global irradiation at inclined angle of PV modules;
   b. PV module operating temperature.
2. Multi-function electronic meters shall be provided for each PV sub-system to record its cumulative power output at the point of grid connection to transmit to the DGU;
3. Operation data including alarm/fault statuses of the SCS inverters of each PV sub-system shall be transmitted to the DGU which shall be capable of capturing all the data required at a sampling frequency of 15 minutes;
4. Data collected by the DGU shall be transmitted to the central monitoring and management workstation via network. Each data shall be time stamped and processed by the System software in the central monitoring and management workstation as specified in ELE35.2.010;
5. The information of the individual PV sub-system shall be displayed in both Chinese and English in the LED TV display panel as specified in ELE35.3.030;
6. All equipment exposed to weather shall be of weatherproof type to IP55 minimum.

ELE33.4.030.9 CENTRAL MONITORING & MANAGEMENT SYSTEM

1. The operation data and signals of the individual PV sub-system shall be transmitted to the central management and monitoring workstation as specified in ELE35.2.010;

2. The operation data and signals shall be collected from each PV sub-system for storage and analysing by the System software in the central monitoring & management workstation. The System software as specified in ELE35.2.030 shall also be capable of producing reports for:

    a. Operation conditions and alarms of each PV sub-system and respective trend histories including:

        i. On/Off/Standby status;

        ii. Power supply Normal/Fault condition;

        iii. DC input current, voltage and instantaneous/cumulative power;

        iv. Instantaneous AC output current and voltage per phase, supply frequency, instantaneous/cumulative output power and harmonics;

        v. Total output power each day;

        vi. Maximum output power each day;

        vii. Minimum output power each day;

        viii. Total running time;

        ix. Sun Hour of each day;

        x. Cumulative Sun Hour;

        xi. Maximum Power Point Tracking (MPPT) status.

    b. Performance indicators of each PV sub-system and respective trend histories including:

        i. Daily, weekly, monthly and yearly yield;

        ii. Daily, weekly, monthly and yearly performance ratio;

        iii. Cumulative output power, corresponding electricity cost saving.

    c. Sensor data collected by each PV sub-system and respective trend histories including:

        i. Global irradiation at horizontal level;

        ii. PV module operating temperature.

ELE33.5 TESTING AND COMMISSIONING

ELE33.5.010.9 TESTING AND COMMISSIONING

1. The Sub-contractor shall carry out all necessary testing and commissioning work upon completion of the installation of the PV System;
2. Verification tests shall be performed in the presence of the CM or his representatives and if necessary, with the power supply company's representatives on all metering, protection, communication and control equipment/system. The harmonic voltage, current distortion and voltage fluctuation as a result of the connection and isolation of the PV System shall be measured. Testing of protection and synchronising systems shall include individual device settings and function. A copy of the test results and all protection settings shall be submitted to the CM for further transmission to the power supply company for approval;
3. The Sub-contractor shall prepare itemized and detailed testing and commissioning schedules for the CM's approval prior to commencing the tests;
4. The Sub-contractor shall carry out preliminary tests to his own satisfaction before arranging for any formal witness test;
5. Unless otherwise indicated, the Sub-contractor shall be responsible for the cost of necessary instrument, plant and labour for all tests, including those witness tests in the presence of the representatives from the power supply company;
6. The Sub-contractor shall carry out all such tests as required by the CM to demonstrate that each item of equipment meets the requirements of the Specification;
7. Valid calibration certificates of testing instruments shall be produced upon request by the CM. The accuracy of testing instruments shall also be demonstrated if directed by the CM irrespective of whether valid calibration certificate is available;
8. Any defects of workmanship/materials, mal-adjustments or other irregularities which become apparent during tests and may affect the test results shall be rectified by the Sub-contractor and the tests shall be repeated at the Sub-contractor’s expense before acceptance by the CM.

ELE33.6 ANALYSIS SOFTWARE AND REPORT FOR SYSTEM OPERATION AND PERFORMANCE

ELE33.6.010.9 ANALYSIS SOFTWARE FOR SYSTEM OPERATION AND PERFORMANCE

1. The Sub-contractor shall enable the System software as specified in ELE35.2.030 for generating reports on the PV System operation and performance basing on the data downloaded from data gathering unit (DGU). The reports shall cover information required in ELE33.4.030 for a rolling period of 12 months;
2. The System software shall be capable of automatically capturing the data downloaded from the DGU for generating the required reports;
3. Format of report shall be submitted to the CM for approval before completion of the PV System installation.

ELE33.6.020.9 HALF-YEARLY REPORT ON SYSTEM OPERATION AND PERFORMANCE

1. The Sub-contractor shall submit reports generated by the System software as specified in ELE35.2.030 to the CM on half-yearly basis for the 24 months after completion of installation and grid connection of the PV System;
2. Each report shall cover a rolling period of the past 12 months and shall be submitted within one month from the last day of the 6-month period concerned.

ELE33.6.030.9 DOCUMENTATION & NOTICES

1. Labelling of Cables:
   a. Machine-printed, self-laminating vinyl for cabling and patch cords;
   b. Backbone cables shall be labelled at each end. The cable or its label shall be marked with its identifier;
   c. All cables shall be labelled with numbered markers at both ends.
2. Labelling of Faceplates:
   a. An unique identifier shall be marked on each faceplate to identify it as connecting hardware;
   b. Each port on the connecting hardware shall be labelled with its identifier.
3. Notices & Circuit Diagrams:
   a. Appropriate warning notices shall be displayed near DC switchgears and at all electrical equipment with dual power supply according to 17G of the Electrical CoP;
   b. Notice showing the name and registration number of the registered electrical contractor for maintaining each PV sub-system shall be displayed according to 17G of the Electrical CoP;
   c. The PV sub-system circuit diagrams to ELE 1.10.030 shall be displayed near the main switch of the PV sub-system.

ELE33.6.040.9 HAND-OVER DOCUMENTS

The Sub-contractor shall provide all necessary documents and software required for the operation and maintenance of the grid connected PV System and shall include but not be limited to the following:

1. Certification and warranties from manufacturers of all major equipment, devices and materials;
2. As-fitted drawings of PV panel installation and PV equipment room;
3. As-fitted schematic diagram of the PV System and sub-systems;
4. Cabling inventory record and connection details;
5. 3 sets of approved Operation and Maintenance manuals including servicing and maintenance requirements recommended by equipment manufacturers and the PV specialist contractor, full test reports of the PV System and sub-systems and all equipment, system settings, all routine operation procedures, reports and graphics generation procedures, maintenance and inspection schedules, necessary tools, system diagnosis, system reset and restoring operation procedures, etc. in both hard copy and electronic "pdf" format;
6. Company name, responsible persons, email addresses and telephone contacts of the PV specialist contractor;
7. Form WR1 for PV System; and
8. The connection cable and software for data retrieval via multi-function electronic meter as stipulated in ELE4.4.5.040.

ELE33.6.050.9 SCOPE OF WORKS DURING MAINTENANCE PERIOD

The Sub-contractor shall carry out all necessary routine maintenance work of the grid connected PV System and sub-systems in accordance with the requirements as specified in ELE30.2 where applicable and shall include but not be limited to the following:

1. To despatch competent and specially trained workmen to attend any requirement for an emergency inspection and repair;
2. To carry out, at half-yearly intervals, routine servicing and maintenance to maintain the PV System and sub-systems in proper working condition within the Maintenance Period;
3. To provide repairs and replacement parts at no additional cost to the Employer for the correct operation of the PV System;
4. Half-yearly Maintenance Servicing

   At six months intervals, the following works shall be carried out and the Sub-contractor shall log and submit a report to the CM after each half-yearly servicing:

   a. Check proper functioning, cable connections and structural stability of the PV panels and array combiner boxes at each PV sub-system on roofs of domestic blocks;

   b. Check proper functioning and cable connections of the SCS inverters, isolation transformer, sensors and sensor gateway, multi-function electronic meter and AC and DC switchgears for each PV sub-system at PV equipment rooms;

   c. Rectify / replace any defective or mal-functioning parts; and

   d. Print half-yearly report on system operation and performance as specified in ELE33.6.020.

ELE34 GRID-BACKUP SOLAR POWERED LIGHTING

ELE34.1 SCOPE OF INSTALLATION 3
ELE34.1.010.9 SCOPE OF WORK 3
ELE34.2 REQUIREMENTS 4
ELE34.2.010.9 GENERAL REQUIREMENTS 4
ELE34.2.020.9 TECHNICAL REQUIREMENTS 4

ELE34.1 SCOPE OF INSTALLATION

ELE34.1.010.9 SCOPE OF WORK

1. Grid-backup solar powered pole top lighting(s) shall be provided at the location(s) as shown on the Drawings for general lighting purpose;
2. Training shall be provided to the Contract Manager's representatives, estate management staff or other personnel as instructed by the Contract Manager for the proper operation and maintenance of the grid-backup solar powered lighting.

ELE34.2 REQUIREMENTS

ELE34.2.010.9 GENERAL REQUIREMENTS

1. Each pole top lighting shall consist of a hot-dip galvanized lighting pole, lamp source, photovoltaic (PV) module(s), battery set and charger, inverter, changeover contactor and other necessary equipment and accessories to ensure proper functioning of the lighting at the time required under all weather conditions;
2. Electrical power generated by the PV module(s) shall be used for charging the battery set and powering the lamps. If power of the battery set has dropped to a low level, normal supply shall automatically cut in to power the lamps;
3. Lighting pole shall be painted to colour matching with the surrounding and as approved by the Contract Manager;
4. PV module shall be mounted on lighting pole top as far as practicable to receive the most amount of sunlight;
5. Pole top lighting shall be switched on and off through the timer or photocell control of other outdoor lightings in its vicinity;
6. Battery set and charger, inverter, changeover contactor and other necessary equipment shall be housed in a well ventilated stainless steel box of grade 316, integrated with or separated from the lighting pole, with adequate access for maintenance and suitable for outdoor use;
7. The Sub-contractor shall submit all relevant details including proposed lighting pole mounting arrangement for Approval before fabrication and installation of the pole top lighting(s);
8. The Sub-contractor shall submit, upon completion of the installation work, 3 sets of approved operation and maintenance manual including servicing and maintenance requirements recommended by manufacturers and schedule of spare parts and tools with indicative unit prices, etc. in both hard copy and "pdf" format.

ELE34.2.020.9 TECHNICAL REQUIREMENTS

1. Lamp source of each pole top lighting shall be of _____ type rated at ___W and shall comply with relevant requirements in other parts of the Specification;
2. PV module(s) of each pole top lighting shall be of mono-crystalline silicon type with a total capacity of ___Wp minimum. Specifications of the PV module(s) shall comply with the requirements in ELE33.2;
3. Battery set shall be of sealed (valve regulated), maintenance-free, lead acid type to IEC 61427 or other relevant national/international standards and with a capacity, when fully charged, to power continuously the lamp source for 18 hours;
4. Lighting pole shall be of __m high and shall comply with relevant requirements in other parts of the Specification;
5. Anti-glare provision shall be included to prevent possible nuisance to occupants of nearby domestic flats in accordance with relevant requirements of BEAM-Plus.

ELE35.5.030.9 MULTI-FUNCTION ELECTRONIC METER DATA REPORT FOR ENERGY MEASUREMENT FOR COMMUNAL AREA OF DOMESTIC BLOCK 20

ELE35.1 SCOPE OF WORKS AND GENERAL REQUIREMENTS

ELE35.1.010.9 GENERAL

1. The works under this part of the Sub-contract shall include the whole of the materials, the labour and necessary software as prescribed or as necessary for the design, supply, delivery, installation, testing, commissioning and maintenance of the entire Smart Meter Monitoring and Energy Information Display System (hereinafter refer to as the System); putting the whole system into full operation as stipulated on the Drawings and the Specification; and training of personnel nominated by the CM. The System shall be capable of receiving, monitoring and processing the parameters of the power supply systems of domestic blocks and their communal facilities including, but not limited to, power distribution to tenants, lift systems, water supply system, lighting system, grid-connected photovoltaic (PV) system, water and gas consumptions etc.;
2. The Sub-contractor shall design, supply and install the System and the selection of proper, correct and compatible equipment, components and interfacing unit to achieve the performance specified. Any equipment necessary for achieving the performance specified shall be provided by the Sub-contractor. Detailed design layouts and full technical information of the System shall be submitted for approval by the CM;
3. The System shall include not only the plant, equipment and software specified, but also include all the incidental sundry components, conduit / wiring system, data/communication networks and licences necessary for the complete execution of the works and for the proper operation and maintenance of the whole System.

ELE35.1.015.9 SPECIALIST SERVICE PROVIDER

1. The Sub-contractor shall employ a specialist service provider with proven experience in the design and installation of systems of similar functions and scale to that required by this Specification to carry out the works;
2. The specialist service provider shall have a local qualified technical services team for maintenance and backup after completion of works;
3. The specialist service provider shall be a System Integrator certified by the supplier / authorised local dealer of the proposed Data Gathering Unit (DGU) as specified in ELE35.2.020;
4. The Sub-contractor shall submit the specialist service provider's relevant information related to their technical capability, working experience on the System to the CM for approval. Whenever necessary, the Sub-contractor shall also submit documents and drawings of the specialist service provider’s completed jobs to the CM for consideration. Inspection of their completed jobs and /or visiting of the proposed specialist service provider's office and workshop may be conducted, if deemed necessary;
5. At the time of submission for approval of specialist service provider and in the operation and maintenance manual, the Sub-contractor shall provide company names, responsible persons, email addresses and telephone contacts of at least three (3) System Integrators, certified by the supplier / authorized local dealer of the proposed DGU, who are able to provide system operation and programming of the DGU utilizing the System Software as specified in ELE35.2.030.

ELE35.1.020.9 SCOPE OF WORKS

The scope of works shall include:-

1. Design, supply, and installation of the System complete with the following:
   a. Central monitoring and management workstation, completed with monitor, UPS and printer;
   b. Data Gathering Units (DGU);
   c. LED TV display panels and display interfacing units;
   d. Digital water flow meters;
   e. Communication network and cabling system;
   f. Dedicated broadband line wherever necessary, and;
   g. All necessary softwares including lifetime licenses.
2. The central monitoring and management workstation shall be located at the Estate Management Office (EMO) of the estate or as shown on Drawings, and shall include but not be limited to the following features:
   a. Dynamic graphic monitoring and control of operation parameters;
   b. Dynamic trend history report function;
   c. Utility cost management;
   d. Real time alarm management;
   e. Full password and user name protection;
   f. Set point archiving, retrieval and printing.
3. Design, supply and commission a customized System software and a tailored made signage content management software to perform all the required functions as described in the Specification;
4. Submission of schematic wiring diagrams of the System and all equipment for the CM's approval. Shop drawings indicating the design of the display arrangement of display panel shall be provided for the CM's approval before placing order and installation;
5. Testing, commissioning and putting into operation of the System to the satisfaction of the CM;
6. Provision of quarterly servicing including submission of data reports on the System operation and performance in the 24 months Maintenance Period;
7. Provision of training to the CM's Representatives, estate management staff and other personnel as instructed by the CM;
8. The System in this Sub-contract shall be independent of other smart meter monitoring and information display system(s) as installed or to be installed in other phases of the Estate, if so existed. The System will not provide connection or integration to other system(s) in other phase(s) of the Estate.

ELE35.1.030.9 FUNCTIONAL REQUIREMENTS

1. The System shall be designed to perform the following functions in outline terms:-
   a. To collect, store, monitor and analyse the electrical parameters of communal area and domestic flats of each domestic block as illustrated in ELE35.5.010, with a minimum of once every 15 minutes, for data processing and display purpose. These electrical parameters includes:
      i. Currents (three phases and neutral);
      ii. Total energy consumption (kWh);
      iii. Total energy generation (kWh);
      iv. Voltages (all phase-to-phase and phase-to-neutral);
      v. Maximum demand (kVA);
      vi. Total power factor;

vii. Total harmonic distortion of current (capable of measuring 31st and lower harmonic order) (%), etc..

b. To collect, store and monitor fresh water consumption data of each domestic block for data processing and display purposes;

c. To allow manual input of gas consumption data of tenants for analysis and display purposes;

d. To collect, store, monitor and analyse the electrical parameters of the power generated and the operational data and signals from the grid-connected PV sub-systems at the PV equipment rooms in each domestic block where provided as specified in ELE33.1, for data processing and display purposes;

e. To select and integrate the information/data as specified in ELE35.3 and transmit the video/media signals via communication network to the LED TV display panel located at main entrance floor lobby of each domestic block;

f. To generate audio and visual alarms automatically in the event of major alarms, system faults and errors, communication line fault and failure of DGU etc. at the central monitoring and management workstation inside EMO of the estate;

g. To consolidate energy consumption data of tenant supply, water supply, public lighting, lifts, and low energy use systems as shown in ELE35.5.020 and ELE35.5.030;

h. To analyse the collected data and present the data in table, spread sheet and graph formats for energy monitoring and energy audit exercise in compliance with BEAM Plus, Building Energy Efficiency Ordinance (BEEO), Energy Measurement of ISO50001 and others as required by the CM.

2. The Sub-contractor shall liaise with the Main Contractor and Fire Services and Water Pump (FSWP) Installation Sub-contractor on the installation of digital water flow meter at the fresh water pump room.

ELE35.2 SMART METER MONITORING AND MANAGEMENT SYSTEM

ELE35.2.010.9 CENTRAL MONITORING AND MANAGEMENT WORKSTATION

1. The central monitoring and management workstation shall include server hardware equipped with full network connectivity and installed with softwares for database server, report generating, signage content management and firewall protection, etc., necessary for the proper operation of the System. An uninterruptible power supply, as specified in ELE24.3.9.050, capable of backing up the central monitoring and management workstation for a minimum of one hour operation upon failure of normal power supply shall be included;
2. The central monitoring and management workstation shall be capable of keeping the System operation and daily logged data from all blocks for a minimum of three years in Microsoft Excel format or equivalent for subsequent processing and analysis. 100% data backup capacity shall be provided by dual harddisks. The capacity of each hard disk shall be able to store all softwares and the three years data with at least 25% spare capacity or 2TB total capacity whichever is larger. The system shall automatically store the logged and processed data in the harddisk and the backup to prevent accidental loss of data;
3. The central monitoring and management workstation shall generate audio and visual alarms in the event of system faults and errors, communication line fault, and failure of DGUs, digital water flow meter and multi-function electronic meters, as specified in ELE4.4.5.040, etc.;
4. The central monitoring and management workstation shall allow inputting and retrieving of various data for record, monitoring, processing, reporting, display, change of system settings, system diagnosis and all other necessary operations by system operators;
5. The central monitoring and management workstation shall possess with the following minimum hardware requirements whichever is higher:

Processor:	Four Core Chip minimum
CPU Speed:	3.4 GHz or above
Memory:	16GB RAM or above
Storage harddisk:	Dual harddisks each with a 125% capacity for the required operation, or not less than 2TB each whichever is higher
Monitor:	Minimum 22” 1920 x 1080 full High Definition LED display
Communications:	Ethernet 10/100BaseT connection or equivalent
Drive:	DVD ± RW / Multi-media player
Accessory:	Internal card reader with USB port
Operating System and Software	MS Windows Servers and MS Office (Traditional Chinese) of latest versions

6. A laser colour printer shall be provided which can be shared with the printer requirement of other electrical system such as the central alarm and door monitoring system as specified in ELE24.3.5.020, provided that the workstations of both systems are located closely;

7. A read and write DVD / Multi-media player used for playing media information such as green estate/environmental education programs in the form of video, powerpoint slideshow and computer animation shall be provided;
8. The System software and signage content management software installed in the workstation shall be compatible for use with the latest version of MS Windows Servers and be able to generate reports in MS Excel format basing on the data automatically downloaded from the DGUs;
9. All recorded data shall write to both hard disks for back up;
10. The central monitoring and management workstation shall connect to the DGUs and LED TV display panels at all domestic blocks in this Sub-contract via the communication network as specified in ELE35.2.040.

ELE35.2.020.9 DATA GATHERING UNIT

1. Data gathering unit (DGU) shall have its own microprocessor, memory and communication units. It shall be able to collect all data from digital water flow meters, multi-function electronic meters and PV system via RS 485 communication port in Modbus protocol, and then upload them to the central monitoring and management workstation via Local Area Network (LAN). Upon failure of the communication with the central monitoring and management workstation, it shall function autonomously and provide at least 7 days' data storage at the first-in first-out basis for all monitoring electrical parameters. All setup parameters and accumulated energy data such as total energy consumption (kWh), maximum demand (kVA), total power factor, usage time quantities shall be stored in non-volatile memory and retained in the event of a control power interruption;
2. All DGUs shall be linked together through a LAN bus. The LAN shall be Ethernet IEEE 802.3u 100BASE-TX, 100BASE-FX or equivalent latest version with data switch located inside EMO of the estate. The LAN bus shall allow equal transfer of data between each DGU on the bus. All DGUs shall be operated in parallel and have equal access to all data in the System;
3. Each DGU shall have a built-in display or tools to allow for direct-access to the DGU for local adjustment of all set points and display of all input and output values and status;
4. To ensure reliable communication between the central monitoring and management workstation and DGUs, a ring circuit wiring arrangement shall be adopted for the LAN;
5. DGUs shall be provided in each block for collecting data from multi-function electronic meters and digital water flow meter and located in the main switch room of each block;
6. DGUs for the System and for the grid connected PV system where provided as specified in ELE33.1, shall be of the same manufacturer;
7. All operation data of the grid connected PV system where provided as specified in ELE33.1, shall be collected, stored, monitored, and analysed by the central monitoring and management workstation. The analysed information of the PV system as described in ELE33.4 shall be displayed at the LED TV display panels at each block and monitored at the central monitoring and management workstation;
8. The supplier / local authorized agent of the DGU shall provide at least three (3) certified local System Integrators who are authorised to compose programming of the DGU and its associated System software as specified in ELE35.2.030.

ELE35.2.030.9 SYSTEM SOFTWARE

1. This section details the performance criteria for the System software and serves as a guideline for the System capabilities to be implemented. The customized System software for the entire System in the form of prototype specifically designed and prepared for the development shall be completed with demonstration to the satisfaction of the CM upon 6 months after the award of the Sub-contract. The Sub-contractor shall provide the System software to support all command functions and application programmes and shall satisfy the requirements as stipulated in the Drawings and Specification;
2. The System software, which shall be user friendly multi-tasking/multi-user allowing multi-terminal operation and concurrent execution of multiple real time programs, shall be an energy information system offering monitor capabilities, comprehensive power quality and reliable analysis for energy consumption. It shall create a database for analysing the electrical data transmitted from the DGUs connected to the network. It shall be flexible, scaleable and compatible with industry-standard Modbus protocol and the data protocols of the meters connected to the DGUs;
3. The System software for retrieving data from DGUs shall be an integrated product of the DGU by the same manufacturer. Lifetime license of the System software shall be available to the Employer;
4. The System software shall exercise all features of central monitoring and management workstation, DGUs, all associated devices/equipment and report all detected failures;
5. The System software shall perform a scanning test for proper operation of all connected DGUs at interval of not more than one hour. Devices not functioning properly or responsively shall be annunciated with alarm signal and noted on the log;
6. There shall be a minimum of three security levels of operator access. Each operator's identifier can be up to twenty (20) characters, and associated with a field programmable password of a minimum of six characters;

   The three levels of access shall be generally according to the following basic principles:

   a. Level 1: Display only;
   b. Level 2: Display plus download of designated data;
   c. Level 3: Display, download of any data, reset and amend passwords, etc. plus full program and data base editing.

   Operator inputs executed under valid system request shall be logged. This record shall contain the operator command and the time and date of input execution.
7. The System software shall include but not be limited to the following features/software capabilities:

   a. Human-machine interface (HMI) graphical display or equivalent in which user can insert any prevalent picture and photo formats, high definition video formats, icons, flash, html, etc. to design the user interface;
   b. Device configuration software to allow operators to add or deduct the quantity of energy meters and digital water flow meters in future;
   c. Data collection from DGU and data conversion to Microsoft Excel format or equivalent for subsequent processing, analysis and report generation;
   d. Trending: Graphical representation of user-selected data values as a function of time (data trending displays). The System software shall allow users to obtain accumulated figures (e.g. kWh etc.), average figures (e.g. kW, current etc.), line charts of the variation of kW, current, voltage, power factor, harmonic contents for any arbitrarily selected period;
   e. The ability to manage event and alarm information using the following features:

i. Display system, energy meter and PV system events stored in the system database;

ii. Display events sorted according to time stamp, source meter, PV system, priority level, cause or effect;

iii. Display events within a range of time stamps, source meters, priority levels, causes or effects.

f. Allowing manual input of user defined data such as tenants' gas consumption data for analysis and display purposes.

8. Dynamic data shall be automatically logged and updated at a pre-programmed interval of minimum 15 minutes;
9. The reports shall provide but not be limited to the following information on regular intervals such as daily, weekly, monthly, half-yearly, yearly and etc. as required:
   a. Monthly and annual electrical energy consumption of all tenants of each domestic block;
   b. Monthly and annual electrical energy consumption of communal area;
   c. Monthly and annual electrical energy generation of the grid-connected PV system of each block;
   d. Monthly and annual water consumption of each block;
   e. Monthly and annual gas consumption of each block.
10. The record format of the collected and processed data should be similar to the sample formats as shown in ELE35.5 and shall be submitted for approval by the CM;
11. All collected and processed data as described in ELE35.5 shall be tabulated, stored and able to be retrieved in excel format for manual processing if required;
12. The System software shall be capable of generating pop-up graphics in the event of major faults and failures as described in ELE35.2.010 sub-clause (3);
13. The System software shall able to be restored to its original conditions and settings by means of a rescue disk or appropriate backup in the event of system software breakdown, such that the whole system could be resumed to normal operation.

ELE35.2.040.9 COMMUNICATION NETWORK AND CABLING SYSTEM

1. A Local Area Network (LAN) providing connectivity between the central monitoring and management workstation, the DGUs and the LED TV display panels shall be set up and conform to the following network standards: Ethernet IEEE 802.3u 100BASE-TX and 100BASE-FX. The network shall comprise all necessary devices and components including Ethernet switches, routers, Cat-5e or Cat. 6 to fibre-optic patch panel, etc. and all interfaces and accessories as necessary which shall be commonly available in the market with good compatibility and connectivity among different brands or manufacturers;
2. For the interface of shielded twisted pair signal cables installation between the DGUs and multi-function electronic meters or digital water flow meters, the Sub-contractor shall provide interfacing termination boxes inside main switch room, PV equipment room and fresh water pump room where multi-function electronic meters and digital water flow meter are installed. Different specialist service providers shall terminate the required signal cables from their respective system to the above interfacing termination boxes;
3. The cabling system shall include fibre-optic cables, Cat-5e or Cat-6 cables, shielded twisted pair cables, cable containments equipment rack and all accessories as necessary for the System;
4. The cabling system shall generally conform to ANSI/EIA/TIA-569B Commercial Building Standard for Telecommunications Pathways and Spaces and ISO/IEC 11801 Information technology - Generic Cabling for Customer Premises;

5. The cables run in underground cable duct environment shall be with armoured protection and be manufactured by ISO Certified Manufacturers;
6. For each LAN connection with a cable length over 90 m, fibre-optic cables shall be employed.

ELE35.2.050.9 DEDICATED BROADBAND LINE

1. For those blocks that cannot be connected to the communication network via cables as described in ELE35.2.040 due to the obstruction by a barrier, such as a public road inaccessible for cabling work, or other site constraint that disallow cabling work, the connection to these blocks shall be provided by dedicated broadband line subscribed from a Broadband Internet Service Provider (BISP);
2. If dedicated broadband lines are provided for the central security system as mentioned in ELE24.3.5, the connection for the Smart Meter Monitoring and Energy Display System shall share the same dedicated broadband lines via routers;
3. Each broadband line shall conform to the following, unless otherwise specified:
   a. Minimum 8 Mbps bandwidth for both uploading and downloading;
   b. Single fixed IP;
   c. IP access right within estate between central monitoring and management workstation and DGUs / LED display panels;
   d. All Transmission Control Protocol (TCP) and User Datagram Protocol (UDP) ports of broadband line shall be opened.
4. The Sub-contractor shall be responsible for the subscription and maintaining of the services at the EMO and the blocks, where the services are needed, for the entire period starting from testing and commissioning phase of the Works till the expiry of Maintenance Period. The details of the broadband connection services and the BISP shall be approved by the CM;
5. For all communication via broadband line, adequate data security shall be provided.

ELE35.2.060.9 DIGITAL WATER FLOW METER

1. Digital water flow meter shall be provided as shown on the Drawings. The installation of the digital water flow meter shall follow the manufacturer's recommendation and requirements such as the upstream and downstream pipe conditions;
2. The digital water flow meter shall be of clamp-on ultrasonic type, and of the cumulative type, i.e. a cumulative volume of water passing through the device in litre or cubic meter, and shall be suitable for both horizontal and vertical installations;
3. The digital water flow meter shall consist of flow transducers and integral signal transmitter cum digital display unit. The flow transducers shall be installed on the water pipework without obstructing the flow. The protection class of the transducers and transmitter shall be at least to IP 65;
4. The digital water flow meter shall have an accuracy to ±1.0% of the actual flow at a flow velocity of 0.5 m/s or above;
5. The digital water flow meter shall have network connectivity in Modbus protocol;
6. The transmitter cum digital display unit shall be enclosed in a lockable metal box.

ELE35.3 ENERGY INFORMATION DISPLAY SYSTEM

ELE35.3.010.9 GENERAL

1. The energy information display shall include a LED TV display panel of minimum 47 inches with integrated stereo speakers, display interfacing unit and all peripheral devices and connections necessary for the proper operation of the display on LED TV display panel at the main entrance lobby of a domestic block;
2. The display panels shall display information, video and/or audio signals originated from the central monitoring & management system in the EMO of the estate;
3. Installation details and shop drawings shall be submitted to the CM for approval prior to installation.

ELE35.3.020.9 LED TV DISPLAY PANEL

1. The LED TV Display Panel shall be of the minimum requirements as below:

a.	Screen Size	47 inches minimum
b.	Aspect Ratio	16:9
c.	Resolution	High Definition1920 x 1080 p minimum
d.	Screen Enhancement	Anti-reflective coating
e.	Intensity	High display intensity

2. The LED TV Display Panel shall be installed on a mounting frame that allows adjustment of viewing angle.

ELE35.3.030.9 DISPLAY REQUIREMENTS

1. Information and signals in both Chinese and English to be displayed for each individual block shall include, but not be limited to, the following items:
   a. Average energy consumption (kWh/flat), water consumption (m^3/flat) and gas consumption (MJ/flat) by tenants in last month, and compared with data of same month of last year for each block, the whole estate, and/or average of all public rental housing estates in Hong Kong (subject to data availability);
   b. Average energy consumption (kWh/flat) for communal area in last month and same month of last year for each block;
   c. Cumulative energy consumption (kWh) of tenants of each domestic block of all days in each month and the last month;
   d. Monthly electricity, water and gas consumption by tenants of each block in past 12 months to be displayed in bar chart or curve format, etc.;
   e. Output power and energy generation information of PV system, where provided, include but not be limited to:
      i. Instantaneous output power of individual PV sub-systems and total output power;
      ii. Individual PV sub-system output power and total output power of the day;
      iii. Maximum system output power day and the total output power;
      iv. Minimum system output power day and the total output power;
      v. Cumulative output power of individual PV sub-system and cumulative system total output power;
      vi. Cumulative system running time.

f. Date and time;

g. Green information and/or video of various format provided by HA according to programmed schedule;

h. Green and educational information and/or video of various format provided by other environmental organizations and bodies according to programmed schedule;

i. Input text signals.

2. The above information could be arbitrarily selected for display in each of the LED TV Display Panel with the aid of a tailor-made signage content management software to enhance the attractiveness of presentation to the tenants;
3. The Sub-contractor shall submit the design of the display arrangement to the CM for prior approval;
4. The above displayed information shall be linked with the output data as shown in the reports on the System operation and performance as described in ELE35.5.

ELE35.3.040.9 SIGNAGE CONTENT MANAGEMENT

1. Signage content management shall comprise display interfacing units connecting to the LED TV display panels and a tailor-made signage content management software with lifetime license fulfilling the display requirements as specified in ELE35.3.030;
2. Each display interfacing unit shall be a data processing unit (a Windows based barebone computer or equivalent) with full set of I/O connectivity, enclosed in a ventilated metal box and mounted adjacent to the LED TV display panel, receiving data from the central monitoring management workstation and receive the signals of corresponding IP address for video display on respective LED TV display panel;
3. The tailor-made signage content management software shall be installed in the central monitoring and management workstation which can feed in data from the database generated by the System software;
4. The signage content management software shall be able to produce human-machine interface video display in which users can insert any prevalent picture and photo formats, high definition video formats, icons, flash, html, etc. for displaying on the LED TV display panels;
5. At the central monitoring and management workstation, users can preview the display content on every LED TV display panel at respective domestic block.

ELE35.4 MISCELLANEOUS

ELE35.4.010.9 DOCUMENTATION

1. Labelling of Cables:
   a. Machine-printed, self-laminating vinyl for cabling and patch cords;
   b. Backbone cables shall be labelled at each end. The cable or its label shall be marked with its identifier;
   c. All cables shall be labelled with numbered markers at both ends.
2. Labelling of Faceplates:
   a. An unique identifier shall be marked on each faceplate to identify it as connecting hardware;
   b. Each port on the connecting hardware shall be labelled with its identifier.

ELE35.4.020.9 TESTING AND COMMISSIONING

1. The Sub-contractor shall carry out all necessary testing and commissioning work upon completion of the installation of the Smart Meter Monitoring and Energy Information Display System in accordance with ELE30.1 where applicable;
2. Verification tests shall be performed in the presence of the CM's representatives. A copy of the test results and all protection settings shall be submitted to the CM;
3. The Sub-contractor shall prepare itemized and detailed testing and commissioning schedules for the CM's approval prior to commencing the tests;
4. The Sub-contractor shall carry out preliminary tests to his own satisfaction before arranging for any formal witness test;
5. The Sub-contractor shall be responsible for the cost of necessary instrument, plant and labour for all tests;
6. The Sub-contractor shall carry out all such tests as required by the CM to demonstrate that each item of equipment meets the requirements of this Specification;
7. Valid calibration certificates of testing instruments shall be produced upon request by the CM. The accuracy of testing instruments shall also be demonstrated if directed by the CM irrespective of whether valid calibration certificate is available;
8. Any defects of workmanship/materials, mal-adjustments or other irregularities which become apparent during tests and may affect the test results shall be rectified by the Sub-contractor and the tests shall be repeated at the Sub-contractor's expense before acceptance by the CM.

ELE35.4.030.9 HAND-OVER DOCUMENTS

The Sub-contractor shall provide all necessary documents required for the operation and maintenance of the Smart Meter Monitoring and Energy Information Display System and shall include but not be limited to the following:

1. Certification from manufacturer of all major equipment, devices and materials;
2. As-fitted layout shop drawings of backbone cabling distribution;
3. As-fitted schematic diagram of the System and all sub-systems;
4. Cabling inventory record and connection details;

5. 3 sets of approved Operation and Maintenance manuals including servicing and maintenance requirements recommended by equipment manufacturers and the specialist service provider, full test reports of the System and all equipment, system settings, all routine operation procedures, reports and graphics generation procedures, maintenance and inspection schedules, necessary tools, system diagnosis, system reset and restoring operation procedures, etc. in both hard copy and electronic "pdf" format;
6. A rescue disk or other appropriate backup means for restoring the System software to original conditions and settings. Detailed step-by-step procedures for using the rescue disk or backup means to restore the System shall be included in the Operation and Maintenance manual;
7. License of all software programs including dongle keys, serial numbers, etc.;
8. 3 sets of software programs in DVD±RW;
9. Passwords at various levels of the System Software;
10. Company names, responsible persons, email addresses and telephone contacts of at least three (3) System Integrators certified by the supplier / local authorized agent of the DGU.

ELE35.4.040.9 TRAINING

The Sub-contractor shall provide training to the CM's representatives, estate management and technical staff or other personnel as instructed by the CM for a total duration of six working days, on the testing & commissioning, operation and maintenance of the System. The training shall be conducted separately for technical and management staff in three sessions, one before and one after commissioning of the System, and the remaining session shall be at the end of the Maintenance Period. Each training session shall be approved by the CM to cover any or all of the following topics and items:

1. Testing & commissioning procedures;
2. Operation and maintenance of the complete system including data gathering units, workstation etc.;
3. Use of all software programmes of the System for daily operation and monitoring of the System, including but not limited to storage and retrieval of data, generation of reports, spread sheets and graphics, analysis of data collected, and restoring the whole system by a system rescue disk or backup means, as described in ELE35.2.030 and ELE35.3.040;
4. Hands-on training of all operations for technical staff;
5. Training video showing step-by-step operation;
6. Training manuals with extracted screen front panels showing step-by-step procedures of all operations.

ELE35.4.050.9 SCOPE OF WORKS DURING MAINTENANCE PERIOD

The Sub-contractor shall carry out all necessary routine maintenance work of the Smart Meter Monitoring and Energy Information Display System in accordance with the requirements as specified in ELE30.2 where applicable and shall include but not be limited to the following:

1. To despatch competent and specially trained workmen to attend any requirement for an emergency inspection and repair;
2. To carry out, at three months intervals, routine servicing and maintenance to maintain the System, including both hardware and software, in proper working condition within the Maintenance Period;
3. To provide repairs and replacement parts at no additional cost to the Employer for the correct operation of the System;

4. Quarterly Servicing

   At three months intervals, the following works shall be carried out and the Sub-contractor shall log and submit a report to the CM after each quarterly servicing:

   a. Check proper functioning and cable connections and restart the central monitoring and management workstation at EMO;

   b. Check proper functioning and cable connections of the communication network, DGUs, multi-function electronic meters and digital water meters at various locations;

   c. Check proper functioning and cable connections of the display interfacing unit and the LED TV display panel at the main entrance lobby of each domestic block;

   d. Update software installed when service pack has been launched;

   e. Rectify / replace any defective or mal-functioning parts; and

   f. Print data reports on the System operation and performance of a rolling period of the past 12 months as specified in ELE35.5 and submit them to the CM within one month from the last day of the 3-month period concerned.

ELE35.5 DATA COLLECTION POINT SCHEDULE AND DATA REPORT

ELE35.5.010.9 DATA COLLECTION POINT SCHEDULE

Data Collection Point Schedule

Data to be collected for each Domestic Block
Date-month-year: _____
Estate Name: _____
Block Name/No. : _____

Electrical

Point summary					Measured						
Multi-Function Electronic Meter no.	Load connection	Location of signal interfacing points	Circuit Procedure Device Rating (A)	Category for Energy Measurement	Total energy consumption (kWh)	Total energy generation by PV system (kWh)	Maximum demand (kVA)	Currents (three phase and neutral) (A)	Voltage (all phase-to-phase and phase-to-neutral) (V)	Total Power Factor	Total Harmonic Distortion of current (%)
1	Customer main circuit breaker no. 1	Main Switch Room	2250	-	1		1	4	6	1	1
2	Customer main circuit breaker no. 2	Main Switch Room	2250	-	1		1	4	6	1	1

ELE36.1 SCOPE OF WORK

ELE36.1.010.9 GENERAL

1. This specification stipulates the requirements of the Automatic Meter Reading (AMR) Outstation which shall be read in conjunction with the "Typical Drawings for the Supply and Installation of AMR Outstation" issued by the WSD and the following Water Supplies Department (WSD) standard specifications:-
   a. E-89-01 Automatic Meter Reading (AMR) Outstation
   b. E-11-03 Electrical and Instrumentation Panels and Cubicles
   c. E-78-04 Programmable Logic Controller
   d. E-80-01 Instrumentation Equipment – General
   e. E-88-05 Power Supply Equipment for Telemetry Systems
   f. E-30-01 Electrical Cables
2. The Sub-contractor shall design, supply and install the AMR Outstation as shown on the Drawings and Specification. The Sub-contractor shall coordinate with all parties concerned, in particular to the Main Contractor and other Sub-contractors to cope with the construction programme; and
3. An AMR Outstation proposal detailing the design, layout and equipment for building up the AMR Outstation shall be submitted by the Sub-contractor to the WSD for approval prior to commencement of installation work. The sample for the "Checklist on documents for inclusion in the AMR Outstation proposal" is shown in ELE36.6.

ELE36.1.020.9 SCOPE OF WORK

The scope of work shall include the following:

1. Design, supply, installation, testing and commissioning of the AMR Outstation with the number of AMR Outstation(s) as shown on the Drawings;
2. Preparation and submission of AMR Outstation proposal, testing and commissioning (T&C) procedure, operation and maintenance (O&M) manual complete with all necessary documentation and test certificates to the WSD for approval;
3. Coordination, communication and attending meetings with project team and WSD in building up the AMR Outstation from time to time;
4. Design, supply and installation of all infrastructures for AMR equipment and network including concealed conduits, cabling and junction boxes;
5. Provision of site works for laying, connection and termination of associated cables for all equipment and smart water meters including power cables, signal cables, control cables and communication network cables;
6. Provision of site works for the programming and configuration of AMR Outstation(s) including programmable logic controller (PLC), data concentration unit (DCU), meter interfacing unit (MIU), pulse-to-M-Bus converter and communication equipment. Configuration details of MIU will be provided by the WSD;
7. Detailed design and requirements of data and alarm transmission between (a) smart water meters and DCU; (b) PLC/DCU and Master Station shall be proposed by the Sub-contractor in accordance with the specification and drawings. The Sub-contractor's proposal shall be agreed by WSD prior the site installation;
8. Provision of electricity power supply at all necessary locations for operation of AMR Outstation(s);

9. Supply, installation, connection and termination of a complete system of power cables, control cables, M-Bus cables and communication network cables to all equipment, instrument and ancillaries supplied, modified and installed;
10. Supply and installation of all necessary earthing system to form a complete, neat and safe installation as required to comply with the relevant wiring regulations;
11. Provision of the broadband (3G network services may be accepted subject to CM's approval in case of unavailability of broadband network) to enable the AMR Outstation(s) to securely communicate with the AMR Master Station prior to handing over of the system to the WSD;
12. Provision of pulse-to-M-Bus converter for Electromagnetic (EM) water meter (if any) for interfacing of metering data in pulses with DCU in M-Bus protocol;
13. Preparation and submission of operation and maintenance (O&M) manuals, including all approved drawing, documents, test records / certificates and submit to WSD for approval prior to handing over of the system; and
14. Even not explicitly specified, all required works arising from execution of the AMR System works shall be deemed to have included.

ELE36.2 SYSTEM DESCRIPTION

ELE36.2.010.9 AUTOMATIC METER READING (AMR) SYSTEM

1. The AMR System of the WSD shall collect metering data remotely and automatically, manage and analyse metering data, provide output for billing and water supplies management and disseminate useful information to customers;
2. The infrastructure of the system shall consist of AMR Outstations and AMR Master Station;
3. The AMR Outstation(s) shall comprise smart water meters equipped with meter interfacing units (MIU) compatible with hard-wired Meter-Bus (M-Bus) communication protocol, an M-Bus network, -AMR panel comprising programmable logic controller (PLC), data concentration unit (DCU), communication router and the associated networking equipment as well as 24V battery, battery charger and other associated power supply equipment. The AMR Outstation shall be interfaced with the AMR Master Station at the WSD and utilize broadband/3G networks as deemed appropriate by the WSD;
4. The AMR Master Station shall be supplied and installed by the WSD. The AMR Master Station shall comprise necessary hardware and software, equip with the required network communication and security equipment, together with all AMR Outstations to form a complete AMR System; and
5. The smart water meters equipped with MIUs for building up AMR Outstation shall be supplied by the WSD and installed by Main Contractor. The Sub-Contractor shall supply (except the smart water meters), install and commission the AMR Outstation according to this specification and the requirements as specified by the WSD from time to time.

ELE36.3 MATERIALS AND EQUIPMENT

ELE36.3.010.9 GENERAL

1. An AMR Outstation shall be designed to collect metering data from smart water meters and transmit them to the AMR Master Station at the WSD. The requirements of the components composing the AMR Outstation shall be as follows:
   a. Smart Water Meters and Meter Interfacing Units (MIU)
      - Mechanical water meters and MIUs
      - Electromagnetic (EM) water meters
   b. M-Bus Network
   c. Automatic Meter Reading (AMR) Panel
      - Panel Enclosure
      - Data Concentration Unit (DCU)
      - Programmable Logic Controller (PLC) Unit
      - Router and Switch
      - Cables
      - Power Supply Unit
      - MCB Unit
      - 24V dc to 220V ac Inverter
      - Selector
      - Communication Networks (Broadband/3G)
   d. Backup Battery Unit
      - Battery Charger Panel
      - Battery Panel
   e. Cabling Facilities and Site Installation
   f. Data Transmission Equipment and Network

ELE36.3.020.9 SMART WATER METERS AND METER INTERFACING UNITS (MIUS)

1. Smart water meters shall be provided by the WSD for installation by the Main Contractor. The meters shall be of mechanical, electromagnetic type or other types as deemed appropriate by the WSD. The maximum distance between the terminal box to either of the smart water meter shall be 1.5 metres.
   a. Mechanical water meters and MIUs

      The mechanical water meters provided by the WSD for installation by the Main Contractor shall be equipped with MIUs which read the meter register and transfer the meter reading via a wired M-Bus communication protocol to a DCU. Each MIU is equipped with a connecting cable complying with the M-Bus protocol EN 13757 and EN 1434 for connection to the bus-wire of the M-Bus network. The Sub-contractor shall be responsible for the cable connection and termination between the MIUs and the bus-wire of the M-Bus network.

      The MIU shall serve as an interface between the water meter and the M-Bus network. It shall record the meter readings and store in its internal memory with date and time stamps and to transmit the stored data to the DCU via the M-Bus bus-wire once a data interrogation request is initiated by the DCU.

      The data and alarm required to transmit from mechanical meter with MIU to DCU shall include, but not limited to, the following:

- Data required: Meter Count, Date &Time, Primary & Secondary address and other data as required by WSD; and
- Alarm required: Low Battery, Leakage, Tampering detection and other alarm as required by WSD.

b. Electromagnetic (EM) water meters

The EM water meters provided by the WSD for installation by the Main Contractor shall be equipped with a flow converter capable of generating electric pulse output for AMR application and the flow converter shall be installed by the Sub-contractor.

A pulse-to-M-Bus converter together with IP54 panel for interfacing of metering data in pulses with DCU in M-Bus protocol shall be supplied and installed by the Sub-contractor. The pulse-to-M-Bus converter shall be housed in the panel with a degree of protection of IP54 and shall be properly fixed or mounted on the secured location. The Sub-contractor shall be responsible for the cable connection and termination between the EM water meters and pulse-to-M-Bus converter and also the converter to the M-Bus network.

The pulse-to-M-Bus converter shall consist of an electronic unit that collects meter pulses which are converted into physical units. The data is transmitted via Meter-Bus protocol (EN 13757) to a data concentration unit. The converter shall equip with the following characteristics:

- Physical unit and medium programmable for the pulse counter input;
- Power supply via M-Bus / Backup battery to ensure pulse counting if M-Bus fails;
- Support external power supply;
- Minimum 1.5m cable length for connecting pulse transmitter.

The data and alarm required to transmit from EM water meter to DCU shall include, but not limited to, the following:

- Data required: Volume flow from pulse to M-Bus and any other data as required by WSD; and
- Alarm required: Low Battery alarm any and other alarm as required by WSD.

ELE36.3.030.9 M-BUS NETWORK

1. The M-Bus is a European Standard EN 13757 and EN 1434 which is developed for the remote reading of utility meters. The M-Bus network shall supply the power necessary for interrogation of metering data from the MIUs installed on the smart water meters;
2. The M-Bus network shall be composed of a 4-core 1.5mm^2 copper cable with two cores to serve as the bus-wire for the M-bus system, while reserving the remaining two cores as spare cores. The cable shall be laid inside at least 25mm diameter concealed conduits. The spur cables from the MIUs shall be connected to the main bus cable via terminal blocks inside the terminal box. Spare cores shall be terminated to the terminal blocks. The specification for the wiring system in conduits/trunking shall be referred to ELE11, 12 and 13;
3. The specification of the copper cable shall refer to the “Standard Specification E-30-01, Electrical Cables” from WSD;
4. The M-Bus shall be reverse-polarity protected and used for both data transmission and power supply from the DCU to the MIUs. The M-Bus shall be short-circuit proof and no bus failure shall be resulted in case of faults in any MIU;

5. The M-Bus shall support various bus topologies, including linear, star and tree configuration with any given segment, up to 250MIUs. For each AMR Outstation, the M-bus network shall provide 10% spare capacity for domestic flats and 20% spare capacity for non-domestic units for connection of additional MIUs in future expansion at each DCU. Network cascading with additional DCUs shall also be acceptable for provision of the required spare capacity. The maximum cable length and cable capacitance shall be 350 metres and 180nF respectively;
6. The M-Bus shall adopt a master-slave communication protocol, which shall facilitate bi-directional data transmission from DCU to MIU triggered by changing voltage in the M-Bus bus-wire. The nominal bus voltage shall be around 36V at the master's output. Communication requests shall be activated by change of voltage to the input circuits of the MIU by the DCU, while the data transmission from MIU to DCU shall be triggered by changing current demand at the MIU. The transmission rate shall be adjustable from 300 to 2400 baud (bits per second) supporting automatic error detection by means of parity and checksum to enable repetition of data transmission in the event of an error;
7. All softwares included shall be in free or full user licenses with no expiry date. Full set of system recovery diskettes, back up diskettes for the softwares shall be provided;
8. Terminal blocks shall be used for the connection of all external cables. Power supply terminals of all equipment and terminals within fabricated panels or cubicles shall comply with IEC 60947-7-1. It shall be single-level feed-through, screw or screwless type connection, DIN rail-mounted, vibration and corrosion resistant and modular design suitable for harsh industrial environment;
9. Terminals shall be permanently identified by number or letter, and shall be so positioned as to permit convenient access for wiring. Adjacent rows of terminals shall not be closer than 150mm. Power supply terminals shall be segregated from signal terminals and shall be shielded to prevent accidental contact. Access to the terminals of instruments shall not expose internal components, require the disassembly of the instruments or removal of the instruments from the installation as a whole; and
10. Internal panel wiring shall be coloured black for a.c. connections, grey for d.c. connections and green/yellow for earth connections. At least 10% spare terminals shall be provided.

ELE36.3.040.9 AUTOMATIC METER READING (AMR) PANEL

1. AMR panel shall be installed in the water meter room / AMR equipment room / AMR equipment cabinet on the ground floor, or near the ground floor, so as to facilitate ease communication network connection and maintenance works. Particular attention should be paid on the maximum length of M-Bus cable from smart water meters to the AMR panel;
2. The AMR panel shall be designed for housing the PLC, DCU, communication router, communication networking equipment, terminal blocks for power supply, control wiring connection and associated equipment; and
3. The AMR panel is supplied by both 220V a.c. and 24V d.c. supplies. Most of the equipment, except DCU, inside the AMR panel is running on 24V d.c. which is provided by 24V d.c. power supply unit inside the panel and the external 24V d.c. from battery charger. As the DCU inside the AMR panel is operating on 220V a.c., an inverter is required to convert secured 24V d.c. to 220V a.c. supply for the DCU only.

ELE36.3.050.9 PANEL ENCLOSURE

The panels shall be designed for indoor wall-mounted installation and fabricated with 1.5mm thick stainless steel. The size of the panels shall be not larger than 600(h) x 400(w) x 300(d) mm. The panels shall be designed to the degree of protection of IP54. The design and construction of the panels shall be in compliance with the WSD Standard Specification E-11-03. The circuit and connection diagrams shall be provided inside the panel.

ELE36.3.060.9 DATA CONCENTRATION UNIT (DCU)

1. The DCU shall serve as the M-Bus master of the M-bus network, which is designed to collect metering data at a programmable interval from the MIUs of meters and store the meter readings to its non-volatile memory for transmission to the AMR Master Station via the communication network;
2. The DCU shall be able to exchange data with the existing application server in the AMR Master Station;
3. The DCU shall be able to automatically transmit the metering data via internet connection using integrated LAN interface and shall be equipped with at least one Ethernet RJ45 port for data transmission;
4. The DCU shall be capable of connecting all the M-Bus devices of the AMR Outstation with 10% spare capacity for domestic flats and 20% spare capacity for non-domestic units at each DCU. Additional DCU shall be provided if necessary;
5. The DCU shall be programmable to initialise retrieval of meter reading data from the MIUs at an interval of 15 minutes, 30 minutes, 1 hour, 2 hours, 4 hours, 6 hours, 12 hours or 24 hours;
6. The DCU shall have an internal non-volatile memory of capacity sufficient to store 500,000 meter readings;
7. The DCU shall be equipped with at least one USB 2.0 port and one Ethernet RJ45 port for firmware upgrading, parameter configuration and diagnosis by a notebook computer installed with the DCU configuration and diagnosis software. The software shall be provided together with the DCU;
8. The DCU shall be cascadable for connecting more devices to build up larger M-Bus networks;
9. The DCU shall use FTP protocol to transmit XML metering data to the AMR Master Station while the PLC will use TCP Client to transmit AMR panel status to the AMR Master Station;
10. The DCU shall be suitable for operating at ambient conditions of temperature 0 to 50°C; and
11. The DCU shall operate on 220V 50 Hz a.c. power supply or a 24V d.c. power supply either from the battery charger output or from the 24V battery.

ELE36.3.070.9 PROGRAMMABLE LOGIC CONTROLLER (PLC) UNIT

The PLC Unit shall be provided to facilitate automatic, remote control and monitoring of equipment such as DCU, power supply, battery, communication equipment, etc.

1. The PLC Unit shall be of compact design housing embedded inputs, outputs, power supply and communication ports and equipped with an embedded LCD or indicating lights for showing modes of PLC operation, e.g. program mode, run mode and diagnosis mode etc.;
2. The PLC Unit shall operate on 24V d.c. power supply and possess battery backed up internal memory for user program and data with a minimum memory size of at least 64 kbyte for data logging;

3. The PLC Unit shall have at least one (1) RS232/RS485 port and one (1) Ethernet port supporting serial protocols including DH-485 and TCP/IP for connection of router, programming tools for data communication, on-line programming and diagnosis;
4. The PLC Unit shall be equipped with at least six (6) nos. of digital input and six (6) digital output with volt-free contacts. The digital input channels shall be fast enough to catch pulse input up to 100kHz;
5. The PLC shall be programmed to force a reset to the router and/or DCU upon detection of cessation of data communication for a period of time;
6. All input / output channels shall be adequately programmed to relay the required alarm signals such as power supply failure, battery low, battery fault, etc.;
7. Twenty per cent (20%) of readily available spare channels for each type of digital, analogue counter input / output channels of the PLC Unit shall be provided. The Sub-contractor shall be responsible for providing all the labour, equipment, cabling, materials, programming and engineering costs for the utilization of the spare channels when any additional site signals are considered necessary by the WSD;
8. The PLC Unit shall accept program downloaded locally via their communication ports from a notebook or tablet computer. The Sub-contractor shall be responsible for providing the programming software for the PLC Unit;
9. The PLC Unit shall have provisions for communicating with the AMR Master Station on a report-by–exception manner in order to reduce network traffic and shall be capable of stand-alone operation in the event of communication link and the AMR Master Station failure;
10. The PLC shall be suitable for operating at ambient conditions of humidity 10 to 90% and temperature 0 to 50°C; and
11. The specification of the PLC shall be read in conjunction with the "Standard Specification E-78-04, Programmable Logic Controller" from WSD.

ELE36.3.080.9 ROUTER AND SWITCH

The communication equipment shall facilitate the communication and data transmission between the AMR Outstation and the AMR Master Station. The metering data collected by the DCU shall be transmitted to the AMR Master Station at the WSD via Ethernet router through broadband, 3G network or other means as deemed appropriate by the WSD.

1. The router shall be designed for enterprise or industrial use capable of serving a high speed, high availability and high reliability performance. The router shall support the features of firewall support, VPN security and SNMP management;
2. The router shall provide broadband network interface, 3G/4G network interface via SIM card and wi-fi interface for data transmission;
3. The router shall provide VPN security encryption feature with VPN tunnelling protocol IPSec with AES 256;
4. The router shall provide the feature of Dyn DNS client which support the access to the router with a dynamic IP address;
5. The router shall be integrated with Ethernet switch which shall provide at least 1 number of Ethernet WAN 10/100Mbps port (RJ45) and 4 numbers of Ethernet LAN 10/100mb port (RJ45), or a separated Ethernet switch with same port numbers shall be provided; and
6. The router shall be suitable for operating at ambient conditions of humidity 10 to 90% and temperature 0 to 50°C.

ELE36.3.090.9 CABLES

1. The M-Bus network shall be composed of a 4-core 1.5mm^2 copper cable with two cores to serve as the bus-wire for the M-bus system, while reserving the remaining two cores as spare cores. The maximum cable length shall be 350 metres (from MIU to a DCU). All M-Bus cable maximum cable capacitance is 180nF;
2. PVC insulated power and control cables shall comply with IEC 60502-1;
3. PVC insulated cables for panel wiring shall comply with IEC 60227-3 or BS 6004;
4. The conductor shall be of stranded, plain, annealed copper complying with IEC 60228. Four-core cables shall have full size neutral conductors;
5. The specification of the copper cable shall refer to the "Standard Specification E-30-01, Electrical Cables" from WSD;
6. Ethernet cable shall transmit digital signal among AMR Panels in a form of Ethernet network;
7. Ethernet cable shall be Cat 5e cable complying ANSI/TIA-568-C.2 and IEC 61156-5; and
8. The maximum Ethernet copper cable length shall be 100 metres. In case the cable distance exceeded 100 metres, ethernet to optical fiber converter and the associated equipment/power supplies shall be supplied and installed by the Sub-contractor.

ELE36.3.100.9 POWER SUPPLY UNIT

The power supply unit shall comply with EN/IEC 60950 and support the power supply of the AMR panel.

ELE36.3.110.9 MINIATURE CIRCUIT BREAKERS (MCB) UNIT

1. The rating of the MCB unit shall be determined by the power requirement of the overall components of the AMR panel; and
2. The specification for the MCB shall be referred to ELE3.5.

ELE36.3.120.9 24V DC TO 220V AC INVERTER

It shall transform 24V d.c. supply to 50 Hz (+/-0.1%) 220V (+/-3%) a.c. sinusoidal supply for the consumption of a.c. loading(s) in AMR Panel. The rating of the inverter shall be 125% of that of the a.c. loading(s). The output efficiency of the inverter shall be 88% or above at 50-100% loading condition. The inverter shall comply with EN/IEC 60950.

ELE36.3.130.9 SELECTOR SWITCH

1. Selector switches shall be of rotary, independently manual operated action with double break air-break contacts complying with the following requirements:-
   a. Rated insulation voltage: 600V 50 Hz a.c. or 300V d.c.;
   b. Rated thermal current of contacts: Not less than 15A at 220V 50Hz a.c.;
   c. Endurance: 1 million mechanical operations and 0.1 million on-load electrical operational cycles.
2. The specification of the selector switch shall refer to the "Standard Specification E-11-03, Electrical & Instrumentation Panels and Cubicles" from WSD.

ELE36.3.140.9 BACKUP BATTERY UNIT

1. A battery charger and backup battery unit shall provide the backup power to the system when the input power source is interrupted;
2. In general, the equipment shall include the following:
   a. Maintenance free battery
   b. Battery charger with both float and boost charging facilities
   c. Panel enclosure for both a. and b.

d. Interconnecting cables between a. and b.

3. The system shall operate from a 220V 50Hz a.c. power supply. Unless otherwise specified, the output voltage of the battery supply shall be 24V d.c.. The equipment supplied shall include all sub-units and components to form a complete system. The equipment shall be suitable for operation from 0 to 50°C with a relative humidity up to 90%.

ELE36.3.150.9 BATTERY CHARGER PANEL

The Battery Charger Panel for housing the 24V battery charger shall comply with the following requirements:

1. The enclosure shall be fabricated with 1.5mm thick stainless steel to IP54;
2. Unless otherwise approved by WSD, the size of the panel shall be not larger than 400(h) x 300(w) x 210(d) mm;
3. It shall be designed for housing a 24V battery charger and the associated control board and terminal blocks for power supply and control wiring connection;
4. The 24V battery charger shall be incompliance with the WSD Standard Specification E-88-05; and
5. The front panel shall be installed with a voltmeter and an ammeter of appropriate ranges for load output voltage and current and LED alarm indications.

ELE36.3.160.9 BATTERY PANEL

The Battery Panel for housing the 24V battery shall comply with the following requirements:

1. The enclosure shall be fabricated with 1.5mm thick stainless steel to IP54;
2. Unless otherwise approved by WSD, the size of the panel shall be not larger than 380(h) x 380(w) x 210(d) mm;
3. It shall be designed for housing the battery cells and the associated terminal blocks for power supply and control wiring connection;
4. The 24V battery charger shall be incompliance with the WSD Standard Specification E-88-05; and
5. The battery cell capacity shall be able to support operation of the AMR Outstation for six (6) hours with 20% safety margin taking into account all various derating factor under a.c. power failure condition.

ELE36.3.170.9 CABLING FACILITIES AND SITE INSTALLATION

1. A complete cabling system shall consist of power cables, control cables, M-Bus cables and communication network cables including associated conduits to all equipment;
2. Except for surface mounted conduit which shall be of G.I. type, a system of concealed PVC conduit and steel trunking together with accessories for the AMR system of water suppliers shall be provided as shown on the Drawings;
3. The cabling work shall include the provision of conduits, cable trays, ladders, mounting brackets, supports, channels, cleats, ties, lugs, glands, shrouds, tapes, markers, ferrules, joints, terminations etc., as necessary and required to form a complete, neat and safe installation. All conduits and equipment boxes shall be marked for identification;
4. The Sub-contractor shall prepare a complete cable list for the power, control, M-Bus and communication network cables shown on the Drawings; and

5. Terminal boxes with size of 150mm(h) x 150mm(w) x 75mm(d) complete with the associated connectors and connection terminal blocks on the concealed junction boxes shall be supplied and installed on each floor to facilitate connection of the signal cables of the MIUs to the M-bus wires. The bus-wires shall be terminated to the DCU for data concentration and temporary storage.
6. At least two 25mm cable conduits shall be provided to run through the water meter room/cabinet of each floor and water meter room/AMR equipment room/AMR equipment cabinet and terminate with a 150mm(h) x 150mm(w) x 75mm(d) adaptable box in each of the water meter rooms /cabinets for installing M-Bus cables and network communication cables;
7. A 220V 50Hz a.c. power supply with a 13A fuse spur unit for each AMR panel and the required wall space for mounting AMR panel(s) shall be provided;
8. A 25mm cable conduit running through the AMR equipment room / AMR equipment cabinet to the telecommunication room/TBE room shall be provided and to be terminated with 100mm(h) x 100mm(w) x 50mm(d) adaptable boxes;
9. For cases with more than one AMR equipment room within a development, a 25mm cable conduit running through those of the AMR equipment rooms / AMR equipment cabinets for network communication cables shall be provided and to be terminated with 100mm(h) x 100mm(w) x 50mm(d) adaptable boxes;
10. If master meter and check meter positions are provided, two 25mm cable conduits running through the master meter room and check meter room to the AMR equipment room shall be provided and to be terminated with 150mm(h) x 150mm(w) x 75mm(d) adaptable boxes, or individual AMR panel with associated electricity power supply point and telecommunication cable conduit shall be provided at each of the water meter rooms/cabinets; and
11. If the cables run across the access or without proper supports, suitable fixed cable conduits and flexible conduit shall be provided for cable protection.

ELE36.3.180.9 DATA TRANSMISSION EQUIPMENT AND NETWORK

The AMR Outstation communication equipment and all required network shall be provided to enable the AMR Outstation to securely communicate with the AMR Master Station for data transmission through broadband/3G communication networks as deemed appropriate by the WSD.

1. The data transmission from smart water meters to the AMR Master Station shall be initiated by the DCU. The time for data transmission of the AMR Outstation shall be preset by the AMR Master Station, in which clock synchronisation of the DCU with the AMR Master Station shall be carried out;
2. TCP/IP communication protocol shall be adopted, in which a broadband account or a 3G mobile data services account as deemed appropriate by the WSD with dynamic IP address shall be assigned to the AMR Outstation;
3. The communication network shall be capable of forming a connection established by the AMR Master Station to obtain AMR data, diagnostic information or programming the DCU of the AMR Outstation on an ad hoc basis;
4. The metering operation shall be handled by the AMR Master Station, which shall respond to the pre-scheduled data transmission requests initiated by the AMR Outstations. The AMR Master Station can also initiate ad-hoc polling to particular AMR Outstation on need basis;
5. Communication network service from ISP shall be provided to enable effective data transmission from the AMR Outstation to the AMR Master Station during testing and commissioning (T&C) and before handing over of the system to WSD; and

6. The Sub-contractor shall be responsible for the subscription and maintaining of the communication network services between AMR Outstation(s) and the AMR Master Station at WSD for the entire period starting from testing and commissioning phase of the Works till the expiry of Maintenance Period. The details of the broadband/3G connection services shall be approved by the Contract Manager.

ELE36.3.190.9 INTELLECTUAL PROPERTY AND PROPRIETARY RIGHTS

1. If the supplied equipment required intellectual property rights, appropriate licences shall be obtained from the relevant rights owners and copies of which shall be furnished to the WSD prior to handing over of the system;
2. All technical information, documents and manuals furnished to the WSD shall have the license, copyright or written permission from the proper rights holder for using of these materials by the WSD; and

3 Documentary evidence of all licences of all software for the Works shall be provided prior to handing over of the system to the WSD.

ELE36.3.200.9 BUILDING SERVICES PROVSION FOR AMR EQUIPMENT ROOM

1. The Sub-contractor shall supply and install mechanical ventilation, lighting and power for the AMR equipment as shown on the Drawings.

ELE36.4 TESTING AND COMMISSIONING

ELE36.4.010.9 INSPECTION AND EQUIPMENT TEST

1. The Sub-contractor shall inspect the supplied equipment for verification of the brand, model, capacity, clock speed, ratings specifications, serial numbers of the hardware as well as the brand, version, serial number, licence keys, licence documents of all hardware, software and firmware supplied;
2. The Sub-contractor shall carry out equipment test including, but not limited to, the following procedures:
   a. Verify the correct inventory of hardware including software licences, authentication certificates, cables, etc.;
   b. Demonstrate that all spare memory, equipment capacity and system expansion requirements;
   c. Demonstrate that all input and output expansion requirements have been met, including wiring and signal isolation, and verify that power supplies are capable of supporting the increased load for this expansion;
   d. Demonstrate all hardware and software boot-up and diagnostics;
   e. Verify all power supply voltages are within tolerance;
   f. Verify proper earth connections and isolation of instrumentation earth for all equipment;
   g. Demonstrate that all preloaded software and firmware have been properly installed and are operating correctly;
   h. Verify the connectivity and speed of the communications network equipment; and
   i. Demonstrate the systems to full functioning.

ELE36.4.020.9 TESTING AND COMMISSIONING (T&C)

1. A testing and commissioning procedure shall be proposed by the Sub-contractor and submitted to the WSD for approval prior to commencement of testing and commissioning work;
2. After completing the installation of the AMR Outstation and prior to setting to work, individual equipment shall be tested to ensure that it performs in accordance with the specified requirements and is in satisfactory working conditions;
3. Before carrying out the required site test, the Sub-contractor shall ensure the following:
   a. The AMR Outstation is installed in accordance with all relevant drawings, circuit diagrams and the specified requirements;
   b. All cables and individual conductors are labelled and ferruled as per the relevant drawings;
   c. All items of the AMR Outstation are adequately and correctly labelled and identified;
   d. The insulation resistance and continuity of all conductors of cables, etc. are acceptable; and
   e. The earthing arrangements are complete and a satisfactory value of earth loop impedance has been achieved.
4. The test procedures and format of test records shall be submitted to the WSD for approval prior to the scheduled commencement of testing and commissioning;
5. All measuring instruments, indicators, testing computers, network testing instruments and other apparatus necessary for carrying out the tests shall be provided by the Sub-contractor and accepted by the WSD;

6. The Sub-contractor shall submit a comprehensive T&C procedure including, but not limited to, the following items for approval:
   a. Integrity of the AMR data on the DCU;
   b. Integrity of the AMR data on the Router/Modem;
   c. Integrity of the AMR data on the AMR Master Station;
   d. Configuration and operation check on the MIUs;
   e. Operation check on the PLC;
   f. Change over test on the backup battery unit;
   g. Operation check on the AMR Outstation upon a.c. power supply failure;
   h. 6-hour discharge test on the battery of the AMR Outstation;
   i. Demonstration of remote programming and diagnosis of the AMR Outstation.
7. Final acceptance test full function of the AMR Outstation including successful data transmission to the AMR Master Station shall be conducted by the Sub-contractor to the satisfaction of the WSD.

ELE36.4.030.9 SYSTEM TRANSFER FOR OPERATION AND MAINTENANCE

1. Upon successful commissioning of the AMR Outstation by the Sub-contractor to the satisfaction of the WSD, when requested by the WSD, the whole system including communication network shall be handed over to the WSD for operation and maintenance;
2. An Operation and Maintenance manual complete with all necessary documentation, catalogues, drawings, reports, test certificates and T&C records shall be submitted to the WSD for approval prior to handing over of the system. Four (4) complete sets of hardcopy of the final O&M manual with softcopy in pdf format in a CD-ROM shall be provided; and
3. Upon requested by the WSD for handing over of the AMR Outstation, the Sub-contractor shall arrange a joint inspection with the WSD to check and confirm the AMR Outstation for the purpose of system handing over.

ELE36.4.040.9 TRAINING

1. The Sub-contractor shall provide not less than 40 hours training of the operation and maintenance for the AMR system with a proposed training programme approved by the Contract Manager / WSD. The training shall be conducted during normal working hours for the estate management staff/WSD. The Sub-contractor shall record in 720p video or better throughout one training session and hand over 2 copies of DVD-videos of the record to the Contract Manager; and
2. The Sub-contractor shall provide sufficient copies of detailed training manuals for operation and maintenance for the estate management staff and WSD.

ELE36.5 MAINTENANCE

ELE36.5.010.9 GENERAL

1. The Sub-contractor shall provide free maintenance including labour and materials to the system installation for the entire Maintenance Period after completion of the installation; and
2. During the Maintenance Period, the Sub-contractor shall attend to all faults and complaints, remedy all defects, replace all malfunction items and maintain the complete installation in a clean, tidy and functional condition to the satisfaction of the Contract Manager and WSD.

ELE36.5.020.9 24-HOUR ON-CALL SERVICE DURING MAINTENANCE PERIOD

1. The Sub-contractor shall provide 24-hour on-call service at any time during the Maintenance period. The Contract Manager may instruct the Sub-contractor, in the Maintenance Period via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and Approved by the Contract Manager, to attend the reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel, who shall arrive at site and shall carry out any necessary inspection testing and repair work as soon as practicable and under all weather conditions;
2. The Sub-contractor shall submit to the Contract Manager for this purpose at least two names of English speaking representatives, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for Approval. Prior Approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers etc. during the Maintenance Period at least two weeks before the change is effected;
3. The Sub-contractor shall attend to emergency calls within three (3) hours of receiving such calls out of normal working hours and a maximum time limit of two (2) hours during normal working hours. For other repair calls, they shall carry out repair work within twenty four (24) hours; and
4. The maintenance and servicing works, as described above, form part of the Main Works described in Clause 8.3(2)(c) of the General Conditions of Main Contract.

ELE36.6 CHECKLIST ON DOCUMENTS FOR INCLUSION IN THE AMR OUTSTATION PROPOSAL

ELE36.6.010.9 CHECKLIST ON DOCUMENTS FOR INCLUSION IN THE AMR OUTSTATION PROPOSAL

[Extracted from the appendix of WSD's standard specification: E-80-01, "Automatic Meter Reading (AMR) Outstation"]

Appendix

[August 2017]

Check List on Documents for Inclusion in Automatic Meter Reading (AMR) Outstation Proposal

Part I – General Information

Address of Premises: _____

_____

Name of Consumer: (In English) _____

(In Chinese) _____

Contact Tel No.: _____

Email address: _____

ASN No. / CCID No. (if applicable): _____

WSD Reference No. (if applicable): _____

Part II – Documents to be included

The AMR Outstation proposal/supplementary information includes:

Please tick the appropriate boxes

		Enclosed in the proposal	Not Applicable
(1)	Site location plan - showing the location and boundary of the development	☐	☐
(2)	Building floor layout plan - showing the meter room(s)/box(es) for housing the AMR panel(s)	☐	☐
(3)	Meter room/box layout - indicating typical meter room/box - showing the detailed layout of the meter room/box with dimensions	☐	☐

P.1

		Enclosed in the proposal	Not Applicable
	- showing the meter positions including the associated fittings - showing the position of M-Bus adaptable boxes with dimensions - showing the distance between adaptable box to either of meter shall not be more than 1.5m - showing the layout and routing of cable conduits - indicating the meter room/box shall be lockable		
(4)	AMR equipment room (meter room/box for housing the AMR panel) layout - showing the position of AMR panel with dimensions - showing the positions of adaptable boxes for M-Bus cable and telecommunication cable and 13A fuse spur unit with dimensions - showing the layout of cable conduits - showing the distance between adaptable box to either of meter shall not be more than 1.5m - indicating the length of M-Bus cable (shall not be more than 350m)	☐	☐
(5)	Meter schedule - showing the address of each premises in the building that requires individually metered water supply - showing the numbers, sizes and types of meters	☐	☐
(6)	Design of the AMR Outstation Including: - detail drawings - schematic diagram - general arrangement of AMR panel - wiring diagram of PLC - power supply circuit diagram including backup battery and battery charger - schematic diagram of communication network showing the application of broadband/3G - indicating the numbers of meters connected to each DCU and the max. no of devices that can be connected - indicating the pulse-to-M-Bus converter for EM water meter if applicable	☐	☐
(7)	Equipment details - showing the list and details of equipment for AMR Outstation including the brand and model of equipment	☐	☐

		Enclosed in the proposal	Not Applicable
	- showing the numbers of M-Bus devices supported by the DCU and the capacity of internal memory - showing by calculation the battery size is capable for supporting the backup operation in specified hours - indicating the panels' dimensions, material and the degree of protection		
(8)	Installation Programme - indicating the Building Covenant date - showing the detail installation programme - indicating the installation date of the smart water meters	☐	☐
(9)	Other information required by the Water Supplies Department (WSD). Please specify: _____	☐	☐

Remarks:

a. The submission and approval of AMR Outstation proposal shall be separated from the submission and approval of plumbing proposal for application of water supply. The information submitted for the above purposes shall be self-contained and shall not be mixed up.

b. Information (e.g. meter room/box layout, meter schedule, etc.) related to the application of water supply shall be approved under the plumbing proposal. Such information provided in the AMR Outstation proposal is for reference only.

c. Catalogues of equipment are not required to be submitted at the Proposal Stage. However, such catalogues shall be submitted to the WSD for information together with the submission of operation and maintenance manual.

ELE37.1 GENERAL REQUIREMENTS

ELE37.1.010.A SCOPE OF WORKS

The Sub-contractor shall provide the following electric vehicles (EV) charging facilities as shown on the Drawings:

1. Mode 3 medium charger (MC) and Mode 3 (Lite) MC with Type 2 32A socket outlet to IEC 62196;
2. Mode 4 quick charger (QC) with connector to Combined Charging System (CCS) Combo 2 to IEC 62196-3;
3. EV charging enabling facilities;
4. Central workstation;
5. System Interfaces to exchange electronic data with a HA data hub server via broadband network with fixed IP (4G/5G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP);
6. Load management system (LMS) where required;
7. Fee collection system including payment consoles;
8. All necessary wiring and accessories.

ELE37.1.020.A WIRING CONNECTION

The Sub-contractor shall provide all necessary cable wiring for data and power connection for , Mode 3 MC, Mode 3 (Lift) MC, Mode 4 QC, EV charging enabling facilities, LMS, central workstation and fee collection system.

ELE37.1.030.9 EXECUTION OF THE WORK

1. Electrical work on EV charging facilities including installation, testing and commissioning, and maintenance works shall be carried out by registered electrical contractors and registered electrical workers of the appropriate grade under the Electricity (Registration) Regulations (Cap.406);
2. All proposed equipment shall have a guarantee of spare parts supply of at least five years.

ELE37.1.040.A STATUTORY REGULATIONS

The EV charging facilities shall comply with the following statutory regulations:

1. Code of Practice for the Electricity (Wiring) Regulations and its subsidiary code 26S - Charging Facilities for Electric Vehicles;
2. Technical Guidelines on Charging Facilities for Electrical Vehicles issued by the Electrical and Mechanical Services Department;
3. Technical Guidelines for Electric Vehicle (EV) Charging-enabling for Car Parks of New Building Developments issued by the Environment and Ecology Bureau;
4. Guidance Note on Fault Protection for Direct Current Electric Vehicle Charging Facilities issued by Electrical and Mechanical Services Department;
5. Other Statutory Regulations as detailed in ELE1.4.010.

ELE37.1.050.A STANDARDS

1. The EV charging facilities shall comply with IEC 61851-1;
2. The Mode 4 QC shall comply with IEC 61851-23.

ELE37.2 SYSTEM DESCRIPTION

ELE37.2.010.A GENERAL

1. EV charging facilities shall be provided for monthly and hourly parking spaces respectively as shown on Drawings;
2. For monthly parking spaces with completed set of EV charging facilities, the Sub-contractor shall provide the fixed electrical installations including, but not limited to switchboards, distribution boards, cabling, cable containment and a Mode 3 (Lite) MC at each parking space as indicated on the Drawings. Wooden meter board shall be provided inside electric meter room or other locations as specified on Drawings for future installation of electricity meter by power company;
3. For hourly parking spaces with completed set of EV charging facilities, the Sub-contractor shall provide the fixed electrical installations including, but not limited to switchboards, distribution boards, cabling, cable containment, fee collection system and a Mode 3 MC or Mode 4 QC at each parking space as indicated on the Drawings;
4. The EV medium chargers and / or quick chargers for hourly parking spaces shall be connected to the central workstation(s) and fee collection system at Shroff office or other locations as specified on Drawings for central monitoring of EV medium charger, and / or quick charger and remote control of the charger operation. The Sub-contractor shall provide all necessary data cabling and network equipment for the installation;
5. The fee collection system shall be provided for EV charging facilities. The Sub-contractor shall allow necessary provision in the Mode 3 MC and Mode 4 QC to interface with the fee collection system as specified in ELE37.3.2.020. The payment consoles are allowed at designated location as shown on Drawings and the Sub-contractor shall provide all necessary data cabling, network equipment for the installation and power points for the payment consoles and allow cable containment facilities from each payment consoles to the Mode 3 MCs and Mode 4 QCs, LMS, and / or central workstation for communication of fee collection system;
6. EV charging facilities for hourly parking spaces shall be connected to the payment consoles adjacent to the parking spaces or at designated location as shown on Drawings. The payment consoles shall then be connected to the central workstation at Shroff office or other locations as confirmed by CM for central monitoring of EV MC and / or QC and remote control of the charger operation:
    a. The central workstation shall be automated with system interfaces to exchange electronic data with an HA's data hub server after implementation, to perform fee collection (e.g. Octopus online payment), and to control and monitor remotely the EV chargers via broadband network with fixed IP (4G/5G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP);
    b. For project with remoted site, the central workstation shall be exchanged electronic data with equipment on Site such as EV chargers and payment consoles via broadband network with fixed IP (4G/5G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP);
    c. All relevant cost of broadband network including any service fee required during Maintenance Period shall be borne by the Sub-contractor.

ELE37.3 MATERIALS AND EQUIPMENT

ELE37.3.1 MODE 3(LITE) MEDIUM CHARGER

ELE37.3.1.010.A GENERAL

1. The Mode 3 (Lite) MC shall be designed for Mode 3 Charging as specified in IEC 61851-1. The Sub-contractor shall provide relevant type test certificates to substantiate compliance with this standard. The Mode 3 (Lite) MC shall be able to deliver rated power output of not less than 7kW, 220V single phase. All the fixed installation shall comply with the relevant requirements of the Electricity Ordinance (Cap.406) and its subsidiary Regulations;
2. The Mode 3 (Lite) MC shall comprise a wall-mounted or floor-mounted pole fitted with an IEC 62196 type 2 32A socket, and integrated with all required power, control and communication system for safe and satisfactory charging of an electric vehicle complying with the relevant IEC charging standards. A 32A double pole isolator shall be provided at the proximity of the Mode 3 (Lite) MC for maintenance purpose;
3. The Mode 3 (Lite) MC casing shall provide protection against a minimum impact severity of AG2;
4. Covers shall be provided for protection of the 32A socket;
5. The Mode 3 MC (Lite) shall be provided with an electrical or mechanical system to prevent the plugging / unplugging of the charging plug unless the socket outlet or the vehicle connector has been switched off from the supply. The Mode 3 (Lite) MC shall be designed to ensure the inserted charging plug will be automatically unlocked to allow removal from the charging socket after normal stopping of the charging process or when the charger is faulty or under failure of the electricity supply to the Mode 3 (Lite) MC;
6. The Mode 3 (Lite) MC shall be protected from ingress of dust and water to an index of protection of IP54 in accordance with IEC 60529;
7. Indication light(s) with instruction notice to show each colour / flashing from indication light represented the charger status or display screen shall be provided for each charger in order to show the charger status including out of services, ready for charging, charging and charging completed;
8. Local job reference for installation of the Mode 3 (Lite) MC, and with at least 12 months in-service record upon completion of the installation shall be provided;
9. The Mode 3 (Lite) MC shall be suitable for the following operation flow by RFID card to initiate the start / stop of the charging process at monthly parking space is as follow for reference:
    a. The driver parks the EV at the designated parking area and switch off the power of EV;
    b. The driver connects the charging cable into EV charging inlet and Mode 3 (Lite) MC socket. Once the charging cable is plugged into the EV and Mode 3 (Lite) MC, the EV is ready for charging;
    c. The driver taps the RFID card over the card reader on Mode 3 (Lite) MC. Once it is validated, the charging process will be activated. The charging cable shall be locked up automatically;

d. After the charging process is completed, the charger will stop automatically. Charging is completed and the charging cable can be unlocked by tapping the RFID card over the card reader on Mode 3 (Lite) MC. If the driver would like to terminate the charging process during charging, the driver stops the charging process by tapping the RFID card over the card reader on Mode 3 (Lite) MC. Once it is validated, the driver can stop the charging process and unlock the charging cable from charger.

ELE37.3.2 MODE 3 MEDIUM CHARGER

ELE37.3.2.010.A GENERAL

1. The Mode 3 MC shall be designed for Mode 3 Charging as specified in IEC 61851-1. The Sub-contractor shall provide relevant type test certificates to substantiate compliance with this standard. The Mode 3 MC shall be able to deliver rated power output of 7kW, 220V single phase. All the fixed installation shall comply with the relevant requirements of the Electricity Ordinance (Cap.406) and its subsidiary Regulations;
2. The Mode 3 MC shall comprise a wall-mounted or floor-mounted pole fitted with an IEC 62196 type 2 32A socket, and integrated with all required power, control and communication system for safe and satisfactory charging of an electric vehicle complying with the relevant IEC charging standards. A 32A double pole isolator shall be provided at the proximity of the Mode 3 MC for maintenance purpose;
3. The Mode 3 MC casing shall provide protection against a minimum impact severity of AG2;
4. The payment consoles and RFID card reader shall be provided for the Mode 3 MC to initiate the start / stop of the charging process;
5. Covers shall be provided for protection of the 32A socket;
6. Indication light(s) with instruction notice to show each colour / flashing from indication light represented the charger status or display screen shall be provided for each charger in order to show the following charger status or equivalent in both English and Chinese description:
   a. Out of Services 暫停服務
   b. Ready for Charging 準備充電
   c. Charging 充電中
   d. Charging Completed 充電完成
7. The Mode 3 MC shall be compliant with the Open Charge Point Protocol (OCPP) 1.6J or later version;
8. The Mode 3 MC shall be provided with an electrical or mechanical system to prevent the plugging / unplugging of the charging plug unless the socket outlet or the vehicle connector has been switched off from the supply. The Mode 3 MC shall be designed to ensure the inserted charging plug will be automatically unlocked to allow removal from the charging socket after normal stopping of the charging process or when the charger is faulty or under failure of the electricity supply to the Mode 3 MC;
9. The Mode 3 MC shall be protected from ingress of dust and water to an index of protection of IP54 in accordance with IEC 60529;
10. The Mode 3 MC shall have built-in power meter being capable of providing real time electrical data. The real time data captured includes but not limited to start / stop charging time and charging duration, voltage, ampere, power factor, kVA, real power (kWh) and other additional real time data as required by the CM. The Sub-contractor shall submit proposal regarding output format of the real time electrical data to the CM for approval;

11. The Mode 3 MC shall have appropriate input / output sockets at a convenience position, using Ethernet LAN or similar socket and plug as approved by the CM, for communication with central workstation for central energy monitoring purpose and fee collection system. The connection cable with the appropriate plug shall be provided. The data shall be in a common excel format or raw data with software for converting the raw data into excel format, as approved by the CM. In case a proprietary made software for data retrieval is being used, free license for the software shall be provided. The Sub-contractor shall demonstrate the function with a portable PC during testing and commissioning;
12. Local job reference for installation of the Mode 3 MC with central management system, and with at least 12 months in-service record upon completion of the installation shall be provided;
13. The Mode 3 MC shall be suitable for the following operation flow by RFID card at hourly parking space in by-pass mode upon failure of central workstation and / or fee collection system is as follow for reference:
    a. The driver parks the EV at the designated parking area and switch off the power of EV;
    b. The driver connects the charging cable into EV charging inlet and Mode 3 MC socket. Once the charging cable is plugged into the EV and Mode 3 MC, 'Ready for Charging' display or change of indication light colour will be shown on the charger;
    c. The carpark operator taps the RFID card over the card reader on Mode 3 MC. Once it is validated, the charging process will be activated. The display on charger will be changed to 'Charging' or change of indication light and the charging cable shall be locked up automatically;
    d. After the charging process is completed, the charger will stop automatically. The display will change to 'Charging Completed' or change of indication light colour and the charging cable can be unlocked by tapping the RFID card over the card reader on Mode 3 MC. If the driver would like to terminate the charging process during charging, the carpark operator stops the charging process by tapping the RFID card over the card reader on Mode 3 MC. Once it is validated, the charging process will be stopped and the charger cable will be unlocked from the charger.
14. The Mode 3 MC shall also be suitable for the following operation flow by remote on / off of central workstation at hourly parking space in by-pass mode upon failure of fee collection system is as follow for reference:
    a. The driver parks the EV at the designated parking area and switch off the power of EV;
    b. The driver connects the charging cable into EV charging inlet and Mode 3 MC socket. Once the charging cable is plugged into the EV and Mode 3 MC, 'Ready for Charging' display or change of indication light colour will be shown on the charger;
    c. The driver goes to Shroff office to inform the carpark operator the respective parking space number. The carpark operator then activates the charging process via the central workstation. The display on charger will be changed to 'Charging' or change of indication light colour and the charging cable shall be locked up automatically;

d. After the charging process is completed, the charger will stop automatically. The display will change to 'Charging Completed' or change of indication light colour and the charging cable can be unlocked by carpark operator via the central workstation as requested by the driver. If the driver would like to terminate the charging process during charging, the driver should go to the Shroff office to inform the carpark operator. The carpark operator then stops the charging process via the central workstation and unlocks the charging cable from charger.

15. For normal operation mode, the Mode 3 MC shall also be suitable for fee collection. One of the possible operation flow by paying the selected duration first before start charging with fee collection system is as follow for reference:
    a. The driver parks the EV at the designated parking area and switch off the power of EV;
    b. The driver connects the charging cable into EV charging inlet and Mode 3 MC socket. Once the charging cable is plugged into the EV and Mode 3 MC, 'Ready for Charging' display or change of indication light colour will be shown on the charger;
    c. The driver goes to the payment console and selects the respective parking space number in the touch screen. The driver selects the charging duration and presents the payment card or device to the reader to start the charging process. The display on charger will be changed to 'Charging' or change of indication light colour and the charging cable shall be locked up automatically;
    d. After the charging process is completed, the charger will stop automatically. The display will change to 'Charging Completed' or change of indication light colour and the driver presents the same payment card or device which is used to start the charging process to the reader of payment console to pay the charging fee and unlock the charging cable. If the driver would like to terminate the charging process during charging, the driver should go to the payment console and present the same payment card or device which is used to start the charging process to the reader to pay the charging fee and press the 'stop' selection on the payment console to stop charging and unlock the charging cable from charger.
16. Mode 3 MC shall be either with front or side entry socket. The Sub-contractor shall select the suitable type of Mode MC to suit site installation requirement, in which the Mode 3 MC with charging cable being plugged shall not occupy additional space inside the parking space;
17. The Mode 3 MC shall be designed to enable adoption of fee collection system, LMS and HA data hub server.

ELE37.3.2.020.A INTERFACE WITH PAYMENT CONSOLES FOR FEE COLLECTION SYSTEM

1. The payment consoles shall exchange electronic data with the Mode 3 MC with the fee collection system and central workstation. The Mode 3 MC shall be designed in OCPP as specified in ELE37.3.2.010, and equipped with all necessary facilities including Ethernet LAN ports or other equivalent communication ports that supports electric charging, networking, payment gateway and remote monitoring such that it has the capability of serving as an online Mode 3 MC.

ELE37.3.2.030.A INTERFACING REQUIREMENTS WITH CENTRAL WORKSTATION

1. The fee collection system, Mode 3 MC shall be designed with communication protocol in compliance with the OCPP as specified in ELE37.3.2.010, and equipped with Ethernet LAN port or other suitable communication ports as approved by the CM and application programme interface to allow data logging, data transmission to central workstation for central monitoring and analysis of fee collection system data, the Mode 3 MC data. The payment console, Mode 3 MC shall be equipped with Ethernet LAN port or other provision to enable adoption of a smart system with features including fee collection system, dissemination of real-time information including availability status, capturing of usage data, reporting of utilization, smart phone interface and apps, load management, etc. The Mode 3 MC On / Off status and output signal for disconnection of charging plug from the charger shall be available and readable such that the EV medium and quick charger availability status can be relayed to the remote server for on-line display;
2. The fee collection system, Mode 3 MC shall be designed with time synchronization feature to synchronise with the clock time of the central workstation;
3. The Mode 3 MC should be designed with different operation modes including:
   a. By-pass mode for local start / stop operation;
   b. Control terminal mode for connection of the EV medium charger(s) to the central workstation for centralized management / fee collection, which will override the stand-alone mode automatically.

ELE37.3.332A DOUBLE POLE ISOLATOR

ELE37.3.3.010.9 GENERAL

1. The 32A double pole isolator shall comply with the requirement as mentioned in ELE3.8;
2. Isolators mounted outdoors, or in positions where they may be exposed to rain or water, shall be weatherproof with ingress protection of at least IP55 to BS EN 60529 or IEC 60529.

ELE37.3.4CENTRAL WORKSTATION

ELE37.3.4.010.A GENERAL

1. The Central Workstation shall include the following:
   a. Central workstation completed with a fully developed EV charging facilities management software and central database. The central workstation shall possess with the following minimum hardware requirements whichever is higher for the computer OCPP server and computer workstation:

Computer OCPP Server	
Processor:	Intel i7 and Four Core Chip minimum or equivalent
CPU Speed:	3.4 GHz or above
Memory:	16GB DDR4 RAM or above
Storage harddisk:	Dual harddisks each not less than 4TB SSD in RAID each whichever is higher
Monitor:	Minimum 22” 1920 x 1080 full High Definition LED display
Communications:	Ethernet 10/100BaseT connection or equivalent

Drive:	DVD ± RW / Multi-media player
Accessory:	Internal card reader with USB port
Operating System and Software	MS Windows Server or Linux Server or equivalent
Computer Workstation	
Processor:	Four Core Chip minimum
CPU Speed:	3.4 GHz or above
Memory:	16GB DDR4 RAM or above
Storage harddisk:	Dual harddisks each not less than 1TB SSD in RAID each whichever is higher
Monitor:	Minimum 22" 1920 x 1080 full High Definition LED display
Communications:	Ethernet 10/100BaseT connection or equivalent
Drive:	DVD ± RW / Multi-media player
Accessory:	Internal card reader with USB port
Operating System and Software	MS Windows and MS Office (Traditional Chinese) of latest versions

b. Uninterrupted power supply unit (UPS) - for a back-up period of not less than 15 minutes;

c. Communication interface for fee collection system, LMS and Mode 3 MC and Mode 4 QC;

d. Data point for broadband connection with fixed IP (4G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP);

e. Report printer.2. The Central Workstation shall be capable of handling the following activities:

a. Processing of charging for Mode 3 MC and Mode 4 QC;

b. Record of malfunctions of equipment and every transaction;

c. Daily charging record and statistics;

d. Information on Mode 3 MC and Mode 4 QC;

e. Activation and deactivation of the Mode 3 MC and Mode 4 QC;

f. Automatic alarm message in case of faulty operation;

g. Display graphical mapping with individual charger and power consumption status;

h. Real time swap tariff schemes: Time charging or Energy charging subject to setting of tariff scheme;

i. Charging unit rate pre-set and re-adjustable.

3. The Central Workstation shall link up with all other components to monitor and proceed with the operations of the EV charging facilities through an Ethernet LAN network. It shall provide overall control of EV charging activities, and data collected, and comprehensive and efficient financial and statistical report generation;

4. The Central Workstation shall be able to allow reading, checking, debiting and archiving against usage of Mode 3 MC, Mode 4 QC and process the activation / deactivation requests of the Mode 3 MC, Mode 4 QC and store the charging information in the central database;

5. All software included shall be in free or full user licenses with no expiry date. Full set of system recovery diskettes, back up diskettes for the software shall be provided. The administration right of the EV charging facilities management software shall be vested to the estate management staff;
6. Spare capacity shall be allowed in the central workstation for future addition or change of Mode 3 MC and Mode 4 QC to all parking spaces;
7. All data shall be provided in a file format for data exchange subject to the approval by the CM. The data of individual EV charger charging history shall be exported to different file format, e.g. Excel, subject to the approval by the CM. The Sub-contractor shall install programme in the OCPP server so that the file can be opened directly;
8. The availability of EV parking spaces as well as the Mode 3 MC and Mode 4 QC status & charging status of car parks with chargers shall be stored in a file that is updated in a time interval as the default setting subject to the approval by the CM. The update interval shall be user configurable;
9. The software shall be reliable and robust (fault-tolerant) such that the system would maintain reliable operation even in presence of hardware faults and software errors;
10. The OCPP Server shall be included featuring ports and communication hardware as needed;
11. The live data such as charger status log according to OCPP 1.6J or latest version of EV chargers shall be collected (in every 15 minutes interval) and kept in the OCPP Server for at least 12 months, but not limited to the following:
    a. Parking Space ID (unique ID for each parking space);
    b. Charger Availability (Unavailable, Available);
    c. Charger Status (available, charging, preparing, finishing or suspended);
    d. Start Time with meter reading (kWh) (the last starting time of the MC and QC to charge an EV) with meter reading (kWh);
    e. Stop Time with meter reading (kWh) (the stop time of the MC and QC with reference to its start time. If the charger is still charging an EV, a dashed line will be displayed.);
    f. Charging Duration (hh:mm) (the duration between start and stop time. If the charger is still charging an EV, a dashed line will be displayed.);
    g. Start Reading (kWh) (the accumulated power of the smart meter captured by start charging time.);
    h. Stop Reading (kWh) (the accumulated power on smart meter captured by stop charging time. A dashed line will be displayed when the MC and QC are engaged.);
    i. Charging Energy (kWh) (accumulated real power between “Start Reading (kWh)” and “Stop Reading (kWh)”;
    j. Live Reading(kWh) (current reading of accumulated real power on smart meter);
    k. Voltage(V) (current reading of voltage of smart meter);
    l. Current(A) (current reading of current of smart meter);
    m. Power Factor (current reading of power factor of the smart meter);
    n. Real Power (current reading of output power of the smart meter);
    o. Charger Last Update Time (last updated time of the charger);
    p. Meter Last Update Time (last updated time of the smart meter);
    q. Pulse Width Modulation (PMW) Voltage Level;
    r. The live data shall be displayed in the OCPP Server and exported in Excel format.

12. The Central Workstation shall be suitable for exchanging Octopus Data Exchange File(s) (in Octopus proprietary format) with Octopus Clearing System and fee collection system;
13. Software provision in the Central Workstation for future installation of other payment devices such as online or mobile apps shall be allowed;
14. Computer workstation shall only be used in daily operation and monitoring by the operator.

ELE37.3.4.020.N INTERFACING REQUIREMENTS WITH HA DATA HUB SERVER

1. The Central Workstation shall be automated with system interfaces to exchange electronic data with a HA's data hub server via broadband network with fixed IP (4G/5G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP). The Contractor is responsible for implementing the process to perform the following system interfaces between Central Workstation and the data hub server:
    a. Providing information of the detailed transactions for reporting to HA, and sending it to the data hub server;

        The process is to produce and send an interface file to the data hub server for reporting the detailed transactions. The information to be sent to the data hub server includes but not limited to the following:

        i. Payment Console ID;
        ii. Transaction Reference (Payment Console reference);
        iii. Transaction Type;
        iv. Charging Start Date and Time;
        v. Charging End Date and Time;
        vi. Charging Duration (hh:mm) (the duration between start and stop time);
        vii. Charging Energy (kWh);
        viii. EV-Charger ID;
        ix. Amount collected;
        x. Parking Space ID;
        xi. Amount Collected;
        xii. Payment Method;
        xiii. RFID Card ID (if applicable).

    b. Providing statistical information for management reporting to HA, and sending it to the data hub server;

        The process is to produce and send an interface file to the data hub server daily for reporting the detailed transactions. The information to be sent to the data hub server includes but not limited to the following:

        i. EV-Charger ID;
        ii. Parking Space ID;
        iii. Total Charging Duration;
        iv. Total Amount Collected.

2. The Sub-contractor shall develop all programs and / or scripts in Central Workstation to perform the system interface processes and automate these processes such that the interfaces can be performed with minimum human operation. The automation shall include:
    a. To generate the file to the data hub server;
    b. To connect to the data hub server by broadband network / 4G/5G USB modem;

c. To provide Secure File Transfer Protocol (SFTP) username and password for authentication;

d. To make SFTP file transfer request to the data hub server to send / get the files as binary data;

e. To disconnect the SFTP session;

f. To log the progress of the automated processes during execution, and save the log in Central Workstation;

g. To display message in Central Workstation to show the result of the processes after execution.

3. The system interface processes shall be automated to run daily at regular timeslot. When required, ad-hoc execution of the automated processes shall be allowed;

4. The system interface files and the logs from the executed processes shall be kept in the Central Work Station for an adjustable period up to three months;

5. The Sub-contractor shall provide the user guide for operating and administering the system interfaces. The user guide shall include but not limited to:

   a. How to set the daily schedule of the automated processes for regular execution;

   b. How to launch the automated processes manually for ad-hoc execution;

   c. How to inspect the result of the automated processes after execution;

   d. The exception handling procedures when the execution of any automated process failed which include the reporting channel(s) for the failure, the steps to manually dispatch and receive the electronic data with alternative means (e.g. flash static memory, DVD-R, e-mail attachment, etc.) in case connection to the data hub server cannot be established, the steps to manually perform the failed system interface process, etc.;

   e. How to change the system interface parameters, such as the login username and password, the carpark stock identifier, the destination broadband network / 4G USB modem connection to the data hub server, etc..

6. The Sub-contractor is responsible for liaising with and providing assistance to HA staff for implementation of the system interfaces. The implementation will consist of the following tasks:

   a. To set up broadband network / 4G/5G USB modem connection;

   b. To develop SFTP requests from Central Workstation;

   c. To develop programs and / or scripts in Central Workstation;

   d. To prepare user guide for operating and administering the system interfaces;

   e. To participate in the acceptance testing of the system interfaces to prove that all automated system interface processes work properly, information to the data hub server is correct;

   f. To provide proper training for the operation and administration of the system interfaces to the operators.

ELE37.3.4.030.N INTERFACING REQUIREMENTS WITH EPD EV-CHARGING EASY APP

1. The Central Workstation shall be automated with system interfaces to exchange electronic data with a EPD's data hub server via broadband network with fixed IP (4G/5G USB modem with fixed IP may be accepted subject to CM's approval in case of unavailability of broadband network with fixed IP). The Contractor is responsible for implementing the process to perform the following system interfaces between Central Workstation and the data hub server;

2. The Sub-contractor is responsible for implementing the processes to provide data file containing for EV-Charging Easy APP information (the format in accordance with the structure specified by EPD) to EPD's data hub server for display information in EV-Charging Easy APP on EPD's request. The Sub-contractor shall design and provide a system software for interfacing and exchanging electronic data of information with EPD;
3. The Sub-contractor shall be responsible for liaising with EPD for the proper implementation of the interfaces, including the interface channel, frequency etc..

ELE37.3.4.040.N RADIO FREQUENCY IDENTIFICATION (RFID) CARD

1. The RFID card shall be made of durable plastic with size to ISO/IEC7810 ID-1. The card shall be a type commonly used in the EV charging system;
2. The central workstation with software tool shall be designed to permit RFID cards to be issued with online simple operation of command code on the Mode 3 MC and Mode 4 QC. The software tool shall be provided or manual operation on EV charger's card reader to input the RFID card's code on the Mode 3 (Lite) MC for offline operation. The RFID card shall be unique coded that the administrator can transmit the RFID card's code to the EV charger for access control of the EV charger;
3. Each driver of monthly parking control locally of the designated EV charger by the RFID card to initiate the start / stop of the charging process;
4. The Sub-contractor shall provide 5 nos. of RFID card for each Mode 3 (Lite) MC or Mode 3 MC with LMS for monthly parking;
5. The carpark operator control all of the EV chargers by the RFID card to initiate the start / stop of the charging process in case for by-pass mode for hourly parking and / or monthly parking;
6. The Sub-contractor shall provide 5 nos. of RFID card in total for Mode 3 MC and Mode 4 QC for hourly parking;
7. The Housing Authority logo, charger reference number and the name of the corresponding estate shall be clearly shown on the RFID cards. The Sub-contractor shall submit the charger reference number for printing in the card to the CM for approval.

ELE37.3.5 MODE 4 QUICK CHARGER

ELE37.3.5.010.N GENERAL

1. The Mode 4 QC shall be designed for Mode 4 Charging as specified in IEC 61851-1, and IEC 61851-23. The Sub-contractor shall provide relevant type test certificates to substantiate compliance with this standard. All the fixed installation shall comply with the relevant requirements of the Electricity Ordinance (Cap.406) and its subsidiary Regulations. The Mode 4 QC shall possess with the following minimum hardware requirements whichever is higher:

Charging Mode	Mode 4 Charging (IEC 61851-23:2014 compliance)
Input Voltage	380±10%, 3-phase
Input Frequency	50Hz±2%
Phase	3-phase 4-wire
Power Factor	0.96 equal or above
Ground Fault Protection	Residual current protective device at least Type A having the characteristic specified in Code 11J of the Electrical CoP

Output Power	Min. 100kW equal or up to Max.120kW
Output Voltage	200Vdc to 1,000Vdc for CCS Combo 2
Overall Conversion Efficiency	0.94% equal or above
Ambient Temperature	-10^{o}C to +50^{o}C or larger range
Harmonic	Total 5% equal or less
Cooling Method	Forced air-cooled / liquid-cooled or any appropriate cooling method
Noise Level	65dB equal or less (while charging)

2. The Mode 4 QC shall comprise a floor standing cabinet fitted with the following:
   a. The display screen with Minimum 7" inches touch LED monitor screen with the user interface (UI) displaying the operation information of the quick charger on a screen should be bilingual, i.e. both English and traditional Chinese are available for drivers;
   b. DC quick charger with charging cable;
   c. All required power modules should be designed to have multiple sets of min. 10kW or above per power module and they can be easily drawn out and inserted in. The charger can be operated in the lower charging output power in case of up to 3 power modules failure;
   d. Control and communication system;
   e. All above installed in the steel cabinet for safe and satisfactory charging of an electric vehicle complying with the relevant IEC charging standards.
3. The Mode 4 QC shall be converted three-phase AC to DC within the EV charging equipment. The resulting DC is supplied to the EV via a charging cable that is tethered to the EV charging equipment;
4. The Mode 4 QC casing shall provide protection against a minimum impact severity of AG2 as approved by the CM. It shall be a stainless steel or robust metal enclosure with epoxy powder coating finish with minimum 1.5mm thick, or other materials as approved by the CM;
5. The payment consoles and RFID card readers shall be provided for the Mode 4 QC to initiate the start / stop of the charging process;
6. The Mode 4 QC shall install standard quick charger and incorporates one DC charging standard in CCS Combo 2 and able to deliver not less than 100kW DC with max. current at 200Adc connector which shall be compatible with the CCS Combo 2 with the IEC 62196-3 compliant connector with a charging cable of about 5 metres in length;
7. The payment consoles shall connect with the Mode 4 QC to initiate the start / stop of the charging process. The charger shall be able to stop the charging process automatically when the EV is fully charged or the connector is disconnected from the EV;
8. The display screen shall be provided for each charger in order to show the following charger status or equivalent in both English and Chinese description:
   a. Out of Services 暫停服務
   b. Ready for Charging 準備充電
   c. Charging 充電中
   d. Charging Completed 充電完成
9. The Mode 4 QC shall be compliant with the Open Charge Point Protocol (OCPP) 1.6J or later version;

10. The DC quick charger shall normally be locked when charging unless the EV has been charging completed or stop charging from the EV;
11. The Mode 4 QC shall be protected from ingress of dust and water to an index of protection of IP55 in accordance with IEC 60529;
12. The Mode 4 QC shall have built-in power meter being capable of providing real time electrical data. The real time data captured includes but not limited to start / stop charging time and charging duration, voltage, ampere, power factor, kVA, real power (kWh) and data refers to ELE37.3.4.010 and other additional real time data as required by the CM. The Sub-contractor shall submit proposal regarding output format of the real time electrical data to the CM for approval;
13. The Mode 4 QC shall have appropriate input / output sockets at a convenience position, using Ethernet LAN or similar socket and plug as approved by the CM, for communication with central workstation for central energy monitoring purpose and fee collection system. The connection cable with the appropriate plug shall be provided. The data shall be in a common excel format or raw data with software for converting the raw data into excel format, as approved by the CM. In case a proprietary made software for data retrieval is being used, free license for the software shall be provided. The Sub-contractor shall demonstrate the function with a portable PC during testing and commissioning;
14. Oversea / Local job reference for installation of the Mode 4 QC with central management system, and with at least 12 months in-service record upon completion of the installation shall be provided;
15. The EV charger shall be designed to enable adoption of fee collection system;
16. For normal operation mode, the Mode 4 QC shall also be suitable for fee collection. One of the possible operation flow by paying the selected duration first before start charging with fee collection system is as follow for reference:
    a. The driver parks the EV at the designated parking area and switch off the power of EV;
    b. The driver connects the vehicle connector into EV charging inlet from Mode 4 QC. Once the vehicle connector is plugged into the EV from Mode 4 QC, ‘Ready for Charging’ display will be shown on the charger;
    c. The driver goes to the payment console and selects the respective parking space number in the touch screen. The driver selects the charging duration and presents the payment card or device to the reader to start the charging process. The display on charger will be changed to ‘Charging’ and the vehicle connector can be locked up by the EV automatically;
    d. After the charging process is completed, the charger will stop automatically. The display will change to ‘Charging Completed’ and the driver presents the same payment card or device which is used to start the charging process to the reader of payment console to pay the charging fee and unlocked the vehicle connector. If the driver would like to terminate the charging process during charging, the driver should go to the payment console and present the same payment card or device which is used to start the charging process to the reader to pay the charging fee and press the ‘stop’ selection on the payment console to stop charging and the vehicle connector will be unlocked from the EV, and plugged back to the QC by driver.
17. The Mode 4 QC shall be suitable for the following operation flow by RFID card at hourly parking space in by-pass mode upon failure of central workstation and / or fee collection system is as follow for reference:
    a. The driver parks the EV at the designated parking area and switch off the power of EV;

b. The driver connects the vehicle connector into EV charging inlet from Mode 4 QC. Once the vehicle connector is plugged into the EV from Mode 4 QC, 'Ready for Charging' display will be shown on the charger;

c. The carpark operator taps the RFID card over the card reader on Mode 4 QC. Once it is validated, the charging process will be activated. The display on charger will be changed to 'Charging' and the vehicle connector can be locked up by the EV automatically;

d. After the charging process is completed, the charger will stop automatically. The display will change to 'Charging Completed' and the vehicle connector can be unlocked by tapping the RFID card over the card reader on Mode 4 QC. If the driver would like to terminate the charging process during charging, the carpark operator stops the charging process by tapping the RFID card over the card reader on Mode 4 QC. Once it is validated, the charging process will be stopped, the vehicle connector will be unlocked from the EV, and plugged back to the QC by driver.

18. The Mode 4 QC shall also be suitable for the following operation flow by remote on / off of central workstation at hourly parking space in by-pass mode upon failure of fee collection system is as follow for reference:

    a. The driver parks the EV at the designated parking area and switch off the power of EV;

    b. The driver connects the vehicle connector into EV charging inlet from Mode 4 QC. Once the vehicle connector is plugged into the EV from Mode 4 QC, 'Ready for Charging' display will be shown on the charger;

    c. The driver goes to Shroff office to inform the carpark operator the respective parking space number. The carpark operator then activates the charging process via the central workstation. The display on charger will be changed to 'Charging' and the vehicle connector can be locked up by the EV automatically;

    d. After the charging process is completed, the charger will stop automatically. The display will change to 'Charging Completed' and the vehicle connector can be unlocked by carpark operator via the central workstation as requested by the driver. If the driver would like to terminate the charging process during charging, the driver should go to the Shroff office to inform the carpark operator. The carpark operator then stops the charging process via the central workstation, the vehicle connector will be unlocked from the EV, and plugged back to the QC by driver.

19. Mode 4 QC shall be either with front or side charging cable with chargers. The Sub-contractor shall select the suitable type of Mode 4 QC to suit site installation requirement, in which the Mode 4 QC with charging cable being plugged shall not occupy additional space inside the parking space;

20. The Contractor shall supply and install concrete plinth as foundation for installation of EV multi-standard quick chargers at EV quick charging station as advised by manufacturer. The concrete plinth with sufficient height shall be designed that the power supply cable can run underneath the DC charging station and be properly terminated onto the equipment.

ELE37.3.5.020.N INTERFACE WITH PAYMENT CONSOLES FOR FEE COLLECTION SYSTEM

1. The payment consoles shall exchange electronic data with the Mode 4 QC with the fee collection system and central workstation. The Mode 4 QC shall be designed in OCPP as specified in ELE37.3.5.010, and equipped with all necessary facilities including Ethernet LAN ports or other equivalent communication ports that supports electric charging, networking, payment gateway and remote monitoring such that it has the capability of serving as an online Mode 4 QC.

ELE37.3.5.030.N INTERFACING REQUIREMENTS WITH CENTRAL WORKSTATION

1. The fee collection system, Mode 4 QC shall be designed with communication protocol in compliance with the OCPP as specified in ELE37.3.5.010, and equipped with Ethernet LAN port or other suitable communication ports as approved by the CM and application programme interface to allow data logging, data transmission to central workstation for central monitoring and analysis of fee collection system data, he Mode 4 QC data. The payment console, Mode 4 QC shall be equipped with Ethernet LAN port or other provision to enable adoption of a smart system with features including fee collection system, dissemination of real-time information including availability status, capturing of usage data, reporting of utilization, smart phone interface and apps, load management, etc. The Mode 4 QC On / Off status and output signal for disconnection of charging plug from the charger shall be available and readable such that the EV medium and quick charger availability status can be relayed to the remote server for on-line display;
2. The fee collection system, Mode 4 QC shall be designed with time synchronization feature to synchronise with the clock time of the central workstation;
3. The Mode 4 QC should be designed with different operation modes including:
   a. By-pass mode for local start / stop operation;
   b. Control terminal mode for connection of the EV medium charger(s) to the central workstation for centralized management / fee collection, which will override the stand-alone mode automatically.

ELE37.3.6 LOAD MANAGEMENT SYSTEM

ELE37.3.6.010.N GENERAL

1. In case the electricity supply capacity in premises cannot support simultaneous medium charging at all monthly parking spaces to be covered, a load control by means of load management system (LMS) can be implemented to facilitate the EV charging in the carpark so as to fully utilise the available electricity supply for EV charging circuits and subject to the CM for approval prior to installation. When LMS is implemented, Mode 3 MC shall be provided instead of Mode 3 (Lite) MC for all monthly parking spaces which shall be connected to the central workstation;
2. The load management controller shall capable to control in different management control algorithms with numbers of connected chargers for Mode 3 MC;
3. The LMS shall adopt OCPP with 1.6J or later version to ensure compatibility with most EV chargers available in the market adopting the same protocol. Automatic sharing and distribution of power supply to all parking spaces shall be provided;
4. The control algorithms shall be devised in the LMS e.g. even distribution, queuing, priority, and etc. subject to the design. To enhance safety and reliability, fail-safe features shall also be provided in the LMS. The control algorithms can be modified by the LMS' supplier subject to management need from requested by Carpark operator;
5. A notification should be provided in the car park to alert users of the EV chargers that the anticipated charging rate (and hence charging time) may by varied with the prevalent demand on the total charging services in the carpark;
6. The Central Workstation described in ELE37.3.4 shall also be capable of handling the following activities for monthly parking only:
   a. Load management presented with graphical control;
   b. Even distribution mode in averaging current charging, the total current is shared with each individual car equally until the setting of minimum charging rating by queuing;

c. Priority mode that independent setting charging, the current is fixed to the designated Mode 3 MCs when charging and the remaining cars would be kept in averaging current charging;

d. Fail-safe in loss communication or failure with individual charger or whole cluster, the charging rating for all Mode 3 MCs would be set at minimal pre-set rating.

7. The Mode 3 MC completed with internal control device shall be compatible with the Load Management System that utilised for load control when charging.

ELE37.3.7 FEE COLLECTION SYSTEM

ELE37.3.7.010.N GENERAL

1. The fee collection system shall consist of central workstation and payment consoles to integrate the EV charging facilities on-site. The number of the payment consoles shall be confirmed by the CM. The fee collection system shall compatible with IEC 61851 and Open Charge Point Protocol (OCPP) v1.6J, subject to the EV charging facilities;
2. The payment console shall include the following:
   a. Octopus card reader;
   b. Communication interface (i.e. Octopus);
   c. Data point;
   d. Thermal printer;
   e. Hardware provision in the payment console for future installation of other payment devices such as online payment or mobile apps;
   f. Each payment console shall have sufficient capacity to serve all carpark spaces for future extension of EV charger.
3. The fee collection system shall be suitable for exchanging Octopus Data Exchange File(s) (in Octopus proprietary format) with Octopus Clearing System;
4. The fee collection system shall consist of 6 configurable EV charging tariff schemes, namely:
   a. Zero payment method (Before implementation fee collection for zero payment);
   b. Pre-paid time charge (Option after implementation fee collection);
   c. Pre-paid energy charge (Option after implementation fee collection);
   d. Post-paid time charge (Option after implementation fee collection);
   e. Post-paid energy charge (Option after implementation fee collection);
   f. Offline payment (Option after implementation fee collection).
5. The charging workflow and details of each scheme are detailed in the ELE37.3.2.010 and ELE37.3.5.010 of this Specification. The fee collection system shall be capable to enforce the captioned EV charging tariff schemes with the associated hardware and software provisions;
6. The fee collection system shall collect the EV charging tariffs by the Octopus card and shall be authorized by Octopus Holdings Limited for operations in Hong Kong through type approval test. Hardware provision shall be allowed in the payment console for future installation of other payment devices such as mobile payments;
7. The fee collection system shall operate through the internet router to perform Octopus card payment, paper receipt printing and vacancy reporting to the designated servers;
8. The fee collection system shall centralize the information collected from the live status of the EV charging facilities up to 2 years. The Central Workstation shall also perform the functions, including, but not limited to:

a. Management of the four (4) configurable EV charging tariff schemes;
b. Interface with the EV charging system for enabling / disabling of service, adopting tariff schemes and collecting usage data (i.e. power consumption, occupancy);
c. Data exchange with the payment consoles for usage of EV chargers and collection of tariffs;
d. Payment data transferred to Central Workstation for usage information;
e. Conduct Octopus Card payment service;
f. Store the required log and data, and generate statistic / summary reports;
g. Generate and transmit automatic notification messages via paper receipt;
h. Record fault log of all EV chargers and the System;
i. Any necessary functions to enable the payment service.

9. Each payment console shall act as the man-machine interface with the public users to operate the EV charging facilities and conduct payment, with the functions including but not limited to:
   a. Display the real-time status of each EV chargers on-site (e.g. available, in-use, out-of-service, error messages (e.g. Go to Shroff office for assistant), the remaining charging time of individual charger, etc.);
   b. Select, enable and disable the power transmission of each individual EV charger;
   c. Select, enable and disable EV charging cable locking mechanism of each individual EV charger;
   d. Select the desire charging duration / scheme;
   e. Conduct payment, check-in and check-out through Octopus card reader to select the desire charging duration / scheme;
   f. Any necessary functions to enable the payment service;
   g. The payment console shall also comply with the following parameters:

Processor:	Intel i5 and Four Core Chip minimum or equivalent
CPU Speed:	2.5 GHz or above
Memory:	At least 8GB DDR4 RAM
Storage harddisk:	One (1) unit of >=256GB SSD
Touch-screen:	21.5-inch LCD touch-screen which supports multi-touch function or better
Resolution:	1920 x 1080 pixels or better
Brightness:	300 cd/m^2 or better
Materials:	Metal casing or other material approved by the CM
Dimension	At most 500 (W) x 1800 (H) x 350 (D) or other size approved by the CM
Mounting	Floor mounted stand or wall mounted, subject to the site conditions
Operating voltage:	220 Vac
Operating system:	Agreeable to Octopus Holdings Limited

10. The payment consoles shall act as the platform for public to control and operate the new EV charging facilities on-site, perform EV charging payment for one to many;

11. The payment consoles shall be a computer with operating system (OS) agreeable to Octopus Holdings Limited installed and equipped with a LCD touch-screen and Octopus card reader to support the payment online service of the system;
12. The payment consoles shall be equipped with a tailor-made graphical user interface (GUI), e.g. showing the car park number and charging status, etc. The GUI shall allow user to select any connected EV chargers, activate and deactivate the power charging service, conduct payment via Octopus cards, and provide charging status and data for users' reference. The design and the workflow of the GUI shall be proposed by the Sub-contractor and submitted for CM's approval;
13. The payment consoles shall be equipped with touch-screen supporting multi-touch to collect users' input for the EV charging service;
14. The payment consoles shall be equipped with an Octopus card reader, support payment via Octopus card system and shall be authorized by Octopus Holdings Limited for Octopus card operation in Hong Kong. The Sub-contractor shall design the system and acquire the type approval from Octopus Holdings Limited;
15. Due to limited space available on-site, the Sub-contractor shall propose a suitable size of the payment consoles for CM's approval and tailor-made (if necessary) the payment consoles at his own expense;
16. The cable jacks shall be covered with locks or sealed off such that they can only be accessible by maintenance staff with specific tools (e.g. key locking, etc.);
17. The fee collection system shall be able to generate and transmit notification messages subject to the usage of each individual public user via receipt. The notification messages shall consist charging status and tariff summary information, including but not limited to:
    a. Current date and time of the System when generating the notifications;
    b. EV charger number selected;
    c. EV charging tariff scheme adopted;
    d. Duration of the EV charging service selected;
    e. Service start time and service end time;
    f. Total tariff to be collected;
    g. Tariff summary and breakdown;
    h. Error / fault notifications;
    i. Idling and penalty time notifications;
    j. Octopus card number and details;
    k. Other information and message as directed by the CM.
18. The fee collection system shall consist of interlocking mechanism to maintain the service of in-used EV chargers and prevent any intrusion from third party other than the original public user. The fee collection system shall verify the same Octopus card number before enabling, disabling, suspending and amending the service of in-used EV charger;
19. The interlocking mechanism shall extend to the operations of EV charger, where the connected charging cable shall only be released when the service is completed / suspended and checkout by the same Octopus card;
20. The Sub-contractor shall provide three (3) registered Octopus cards with the administrator rights to access to all payment consoles for fully operating all EV chargers. To access of these Octopus cards shall be recorded in the data logging for checking. The interlocking mechanism shall exclude these registered Octopus cards;

21. The fee collection system shall provide a bypass mode such that a failure of the System shall allow the continuous operation of the EV chargers. Under the activation of the bypass mode, all EV chargers shall allow users to operate directly as the same as the original operation without the fee collection system detailed in the ELE37.3.2.010 and ELE37.3.5.010 of this Specification. This bypass mode shall support both automatic and manual activation;
22. For failure of the fee collection system, the EV chargers shall be equipped with emergency button and shall allow users to stop the charging process and unlock the connected power cable. Or the Sub-contractor shall coordinate with the original supplier of the EV charging facilities and update all EV chargers to provide a default hidden "Stop Charging" button on the touch screen panel of the EV chargers during charging process. The button will be automatically shown upon failure of the fee collection system, and shall allow users to stop the charging process and unlock the connected power cable. Data such as EV charger identifier and timestamp, etc. of the use of this button shall be logged in database. The button in the screen shall be hidden automatically once the payment system resumes normal. The activation of this button shall also be allowed configurable by system administrator. Or a method to stop and resume as approved by the CM;
23. The Sub-contractor shall design and provide the user guide printed on each EV charger regarding the new charging procedure with payment consoles. The Sub-contractor shall also provide the payment console user guide, which shall be in the form of laminated, or other preservative, print-out next to each floor of payment consoles;
24. The fee collection system shall be able to exchange data with HD's back-end system through the OCPP Server of the EV charging system. One (1) set of software for the system with Application Programming Interface (API) shall be provided;
25. The OCPP Server shall also be able to exchange data with API provided by HD's back-end system and update the OCPP Server when necessary at the Sub-contractor own expense;
26. The fee collection system shall be connected with the EV charging system. One (1) set of software for the system with API shall be provided;
27. All APIs specifically developed under this Specification shall be provided and shall be perpetual in nature for permanent use;
28. The payment consoles shall be installed at various site location as confirmed by the CM and shall integrate with the EV charging facilities on-site to form a synchronized online payment with Octopus and control system for enabling EV charging payment services to the public users. The payment consoles shall act as a platform for public to operate the EV charging facilities on-site with user-selected durations and payment schemes. The fee collection system shall be capable of collecting EV charging fee from public via Octopus card and / or other payment devices (e.g. online payment or mobile apps, etc. where specified in future), which shall be subject to CM's approval, according to their individual usage of the EV charging facilities. Hardware provision shall be allowed in the payment consoles for future installation of other payment devices.

ELE37.4 INSTALLATION REQUIREMENTS

ELE37.4.1 EV CHARGING FACILITIES

ELE37.4.1.010.A GENERAL

1. Each EV charging facilities (Mode 3 (Lite) MC, Mode 3 MC and Mode 4 QC) shall be installed as a separate radial circuit of the fixed electrical installation;
2. Each EV charging facilities (Mode 3 (Lite) MC and Mode 3 MC) shall be individually protected by an earth leakage protective device of residual current operated circuit breaker (RCCB) or residual current operated circuit-breaker with integral overcurrent protection (RCBO) of 32A rating with residual operating current not exceeding 30mA. The earth leakage protective device shall be of type B characteristic to protect against DC fault current as per Code 26S of Electrical CoP;
3. Each DC charging station (Mode 4 QC) complied with the IEC 61851-23:2014 shall be individually protected by a residual current protective device of at least Type A, having the characteristic specified in Code 11J of the Electrical CoP, when installed on the AC supply circuit upstream to the charging station. The residual current protective device shall be able to use together with the charging station and function safely as intended as per Code 26S of Electrical CoP and Guidance Note on Fault Protection for Direct Current Electric Vehicle Charging Facilities.

ELE37.4.2 MODE 2 MEDIUM CHARGER

ELE37.4.2.010.X DELETED

ELE37.4.3 PAYMENT CONSOLES, MODE 3 (LITE), MODE 3 MEDIUM CHARGER AND MODE 4 QUICK CHARGER

ELE37.4.3.010.A GENERAL

1. The Mode 3 (Lite) MCs, Mode 3 MCs, and payment consoles shall be suitable for wall-mount or floor-mount. For wall-mounted application, wall-mounted brackets shall be provided while for floor-mounted application, a mounting pole shall be provided for Mode 3 (Lite) MC and Mode 3 MC by Contractor and a mounting pole made of 1.5mm stainless steel shall be provided for payment consoles by this Sub-contractor. Details of mounting method shall be submitted to the CM for approval prior to installation;
2. The Mode 4 QCs shall be suitable for floor-mounted application. Details of mounting method, maintenance space and concrete plinth shall be submitted to the CM for approval prior to installation.

ELE37.4.4 32A DOUBLE POLE ISOLATOR

ELE37.4.4.010.A GENERAL

1. The 32A double pole isolator at each parking space shall be housed inside a metal housing equipped with provision of padlocking. Details of metal housing shall be submitted to the CM for approval prior to installation;

2. For outdoor application, the 32A double pole isolator shall be housed inside a weatherproof enclosure of IP65 in accordance with IEC 60529 with provision of access door and padlocking. Details of weatherproof enclosure shall be submitted to the CM for approval prior to installation;
3. For the isolator is installed inside the EV pole for Mode 3 (Lite) MC and Mode 3 MC, the 32A double pole isolator shall be referred to the clause in ELE37.3.3.010. Details of EV pole shall be submitted to the CM for approval prior to installation.

ELE37.4.5 DOCUMENTATIONS AND SOFTWARE LICENSE

ELE37.4.5.010.N GENERAL

1. The Sub-contractor shall provide the documentation such as installation DVD/CD, and potable USB drive or other acceptable media of all the software supplied including but not limited to the operating system, system software, application programs, configuration files, together with the user licenses;
2. The Sub-contractor shall provide all necessary interfacing protocol and information of the equipment used to facilitate the development of integration;
3. The Sub-contractor shall provide, maintain, and update the following documentation:
   a. System manual;
   b. Data manual;
   c. Program manual;
   d. Application user manual;
   e. Maintenance manual;
   f. System interface specification;
   g. Disaster recovery plan.
4. The Sub-contractor shall provide all necessary software licences for the whole EV charging facilities.

ELE37.5 TESTING AND COMMISSIONING

ELE37.5.010.A TESTS

The Sub-contractor shall carry out the following tests for the installation in the presence of the CM or his representatives:

1. Test of all electrical installation in compliance with the Electrical COP;
2. Continuous operation of charging the electrical vehicle;
3. Testing and demonstration of all functions of the electric vehicle charging facilities including Mode 3 (Lite) MC, Mode 3 MC, Mode 4, LMS, fee collection system and central workstation, etc. as mentioned in the Specification.

ELE37.5.020.9 TEST RECORD

The Sub-contractor shall record all the tests and submit to the Contract Manager for Approval.

ELE37.5.030.9 TRAINING

1. The Sub-contractor shall provide not less than 40 hours training of the operation and maintenance for the EV charging facilities with a proposed training programme approved by the Contract Manager. The training shall be conducted during normal working hours for the estate management staff. The Sub-contractor shall record in 720p video or better throughout one training session and hand over 2 copies of DVD-videos of the record to the Contract Manager;
2. The Sub-contractor shall provide sufficient copies of detailed training manuals for operation and maintenance for the estate management staff;
3. The Sub-contractor shall provide 2 sets of the recovery disks for system restoration and e-copies of operation and maintenance manuals to the Contract Manager before handover.

ELE37.6 MAINTENANCE

ELE37.6.010.9 GENERAL

1. The Sub-contractor shall provide free maintenance including labour and materials to the system installation for the entire Maintenance Period after completion of the installation;
2. During the Maintenance Period, the Sub-contractor shall attend to all faults and complaints, remedy all defects, replace all malfunction items and maintain the complete installation in a clean, tidy and functional condition to the satisfaction of the Contract Manager.

ELE37.6.020.9 24-HOUR ON-CALL SERVICE DURING MAINTENANCE PERIOD

1. The Sub-contractor shall provide 24-hour on-call service at any time during the Maintenance Period. The Contract Manager may instruct the Sub-contractor, in the Maintenance Period via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and Approved by the Contract Manager, to attend the reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel, who shall arrive at site and shall carry out any necessary inspection testing and repair work as soon as practicable and under all weather conditions;
2. The Sub-contractor shall submit to the Contract Manager for this purpose at least two names of English speaking representatives, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for Approval. Prior Approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers etc. during the Maintenance Period at least two weeks before the change is effected;
3. The Sub-contractor shall attend to emergency calls within three (3) hours of receiving such calls out of normal working hours and a maximum time limit of two (2) hours during normal working hours. For other repair calls, they shall carry out repair work within twenty four (24) hours;
4. The maintenance and servicing works, as described above, form part of the Main Works described in Clause 8.3(2)(c) of the General Conditions of Main Contract.

ELE37.6.030.A PREVENTIVE MAINTENANCE

1. The Sub-contractor shall provide quarterly maintenance inspection and service to the electric vehicle charging facilities such as checking overall functioning of the system, review the status, logging, and alarm history for the EV charging facilities, system data backup, software configuration, diagnostic exercise for all components and perform physical inspection, checking and cleaning / replacing filter of DC charging station, supply and install printer paper in payment consoles, etc. The Sub-contractor shall submit a proposed maintenance programme, including the scope of maintenance activities, to the CM for Approval within 14 days after the commencement of the Maintenance Period. An inspection report should be submitted to the CM after each quarterly inspection;
2. For half yearly, the Sub-contractor shall provide the maintenance services including, but not limited to functional checking for program examination, and items in quarterly above;
3. For annually, the Sub-contractor shall provide the maintenance services including, but not limited to functional checking, gateway program examination, carry out the program modification and improvement work as required from the EV charger's supplier, and items in half yearly above;

4. Upon request by the CM within the Maintenance Period, the Sub-contractor shall also provide free service to modify the computer programme to facilitate alteration of the system, such as change of payment method;
5. Four weeks before expiry of the Maintenance Period, the Sub-contractor shall carry out a hand / take-over inspection with the party taking up the on-going maintenance of the system in the presence of the CM or his representatives. Defects found should be rectified by the Sub-contractor to the satisfaction of the CM;
6. At the end of the Maintenance Period, the Sub-contractor shall execute all work of inspection, examination, and overhaul as required, to the complete installation to the satisfaction of the CM.

ELE38 MULTITRADE INTEGRATED MECHANICAL, ELECTRICAL AND PLUMBING (MIMEP)

ELE38.1 SCOPE OF WORKS 3

ELE38.1.010.N EXTENT OF APPLICATION 3

ELE38.2 PARTICULAR REQUIREMENTS OF MIMEP MODULE 4

ELE38.2.010.N GENERAL 4

ELE38.2.020.N ELECTRICAL SERVICES IN MODULAR INTEGRATED CONSTRUCTION ELECTRICAL METER ROOMS (MIC EMR) ONLY AT TYPICAL FLOOR OF DOMESTIC BLOCK 4

ELE38.2.030.N CEILING MOUNTED HORIZONTAL MODULE 4

ELE38.1 SCOPE OF WORKS

ELE38.1.010.N EXTENT OF APPLICATION

1. The Sub-contractor shall design, assemble, install and test the off-site prefabricated MiMEP modules, including but not limited to the following items, for on-site assembly and installation:
   a. Electrical services in Modular Integrated Construction Electrical Meter Rooms (MiC EMR) only at typical floor of domestic block.
2. The complete off-site prefabricated MiMEP module shall mean, not only the major equipment, all associated electrical works and system components as shown on the Drawings, but all the incidental supporting frame / hanger, lifting lugs and sundry components necessary for the complete on-site assembly and installation, whether or not these supply components are mentioned in detail in the tender documents;

ELE38.2 PARTICULAR REQUIREMENTS OF MiMEP MODULE

ELE38.2.010.N GENERAL

1. Each individual MiMEP module shall be designed and constructed as a self-contained packaged unit with appropriate provisions to facilitate the transportation, delivery, assembly and services connection on Site.

ELE38.2.020.N ELECTRICAL SERVICES IN MODULAR INTEGRATED CONSTRUCTION ELECTRICAL METER ROOMS (MIC EMR) ONLY AT TYPICAL FLOOR OF DOMESTIC BLOCK

1. The module shall comprise switchgear assemblies for domestic unit as detailed in ELE2.1.5.010 and ELE2.1.6.010 including, but not limited to, TP & N fuse combination unit, MCB distribution board, prefabricated trunking, meter boards for the installation of Supply Company's meter, other accessories and the mounting framework as appropriate. Installation of double pole MCB and connecting cables may be conducted on-site;
2. Interconnection of cables between the MiMEP modules and other electrical installation shall be conducted on-site;
3. Pre-installed electrical wirings, if any, shall be neatly grouped and labelled for easy identification.

ELE38.2.030.N CEILING MOUNTED HORIZONTAL MODULE

1. Ceiling mounted Mechanical Ventilation (MV) installation in typical floor, corridor and plant room shall be constructed through MiMEP approach. The MV horizontal module shall be pre-fabricated in sections for assembly on Site to form a complete system;
2. Jointing details, material / equipment and assembly methodology shall be submitted to the CM for approval;
3. Individual module section shall not pass through fire compartmentation wall unless appropriate fire rated connection unit is facilitated between services modules passing through the compartmentation wall;
4. Integrated supporting frame and hanger shall be provided for composite fixing of the MV service for each module. The frame shall be of robust with flexible fixing and bracketry facilities for mounting of different duct works in position. The flexible fixing facilities shall be able to accommodate certain degree of services fixing adjustment in order to suit the alignment of module interfacing with on-site installation or among modules themselves;
5. 10% loading capacity for the integrated supporting frame / rack shall be allowed for the addition and alteration works for the system components;
6. The design of the supporting frame and hanger system shall allow the alteration, take down and re-fix of the MV components without affecting the structural integrity of the overall framing of the module. Clear marking / warning notice shall be shown for critical structural support components that shall not be dismantle during the alteration works;
7. The layout, appearance and arrangement of exposed ceiling mounted modules shall be submitted to the CM for approval.

FWP1.1 THE WORKS

FWP1.1.010.9 SITE OF THE WORKS

The site of the Works is specified in Project Specific Specification.

FWP1.1.020.A SCOPE OF THE WORKS

1. The works to be carried out under this Sub-contract shall include the whole of the materials and labour necessary for the complete fire services installation, water pump installation and rainwater treatment installation, and the maintenance of the same for twenty four (24) months following the certified completion date of the Main Works or any Section(s) of the Main Works, for the buildings / premises specified in Project Specific Specification all as shown on the Drawings and detailed in this Specification;
2. The fire services installation comprises:
    a. Fire hydrant / hose reel system and associated fixed and intermediate booster fire pumps;
    b. Sprinkler system and associated sprinkler pumps;
    c. Drencher system and associated drencher pumps;
    d. Fire alarm system;
    e. Automatic fire detection system;
    f. Audio / visual advisory system;
    g. Automatic fixed installation other than water;
    h. Portable hand-operated approved appliance;
    i. Street fire hydrant booster pump system.
3. The water pump installation comprises:
    a. Fresh water feed pumps;
    b. Flush water feed pumps;
    c. Fire services feed pumps;
    d. Fresh water / flush water / irrigation water booster pumps;
    e. Sewage / waste water / storm water pumps;
    f. Lift pit dewatering system;
    g. PRV fault indication system.
4. The rainwater treatment installation comprises all associated pumps, chlorinators, cartridge filters and pipework;
5. The rainwater treatment installation by the Sub-contractor is part of the rainwater harvesting system which also include the rainwater catchments areas, rainwater collection pipeworks and treated rainwater distribution system. The Sub-contractor shall coordinate with the Contractor for the completion of the whole rainwater harvesting system;

6. The complete installation shall mean, not only the major items of equipment, associated pipework, fittings, control and electrical works and apparatus conveyed in this Specification, but all the incidental sundry components necessary for the complete execution of the works and for the proper operation of the installation with their labour charges, whether or not these supply components are mentioned in detail in the tender documents.

FWP1.1.030.9 SAMPLE FLATS AND SAMPLE WING

During the construction for domestic building blocks, a specified sample flats and wing located on a typical floor will be required to be completed by the Main Contractor including the flats, the corridor and the lift lobby etc.. The Sub-contractor shall complete the fire service installations such as fire hydrant, hose reel etc. in the specified sample flats and wing in coordination with the Main Contractor to cope with the sample flats and wing construction programme. The proposed samples and details of fire service installations in the sample flats and wing shall be submitted to the CM for Approval prior to commencement of works. The Sub-contractor shall be responsible for replacement of any fire services installations which are found damaged or deformed and to carrying out the necessary adjustments to restore to as-new condition before building completion.

FWP1.2 DOCUMENTATION

FWP1.2.010.9 DRAWINGS AND DOCUMENTS

1. Schedule of the Sub-contract Drawings is listed in the Appendix as specified in Project Specific Specification;
2. The tenderer's attention is also drawn to the latest revision of the following Standard Drawing and Document issued by the Housing Department which shall also be complied with where relevant:
   a. Standard Symbol Schedule.
3. The aforesaid Standard Drawings and Documents will be available for inspection at the office of Housing Department during normal office hours upon application to the Contract Manager;
4. The Sub-contract Drawings and the above Standard Drawings and Documents shall hereinafter be referred to as the Drawings.

FWP1.2.020.9 TECHNICAL INFORMATION SUPPLIED WITH TENDER

1. All technical information supplied with the tender, including the materials offered, is for tender assessment only;
2. Acceptance of the tender will not relieve the Sub-contractor of his responsibility for the proper working of the installation to meet the specified requirements in compliance with the Sub-contract documents to the entire satisfaction of the Contract Manager;
3. In the event of the installation being, in the opinion of the Contract Manager, not in compliance with the specified requirements, the Sub-contractor shall modify his design, replace any unsatisfactory materials and do everything necessary for compliance with the specified requirements at his own cost.

FWP1.2.030.A DEFINITIONS AND ABBREVIATIONS

In this Specification the word "shall" is mandatory, the word "will" is informative, the word "should" is advisory, and the word "provide" means supply and fix, or supply and install. In addition, the following words shall have meanings herein assigned:

1. "Authority"

   Hong Kong Housing Authority.

2. "Indicated"

   Indicated elsewhere in the Specification or on the Drawings.

3. "Or Equal" or "Or Similar"

   Having similar characteristics and specification as regards type of construction, performance, general appearance and standard of quality of manufacture.

4. "FSD"

   Fire Services Department of the Government of Hong Kong Special Administrative Region.

5. "BS"

   British Standards, including British Standard Specifications and British Standard Codes of Practice published by the British Standards Institution.

6. "EN"

European Standard.

7. "BS EN"

   European Standard adopted as British Standard.

8. "LPC"

   Loss Prevention Council, United Kingdom.

9. “LPCB”

   Loss Prevention Certification Board, United Kingdom.

10. "NFPA"

    National Fire Protection Association, USA.

11. "UL"

    Underwriters' Laboratory, USA.

12. "IEE Regulations"

    The "Regulations for Electrical Installations" 17th Edition or later published by the BSI and the IET.

13. “IET”

    The Institution of Engineering and Technology, United Kingdom.

14. “APHA”

American Public Health Association

15. “AISI”

American Iron and Steel Association

16. “ASME”

The American Society of Mechanical Engineers

17. "ASTM"

    American Society for Testing and Materials.

18. "ANSI"

    American National Standards Institute.

19. "PASS"

    Performance Assessment Scoring System.

20. "BEC"

    Code of Practice for Energy Efficiency of Building Services Installation.

21. “WSD”

Water Supplies Department of the Government of Hong Kong Special Administrative Region.

22. “ISO”

    International Organization for Standardization.

23. “IEC”

    International Electrotechnical Commission.

24. “JIS”

Japanese Industrial Standards.

FWP1.2.040.9 REQUIREMENTS FOR SUB-CONTRACTOR'S DRAWINGS

1. Size of Drawings:

   Drawings submitted by the Sub-contractor shall be of a standard size from A0 to A4 in accordance with BS EN ISO 5457. "As-fitted" drawings shall be of A0 or A1 size only.

2. Installation Drawings

   a. The Installation Drawings (See PRE.BS1.210) shall detail and dimension the following, where relevant:

      i. General layout drawings giving accurate and dimensioned locations of all plant and equipment included in the Sub-contract;

      ii. Details showing arrangement of assemblies, piping and valve arrangements, connections and junctions between components, etc., which cannot be accurately defined on layout drawings;

      iii. Schematic diagrams for each system to confirm the principle of operation and operating conditions, provisions for testing and commissioning to be included;

      iv. Electrical details, including schematic diagrams for motor control panels, component layout, cable and conductor sizes, cabling arrangement, termination details, control & interlocking logic diagram;

      v. Fire detector and alarm positions and wiring routes with details and function;

      vi. Conduit and trunking routes with conduit / trunking sizes, showing all accessories, details of cables and circuit references;

      vii. Earthing and equipotential bonding system with details of conductor sizes and routing, bonding arrangement;

      viii. Label schedules, showing wording and formats for the labelling of equipment and distribution board circuits.

   b. Operating and maintenance clearances for the equipment and their static and dynamic structural loading shall be shown on the installation drawings wherever necessary.

3. "As-fitted" Drawings

   a. The "as-fitted" drawings shall be based on the full set of Approved Installation Drawings updated to show the actual positions and arrangement of all items installed. Any additional drawings which are considered necessary by the CM for showing the complete installation shall be included. The Drawings shall be drawn in black-ink lines on quality paper suitable for reproduction of prints;

   b. "As-fitted" drawings shall include, but not be limited to, the following:

      i. Site plan (showing street hydrant and underground pipe routes, water mains and pump room locations, rainwater treatment plant room locations etc.);

      ii. Schematic piping diagram;

      iii. Schematic wiring diagram;

      iv. Block control diagram for fire services and water pump systems;

      v. Block control diagram for rainwater treatment system;

      vi. Operation sequence for fire services and water pump systems;

vii. Fire services layout plan;

viii. Pump / booster pump room layout plan;

ix. Rainwater treatment plant room layout plan;

x. Control cubicle layout;

xi. Details for other installations (such as water feature, etc.);

xii. Conduit drawings;

xiii. Other items as required by the CM.

FWP1.3 COMPLIANCE WITH REGULATIONS AND STANDARDS

FWP1.3.010.A STATUTORY REGULATIONS

The Sub-contractor shall comply with all Regulations and requirements including those of the Government of Hong Kong Special Administrative Region, the Hong Kong Fire Services Department (FSD), the Water Authority, the Building Authority, the Electrical and Mechanical Services Department (EMSD) and Electricity Supply Company, together with any revisions or amendments made thereto, and shall be responsible for giving notifications to the appropriate Authorities and for paying all fees all in accordance with the Sub-contract. The following are particularly relevant:

1. The Fire Services Ordinance and its Regulations;
2. The Waterworks Ordinance and its Regulations;
3. The Electricity Ordinance and its Regulations;
4. The Noise Control Ordinance and its Regulations;
5. The Radiation Ordinance and its Regulations;
6. Codes of Practice for Minimum Fire Service Installations and Equipment and Inspection, Testing and Maintenance of Installations and Equipment issued by the Fire Services Department (hereinafter referred to as Fire Services CoP);
7. Circular Letters issued by the Fire Services Department;
8. Technical Requirements for Plumbing Works in Buildings and Circular Letters issued by the Water Supplies Department;
9. Code of Practice for the Electricity (Wiring) Regulations (hereinafter referred to as the Electrical CoP);
10. Building Energy Efficiency Ordinance;
11. Code of Practice for Energy Efficiency of Building Services Installation (hereinafter referred to as the Building Energy Code (BEC).

FWP1.3.020.A STANDARDS AND PRACTICE

All materials and workmanship shall comply, where applicable, with all relevant sections, together with any revisions or amendments made thereto, of the following:

1. Relevant Worksections for Electrical Installation of Building Services Installation Specification of the HKHA Specification Library (hereinafter referred to as the HKHA Electrical Installation Specification) as specified in Project Specific Specification;
2. The BEC, 2021 Edition, issued by the Electrical and Mechanical Services Department. The Sub-contractor shall provide necessary information and documents to the Contract Manager for preparation of submissions under the Building Energy Efficiency Ordinance;
3. The Supply Rules issued by the respective Supply Company currently in operation in Hong Kong;
4. Relevant Worksections of Building Works Specification of the HKHA Specification Library (hereinafter referred to as the HKHA Building Works Specification);

5. Appropriate British Standard Specification(s) (subject to FWP1.3.040). When a British Standard quoted in this Specification has been wholly or partially superseded by another equivalent or similar national / international standard, the Sub-contractor is allowed to offer material in compliance with the latter in lieu of the former for the Contract Manager's Approval, on condition that prior approval by the appropriate Authorities (where required) has already been given;
6. National Fire Protection Association codes/standards (hereinafter referred to as NFPA codes/standards);
7. Code of Practice for Prevention of Legionnaires' Disease;
8. Loss Prevention Council Rules for Automatic Sprinkler Installations incorporating BS EN 12845:2015 and relevant FSD circular letters (hereinafter collectively referred to as LPC Sprinkler Rules);
9. The Standard for Fire Detection and Fire Alarm Systems for Buildings BS 5839-1: 2017 (Incorporating Corrigendum No.1) and relevant FSD circular letters (hereinafter collectively referred to as AFA Rules).

FWP1.3.030.9 PRECEDENCE

In case of conflict between the requirements among the publications referred to in FWP1.3.010 and FWP1.3.020, interpretation shall be in accordance with the following order of precedence unless otherwise directed by the Contract Manager:

1. Ordinances and Regulations, Laws of Hong Kong;
2. Fire Services CoP and Circular Letters issued by the Fire Services Department;
3. Electrical CoP;
4. LPC Sprinkler Rules and AFA Rules;
5. The Specification and/or the Drawings;
6. HKHA Electrical Installation Specification;
7. Building Energy Code;
8. Supply Rules;
9. HKHA Building Works Specification;
10. British Standard Specifications and British Standard Codes of Practice;
11. NFPA codes/standards.

FWP1.3.040.9 APPLICATION OF BRITISH STANDARDS / INTERNATIONAL OR NATIONAL STANDARDS / CODES OF PRACTICE

1. Where the date / year of British Standards (BS) / International or National Standards / Codes of Practice (CoP) is not specified in the Specification, it shall be deemed to refer to any valid or latest version, and any applicable amendments to that version;
2. Where the date / year is specified, due to intended purposes, the specified version and any amendments to that version shall be complied with unless otherwise approved by the Contract Manager;
3. "Head standards" (HS) are not dated because they do not contain any technical content. However reference to a head standard invokes all relevant extant "parts" of that standard which are themselves dated. Reference to head standards is a practicable method of using a general BS reference in situations where detailed reference to each part would be cumbersome.

FWP1.4 MATERIALS

FWP1.4.010.9 METRIC UNITS

Unless otherwise specified, only materials of metric unit shall be used.

FWP1.4.020.9 SUBMISSIONS FOR APPROVAL

1. The Sub-contractor shall submit catalogues, technical information and samples of the materials proposed for Approval as required by the CM. (See PRE.BS1.350 and PRE.BS1.360);
2. The Sub-contractor shall include in the submissions copies of valid Approval documents / certificates issued by FSD and / or product certification bodies recognised by FSD for those items on the List of Fire Service Installations and Equipment and other products requiring FSD's Approval / Acceptance published by FSD;
3. The Sub-contractor shall include in the submissions copies of valid Approval documents issued by the Water Authority and test certificates / reports issued by the certification bodies or accredited laboratories acceptable to the Water Authority for those piping and fittings as listed on the Annex - "Fittings to be Installed or Used in Inside Service or Fire Service" to WSD's Form WWO 46.

FWP1.4.030.9 SAMPLES - SPECIAL REQUIREMENTS

In addition to the requirements of PRE.BS1.360 a sample of each type of sprinkler head, fire alarm call point, heat detector and smoke detector as included in the tender shall be submitted to the Contract Manager upon request. Tests to demonstrate the function of the equipment shall be conducted where required. Samples may be required immediately after submission of Tender and before tender recommendation or acceptance. The Tenderer shall be prepared to deliver the materials to the Contract Manager's office and collect after examination and demonstration.

FWP1.4.040.9 EQUIPMENT SCHEDULE

The Tenderer shall complete the Equipment Schedule attached to the Tender Document and also furnish the following information, as required by the Contract Manager:

1. Name of manufacturer, country of manufacture, type and catalogue number, and full technical performance details, of all major items of equipment offered;
2. Voltage of operation and current consumption of automatic smoke and heat detectors under:
   a. Normal conditions; and
   b. Alarm conditions.
3. Type and size of wiring for alarm circuits;
4. Evidence, or a signed statement, to the effect that all items of equipment are approved by FSD;
5. Copies of test certificates showing compliance with the specified standards of the offered equipment and materials issued by the British Standards Institution or any other recognized international testing authorities;
6. Illustrated technical brochures in English showing all major items of equipment and their installation requirements.

FWP1.4.050.9 ALTERNATIVE SOURCES OF SUPPLY

1. Items of equipment and materials for the Works included in the Equipment Schedule shall fully comply with the Specification and Drawings and the Tenderer is allowed to include up to three offers for any one item;
2. Following acceptance of the Tender the Contract Manager may accept alternative equipment and materials proposed by the Sub-contractor in writing provided always that they are fully in compliance with the Specification and Drawings without imposing any additional contractual and financial liabilities on the Authority. Save as aforesaid, alternatives to the agreed Equipment Schedule will not be accepted.

FWP1.4.070.9 CONSISTENCY

All equipment of the same category shall preferably be of the same colour scheme throughout and shall be the product of the same manufacturer.

FWP1.4.080.9 ZINC FREE BRONZE

Where zinc free bronze is specified in the Specification, the zinc content shall not exceed 0.5%.

FWP1.4.090.9 USE OF ASBESTOS

Asbestos or products containing asbestos shall not be used without prior Approval.

FWP1.4.100.9 FIRE EXTINGUISHING MEDIA

Fire extinguishing media for any fire services equipment installation shall be of zero ozone depleting potential product. Upon request, the Sub-contractor shall produce evidence and document to prove that the fire extinguishing media is of zero ozone depleting potential product.

FWP1.4.110.9 SITE STORAGE

1. Tubes and all items of plant and equipment shall be delivered, stored, and maintained in perfect condition;
2. Tubes shall have their ends effectively sealed;
3. All plant and equipment shall be stored under weatherproof cover until they are required to be incorporated into the installation.

FWP1.5 SUPERVISION

FWP1.5.010.9 APPOINTMENT OF SUPERVISING ENGINEERS AND SITE SUPERVISORS

1. Immediately upon the award of the Sub-contract, the Sub-contractor shall appoint Supervising Engineer(s) and Site Supervisor(s) specified in this Specification, who shall be both English and Cantonese speaking and in the Sub-contractor's full-time employment for the supervision of the Sub-contract Works to the satisfaction of the Contract Manager;
2. Immediately after the award of the Sub-contract, the name, qualifications and curriculum vitae of the Supervising Engineer(s) and Site Supervisor(s) shall be submitted for Approval to the satisfaction of the Contract Manager;
3. None of the Supervising Engineer(s) and Site Supervisor(s) shall be removed from their respective duties without prior Approval;
4. In the event of any of them being unsatisfactory, in the opinion of the Contract Manager, or misconducting themselves, they shall be removed forthwith and be replaced by suitable substitutes to the Contract Manager's satisfaction within seven days from the Contract Manager's instruction in writing.

FWP1.5.020.9 SUPERVISING ENGINEERS

1. Unless otherwise specified, the Sub-contractor is to employ for the supervision of all works on Site, at least one qualified Supervising Engineer. The Supervising Engineer shall generally represent the Sub-contractor in all respects of the Sub-contract and assume the following duties:
    a. Coordinate and supervise the work in the Sub-contractor's office and the Site;
    b. Develop, in conjunction with the Main Contractor, schedules of installation drawings, builder's work drawings, material submission and delivery, statutory submissions, the programme of works and testing and commissioning programme, for approval by the CM;
    c. Liaison with the CM and other parties;
    d. Attend at the office of the CM for the finalisation of drawings and equipment selection;
    e. Attend progress meetings and coordination meetings;
    f. Monitor and supervise installation drawings submission, builder's work drawings submission, material submission and delivery, statutory submissions in accordance with the respective submission schedules approved by the CM. Submit progress reports to the CM monthly or at shorter intervals when such requested by the CM;
    g. Check and confirm the installation drawings, builder's work drawings and material submissions are suitable for the installation works and in compliance with the requirements of the Sub-contract;
    h. Examine, verify and confirm in writing to the CM on a monthly basis that the material delivered to the Site under the Sub-contract has been approved by the CM;
    i. Certify all material delivery vouchers in accordance with PRE.B12.280 of the Main Contract;
    j. Prepare, in conjunction with the Main contractor, the delivery method statements for delivery of plant and equipment;

k. Undertake all site test and commissioning of the Sub-contract Works and endorse the test and commissioning reports to confirm that he is satisfied with the completeness, workmanship and performance of the installations which comply fully with the Sub-contract requirements, prior to submission to the CM.

2. Qualification requirements:

   At least one year of proven post qualification experience at supervisory level on fire services and water pump installations in buildings with the following qualification:

   a. Registered Professional Engineer (Mechanical, Fire or BS Discipline) under the Engineers Registration Ordinance; or

   b. Member of the Institution of Mechanical Engineers, UK; or

   c. Member of the Chartered Institution of Building Services Engineers, UK; or

   d. Member of the Hong Kong Institution of Engineers (Mechanical, Fire or BS Discipline) elected after 5 December 1975.

3. The Supervising Engineer shall be highly competent and experienced, and shall be given a high level of delegated authority such that he / she can take decisions, including those involving expenditure.

FWP1.5.030.9 SITE SUPERVISORS

1. Unless otherwise specified, the Sub-contractor is to employ at least one qualified Site Supervisor. The Site Supervisor shall be stationed on site;

2. Qualifications requirements:

   Mechanic with at least 3 years of practical experience in fire services and water pump installation.

FWP1.6 SUB-CONTRACTORS OBLIGATIONS

FWP1.6.010.9 RADIATION ORDINANCE - IONISATION TYPE SMOKE DETECTORS

The Sub-contractor shall hold a valid Radioactive Substances Licence granted by the Hong Kong Radiation Board and observe all conditions of licence, rules and regulations of the Radiation Ordinance and Radiation (Control of Radioactive Substances) Regulations in the storage, handling, installation, disposal etc. of ionization type smoke detectors throughout the whole contract period and the subsequent Maintenance Period.

FWP1.6.020.9 OBTAINING FIRE CERTIFICATE

1. The Sub-contractor shall be responsible for giving notifications to the appropriate Authorities, attending necessary inspection and paying all fees levied, including them in the Tender Price, and also for collecting all necessary certificates and licences for the installation as soon as available, and delivering them to the Contract Manager;
2. The Sub-contractor shall also be responsible for amending FS installation drawings for submission of FSI/314 in accordance with the latest approved building plans certifying that the details and specifications of all installations shown on drawings are prescribed by the Fire Services Department and in accordance with all relevant rules and codes;
3. The Sub-contractor shall also be responsible for submission of FSI/501a to the Fire Services Department for all FS installations and the associated requirements including fireman's lifts.

FWP1.6.030.9 BUILDING SERVICES PERFORMANCE ASSESSMENT SCORING SYSTEM

1. The Housing Authority has adopted a Building Services Performance Assessment Scoring System (BSPASS) to assess the performance of building services Nominated Sub-contractors undertaking works for the Authority;
2. BSPASS will be operated in this Sub-contract and assessments by Building Services PASS Assessment Team (BSPAT) or other staff of the Housing Authority will be conducted at quarterly intervals or other intervals as required by the Contract Manager;
3. Upon the Contract Manager's notification, the Sub-contractor's authorised representative shall attend all such assessments;
4. The Sub-contractor shall provide all necessary attendance, and all necessary measuring instruments, in addition to those specified in PRE.BS1.630, etc. to facilitate the BSPASS assessment as stipulated in the relevant BSPASS manuals;
5. In addition, the Sub-contractor shall also provide labours for the opening up and re-fixing of the works, the operation of the equipment and the testing, etc. as required by the assessment.

FWP1.6.040.9 MODIFICATION WORKS IN NON-DOMESTIC PREMISES DURING MAINTENANCE PERIOD

1. During the Maintenance Period, the Employer may employ other workmen or contractors to carry out modification works pertaining to the installation to suit the fitting out works of the tenants;
2. The Sub-contractor shall provide the necessary attendance, including operation of the installation, as instructed by the Contract Manager to facilitate such modification works;

3. The costs of the attendance will be determined by a fair valuation made by the Contract Manager in conjunction with the Sub-contractor and paid for separately;

4. The employment of other workmen or contractors by the Employer for the modification of the installation shall not in any way relieve the Sub-contractor of his responsibilities for the maintenance and defects of the Works, other than those parts which have been modified by others, in accordance with the Contract.

FWP1.6.050.9 LICENSED PLUMBER AND ATTENDANCE FOR INSPECTION BY THE WATER AUTHORITY

1. The Sub-contractor and their employed Licensed Plumber (LP) shall carry out the water services works for fire services and water pump installation mentioned in this Specification and shown on the Drawings, as approved by the Water Authority;

2. The LP should have obtained Level 2 or above in English Language in the Hong Kong Diploma of Secondary Education Examination (HKDSEE), or Grade E or above in English Language (Syllabus B) in the Hong Kong Certificate of Education Examination (HKCEE), or equivalent. In case the LP cannot meet such requirement, the Sub-contractor shall provide a competent personnel (e.g. registered engineer, relevant site personnel) with equivalent qualification in English to support the water services works for fire services and water pump installation handled by the LP;

3. The Sub-contractor shall submit and update all necessary applications and forms to the Water Authority and attend upon their representative for the purpose of tests and inspections for the water services works for fire services and water pump installation. All applications and forms for WSD submission shall be submitted to the Contract Manager for comment before submitting to WSD and record after approval;

4. The LP referred to in sub-clause (1) shall:

    a. Submit material list to WSD under Form WWO-46 and subsequent update as soon as the proposed materials, and / or proposed change of approved materials, which are approved by the Contract Manager, and before placement of order for such materials;

    b. Ensure that all pipes and fittings have been acknowledged by the Water Authority with permission given for proceeding with the approved water services works for fire services and water pump installation before installation;

    c. Supervise all water services works for fire services and water pump installation under his charge with attendance record submitted to the Contract Manager on monthly basis after commencement of water services works for fire services and water pump installation on Site;

    d. Attend the Main Contractor’s regular site meetings with Nominated Sub-contractors, Direct Contractors and Utility Undertakings as appropriate;

    e. Submit monthly report on quality control and progress for review at the site meetings. The report shall include progress of water services works for fire services and water pump installation, LP’s site inspection and site attendance records, record of material quarantine and verification tests, updated WSD submission record etc.;

    f. Attend regular site meetings if required by the Contract Manager;

    g. Upon completion of the water services works for fire services and water pump installation:

        i. Submit LP’s inspection report of the completed water services works for fire services and water pump installation;

ii. Declare that all pipes and fittings installed on Site have been approved by the Water Authority and registered with WSD under Form WWO 46;

iii. Declare that only cadmium-free category brazing alloy and lead-free category soldering alloy are used, if applicable;

iv. Declare that all pipes and fittings installed and any materials used for the construction and installation of the water services works for fire services and water pump installation are as prescribed by the Waterworks Regulations and approved by the Water Authority.

h. Attend all WSD inspections for the water services works for fire services and water pump installation.

5. The Sub-contractor shall monitor the LP's carrying out of duties as specified in sub-clause (4) above and ensure water services works for fire services and water pump installation under the LP are in full compliance with the Specification and as prescribed by the Waterworks Regulations;

6. The Sub-contractor shall monitor the LP's submission to WSD related to the water services works for fire services and water pump installation. The Sub-contractor shall check the validity of the WSD Form and attachments before onward submission to the Contract Manager for comment / signing. The Sub-contractor's checking of the WSD submission forms, with declaration that the materials used and the construction of the fire services and water pump installation described therein are as prescribed by the Waterworks Regulations, shall be recorded in a standard form in AP2.FWP.APPEND1 which shall be jointly signed by the Sub-contractor's supervising engineer and their employed LP, and countersigned by the building services engineer of the Main Contractor and submitted to the Contract Manager for record;

7. The Sub-contractor shall verify that the LP's declaration under sub-clause (4)(g) are valid. The verification and the declaration shall be recorded in a standard form in AP2.FWP.APPEND2 which shall be jointly signed by the Sub-contractor's supervising engineer and their employed LP, and countersigned by the building services engineer of the Main Contractor and submitted to the Contract Manager for record.

FWP1.6.060.9 WSD INSPECTION OF UNDERGROUND AND CONCEALED PIPEWORK BEFORE COVERING UP

Before covering up of the underground and concealed pipework, the Sub-contractor and their employed Licensed Plumber shall invite WSD to conduct interim inspection of the pipework in accordance with the Waterworks Regulations.

FWP2.1 FIRE SERVICES INSTALLATION

FWP2.1.1 FIRE HYDRANT/HOSE REEL (FH/HR) INSTALLATION

FWP2.1.1.010.9 FH/HR SYSTEM DESCRIPTION

1. The FH/HR system comprises main risers, with Fire Services Inlets, supplying the fire hydrants on each floor and secondary risers supplying hose reels on each floor as shown on the Drawings;
2. The FH/HR system shall be fed from the fire services tank which will be erected by the Main Contractor;
3. Identical duty and standby intermediate booster pumps / fixed fire pumps as shown on the Drawings shall be used in the system to ensure sufficient pressure at each hose reel to provide a minimum jet stream of 6 m and an aggregate flow of not less than 900 1/min at any two hydrant outlets each with a flow of 450 1/min at a running pressure of not less than 350 kPa when the system is fed from the roof tank or with the fire engines boosting water into the Fire Services Inlet at a constant pressure of 800kPa upstream of the Inlet. Pressure reducing valves or self-contained pressure reducing hydrants shall be used wherever the pressure at any hydrant outlet is over 850 kPa;
4. The pressure at any fire hydrant shall in no case exceed 850 kPa. The running pressure at any hydrant outlet, when delivering 450 1/min, shall be not less than 350 kPa.

FWP2.1.1.020.A FH/HR SYSTEM OPERATION

1. The system shall be inter-connected with the Fire Alarm and Control System in accordance with the Drawings and Specification;
2. The standby intermediate booster pump / fixed fire pump shall start when the pressure switch in the duty intermediate booster pump / fixed fire pump discharge does not sense a correct pressure within 15 seconds after the duty intermediate booster pump / fixed fire pump receives the "start" signal. The timer shall be adjustable from 0-2 minutes;
3. For intermediate booster pump, 'pump running' indicating light, alarm buzzer and fire pump 'start / stop' push buttons shall be provided adjacent to the fire services inlets;
4. The fire alarm control panel shall start the fixed fire pump automatically upon receiving the call from any manual call point and once started, the fixed fire pump shall run continuously until it is stopped only manually at the pump control panel;
5. When the intermediate booster pump is independent of the fixed fire pump, it shall be controlled by the 'start / stop' push buttons adjacent to fire service inlets. Once started, the pump shall run continuously until stopped manually either at the 'start / stop' button adjacent to the same fire service inlet or at the pump control panel;
6. When the intermediate booster pump also serves as fixed fire pump, it shall be either started automatically upon receiving the call from any manual call point as stated in above paragraph 4, or by the 'start / stop' push buttons as stated in above paragraph 5. Once started, the pump shall run continuously until stopped manually either at the 'start / stop' push buttons adjacent to the same fire service inlet or at the pump control panel.

FWP2.1.1.030.A SPRINKLER HEAD OVER REFUSE CHUTE AND AT REFUSE STORAGE AND MATERIAL RECOVERY CHAMBER

1. Quartzoid bulb type sprinkler head shall be provided at the top of the refuse chute and at the Refuse Storage and Material Recovery Chamber (RS&MRC) of domestic blocks;
2. The operating temperature of the sprinkler head at refuse chute and at RS&MRC shall be 57℃ and 68℃ respectively;
3. The isolating stop valves with micro switches shall be provided for the top of refuse chute and RS&MRC to identify the valves at open / close status at the fire alarm control panel. Security devices shall be provided to prevent tempering / unauthorized operation of the valves;
4. The flow switch provided to detect the operation of the sprinkler shall be of high sensitivity as in FWP11.6.040. The location and method of connection shall be submitted for Approval.

FWP2.1.1.040.9 PIPEWORK

1. Unless otherwise shown on Drawings, galvanised steel pipework and fittings complying with FWP3 and FWP4 shall be used;
2. The installation shall include all pipework and fittings fully installed as indicated on the Drawings.

FWP2.1.1.050.9 DUTY OF INTERMEDIATE BOOSTER PUMP / FIXED FIRE PUMP

1. The pressure of the intermediate booster pump / fixed fire pump shall fall progressively with the increase of flow, with the shut-off pressure being at the highest. The pump shall deliver not more than 150% of rated capacity at 65% of rated head and the shut-off head shall not exceed 130% of the rated head;
2. Overheating due to continuous operation at no system draw-off condition is not acceptable. By-pass device for excessive water flow to the suction tank shall be provided by the Sub-contractor. The leak off rate of the pump(s) to prevent overheating shall be determined by Sub-contractor;
3. The pump shall be able to deliver water at flow rate and pressure head as indicated on the Drawings;
4. The duty and standby intermediate booster pump / fixed fire pumps shall each be capable of providing an aggregate flow of not less than 900 1/min at any two hydrant outlets each with a flow of 450 1/min at a running pressure of not less than 350 kPa. The pressure at any hydrant shall in no case exceed 850 kPa;
5. The intermediate booster pump shall also be able to maintain the required aggregate flow and pressure at any two hydrants when water is pumped through the FS Inlet at a constant pressure of 800 kPa;
6. The sub-contractor shall be responsible for checking the pump duty operating head and capacity of flow based upon the characteristics of the pipework system and equipment actually installed. Any non-compliance with the design requirements found shall be notified to the Contract Manager;
7. Predicted total head, efficiency, required NPSH and power absorbed versus flow quantity curves shall be submitted. The curves shall commence at zero and be extended to show the performance at 150% of the rated capacity to demonstrate that the pump will be capable of meeting the full range of operating condition on site.

FWP2.1.1.060.9 TYPE OF INTERMEDIATE BOOSTER PUMP AND FIXED FIRE PUMP

1. The intermediate booster pump/ fixed fire pump shall be either horizontal split casing, end suction or horizontal/vertical multi-stage type as shown on the Drawings. Construction of the horizontal split casing or end suction pump shall permit removal of back cover, stuffing box and impeller without disturbance of suction/delivery pipework;
2. For installation with motor rating not exceeding 2.2 kW, close-coupled pumps may be accepted as alternative subject to Approval.

FWP2.1.1.070.9 MOTOR RATING OF INTERMEDIATE BOOSTER PUMP AND FIXED FIRE PUMP

The motor driving the intermediate booster pump / fixed fire pump shall be rated to give 20% more power in addition to the hydraulic power required for the rated flow of the system.

FWP2.1.2 FIRE SERVICES PUMP CONTROL CUBICLE

FWP2.1.2.010.9 APPROVAL OF LAYOUT

Unless otherwise Approved, prior to manufacture, control circuit and panel layout arrangement of the control cubicle shall be in accordance with the Drawings and FWP11.3, FWP11.4 and FWP11.5.

FWP2.1.2.020.9 MOTOR STARTER PROTECTION

The Sub-contractor shall advise the CM of the appropriate type and rating of the short circuit protective device to be used in conjunction with the motor starter in accordance with the motor starter manufacture's recommendation in order to achieve the specified type of coordination.

FWP2.1.2.030.9 TANK EMPTY SIGNAL AT FIRE SERVICES SUPPLY TANK

1. A level control switch for tank empty signal shall be provided at fire services supply tank such as FH/HR tank, sprinkler tank, street fire hydrant tank and drencher tank, when applicable;
2. When water level at fire services supply tank falls to 150 mm above the top level of the suction pipe of the fire services pump, the level control switch at the fire service supply tank shall:
    a. Switch off the pump when it is operating under manual mode; and
    b. Activate a tank empty indication light on the pump control cubicle.

FWP2.1.3 FIRE ALARM AND CONTROL SYSTEM

FWP2.1.3.010.A ALARM AND CONTROL SYSTEM

1. The Sub-contractor shall design, supply, install and connect up, by concealed PVC conduit system, fire alarm and control system from all wired fire services equipment to their respective control panels, fire alarm control panels and repeater panels wherever applicable, at the locations as shown on the Drawings. The fire alarm control panel and associated repeater panel of domestic block shall be of conventional electronic type acceptable to FSD. For non-domestic premises with large nos. of control and monitor points and multi-interfacing arrangement, addressable electronic type fire alarm control panel is acceptable to substitute conventional type fire alarm control panel as shown on drawings subject to approval by the CM;
2. The Sub-contractor shall provide the concealed PVC conduit system complete with wiring for and in connection with the fire alarm control panel, repeater panels, automatic fire alarm panel, sprinkler control panel, drencher system control panel and other fire services equipment;
3. The arrangement on the fire alarm control panels, sub-panel and repeater panels shall be submitted for Approval. The system shall be operated from the 24V battery supply as mentioned in FWP2.1.3.040 if required;
4. Whenever necessary and subject to Approval, parts of the conduit system may be installed in galvanised steel surface conduit / trunking;
5. The Sub-contractor shall apply direct telephone line connections to Fire Services Communication Centre (FSCC) where necessary. The installation cost including connection fee, rental and maintenance charges within the Maintenance Period for the direct telephone lines shall be borne by the Sub-contractor.

FWP2.1.3.020.9 MANUAL FIRE ALARM POINT

1. The manual fire alarm point shall comprise a manual fire alarm call point and an audible alarm point as shown on the Drawings;
2. The manual fire alarm call point shall be semi-flush mounted or surface mounted with the thickness of mounting box not more than 25 mm unless otherwise approved by Contract Manager. Its drip holes beneath the mounting box shall not be blocked.

FWP2.1.3.030.A CIRCUITRY OF MANUAL FIRE ALARM POINTS

1. Wiring of the manual fire alarm points shall be divided into zones;
2. The manual fire alarm points in each floor of a domestic block shall form an individual zone;
3. The sprinkler head over refuse chute and at the refuse chamber of a domestic block shall each form a separate zone at the fire alarm control panel;
4. Zoning arrangement of the manual fire alarm points at non-domestic premises shall be submitted and subject to the CM’s approval;
5. For conventional type fire alarm control panel, the circuit of each zone shall be individually wired to the fire alarm control panel;
6. Cables shall be clearly labelled by cable markers so as to be easily identified at the fire alarm control panel to facilitate testing of each individual circuit.

FWP2.1.3.040.A FIRE ALARM CONTROL PANEL

1. Control and monitoring details shall be referred to the Drawings and FWP10 and submitted for Approval prior to installation;
2. A key box with glass front shall be installed next to each fire alarm control panel, repeater panel or other locations as directed by the CM. One set of properly labelled key for operation of the panel shall be provided in the key box. Another two sets of keys for each panel shall be provided to the CM;
3. The fire alarm and control system and the fire alarm control panel shall operate at 24V DC supply from battery and charger unit connected to essential power supply as detailed in FWP10.6.

FWP2.1.4 PORTABLE EQUIPMENT

FWP2.1.4.010.9 GENERAL

Fire extinguishers, sand buckets and fire blankets shall be provided if applicable and mounted in the positions as shown on the Drawings.

FWP2.1.4.020.9 FIRE EXTINGUISHERS INSIDE TRANSFORMER ROOM

The fire extinguishers inside the Transformer Rooms shall be supplied and installed by the Sub-contractor unless otherwise specified.

FWP2.1.5 SPRINKLER SYSTEM INSTALLATION

FWP2.1.5.010.9 SPRINKLER SYSTEM DESCRIPTION

1. The sprinkler system shall be designed as specified in Project Specific Specification;
2. The system is to provide an automatic fire fighting system using fresh water as the extinguishing medium within the areas as shown on the Drawings;
3. The system shall be fed from a sprinkler water tank located as specified in Project Specific Specification;
4. The Main Contractor will erect the sprinkler water tank;
5. The Sub-contractor shall carry out the installation work from this water tank onward including the connection of this system thereto;
6. The system shall comprise sprinkler pumps (if applicable), control valves, sprinkler inlet valves, non-return valves, risers, distribution pipes, range pipes, sprinkler heads, flow switches, pressure switches, drains, etc. together with all associated equipment, whether or not they are shown on the Drawings, necessary for a complete installation.

FWP2.1.5.020.A SPRINKLER SYSTEM OPERATION

The sprinkler system will operate automatically and shall be inter-connected with the Fire Alarm and Control System. Should a sprinkler head located at any part of the area served by the sprinkler system on any level operates, the pressure switch, on sensing the pressure drop, shall start the sprinkler pump. The flow switch, on sensing the flow of water, shall actuate the fire alarm control panels.

FWP2.1.5.030.9 DUTY OF SPRINKLER PUMP

1. For duty/standby pumps for sprinkler system, the pumps (including any orifice plates) must comply with the pressure/flow characteristics, suction lift requirement, close off maximum pressure and other relevant paragraphs in the LPC Sprinkler Rules;
2. The discharge rate of the jockey pump shall be less than that of the most hydraulically remote sprinkler head or discharge outlet, but in no case less than 25 1/min, and the pressure generated by the jockey pump shall not exceed the maximum allowable pressure permitted on the sprinkler system;
3. The Sub-contractor shall be responsible for checking the pump duty operating head and capacity of flow based upon the characteristics of the pipework system and equipment actually installed. Any non-compliance with the design requirements found shall be notified to the Contract Manager.

FWP2.1.5.040.9 TYPE OF SPRINKLER PUMP

1. The sprinkler pump shall be either horizontal split casing, end suction type or horizontal/ vertical multi-stage type having construction permitting removal of back cover, stuffing box and impeller without disturbance of suction/delivery pipework;
2. For jockey pumps, multi-stage pumps shall be used. The maximum number of stages acceptable is seven unless otherwise Approved;
3. For installation with motor rating not exceeding 2.2kW, close-coupled pumps may be accepted as an alternative subject to Approval.

FWP2.1.5.050.9 PIPEWORK

1. The installation shall include all pipework and fittings complying with FWP3 and FWP4, installed to LPC Sprinkler Rules and as indicated on the Drawings;
2. The distribution pipes as well as the range pipes shall run through beams as far as possible unless otherwise specified.

FWP2.1.5.060.9 SPRINKLER HEADS

1. The sprinkler heads shall be located as shown on the Drawings and they shall be of quartzoid bulb type, unless otherwise Approved;
2. Samples of each type of sprinkler heads shall be submitted for Approval before installation.

FWP2.1.5.070.9 SPRINKLER CONTROL VALVE SET

1. Each control valve set shall comprise:
    a. Main stop valve of gate type;
    b. Alarm valve of wet pipe;
    c. By-pass stop valve or duplicated alarm valve set for sprinkler system in compliance with LPC Sprinkler Rules, if applicable;
    d. Alarm devices, including water motor alarm and gong, pressure switch, etc.;
    e. Facilities for testing to suit Fire Services Department's requirements;
    f. Pressure gauges to indicate "upstream" and "downstream" system pressure;
    g. Retarding chamber or other device as necessary to prevent false alarm due to incoming pressure variations;
    h. Other equipment as necessary.

2. The control valve set shall be installed at the location as shown on the Drawings. All installation, materials and fixing bolts, etc. for mounting the equipment inside the cabinets or on walls as applicable shall be provided by the Sub-contractor;
3. The main stop valve location plate shall be as detailed in LPC Sprinkler Rules, but lettering shall be in both English and Chinese.

FWP2.1.5.080.B WATER MOTOR ALARM AND GONG

Water motor alarm and gong shall be constructed of non-corrosive materials and shall have gong of not less than 200 mm in diameter, suitable for external installation. The water motor alarm gong shall be painted and labelled as required by the Fire Services Department.

FWP2.1.5.090.9 FLOW SWITCHES

1. Flow switches shall be installed to such positions as indicated on the Drawings;
2. Water flow alarm switches as detailed in LPC Rules for Sprinkler Installations shall be utilized for sending signal back to the fire alarm control and indicating panel to indicate which the location is under operation with both visual indication and audible alarm. LPC approved high sensitive water flow alarm switch capable of actuation by operation of one sprinkler head shall be used.

FWP2.1.5.100.9 DRAIN PIPE WORKS

Drain pipe works complete with supports and accessories, duly painted, shall be supplied and installed by the Sub-contractor, connecting various drain points of the sprinkler system to the nearest drains. The drain valve and drain pipe shall be not less than 25 mm in diameter, to allow the system to be efficiently drained if required.

FWP2.1.5.110.9 ORIFICE PLATE/LOCK-SHIELD VALVES

Notwithstanding that the orifice plate/lock-shield valve is not shown on the Drawings, the Sub-contractor shall provide the suitably sized orifice plate/lock-shield valve in the sprinkler system wherever necessary, to suit the pressure/flow characteristics of the sprinkler pump and to meet the requirements of LPC Sprinkler Rules.

FWP2.1.5.120.A SPRINKLER AND CONTROL SYSTEM

1. The Sub-contractor shall design, supply, install and connect up, by concealed PVC conduit system complete with wiring, the fire alarm and control system, fire alarm control panel and sprinkler pump control cubicle (if applicable) as shown on the Drawings;
2. The sprinkler control and alarm indication shall comply with Technical Guidance on Application of Loss Prevention Council Rules for Automatic Sprinkler Installation 2015 incorporating BS EN 12845 in Hong Kong. The Control and Indicating Equipment for sprinkler system shall be of conventional electronic type acceptable to FSD and inter-connected with the fire alarm control panel to form a complete fire and alarm system The arrangement on the panels shall be submitted for Approval. For non-domestic premises with large nos. of control and monitor points and multi-interfacing arrangement, the sprinkler control and alarm indication can be integrated into the addressable electronic type fire control panel subject to approval by the CM. The system shall be operated from the 24V battery supply as mentioned in FWP2.1.3.040 sub-clause (3);
3. Whenever necessary, and subject to Approval, parts of the conduit system may be installed in galvanised steel surface conduit / trunking.

FWP2.1.6 AUTOMATIC FIRE DETECTION SYSTEM

FWP2.1.6.010.A SYSTEM DESCRIPTION

1. Automatic fire detection (AFA) system comprising smoke detectors, heat detector, visual alarm points, etc. shall be supplied and installed by the Sub-contractor as shown on the Drawings;
2. Smoke detector shall be of photoelectric type unless otherwise specified. The design and construction shall be of LPC approved type or other standards acceptable to FSD;
3. Heat detector shall be of combined fixed temperature and rate of rise type except in kitchen area which shall be of fixed temperature type. The design and construction shall be of LPC approved type or other standards acceptable to FSD;
4. Flame detector or other specific types of fire detectors shall be provided at areas with ceiling height where smoke or heat detectors do not cover. Flame detector shall comply with BS EN54-10. Nonetheless, flame detector shall not be adopted at areas vulnerable to false fire alarm due to direct sunlight;
5. The automatic fire detection system shall comply with the statutory requirements as stipulated in FWP1.3.010 and shall be acceptable to FSD.

FWP2.1.6.020.A FIRE ALARM CONTROL FOR AUTOMATIC FIRE DETECTION SYSTEM

1. The Sub-contractor shall design, supply, install and connect up fire detectors by concealed PVC conduit system, to the control and indicating equipment for AFA system, fire alarm control panel(s), sub-panel(s) and repeater panel(s) at the locations shown on the Drawings;
2. The control and indicating equipment for AFA system shall be of conventional electronic type acceptable to FSD and compatible with the smoke / heat detector installed, unless otherwise approved by the CM. For non-domestic premises with large nos. of control and monitor points and multi-interfacing arrangement, the AFA control and indicating signals can be integrated into the addressable electronic type fire alarm control panel subject to approval by the CM;
3. The AFA system shall be either connected to the main fire alarm control panel or formed a sub-panel to feed fire detection signals to the main fire alarm control panel. The arrangement shall be submitted for Approval;
4. Arrangement of sub-panels for Ancillary Facilities Premises
    a. The fire detection system in a domestic block shall be connected to the main fire alarm control panel while the fire detection system for each of the ancillary facilities premises under a domestic block, if required, shall be connected to a sub-panel;
    b. For each of the ancillary facilities premises, a sub-panel, if required, shall be installed at the main entrance of the premise with pairs of fire signals connecting to the main fire alarm control panel of the domestic block as shown in Standard Details Drawing no. STD/B/FS-17. An additional fire alarm bell for the automatic fire detection system of each ancillary facilities premise shall be provided on the external wall of the premise;
    c. Battery & charger for the sub-panel and direct telephone line connection to the Fire Services Communication Centre (FSCC) for each of the ancillary facilities premises shall be separately provided.

5. The Sub-contractor shall provide the concealed PVC conduit system complete with wiring for the automatic fire detection system; whenever necessary and subject to Approval, parts of the conduit system may be installed in galvanised steel surface conduit / trunking;

6. The Sub-contractor shall apply direct telephone line connections to FSCC for each automatic fire detection system. The installation cost including connection fee, rental and maintenance charges within the Maintenance Period for each of the direct telephone lines shall be borne by the Sub-contractor.

FWP2.1.6.030.N ACTUATION OF FIRE SHUTTERS

1. Where automatic fire shutters for compartmentation are provided by the Contractor, the Sub-contractor shall provide actuating devices and an interfacing point adjacent to each fire shutter control panel;

2. The actuating devices shall comprise smoke detectors, audio and visual alarm indicators, installed at both sides of a fire shutter;

3. The actuating signal of an automatic fire shutter shall be connected to the interfacing point and led to the fire alarm control panel of respective premise for control and indication;

4. Each actuating signal shall form an indication zone on the fire alarm control panel;

5. Whenever approved by the FSD, smoke detectors installed solely for fire shutter, fire door, and fire / smoke curtain provided for the purpose of fire compartmentation shall be connected in cross-zoned operation and shall only be operated with fire alarm when any two detectors in coincidence connection are activated. Activation of one detector shall give visual and audible alarm indication on the control panel only. Whenever approved by the FSD, activation of detectors provided solely for the above fire compartmentation provisions shall not activate the building fire alarm and shall not send the fire signal to the FSD via the alarm transmitter and fire alarm direct telephone line.

FWP2.1.7 AUDIO / VISUAL ADVISORY SYSTEM

FWP2.1.7.010.A WORKS DESCRIPTION

1. The Sub-contractor shall provide audio / visual advisory (AVA) system(s) at the areas as shown on the Drawings with equipment and components as specified in FWP10.10. The relevant Standard Detail drawings and schematics in the Sub-contract are for indication of the design intent only. The Sub-contractor shall be responsible for the detailed design of the system to meet with the statutory and performance requirements in the Specification;

2. The Sub-contractor shall provide all necessary equipment and materials to complete the AVA system in order to meet all prescribed requirements in the Fire Services CoP to the satisfaction of the FSD. The Sub-contractor shall propose and submit the system layouts, equipment, materials and detailed wiring schematics for Approval;

3. The AVA system shall provide audio advisory signals throughout the specified areas using an audio advisory system located adjacent to the fire alarm control panel in the fire services control room and loudspeakers at the areas as shown on the Drawings;

4. The Sub-contractor shall be responsible for designing the audio advisory system including the exact quantity and positioning of loudspeakers. The layout of loudspeakers as shown on the Drawings is the design intent for indication of the areas where the audio announcement is required to be provided and the types of loudspeakers required at specified locations;
5. When any of the loudspeakers for the audio advisory system are required to be connected to the public address system(s) provided by other(s), an automatic audio input change-over unit shall be provided for automatic switching of audio inputs;
6. The AVA system shall include visual advisory signs of flashing exit sign boxes in the AVA system protected areas, high level flashing directional sign boxes and low level photo-luminous directional signs in the specified areas for indication of evacuation route to the nearest exit.

FWP2.1.7.020.A SYSTEM OPERATION

1. Upon receipt of the fire alarm signal from the fire alarm control panel, the flashing mode of the exit sign boxes inside AVA system protected areas and directional sign boxes shall be activated throughout the AVA system protected areas;
2. The fire alarm bells shall operate for 10 seconds and then be followed by a pre-recorded emergency announcement in English, Cantonese and Putonghua to alert occupants and direct them to evacuate immediately following the flashing exit signs and flashing directional signs. An attention drawing signal such as a chime sound shall be given out each time before broadcasting of the emergency announcement;
3. The fire alarm bells and the emergency announcement for the AVA system protected areas shall repeat alternately until the fire alarm signal has been reset;
4. The message of the emergency announcement shall be recorded in a voice message module and shall be announced using amplifiers and loudspeakers;
5. In case of failure of the voice message module, the microphone of the audio advisory system in the fire services control room shall be used by an operator to give emergency announcement with a preceding attention drawing signal such as a chime sound to draw the attention of the public;
6. Fire alarm bells shall be operated continuously to give the fire alarm warning if no audio signal is received from the voice message module or microphone.

FWP2.1.8 DRENCHER SYSTEM INSTALLATION

FWP2.1.8.010.N DRENCHER SYSTEM DESCRIPTION

1. The Sub-contractor shall provide drencher system(s) for protection against internal and/or external openings and/or for fire compartmentation as shown on the Drawings with equipment and components as specified in Worksubsection FWP8.2;
2. The Main Contractor will erect the drencher water tank. The Sub-contractor shall check and furnish all necessary dimensional information to enable its capacity shall be adequate for not less than 30 minutes of operation;
3. The Sub-contractor shall carry out the installation work from drencher water tank onward including the connection of this system thereto;

4. Each drencher system shall comprise drencher pumps/ drencher intermediate booster pumps, pressure switches, deluge valve set, manual operating devices, drencher inlets, drencher heads, control panel, heat detectors or pilot sprinklers where appropriate, and all associated equipment, whether or not they are shown on the Drawings, necessary to complete the system complying with the FSD requirements.

FWP2.1.8.020.N DRENCHER SYSTEM OPERATION

1. The drencher system(s) shall be operated both manually and automatically and be inter-connected with the fire alarm and control system;
2. Manual operating devices with operating instruction shall be provided at the deluge valve and near each exit door of the area served by the system(s) and at location(s) required by FSD;
3. For refuge floor, heat detectors shall be used to activate the drencher system;
4. For other locations, the drencher system shall be activated either by heat detectors or pilot sprinklers as shown on the Drawings;
5. In case pilot sprinklers are used, a separate local sprinkler flow switch with test facilities shall be installed to the pilot sprinkler system for actuating the drencher system, such that actuation of sprinklers in other area shall not cause the drencher system to operate;
6. Upon actuation, the system will be capable of delivering the required pressure and flow rate of water to the drencher heads by the drencher pumps through the drencher deluge valve set.

FWP2.1.8.030.N DUTY OF DRENCHER PUMP/ DRENCHER INTERMEDIATE BOOSTER PUMP

1. Identical duty and standby drencher pumps as shown on the Drawing shall be used in the system to provide adequate flow of not less than 10 l/min/m^2 of the protected opening and sufficient pressure that capable to maintain the discharge density and pressure at all drencher heads of not less than 0.35 bars when the system is fed from the drencher water storage tank, once started manually or automatically as stated in FWP2.1.8.020;
2. Whenever drencher intermediate booster pumps are required, suitable start/stop push buttons together with pump running indicator lights and alarm buzzer shall be provided adjacent to the corresponding drencher inlet(s);
3. The drencher intermediate booster pumps shall be capable to provide adequate flow and pressure to the installation with the fire engines boosting water into drencher inlet at a constant pressure of 800 kPa upstream of the inlet upon actuated by the ‘start/stop’ push buttons adjacent to corresponding drencher inlet(s);
4. When the drencher pumps are also utilised as the drencher intermediate booster pumps as shown on the Drawing, they shall be able to perform both functions as stated in above paragraphs 1 and 3;
5. The standby drencher pump/ drencher intermediate booster pump shall be energised to become the duty pump within 15 seconds should the duty drencher pump/ drencher intermediate booster pump fail to operate;
6. The pump flow and pressure characteristics, operation sequence, controls, status indications, labelling and by-pass arrangement for drencher pumps / drencher immediate booster pumps, shall comply with Fire Services CoP;

7. The Sub-contractor shall check the pump duty operating head and capacity of flow based on the characteristics of the pipework system and equipment actually installed by hydraulic calculation and on site verification.

FWP2.1.8.040.N PROVISION OF ORIFICE PLATES AND LOCKSHIELD VALVES

Notwithstanding that the orifice plate/lock-shield valve is not shown on the Drawings, the Sub-contractor shall provide the suitably sized orifice plate / lock-shield valve in the drencher system wherever necessary, to suit the pressure/flow characteristics of the drencher pump and to meet the FSD's requirements.

FWP2.2 WATER PUMP INSTALLATION

FWP2.2.1 SYSTEM DESCRIPTION

FWP2.2.1.010.9 GENERAL

1. The water pump installation for each domestic block shall comprise the following as shown on the Drawings:
    a. Two sets of fresh water pump;
    b. Two sets of flush water pump;
    c. A fresh water booster pump system on Roof;
    d. Two sets of fire services feed pump;
    e. One set of night duty pump for fresh water.
2. The water pump installation shall include all associated electrical works, pipework and system components such as pressure switches, pressure gauges, flexible connectors, gate valves, check valves and strainers as shown on the Drawings.

FWP2.2.1.020.9 SUB-CONTRACTOR'S RESPONSIBILITIES

1. The Sub-contractor shall be responsible for connecting the suction and discharge pipework to the puddle flanges at the sump tanks and the riser pipes connection point inside the pump room as shown on Drawings;
2. The Sub-contractor shall provide and install pressure reducing valves and modulating float valves at the fresh and flush water sump tanks as shown on the Drawings. Ball float valve shall also be provided and installed by the Sub-contractor at the fire services sump tank as shown on the Drawings;
3. The Sub-contractor shall provide, install and connect concealed PVC conduit system for water pump control.

FWP2.2.1.030.9 FRESH WATER BOOSTER PUMP SYSTEM

1. A fresh water booster pump system shall consist of the following:
    a. Three sets of fresh water booster pumps as specified in FWP6.2.025, two duties and one standby, coupled with induction motors as specified in FWP11.2, assembled in the manufacturer's factory, suitable for variable speed drive control;
    b. Three sets of variable speed drive (VSD) units as specified in FWP11.3.030 consisting of multi-pump control microprocessors and variable frequency drives with static frequency inverters of appropriate rating to match with the pump motors, and whenever necessary, including an associated master multi-pump display and control panel board;
    c. A pump control cubicle as specified in FWP11.4 consisting of power supply, control and indication wiring circuits;
    d. A set of at least two nos. of stainless steel pneumatic pressure vessels as specified in FWP5.2.056 and of capacities as shown on Drawings;
    e. Pressure transducers as specified in FWP11.6.080 to hunt water discharge pressure and transmit feedback signal to the multi-pump control microprocessors in the VSD units; and

f. Other necessary components for completing the system.

FWP2.2.1.040.9 PRV FAULT INDICATION SYSTEM DESCRIPTION

1. The Sub-contractor shall provide and install a PRV fault indication system for monitoring all pressure reducing valves installed in fresh, floor washing, irrigation and flush water systems as shown on the Drawings;

2 The PRV fault indication system for each domestic or non-domestic block shall comprise the following:

   a. A PRV fault indication panel consisting of power supply, control and indication wiring circuits at G/F guard counter or at a location shown on the Drawings;

   b. System components including but not limited to pressure switches, valves and associated water pipes and fittings connecting to all pressure reducing valves in the block. Pipe materials in various applications shall refer to FWP3.1.2.050;

   c. G.I. adaptable box with LED indication lamp in the vicinity of respective pressure reducing valve for connecting signal cable to the pressure switch via surface conduit; and

   d. Signal wiring of PVC cables in concealed conduits, connecting between the adaptable box and the PRV fault indication panel.

3. The PRV fault indication panel shall be made of epoxy coated galvanised steel sheet and equipped with the following controls / indicators:

   a. Fault indication lights with designation for each PRV;

   b. A power supply status indicator;

   c. An alarm reset switch;

   d. A buzzer mute switch;

   e. A lamp test button;

   f. A buzzer alarm.

4. For ratio type pressure reducing valves at the down-feeding pipework, the sub-contractor shall inform the main contractor to allow and provide plug-offs of compatible size at the upstream and downstream pipeworks of the pressure reducing valves for installation of pressure switches;

5. Pressure switch for flush water shall be constructed of corrosion resistant material.

FWP2.2.2 SYSTEM OPERATION

FWP2.2.2.010.9 FRESH AND FLUSH WATER PUMP INSTALLATION

1. The pumps shall be operated by level control switches installed at the roof tanks of each block. The control schematic wiring diagram of the fresh and flush water pump installation is shown on the Drawings;

2. When the water level at the roof tank is 100 mm above the top of the outlet pipe, the low level control switch shall start the duty pump until the water level corresponding to the specified tank capacity is reached;

3. When the water level at sump tank falls to 150 mm above the top level of the suction pipe of the pump, a level control switch at the sump tank shall switch off the pump;

4. An audio and visual alarm panel shall be provided at conspicuous high level outside the fresh and flush water pump room to indicate the common fault alarm at each pump control cubicle. The audio alarm shall be a buzzer rated for continuous operation with its sound audible at a distance of not less than 10 m and the visual alarm shall be a red indicating light. The audio and visual alarm shall be reset manually at the pump control cubicle;
5. For domestic blocks, daily automatic operation of full capacity duty pump at an adjustable preset time on or before 11 p.m. shall be incorporated in the fresh and flush water pump controls to fill up the roof water tanks for use over the night.

FWP2.2.2.020.9 FRESH WATER BOOSTER PUMP SYSTEM INSTALLATION

1. The fresh water booster pump system shall perform automatic multi-pump control functions as follows:
    a. To maintain preset constant water output pressure as specified on the Drawings by varying the motor running speed according to the feedback signals of corresponding pressure transducers at pump discharge side to meet system water flow demand;
    b. To switch on lagging pump when demand exceeding the maximum capacity of leading pump;
    c. To switch pump start-and-stop automatically according to the programme built in the multi-pump control microprocessor of the VSD unit for pump sequence operation and alternatively in order to maintain equal tear and wear of all pumps;
    d. To count the running hours of each pump and to perform automatic switching of pumps to avoid non-stop operation of any pump exceeding the preset maximum running hours in every on/off cycle;
    e. To utilize the associated pneumatic pressure vessels to keep pump running at zero demand for certain moment before pump stopping and to supply the least flow prior to pump starting to avoid quick start-and-stop of pump;
    f. To enable automatic switching of duty pump and trigger visual and audio alarm in case of any VSD fault and/or pump failure in running;
    g. To stop all pumps and trigger alarm for low water level at supply water tank.
2. The fresh water booster pump system shall comply with the following operating and installation requirements:
    a. All pumps in a booster pump system shall be capable of operating simultaneously regardless of their design function of duty and standby purposes;
    b. Each VSD unit is normally equipped with its own pressure transducer. For any system which feedback signal is grouped from one common pressure transducer for all pumps, a duplicate transducer capable of automatic changeover shall be provided as a standby;
    c. When a master multi-pump display and control unit is necessary to fulfil the multi-pump control functions, an identical duplicate shall be provided in parallel with selector knob for easy changeover in case the master unit in use is found faulty. Both units shall be installed in either the pump control cubicle or a separate metal panel board;
    d. Functions of the multi-pump control on every VSD unit in operation shall be maintained when one or more VSD units in the water booster system is/are isolated no matter being switched off manually or tripped automatically at fault. Failure of any individual system component including pump, VSD unit, master display and control unit and pressure transducer shall not cause total stoppage of the booster pump system;

e. Each pump shall be capable of switching on/off manually at its associated VSD unit;

f. The Sub-contractor shall submit calculations to demonstrate the inclusion of harmonic currents in arriving at the calculated cable losses within the maximum allowable limit in the BEC, for the final power circuit of the VSD units.

3. The following power supply and indications shall be provided in the booster pump control cubicle:

a. Switch isolator for each pump motor;

b. Contactor for emergency stop for each pump motor;

c. Automatic/OFF selector for VSD of each pump motor;

d. Multi-function electronic meter as specified in ELE4.4.5.040 for each pump motor;

e. Phase indication for each pump motor;

f. Pump running indication for each pump motor;

g. Visual and audio indication for pump fault coming from VSD of each pump motor;

h. Visual and audio indication for low water level at supply water tank;

i. Visual and audio indication for low pressure at discharge side.

4. Upon failure of one pump, the faulty pump shall be automatically switched off while at the same time an audio and visual alarm shall be given at the alarm panel outside the pump room on roof and repeated at the alarm panel outside the water pump room on G/F installed with Fresh Water Pump with clear label "Alarm for Roof Fresh Water Booster Pump System". The audio and visual alarm shall be same as that described in FWP2.2.2.010. Upon failure of the control system and when the system pressure has dropped to or below a pressure setting as shown on the Drawings, the audio and visual alarm shall also be actuated.

FWP2.2.2.026.9 RAINWATER IRRIGATION PUMP SYSTEM INSTALLATION

1. The pumps shall be under automatic control according to the cut-in/cut-out sequence as shown on the Drawings;

2. Upon failure of one pump, the faulty pump shall be automatically switched off while at the same time an audio and visual alarm shall be given at the alarm panel outside the pump room and repeated at the alarm panel outside the water pump room as shown on Drawings with clear label "Alarm for Rainwater Irrigation Pump System". The audio and visual alarm shall be same as that described in FWP2.2.2.010. Upon failure of the control system and when the system pressure has dropped to or below a pressure setting as shown on the Drawings, the audio and visual alarm shall also be actuated.

FWP2.2.2.030.9 FIRE SERVICES FEED PUMP INSTALLATION

1. The fire services feed pump shall be operated by level control switch(es) installed at the roof fire services supply tanks such as FH/HR tank, sprinkler tank, street fire hydrant tank and drencher tank, if applicable. The control schematic wiring diagram of the fire services feed pump installation and supply tank low level alarm system is shown on the Drawings;

2. When the water level at a roof fire services supply tank has fallen to a level close to and above 90% of the full effective capacity, the level control switch shall start the feed pump until the water level corresponding to the specified tank capacity is reached;

3. The level control switch for tank empty at the sump tank shall be adjusted to switch off the fire services feed pump when the sump water level falls to 150 mm above the top level of the suction pipe of the pump;

4. An audio and visual alarm panel shall be provided at conspicuous high level outside the feed pump room to indicate the common fault alarm at the feed pump control cubicle. The audio alarm shall be a buzzer rated for continuous operation with its sound audible at a distance of not less than 10 m and the visual alarm shall be a red indicating light. The audio and visual alarm shall be reset manually at the pump control cubicle;

5. For water level monitoring of sprinkler system, it shall also comply with BS EN 12845.

FWP2.2.2.035.A LOW LEVEL ALARM AT FIRE SERVICES SUPPLY TANK

1. A level control switch for low level alarm shall be provided at each of the fire services supply tanks. It shall actuate alarms when the water level in any of the fire services supply tanks falls more than 10% below the level of full effective capacity;

2. In case that the fire services supply tank(s) is / are located at roof or on building higher level where the water is fed by fire services feed pump,

   a. A fire services tank low level indication lamp shall be lit on at the front panel of the feed pump control cubicle;

   b. The alarm signal wiring for water low level of fire services supply tank shall also be connected to the audio and visual alarm panel as described in FWP2.2.2.030 outside fire services feed pump room. The signal for low level alarm shall be reset manually at the pump control cubicle.

3. In case that a fire services supply tank is located at basement or on building lower level where the water is directly fed from town mains,

   a. A fire services tank low level indication lamp shall be lit on at the front panel of the FS pump control cubicle;

   b. The alarm signal wiring for water low level of fire services supply tank shall also be connected to an audio and visual alarm panel outside the fire services supply tank room. The signal for low level alarm shall be reset manually at the pump control cubicle.

4. In any case, the low level alarm signals at fire services supply tanks shall be further connected to the Fire Alarm Control Panel (FAP) near security counter at entrance lobby of a domestic block or FAP / repeater panel at the FS Control Room where provided in any building. Alarm signal shall also be provided at the FAP / repeater panel when there is fault at the water level monitoring and control circuits.

FWP2.2.2.040.9 CONTROL CUBICLE LAYOUT FOR FRESH / FLUSH WATER PUMPS, RAINWATER IRRIGATION PUMPS AND FOR FS FEED PUMP AND FS / SPRINKLER TANK LOW LEVEL ALARM SYSTEM

1. Unless otherwise Approved, control circuit and panel layout arrangement of the control cubicle shall be as shown on the Drawings;

2. The Sub-contractor shall advise the CM of the appropriate type and rating of the short circuit protective device to be used in conjunction with the motor starter in accordance with the motor starter manufacturer's recommendation in order to achieve the specified type of coordination.

FWP2.2.2.050.9 PRV FAULT INDICATION SYSTEM OPERATION

1. The PRV fault indication system shall comply with the following operating requirements:
    a. All system components provided for pressure monitoring and the associated pipes and fittings shall be able to withstand the maximum pressure that may arise upon the failure of respective pressure reducing valve;
    b. Upon system pressure has risen to or above the pre-set high level due to failure of pressure reducing valve, the system shall actuate the local LED indication lamp in the vicinity of respective PRV and send the signal back to the PRV fault indication panel to actuate corresponding indication light with audible alarm;
    c. The buzzer shall sound continuously until manually muted by activation of the mute switch while the red fault indication light shall remain on until the fault is cleared. The audio and visual alarm shall be reset manually at the PRV fault alarm indication panel;
    d. The Sub-contractor shall perform testing and commissioning of the system so as to ensure its compliance with statutory and performance requirements in the Specification;
    e. A permanent marking shall be made on the pressure switch after set up to avoid unintentional shifting of the setting.
2. For ratio type pressure reducing valves at the down-feeding pipework, the actuating pressure of pressure switch shall be close to but higher than the downstream pressure of the respective pressure reducing valve;
3. For pilot type pressure reducing valves at the incoming water supply pipework, the actuating setting of pressure switches for monitoring the first stage and second stage pressure reducing valves for fresh water supply, the pressure reducing valve for flush water supply and the pressure reducing valve for direct feed fresh water supply shall be close to but higher than respective downstream pressure according to the Drawings;
4. The Sub-contractor shall be responsible for the detailed design of the system to suit site specific factors such as incoming mains pressures, pressure reduction setting of pressure reducing valve and modulating float valve characteristics etc., and submit shop drawings and proposed actuating setting of pressure switches for Approval.

FWP2.2.3 PUMPS

FWP2.2.3.010.9 PUMP DUTY

The fresh, flush, booster fresh and fire services water pumps shall be able to deliver water at flow rates and pressure heads as indicated on the Drawings.

FWP2.2.3.020.9 TYPE OF PUMPS

1. Fresh water pumps: horizontal/vertical multi-stage;
2. Flush water pumps: horizontal/vertical multi-stage;
3. Fire services feed pumps: horizontal/vertical end-suction/multi-stage;
4. Fresh water booster pumps: stamped stainless steel multi-stage vertical in-line pump for variable speed drive;
5. Rainwater irrigation pumps: stamped stainless steel multi-stage vertical in-line pump.

FWP2.3 RAINWATER HARVESTING SYSTEM INSTALLATION FOR DOMESTIC BLOCK

FWP2.3.1 SYSTEM DESCRIPTION

FWP2.3.1.010.9 GENERAL

1. The rainwater harvesting system (RWHS) installation shall comprise the following as shown on the Drawings:
    a. Chlorine Dosing;
    b. Cartridge Filter;
    c. Two number of 2-way Valves;
    d. Rainwater Irrigation Pumps;
    e. Control and Metering System.
2. The collected rainwater in the rainwater collection tank shall be treated by both chlorinated solution and cartridge filter before being fed to the 2-way valve, and finally to the irrigation points. Fresh water from break tank shall be fed to the irrigation points through another 2-way valve if the rainwater collected inside the collection tank is at low level.. Control and metering system shall monitor the performance of the RWHS with monitoring measurements on the water and electricity consumptions.
3. The RWHS installation shall include all associated electrical works, pipework and system components as shown on the Drawings.

FWP2.3.2 SYSTEM OPERATION

FWP2.3.2.010.9 SYSTEM CONTROL

1. Water to the irrigation points being fed either from the rainwater collection tank or fresh water break tank shall be controlled by 2 number of inter-connected 2-way valves.
2. One inlet port of a 2-way valve shall be connected to the rainwater outlet pipe of the collection tank through a cartridge filter while the inlet port of another 2-way valve shall be connected to the fresh water supply through a break tank.
3. When the water level in the rainwater collection tank is above the preset low level, the level sensor shall issue a signal to allow rainwater instead of fresh water entering the 2-way valve connected to the rainwater outlet pipe of the collection tank through a cartridge filter.
4. When the water level in the rainwater collection tank is below the preset low level, the level sensor shall issue a signal to allow fresh water instead of rainwater entering the 2-way valve connected to the fresh water supply through a break tank.
5. The function of the two 2-way valves shall be electrically interlocked such that water is either fed from rainwater collection tank or fresh water break tank.

FWP3.1 MATERIALS

FWP3.1.1 GENERAL

FWP3.1.1.010.9 SUITABILITY FOR PURPOSE

All pipes and fittings shall be constructed of materials suitable for the required working and test pressures and temperatures of the fluid carried.

FWP3.1.1.020.9 CONFORMITY WITH SPECIFICATION

1. All pipes and fittings shall conform to the Specification. Alternative materials may be used only with prior Approval;
2. Comply with BS 6920 for non-metallic components in contact with water intended for human consumption. Submit test reports or test certificates to demonstrate full compliance with BS 6920.

FWP3.1.1.030.9 PIPE SIZES

Pipe sizes indicated on the Drawings or in this Specification are nominal bores, with the exception of copper tube, for which the sizes indicated are nominal outside diameters.

FWP3.1.2 PIPEWORK

FWP3.1.2.010.A DUCTILE IRON PIPES, FITTINGS AND ACCESSORIES

1. Ductile iron pipes, pipe fittings and accessories to BS EN 545;
2. Be capable of withstanding the concerned working pressure and maximum static pressure that may arise upon failure of the associated pressure reducing devices;
3. Be accepted by the Water Authority for the intended application. Produce type test certificate / report issued by the certification bodies or accredited laboratories acceptable to the Water Authority for the verification of compliance with this Specification;
4. Slip on flange adaptors:
    a. Be provided at check meters positions;
    b. Be designed and manufactured to suit the pipework installation. The flanges shall comply with BS EN 1092-2 PN 16 or PN 25 as appropriate;
    c. Be made of ductile iron to BS EN 545 and shall be coated with epoxy externally and internally comply with BS EN 14901-1;
    d. Stud bolts and nuts of the flange adaptors shall be made of stainless steel to BS EN 10088-3-1.4401;
    e. Gaskets shall be made of Ethylene Propylene Diene Monomer (EPDM). If used for fresh water, it shall comply with relevant requirements in BS 6920 as required by the Water Authority;
    f. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rod plates, guide rods and steel washers on both sides, and shall be fitted with resilient neoprene sleeves, resilient neoprene washers on at least one side of the assembly for isolating vibration transmission.

5. Be coated with metallic zinc and bitumen finishing externally to BS EN 545 and lined with cement mortar internally, or be coated with metallic zinc and epoxy externally and lined with cement mortar and epoxy internally for use in corrosive condition. Epoxy coating shall comply with BS EN 14901-1. Adoption of epoxy coating shall be submitted to the CM for Approval;
6. The minimum wall thickness of pipes and fittings, which has already taken into account the negative tolerance, shall comply with the following table:

Nominal size DN	Minimum wall thickness of pipes and fittings mm
80	5.62
100	5.80
150	6.35
200	6.90
250	7.45
300	8.00

7. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the ductile iron pipes and fittings delivered to the Site or installed.

FWP3.1.2.020.A GALVANIZED STEEL PIPES AND FITTINGS

1. Galvanised steel pipes to BS EN 10255 with screwing to BS EN 10226-1 and of medium grade for above ground installation and of heavy grade for below ground installation unless otherwise Specified or shown on the Drawings;
2. Galvanised malleable cast iron pipe fittings to BS 143 and 1256 or BS EN 10242;
3. Galvanised wrought steel pipe fittings to BS EN 10241;
4. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the galvanized steel pipes and fittings delivered to the Site or installed.

FWP3.1.2.040.A CARBON STEEL PIPES AND FITTINGS

1. Carbon steel pipes of P265TR1 to BS EN 10216-1 or BS EN 10217-1 with wall thickness suitable for particular application and system working pressure, and with dimensions to BS EN 10220;
2. Correlated fittings shall be butt welding type carbon steel for pressure purposes to BS EN 10253-1.

FWP3.1.2.045.9 UNPLASTICIZED PVC (UPVC) PIPES AND FITTINGS

1. Pipes: comply with BS 3505, Class E or BS EN ISO1452-2 series S6.3 or higher to suit system working pressure and as shown on the Drawings;
2. Fittings: comply with BS 4346-1 in conjunction with BS EN ISO 1452-3 for fittings jointed by solvent cementing, comply with BS EN ISO 1452-3 for other fittings;
3. Colour: white unless approved by the Contract Manager;
4. Jointing compound: be of a type recommended by the manufacturer of the pipes and fittings.

FWP3.1.2.050.A PIPEWORK APPLICATION

Installations shall be carried out using the specifications indicated below unless otherwise specified elsewhere or shown on the Drawings:

	Application	Pipe Diameters	Material
1.	Fresh water pipe / Rainwater pipe	≤ 54 mm	Stainless steel pipe of BS EN 10088-1 grade 1.4401 and to BS EN10312 Series 2
		54 mm < Ø ≤ 65 mm	Stainless steel pipe of BS EN 10088-1 grade 1.4401 and to BS EN 10217-7 or BS EN10312 Series 2
		> 65 mm	Ductile iron pipe as FWP3.1.2.010
2.	Fire services pipe	≤ 150 mm	Galvanized Steel pipe as FWP3.1.2.020
		> 150 mm	Ductile iron pipe as FWP3.1.2.010
3.	Flush water pipe	> 65 mm	Ductile iron pipe as FWP3.1.2.010
		≤ 65 mm	uPVC pipe to BS3505 Class E or BS EN ISO 1452 : Part 2 pipe series S6.3 or higher to suit system pressure and as shown on the Drawings
4.	Bore well water pipe	All	Medium grade galvanized steel pipe as FWP3.1.2.020
5.	High pressure pipes when specified	All	Carbon steel pipe as FWP3.1.2.040

FWP3.1.3 PIPE FITTINGS

FWP3.1.3.010.9 STANDARD PIPE FITTINGS

1. Unless otherwise specified or Approved, only standard fittings and pipe fittings as appropriate shall be used;
2. Pipe fittings shall be of the same size as the pipework connected to them;
3. Pipe fittings fabricated on site, reducing bush and locally manufactured pipe fittings will not be accepted.

FWP3.1.3.020.9 LOCALLY MANUFACTURED PIPE FITTINGS

1. Where restricted site condition does not permit the use of standard pipe fittings, purpose made local fittings may be used only with prior Approval;
2. Local fittings shall be internally and externally painted with two coats of anti-corrosion materials and pressure tested as directed by the Contract Manager, prior to installation.

FWP3.1.3.030.9 BENDS

All bends shall be of long radius type unless otherwise Approved;

Short radius bends can be used for pipe size up to 50 mm diameter and for pipes installed in limited spaces.

FWP3.1.3.040.9 TEES

All tees shall be of the pitcher or twin elbow type, unless otherwise indicated or Approved.

FWP3.1.3.050.9 FLANGES

1. All flanges shall conform to BS EN 1092 and shall be of suitable pressure rating;

2.Gaskets to BS EN 681-1 and shall be suitable for the operation condition in which they are installed.

FWP3.1.3.060.9 REDUCERS

1. Pipe size changes shall be effected by reducers of appropriate length to minimize pressure loss or otherwise by reducing bends or tees;
2. In the case of suction lift, eccentric reducers shall be used at pump suction for air elimination.

FWP3.1.3.070.9 PIPE BRACKETS

1. Pipe brackets shall be of sufficient strength to take the load with no noticeable deflection with clips detachable without disturbing the fixing;
2. Samples or details of the pipe brackets shall be submitted for Approval prior to installation.

FWP3.1.3.080.9 PROVISION OF SLEEVES

All sleeves for openings in walls within a fire compartment shall be PVC. All sleeves for openings in walls and slab connecting the fire compartment with other fire compartments/public area shall be galvanized mild steel.

FWP3.1.3.090.9 POLYTETRAFLUOROETHYLENE (PTFE) TAPES

1. Use PTFE tapes complying with BS 7786 to form a leak-free seal to screw joint;
2. When used under the conditions for which they are designated, PTFE tapes in contact with, or likely to come into contact with potable water shall comply with BS 6920.

FWP3.1.4 EXPANSION JOINTS AND FLEXIBLE CONNECTORS

FWP3.1.4.010.9 STAINLESS STEEL TYPE EXPANSION JOINTS

1. Stainless steel expansion joints shall be used in fresh, rainwater and fire services water pipeworks passing through building expansion joints or other locations as shown on the Drawings, and they shall comply with the following requirements:
    a. Be of axial pattern bellows type and be able to withstand horizontal and vertical movement;
    b. Be screwed ends to BS EN 10226-1, 2, 3 or flanged ends to BS EN 1092-1 as appropriate to facilitate replacement;

c. Be manufactured from stainless steel of Grade 1.4301 to BS EN 10088-1 or equivalent standard or other Approved material appropriate to the system;

d. Be designed to withstand the test pressure of the system and maximum static pressure that may arise upon failure of the associated pressure reducing devices;

e. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rods, rod plates and steel washers on both sides, and be fitted with resilient neoprene sleeves and resilient neoprene washers on at least one side of the assembly for isolating vibration transmission;

f. Testing pressure of the expansion joints shall be not less than twice of the system pressure involved;

g. All expansion joints shall be designed with a long cycle life to suit a pipe system with at least 20 years life expectancy and be installed properly without misalignment;

h. The expansion joints shall be the type accepted by the Water Authority and FSD. For sprinkler system, the expansion joints shall be provided according to the requirement of LPC Sprinkler Rules;

i. Anchors and guides shall be installed according to the recommendations of the expansion joint manufacturer and the details shall be submitted for Approval.

2. Submit the following for Approval of the CM:

a. Type hydraulic test certificates / reports from accredited laboratories; and

b. The installation lengths, materials, rated movements (axial extension, axial compression, lateral deflection, angular rotation, or any combination thereof) and pressure ratings of the expansion joints.

3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the stainless steel type expansion joints delivered to the site or installed.

FWP3.1.4.020.A RUBBER FLEXIBLE CONNECTORS / EXPANSION JOINTS

1. Rubber flexible connectors shall be used for pipeline vibration elimination in flush water and fire services water pipeworks at pump rooms and rubber expansion joints shall be used in only flush water pipework passing through building expansion joints. Rubber flexible connectors / expansion joints shall comply with the following requirements:

a. Be of double or multiple arch / sphere type;

b. Be able to sustain a working pressure compatible with the piping system with which they are connected. Unless otherwise specified, the working pressure shall be no less than 16 bars with a minimum test pressure of 150% of the working pressure and a minimum burst pressure of 55 bars;

c. Be non-toxic, corrosion and abrasion resistant and of sufficient length for effective isolation of vibration;

d. Be fitted with corrosion resistant steel or ductile iron floating flanges to BS EN 1092-1 or BS EN 1092-2;

e. Be provided with a flexible tube made of multiple layers of high tensile fabric reinforcement with EPDM, neoprene or synthetic rubber cover and liner. Tube end shall be of locked bead construction with steel wire bead ring and raised face;

f. Be equipped with control rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rods, rod plates and steel washers on both sides, and be fitted with resilient neoprene sleeves and resilient neoprene washers on at least one side of the assembly for isolating vibration transmission.

2. Submit the following for Approval upon the CM's request:

   a. Type hydraulic test certificates / reports from accredited laboratories;

   b. The installation lengths, materials, rated movements (axial extension, axial compression, lateral deflection, angular rotation, or any combination thereof) and pressure ratings of the rubber flexible connectors.

3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the rubber flexible connectors / expansion joints delivered to the Site or installed.

FWP3.1.4.030.A STAINLESS STEEL FLEXIBLE CONNECTORS

1. Stainless steel flexible connectors shall be used for pipeline vibration elimination in fresh water and rainwater pipework at pump room, and they shall comply with the following requirements:

   a. Be of omega-shape, close pitch annular corrugation, and fabricated from stainless steel plates / sheets / strips;

   b. Be able to sustain a working pressure compatible with the piping system with which they are connected. Unless otherwise specified, the working pressure shall be no less than 16 bars with a minimum test pressure of 150% of the working pressure and a minimum burst pressure of 40 bars;

   c. Be provided with a bellow which shall be non-toxic, corrosion and abrasion resistant and complete with braiding. Appropriate heat treatment shall be conducted to release the internal stress imposed on the bellow during the forming process when the convolution of the bellow is not gradually formed by continuous rolling in shape;

   d. Be of sufficient length for absorption of offset motion and effective isolation of vibration. The total stress on bellow due to internal pressure, offset motion and vibration shall not exceed the design endurance limit. Unless otherwise specified, the minimum rated lateral movement shall be as tabulated below:

Nominal bore of braided bellow	Minimum rated lateral movement
Up to 100 mm diameter	4 mm offset motion plus ±1 mm vibration
Above 100 mm diameter	6 mm offset motion plus ±1 mm vibration

   e. Be comprised of the following component material unless otherwise specified and inert gas arc welding shall be used for the termination of bellow and braiding at the tube ends:

      i. Bellow: austenitic chromium nickel or austenitic chromium nickel molybdenum stainless steel sheet to BS EN 10029, BS EN ISO 9445-1, BS EN ISO 9445-2, BS EN 10048, BS EN 10051 or BS EN 10095;

      ii. Braiding: stainless steel wires or plates;

      iii. Flange: corrosion resistant carbon steel.

   f. Have any part which is in contact with the water of the same material as the bellow;

g. Unless otherwise specified, be of flanged end connection. Flanges shall comply with BS EN 1092-1;

h. Have identification markings for the brand name, model number, bellow material, braiding material, working pressure and bellow nominal diameter;

i. Be equipped with guide rod assembly to prevent damage from excessive movement. The assembly shall consist of guide rods, rod plates and steel washers on both sides, and be fitted with resilient neoprene sleeves and resilient neoprene washers on at least one side of the assembly for isolating vibration transmission.

2. Submit the following for Approval upon the CM's request:

a. Type hydraulic test certificates / reports from laboratories accepted by the Water Authority;

b. The installation lengths, materials, rated movements (axial extension, axial compression, lateral deflection, angular rotation, or any combination thereof) and pressure ratings of the stainless steel flexible connectors.

3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the stainless steel flexible connectors delivered to the Site or installed.

FWP3.1.5 STRAINERS

FWP3.1.5.010.9 TYPE AND APERTURE

Strainer shall be of Y-type or U-type (Bucket/Basket type) as specified below, unless otherwise specified on Drawings. The minimum free flow area ratio shall be 2 and the maximum aperture size shall be of ∅1.5 mm for strainers of nominal size 100 mm or below and of ∅3.0 mm for strainers of nominal size 150 mm or above, unless otherwise specified. For U-type strainer of any nominal size to be used as secondary stage strainer at discharge side of water pump in flush water system, the minimum free flow area ratio shall be 1 and the maximum aperture size shall be of ∅1.0 mm, unless otherwise specified.

FWP3.1.5.020.9 SIZE AND PERFORMANCE

Strainers shall have the same nominal sizes as the pipes in which they are connected and shall be suitable for both working and test pressures of the piping system in which they are installed. Unless otherwise specified all strainers shall have a working pressure of not less than 16 bar.

FWP3.1.5.030.B CONSTRUCTION

1. Strainers shall be constructed of materials as specified below suitable for the required working and test pressures and temperature of the fluid carried. Better or equivalent materials may be offered for Approval;

2. At nominal sizes up to and including 50 mm:

a. For fresh water and fire services, use the following:

i. Adoption: Y-type screwed joint;

ii. Body and cover: spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15 or bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K;

iii. Screen: stainless steel to BS EN 10088-1 Grade 1.4401.

b. For flush water, use the following:

i. Adoption: Y-type screwed joint;

ii. Body and cover: stainless steel to BS EN 10088-1 Grade 1.4401;

iii. Screen: stainless steel to BS EN 10088-1 Grade 1.4401.

3. At nominal sizes above 50 mm:

a. For fire services, use the following:

i. Adoption: Y-type flanged joint;

ii. Body and cover: grey cast iron to BS EN 1561 EN-GJL-250 or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;

iii. Screen: stainless steel to BS EN 10088-1 Grade 1.4401;

iv. Drain Plug: malleable iron;

v. Stud and Nut: stainless steel to BS EN 10088-1 Grade 1.4401.

b. For fresh water and flush water, use the following:

i. Adoption: U-type flanged joint with quick release cover;

ii. Body: grey cast iron to BS EN 1561 EN-GJL-250 or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;

iii. Cover: stainless steel to BS EN 10088-1 Grade 1.4401 or BS EN 10283 Grade 1.4408;

iv. Screen: stainless steel to BS EN 10088-1 Grade 1.4401;

v. Drain Plug: malleable iron;

vi. Clamper, Stud and Nut: stainless steel to BS EN 10088-1 Grade 1.4401 or BS EN 10283 Grade 1.4408.

4. All cast iron and ductile iron components shall be coated with epoxy based material both on internal and external surfaces. The coating for use in fresh water shall be in compliance with relevant requirements in BS 6920 for potable use and to the satisfaction of the Water Authority. Test certificate / report from accredited certification bodies or laboratories shall be submitted to the CM for Approval;

5. U-type strainer shall be equipped with quick release cover composed of clamper or stud and hand nuts which shall be so designed that the basket can be taken out for cleaning without using tools. Appropriate safety mechanism shall be incorporated in the quick release cover.

FWP3.1.5.040.9 END CONNECTIONS

Strainers of 50 mm or below shall be of screwed female end connection to BS EN 10226-1, 2, 3 and strainers of above 50 mm shall be of flanged end connection to BS EN 1092-2.

FWP3.1.5.050.9 CERTIFICATION

Type test certificates / report from laboratories accepted by the Water Authority confirming that the strainers have been tested conforming to this Specification shall be produced upon request.

FWP3.1.5.060.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the strainers for fresh water and fire services systems delivered to the site or installed.

FWP3.2 INSTALLATION

FWP3.2.1 SITE HANDLING

FWP3.2.1.010.9 STORAGE

Prior to installation, all materials shall be stored properly in accordance with the manufacturer's instructions to afford maximum protection against weather, corrosion, mechanical damage and other causes. All pipes shall be stored with closed ends. All damaged materials shall be removed from site immediately.

FWP3.2.1.020.9 CLEANLINESS

All pipes and fittings shall be cleaned before erection with all scale, burrs, furs, sand, slag etc. removed. Cleanliness shall be maintained throughout erection by covering the exposed ends of pipework with a metal or plastic cap.

FWP3.2.2 PIPEWORK LAYOUT

FWP3.2.2.010.9 COORDINATION OF PIPEWORK

The Drawings are diagrammatic and indicate only the approximate location and manner in which the pipework is to be installed. The Sub-contractor shall allow for any diversion to avoid structural beams and other services etc., ascertain the actual work involved and coordinate his pipework installation with the work of other trades and services.

FWP3.2.2.020.9 ROUTING AND GRADING OF PIPEWORK

Pipework shall, where applicable, follow the lines of walls and be graded to ensure venting and draining. A minimum clearance of 25 mm shall be maintained between the pipework and the finished mounting surface.

FWP3.2.2.030.9 ARRANGEMENT OF PIPEWORK

All pipework shall, be neatly arranged and mounted. For a number of pipes running close to one another, they shall be grouped and mounted on steel framed racks arranged so that the number of cross-over is minimum. All vertical pipes shall be plumbed.

FWP3.2.2.040.9 VENTING

Air vents of automatic type must be provided at all high points wherever required.

FWP3.2.2.050.9 DRAINING

1. All water pipework, except those for fire services, shall be fitted with 13 mm diameter key operated cocks, with hose unions, at low points in the system to facilitate drain down;
2. A 25 mm diameter drain cock with hose bib shall be provided between the check valve and the gate valve at the pump discharge to facilitate draining of the riser pipe.

FWP3.2.2.060.9 PROVISION FOR DISMANTLING

1. Sufficient joints and fittings shall be provided to facilitate easy removal of pipes, valves, pumps, etc., for inspection and repair. Disconnecting flanges, or screwed unions as applicable, shall be provided at suitable locations and at valves, pumps, etc;
2. Pipes shall not be embedded in the concrete structure, or grouted in or otherwise installed in such a way as to make alterations difficult at a later date.

FWP3.2.2.070.9 LOCATION OF STRAINERS

Install strainers in positions shown on the Drawings.

FWP3.2.3 PIPEWORK JOINTING

FWP3.2.3.010.9 MANUFACTURERS INSTRUCTIONS

Installation, jointing, storage and handling of the pipes and fittings shall be in accordance with the manufacturer's recommendations.

FWP3.2.3.020.9 LOCATION OF PIPE JOINTS

Pipe joints shall not be made in the thickness of any wall, floor, ceiling or beam.

FWP3.2.3.030.9 JOINTING GALVANIZED STEEL PIPES

1. Unless otherwise Approved, galvanized steel pipes with diameter less than and equal to 150 mm shall be jointed with screwed fittings. Screwed flanges shall be employed only for connection to flanged end valves or equipment;
2. Unless otherwise Approved, galvanized steel pipes with diameter greater than 150 mm shall be jointed with screwed flanges or flanged fittings;
3. Jointing of steel pipes by welding shall only be used when Approved;
4. Screwed fittings shall have pipe threads complying with BS EN 10226-1, 2, 3. Screwed joints shall have tapered threads and shall be made with Approved jointing material. Where the cutting of threads removes the galvanising, an anti-corrosive sealing compound shall be applied to restore the integrity of the protective finish;
5. Galvanized steel pipes for fire services pipework can be jointed by mechanical couplings and fittings with the Approval of the Contract Manager.

FWP3.2.3.040.9 JOINTING DUCTILE IRON PIPES

Unless otherwise specified, all ductile iron pipes shall be jointed:

1. For above ground installation: with screwed flanges or flanged fittings, stainless steel bolts and nuts of BS EN 10088-3 Grade 1.4401 for fresh and flush water pipes and fittings inside water pump room;
2. For below ground installation: with flexible push-on type connection joints.

FWP3.2.3.045.9 JOINTING UNPLASTICIZED PVC (UPVC) PIPES

1. All pipes shall be cut to square ends, free from harmful burrs and be prepared in accordance with the manufacturer's recommendations. Purpose made equipment recommended by the manufacturer shall be used for cutting the pipes and shall be submitted for the Contract Manager's approval;

2. All uPVC pipes shall be jointed with sockets and fittings and as recommended by the uPVC pipes manufacturer;

3. Solvent cementing shall be used for all pipeworks. All the surfaces shall be cleaned with abrasive paper and spirit cleaner. In the application of solvent cementing, heat shall be avoided as the cement may dry before chemical bonding between the two surfaces is completed. Mating surfaces shall be turned for even spread of the solvent. Excessive cement shall be wiped off quickly;

4. Flanged joints shall be used where solvent cementing is not practicable and at locations to facilitate dismantling. Neoprene ring gaskets provided or approved by the flange manufacturer shall be used between flanges. The jointing compound for the pipe and flange must be applied in accordance with the jointing compound manufacturer's recommendation.

FWP3.2.3.050.A MECHANICAL COUPLINGS AND FITTINGS FOR FIRE SERVICES SYSTEM

1. As an alternative to flanged and screwed joints, grooved end mechanical couplings may be employed subject to the Approval of the CM;

2. Mechanical couplings shall be hot dip galvanized, self-centering, engaged and locked in place onto the grooved or shouldered pipe and pipe fitting ends. The result shall be in a positive watertight couple providing some allowance for angular pipe deflection, contraction and expansion. Coupling housing clamps shall consist of two or more malleable iron castings or rolled steel or ductile iron segment holdings with a composition water sealing gasket so designed that the internal water pressure increases in the water tightness of the seal. Sealing gasket shall be selected for the service and working temperature according to the manufacturer's recommendations. The coupling assembly shall be securely held together by two or more zinc plated track head square or oval-neck heat-treated carbon steel bolts and nuts. All pipe fittings connected to mechanical pipe couplings shall have groove and shouldered ends. Flanged or threaded end valves may be used with grooved adapters;

3. Regarding material specification, specifications on components of mechanical couplings shall be as follows:

    a. For coupling housing material, ductile iron shall be to ASTM A536 or to BS EN 1563 or other standards subject to the CM's Approval;

    b. Rubber gaskets shall be tested to the following specifications:

        i. Hardness: ASTM D2240;

        ii. Tensile testing: ASTM D412;

        iii. Compression: ASTM D395;

        iv. Heat aging: ASTM D573.

4. Before couplings are assembled, pipe ends and outsides of gaskets shall be lightly coated with suitable lubricant or graphite paste to facilitate installation;

5. Pipe grooving shall be carried out by using proprietary grooving machine or manufacturer’s recommended grooving machine as approved by the CM and in accordance with the pipe coupling manufacturer's latest specifications. The grooving shall be roll-grooved without the removal of any metal. Zinc coating damaged during the grooving operation of galvanized steel pipe shall be rectified by scrubbing clean the affected area and coated with a zinc rich galvanizing paint approved by the CM;

6. Unless otherwise specified, all mechanical couplings and fittings shall have a minimum working pressure of not less than 16 bars and the testing pressure shall not be less than 1.5 times the working pressure;
7. The electrical continuity of the mechanical couplings shall be effective and shall be verified by site measurement;
8. The mechanical couplings and fittings shall comply with standards acceptable to FSD;
9. The entire coupling installation shall be in accordance with the latest published selected manufacturer's recommendations;
10. The sub-contractor shall obtain WSD's consent on project basis for adopting mechanical couplings and fittings for pipework installation;
11. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the mechanical couplings and fittings delivered to the Site or installed.

FWP3.2.4 PIPEWORK SUPPORTS

FWP3.2.4.010.9 FIRE SERVICES PIPEWORK

1. Pipe bracket for fire services pipework shall be of fixed type;
2. Neoprene or rubber vibration isolation pad of 6 mm thick shall be added between pipe and bracket for installation inside fire services pump room.

FWP3.2.4.020.9 FRESH WATER AND FLUSHING WATER PIPEWORK

1. Pipe bracket for fresh water and flushing water pipework inside water pump room and pressure reducing valve chamber shall be completed with vibration isolator in accordance with FWP3.2.4.060. Where it is impractical to provide vibration isolator in accordance with FWP3.2.4.060, 6 mm thick neoprene or rubber isolation pad between pipework and bracket or other means of vibration isolation shall be provided subject to Approval by the Contract Manager;
2. Fixed type pipe bracket shall be installed at anchor points of the pipework system to avoid pipe movement in critical areas such as at pump suction connecting to puddle flange of water tank, non-return valve at pump discharge side, etc. Means of vibration isolation such as neoprene/rubber pad between pipework and bracket has still to be provided;
3. The sub-contractor shall be responsible for selecting fixed type pipe brackets or brackets with vibration isolator, as appropriate, for the whole pipework system and installing in accordance with the manufacturer's recommendations of brackets with vibration isolator to ensure that the vibration and noise generated from the pipework system would be isolated, in particular, to avoid causing nuisance to the tenants of the domestic flats.

FWP3.2.4.030.9 PERFORMANCE

All pipework shall be well supported so that it is free from excessive stress due to weight of its contents, its own dead weight, and dynamic forces due to liquid movement. Particular care should be taken with branches from vertical risers to ensure that the branch is not supporting the riser.

FWP3.2.4.040.9 PROVISION FOR MOVEMENT

Pipework shall be supported in such a manner as to allow adequate movement for expansion and contraction.

FWP3.2.4.050.9 FIXED TYPE PIPE BRACKET

1. Fixed type pipe bracket shall comprise pipe clip and hanger as follows:
   a. Pipe clip refers to the two halves components which are in direct contact with the pipework;
   b. Hanger refers to the component connecting the pipe clip for fixing onto the mounting structure/supports.
2. Components of the pipe brackets shall be not less than 3 mm thick. Materials of the pipe brackets shall be not less than those as specified below:
   a. Except for sprinkler pipework, pipe brackets for all pipeworks shall comply with the following requirements:
      i. All components including pipe clip, bolt, nut, washer, hanger and anchor bolt shall be made of stainless steel.
   b. Pipe brackets for sprinkler pipework shall comply with the following requirements:
      i. Pipe clip, bolt, nut and washer shall be made of stainless steel; and
      ii. Hanger and anchor bolt shall be made of galvanised mild steel.
   c. I-beam and U-channel for further supporting pipe brackets shall be made of mild steel with anti-corrosion painting;
   d. Stainless steel for components including pipe clip, bolt, nut, washer, hanger and anchor bolt shall be at least to BS EN 10088-3 grade 1.4301 unless otherwise specified.
3. Pipe brackets shall be arranged as close as possible to joints and changes of direction, with each bracket taking its share of the load and of sufficient strength to take the load with no noticeable deflection with clips detachable without disturbing the fixing. Brackets fixing to structure shall be fixed by at least two anchor bolts of adequate size. Samples or details of the pipe brackets shall be submitted for Approval prior to installation;
4. Supports shall be spaced at intervals as specified in FWP3.2.4.070;
5. For all pipeworks except sprinkler pipework where LPC Sprinkler Rules shall apply, the minimum bolt diameter for the clips and the minimum anchor bolt diameter for fixing the pipe hanger to the mounting structure/support at two or more points shall be as follows:

Nominal Pipe Size (mm)	Minimum Bolt Diameter for Pipe Clips (mm)	Minimum Anchor Bolt Diameter for Hanger, Double Fixing (mm)
25 – 50	6	6
65 – 100	10	10
125 – 150	12	12

6. For pipe bracket and support interval designs other than those specified above, substantiation/calculation to demonstrate that the proposed bolt/anchor has sufficient strength to take up the load shall be submitted by the Sub-contractor for Approval by the Contract Manager.

FWP3.2.4.060.9 PIPE BRACKET WITH VIBRATION ISOLATOR

1. Vibration isolator:

   a. Vibration isolator shall contain a steel spring with minimum 8 mm pad of neoprene in series and enclosed in hanger box. The neoprene element shall be moulded with a rod isolation bushing that passes through the isolator hanger box. Spring diameter and isolator hanger box lower hole sizes shall be large enough to permit the hanger rod to swing through a 30 degree arc before contacting the edge of the hole and short circuiting the spring. The minimum static deflection of the spring shall be 20 mm;

   b. Unless otherwise Approved, vibration isolator shall be selected fully in accordance with manufacturer's guidelines and taken into account weight distribution of the pipework system, pipe anchor points, guide etc. to produce uniform deflections and to ensure that the vibration and noise generated from associated pipework system would be isolated and would not be transmitted to other parts of the building, in particular, to avoid causing nuisance to the tenants of the domestic flats;

   c. The Sub-contractor shall be responsible for and submit calculation to verify the correctness of selection and overall suitability of every vibration isolator for the pipework system.

2. Pipe bracket:

   Details of the pipe clip, bolt, nut, washer, hanger and anchor bolt shall be in accordance with those specified in FWP3.2.4.050 wherever applicable.

3. Connection between vibration isolator and pipe bracket:

   Unless approved by the Contract Manager, pipe bracket shall be secured firmly to the vibration isolator in accordance with the manufacturer's guidelines of the vibration isolator.

FWP3.2.4.070.A SUPPORT INTERVALS

1. Supports shall be spaced at intervals not exceeding those shown in the following tables for straight runs, as defined in Table 2 of BS 8000-15, with additional supports for bends and tees:

   a. Ductile iron pipes:

Nominal pipe size (mm)	Spacing for horizontal runs	Spacing for vertical runs
80	2.7 m	2.7 m
100	2.7 m	2.7 m
150 & above	3.6 m	3.6 m

   b. Galvanized steel pipes:

Nominal pipe size (mm)	Spacing for horizontal runs	Spacing for vertical runs
15	1.8 m	2.4 m
20 & 25	2.4 m	3.0 m
32	2.7 m	3.0 m
40 & 50	3.0 m	3.6 m
65 & 80	3.6 m	4.5 m
100	3.9 m	4.5 m
125	4.5 m	5.0 m
150	4.5 m	5.0 m

2. Supports on ground for pipework inside water pump room for fresh and flush water service shall be of stainless steel of BS EN 10088-3 grade 1.4401.

FWP3.2.4.080.9 HANGERS FOR HORIZONTAL PIPEWORK

Unless otherwise specified, hangers for horizontal pipework at high level shall be supported from angle or channel irons, provided by the Sub-contractor, suitable for building-in or otherwise secured to the structure.

FWP3.2.5 INTEGRATION WITH STRUCTURE

FWP3.2.5.010.9 MARKING OUT

The Sub-contractor shall be responsible for marking the exact location of all holes/slots which will be cut by the Main Contractor where required and permitted.

FWP3.2.5.020.9 CLEARANCE OF HOLES

The holes, sleeves and slots reserved through walls/slabs/beams will be cleared and cleaned by the Main Contractor before handover to the Sub-contractor for use. The nails appertaining to concealed electrical boxes shall be cleared by the Sub-contractor subsequent to work completion and prior to execution of final painting work by the Main Contractor.

FWP3.2.5.030.9 FIXING PIPE SLEEVES

Where pipes pass through walls, beams, floors and ceiling, sleeves shall be provided. The Sub-contractor shall ascertain whether slots/holes are to be grouted later and shall fix galvanized steel/PVC sleeves with 2 to 12 mm clearance to allow for expansion and movement of pipe, as FWP3.1.3.080, immediately after pipe erection as follows:

1. Through walls and beams: fix sleeves flush with the finished surfaces;
2. Through floor slabs: fix sleeves in position with 100 mm projection above finished floor level and flush with the underside of the floor.

FWP3.2.5.040.9 CAULKING PIPE SLEEVES

Galvanised steel sleeves used in walls and slabs between fire compartments shall have the full length of annular space between the sleeve and the pipe filled with non-flammable mineral wool or Approved equivalent materials, pointed with Approved fire-rated sealant to maintain the required FRP of the walls / floor slabs, and are durable and effective in sound insulation.

FWP3.2.5.050.9 PIPE ENTRY TO BUILDINGS

Pipe entries into buildings shall be sealed and plugged with mastic compound after installation of pipework to prevent the ingress or egress of water or vermin.

FWP3.2.5.060.9 PROTECTION OF UNDERGROUND PIPES

1. Underground pipes shall be protected against corrosion;
2. Pipework shall be cleaned after jointing and treated with two coats of good quality bituminous paint and wrapped with petrolatum tape for protection against corrosion due to water, salts, soil organics, etc. before laying, and rested on sand or sieved soil before the trench is backfilled;
3. All underground pipework shall be pressure tested before the application of bituminous paint and the application of the petrolatum tape.

FWP3.2.5.070.9 PIPES PASSING THROUGH ASPHALT COVERED FLAT ROOFS

Where pipes pass through flat roofs covered with asphalt, the Sub-contractor shall, unless otherwise specified:

1. Cast or build in cast iron or galvanized mild steel sleeve, of internal diameter 20 mm (minimum) larger than the external diameter of the pipe concerned, projecting minimum 150 mm above roof finish;
2. Caulk space and fill both ends with fire-rated mastic sealant;
3. Cover tops of sleeves with lead collars or pre-fabricated 304 stainless steel collars of 1.5 mm thick to fit the pipe size and sleeve.

FWP4.1 VALVES - GENERAL

FWP4.1.010.9 GENERAL

1. All valves shall be designed and constructed of materials suitable for both the working and test pressures of the piping system in which they are installed and the temperature of the fluid carried. Unless otherwise specified, all valves shall have a working pressure of not less than 16 bar;
2. Valves of the same type shall be from the same manufacturer.

FWP4.1.020.A STANDARD

Valves shall comply with the following standards unless otherwise specified:

Type of Valve	Standard		
	For nominal size up to and including 50 mm	For nominal size above 50 mm	Cast iron grading
Gate Valves	Copper alloy to BS EN 12288	Cast iron to BS 5163-1 in conjunction with BS EN 1074-1 and 2	Grey cast iron to BS EN 1561 EN-GJL-250 Spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15
Globe Valves	Copper alloy to BS 5154	Cast iron to BS EN 13789	Grey cast iron to BS EN 1561 EN-GJL-250 Spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15
Non-return valves	Copper alloy to BS 5154	Cast iron to BS EN 12334 or BS EN 16767	Grey cast iron to BS EN 1561 EN-GJL-250 Spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15

FWP4.1.030.9 TESTING

All valves shall be pressure tested in accordance with the relevant British Standards / European Standards or equivalent international / national standards by the valve manufacturer before leaving the factory.

FWP4.1.040.A CERTIFICATION

1. Be of the type accepted by the Water Authority as required by the statute;
2. Type test Certificate / Report from certification bodies or accredited laboratories acceptable to Water Authority confirming that the valves have been tested conforming to this Specification shall be produced;
3. The following type test Certificates / Reports shall be submitted, wherever applicable:
    a. Test certificates for valves in compliance with the Standards quoted in FWP4.1.020;

b. Test certificates on composition analysis, chemical, physical and mechanical properties of the metallic materials for valves;

c. Test certificates for resilient seating material and epoxy coating showing compliance with the physical property and thickness requirements of this Specification;

d. In case of valves in potable water application, test certificates for non-metallic materials including resilient seating material and epoxy coating, showing compliance with relevant requirements in BS 6920 and suitable for potable water usage issued by Water Regulations Advisory Scheme of the United Kingdom (WRAS) or other accredited laboratories acceptable to Water Authority.

FWP4.1.050.9 SIZE

All valves (except those for flow or pressure control such as modulating float valve and pressure reducing valve) shall have the same nominal size as the pipe in which they are installed unless otherwise specified.

FWP4.1.060.9 ROTATION

Manually operated valves shall be closed by turning the handwheel in a clockwise direction when facing the handwheel. All valves of cast iron body construction shall be provided with an indicator to show the open and shut position.

FWP4.1.070.9 LOCATION

All valves shall be located at convenient positions of operation from the floor.

FWP4.1.080.B CONSTRUCTION

Valves shall be constructed to the following minimum specification; better or equivalent materials may be offered for Approval:

1. Specification A in FWP4.1.090:
   a. For nominal sizes up to and including 50 mm:
      i. Body, bonnet and disc

         Bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K;

      ii. Stem

         Brass to high tensile brass to BS EN 12163 or BS EN 12164.

   b. For nominal sizes above 50 mm:
      i. Body and bonnet

         Grey cast iron to BS EN 1561 EN-GJL-250, or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;

      ii. Disc or Seat

         - Solid or trimmed with bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K; or
         - Resilient material to BS EN 681-1, Type WA, Hardness Category "70" with nominal thickness of minimum 1.5mm on the non-seating areas and 4.0mm on the seating areas, and in case for fresh water application, showing compliance with relevant requirements in BS 6920.

      iii. Stem

         Brass to high tensile brass or leaded brass to BS EN 12163, or stainless steel to BS EN 10088-3 Number 1.4462, 1.4301, 1.4401, 1.4006, 1.4005, 1.4021 or 1.4057.

2. Specification B in FWP4.1.090:

a. For nominal sizes up to and including 50mm (working pressure below 10 bar):
   i. Valve components:
      - UPVC;
      - Ball center-pivoted, smooth and spherical with a circular orifice, and seated on resilient seating suitable for tight shut off;
      - Stem one piece with O-ring made of Ethylene Propylene Diene Monomer (EPDM) for positive sealing of the body.
   ii. Valve operation:
      - By wrench turned in a clockwise direction to close when facing the wrench;
      - At fully open position of valve, wrench to be mounted parallel to the flow of passage through the ball;
      - Wrench to fully close valve at a quarter turn;
      - Provide suitable stops for both fully open and fully closed positions of valve.
   iii. Valve end connections and pressure standards:
      - Socket or union suitable for directly connecting the pipe to which it is installed;
      - Testing method to BS EN ISO 1452-4.

b. For nominal sizes up to and including 50 mm (working pressure at or above 10 bar):
   i. Body, bonnet and disc

      Bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K;

   ii. Stem

      Dezincification Resistant Brass or Bronze to BS EN 1982 CuSn5Zn5Pb5 or CB491K or CC491K.

c. For nominal sizes above 50 mm:
   i. Body and bonnet

      Grey cast iron to BS EN 1561 EN-GJL-250, or spheroidal graphite cast iron (ductile iron) to BS EN 1563 EN-GJS-400-15;

   ii. Disc or Seat
      - Solid or trimmed with zinc free bronze to BS EN 1982 CuSn10 or trimmed with austenitic chromium nickel stainless steel or austenitic chromium nickel molybdenum stainless steel to BS EN 10283 Number 1.4308 or 1.4408; or
      - Resilient material to BS EN 681-1, Type WA, Hardness Category "70" with nominal thickness of minimum 1.5mm on the non-seating areas and 4.0mm on the seating areas.
   iii. Stem

      Stainless steel to BS EN 10088-3 Number 1.4462, 1.4301, 1.4401 or 1.4057.

FWP4.1.090.9 APPLICATION

	Purpose	Clause reference
1.	a. Fresh water (including potable water) b. Fire services c. Waste water d. Storm water e. Bore well water - non-corrosive f. Rainwater	FWP4.1.080 Specification A
2.	a. Flush water b. Sewage c. Bore well water - corrosive	FWP4.1.080 Specification B

FWP4.1.100.A COATING FOR CAST IRON PARTS OF VALVES

1. Cast iron parts of all valves shall be coated with an epoxy based material both on internal and external surfaces. The following minimum thickness of epoxy coating shall apply:

	Electrostatically Fusion Powder Coated (µm)	Airless Sprayed Application (µm)
Flat and Pressurised Parts	250	400
Convex Outer Edges	150	300

2. The coating for use in fresh potable water shall comply with relevant requirements laid down in BS 6920 and be to the satisfaction of the Water Authority.

FWP4.2 GATE AND GLOBE VALVES

FWP4.2.010.9 TYPE

1. Gate valves shall be of the full way solid or split wedge disc type and globe valves shall be of the straight globe type;
2. Gate valves shall be handwheel operated with rising or non-rising stem;
3. Globe valves shall be handwheel operated with rising stem.

FWP4.2.020.9 DESIGN AND CONSTRUCTION

1. The valve body shall be robust and capable of withstanding hard wear;
2. For valves of bronze body construction, the bonnet shall be of the screwed type with ample threads to ensure positive sealing to the body;
3. For valves of grey cast iron body and spheroidal graphite cast iron (ductile iron) construction, the body and bonnet shall be bolted together and the disc shall be guided;
4. The gland shall be fitted with non-asbestos packing and shall be bolted for grey cast iron and spheroidal graphite cast iron (ductile iron) valves.

FWP4.2.030.9 END CONNECTIONS

1. All copper alloy valves shall be of the screwed female end connection and all cast iron valves shall be of the flanged end connections;
2. Threads in screwed end connection shall comply with BS EN 10226-1, 2, 3 and flanges of flanged end connection shall comply with BS EN 1092-2 and their bolts and nuts shall be complied to BS EN 1515-1.

FWP4.2.040.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the gate and globe valves for fresh water and fire services systems delivered to the site or installed.

FWP4.2.050.9 CERTIFICATION

When gate valve with nominal sizes up to and including 50mm for fresh water application is used, submit at sample submission and approval stage either:

1. A copy of the Kitemark Certificate or Kitemark Licence, together with the associated test report demonstrating compliance with BS EN 12288, all issued by the British Standards Institution if available for the CM's information; or
2. Test report issued or certified by the laboratory accepted by the Water Authority demonstrating full compliance with BS EN 12288 for the CM's information.

FWP4.2.060.9 VERIFICATION TESTS FOR GATE VALVES WITH NOMINAL SIZES UP TO AND INCLUDING 50MM FOR FRESH WATER APPLICATION DELIVERED TO SITE

1. Test Arrangements:
    a. Verification tests shall be carried out by the CM's Representative, a Direct Contractor or the Housing Department Material Testing Laboratory upon delivery of material to Site under a delivery note, or during the course of construction as directed by the CM. A representative batch means the material delivered to Site under the same delivery note;
    b. Comply with the followings pertaining to verification tests:
        i. Provide attendance on the Site;

ii. Provide, deliver and collect samples etc. as directed by the CM or as specified.

2. Testing Samples:
   a. Samples shall be selected by the CM's Representative and witnessed by representative of the Sub-contractor;
   b. For gate valve with the Kitemark Certificate or Kitemark Licence:
      i. provide one test sample of any sizes of gate valves from a batch of material delivered to Site under the delivery note as selected by the CM;
      ii. when instructed by the CM, provide another test sample of any sizes of gate valves from any other batch of material delivered to Site under the delivery note.
   c. For gate valve without the Kitemark Certificate or Kitemark Licence, when instructed by the CM, provide two test samples of any sizes of gate valves from each batch of material delivered to Site under the delivery note.
3. Testing Methods:
   a. Laboratory testing of chemical composition of the body, bonnet, disc and stem of gate valve as arranged by the CM's Representative(s);
   b. Acceptance standard:

      The result shall indicate that the chemical composition of the body, bonnet, disc and stem of gate valve complies with the specified standards in FWP4.1.080 or the test report showing the material composition which has been accepted by Water Authority.
4. Non-compliance:
   a. In the event that the testing sample fails to meet the acceptance standard as specified in sub-clause (3)(b), follow either one of the following actions:
      i. Remove the representative batch of material off Site; or
      ii. Carry out re-test for the representative batch of material in accordance with the testing methods as specified in sub-clauses (3)(a) and (3)(b) in a laboratory that accepted by the Water Authority on three separate sets of samples selected by the CM from the representative batch. In the event that the testing sample fails to meet the acceptance standard as specified in sub-clause (3)(b), remove the representative batch of material off Site.
   b. When the representative batch of material is removed off Site, replace with another new batch and carry out test in accordance with the testing methods as specified in sub-clauses (3)(a) and (3)(b) in a laboratory that accepted by the Water Authority for one sample of gate valve with the Kitemark Certificate or Kitemark Licence or two samples of gate valve without the Kitemark Certificate or Kitemark Licence, all selected by the CM from the replacing batch. In the event that the testing sample(s) fail to meet the acceptance standard as specified in sub-clause (3)(b), carry out re-testing as specified in sub-clauses (4)(a);
   c. Bear all associated costs for the test and re-test required in sub-clauses (4)(a) and (4)(b). No extension of time will be allowed.

FWP4.3 BUTTERFLY VALVES

FWP4.3.010.9 TYPE

1. Butterfly valves shall be applied in fire services installation only;
2. Butterfly valves shall be of wafer type to BS EN 593 or grooved end type with FSD approval or equivalent with resilient seat suitable for tight shut-off purpose;
3. Butterfly valve used as sprinkler subsidiary stop valve shall be connected to an actuator for remote indication of its open/close status in the fire services alarm control panel.

FWP4.3.020.9 DESIGN AND CONSTRUCTION

1. The valve body and disc shall be of ductile iron of grades as specified in FWP4.1.080, or equivalent;
2. Shaft shall be of stainless steel of grades as specified in FWP4.1.080, or equivalent;
3. Unless otherwise specified, valves shall be operated by handwheel or wrench.

FWP4.3.030.A END CONNECTIONS

1. For wafer type, the valve body ends shall be capable of matching connecting flanges complying with the requirements of BS EN 1092-2;
2. For grooved end type, the valve body ends shall match with the mechanical couplings and fittings as stated in FWP3.2.3.050.

FWP4.3.040.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the butterfly valves for fire services systems delivered to the site or installed.

FWP4.4 NON-RETURN VALVES

FWP4.4.010.9 TYPE

1. Unless otherwise specified, non-return valves shall be of the hinged swing or recoil type for horizontal installation and spring type shall be of globe or wafer type suitable for both vertical and horizontal installations;
2. When the valve is installed vertically, the flow shall be in an upward direction;
3. When installed at the pump discharge with a water head exceeding 15 m, non-return valves shall be of the recoil or spring type to ensure silent shut-off operation;
4. Notwithstanding the requirements of clause FWP4.1.080, recoil or spring type check valve of cast iron or spheroidal graphite cast iron (ductile iron) body construction shall be acceptable for nominal size of 65mm or below.

FWP4.4.020.9 DESIGN AND CONSTRUCTION

1. Hinged swing type:
   a. The valve body shall be robust and capable of withstanding hard wear;
   b. Bronze swing non-return valves shall have screwed type cap and cast iron swing non-return valves shall have the cap and body bolted together to ensure a strong, tight closure;
   c. Hinge pins shall be of brass / bronze for nominal size of 50mm or below and stainless steel for nominal size above 50mm;
   d. The valves shall be designed to close before reversal of flow starts.
2. Recoil type non-return valves shall have a flow area not less than the cross-sectional area of the connected pipework and shall be non-slam in operation;
3. Spring type:
   a. The valve body shall be robust and capable of withstanding hard wear;
   b. Springs shall be of stainless steel;
   c. The valves shall have a flow area not less than the cross-sectional area of the connected pipework and shall be non-slam in operation;
   d. The valves shall be designed to close before reversal of flow starts.

FWP4.4.030.A END CONNECTIONS

1. End connections of non-return valves shall be as FWP4.2.030;
2. Wafer type spring non-return valves will be acceptable, provided the body ends are capable of matching connecting flanges complying with the requirements of BS EN 1092- 2.

FWP4.4.040.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the non-return valves for fresh water and fire services systems delivered to the site or installed.

FWP4.5 BALL FLOAT VALVES

FWP4.5.010.A GENERAL

1. Unless otherwise specified, ball float valves shall have a working pressure of not less than 10 bar and be tested to 16 bar on the body;
2. Ball float valves of all sizes shall be accepted for fire services systems only;
3. For installations other than fire services system, only ball float valves of size up to and including 50 mm shall be accepted.

FWP4.5.020.9 TYPE

Ball float valves shall be of the slow closing type, unless otherwise specified.

FWP4.5.030.A DESIGN AND CONSTRUCTION

1. General:
   a. The valve body shall be robust and shaped to give a good flow pattern;
   b. The valve piston shall close in the direction of flow such that the pressure in the main will tend to keep the valve closed and that the piston seal is afforded protection from the flow by the piston;
   c. All internal parts shall be easily removable for maintenance with the face and piston seals easily replaced.
2. For nominal sizes above 50mm: epoxy coated cast iron or epoxy coated ductile iron body with gunmetal piston, seat and guide;
3. For nominal sizes up to and including 50 mm: bronze construction valves shall be accepted.

FWP4.5.040.A BALL FLOATS

Ball floats shall be spherical or cylindrical, and be constructed of copper alloy or stainless steel for fresh water application and of stainless steel for flush water application.

FWP4.5.050.A LEVER ARMS

Lever arms for flush water application shall be of stainless steel to BS EN 10088-1 Number 1.4401 and of direct mechanical linkage type.

FWP4.5.060.X DELETED

FWP4.5.070.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the ball float valves for fire services systems delivered to the site or installed.

FWP4.6 PRESSURE REDUCING VALVES (PILOT TYPE)

FWP4.6.010.9 TYPE

The pressure reducing valve shall be hydraulically operated, pilot-controlled type. The whole valve shall be assembled and tested by the manufacturer.

FWP4.6.020.9 OPERATION AND PERFORMANCE

1. The operating range shall be suitable for the particular application;
2. The valve shall maintain a constant reduced downstream pressure regardless of changes in upstream pressure or flow rates;
3. The pilot control system shall be provided with a strainer. The valve shall be flanged-end connection with flange to PN16. The main valve and its pilot control system shall contain no packing glands or stuffing boxes;
4. The valve shall reduce a higher inlet pressure to a steady downstream pressure regardless of fluctuations in flow rate and/or varying inlet pressure. The downstream pressure shall be adjustable and could be reduced down to a pressure suitable for the application. The valve shall be selected in such way that no cavitation shall occur within the anticipated flow and pressure ranges;
5. The amount of pressure reduction against various flow rates and inlet pressures shall comply with the requirements as indicated on the Drawings;
6. Performance curves showing the above characteristics shall be submitted to the Contract Manager upon request.

FWP4.6.030.A MATERIAL

Material composition of every component of the valve shall be suitable for fresh or flush water use as in accordance with its application, and shall have the minimum standard as specified below for its intended purposes. Equivalent materials may be offered for Approval.

1. Body & bonnet

   Cast iron to BS EN 1561 EN-GJL-250 or ductile iron to BS EN 1563 EN-GJS-400-15. The body of the valve shall be coated with an epoxy based material both on internal and external surfaces;
2. Disc & Seat
   a. Solid or trimmed with bronze to BS EN 1982 CuSn5Zn5Pb5 or trimmed with stainless steel to BS EN 10283 Number 1.4308 or 1.4408 for fresh water use;
   b. Solid or trimmed with zinc free bronze to BS EN 1982 CuSn10 or trimmed with stainless steel to BS EN 10283 Number 1.4408 for flush water use.
3. Stem
   a. High tensile brass or leaded brass to BS EN 12163 or stainless steel to BS EN 10088-3 Number 1.4301 or 1.4401 for fresh water use;
   b. Stainless steel to BS EN 10088-3 Number 1.4401 for flush water use.

FWP4.6.040.9 PRESSURE

1. Each valve shall be hydraulic tested at 1.5 times the nominal pressure of the valve for a period of not less than 1 minute at the factory;
2. The valve shall be suitable for both the working and test pressure of the piping system in which they are installed. Unless otherwise specified or Approved, it shall have a working pressure of not less than 16 bar.

FWP4.6.050.9 CERTIFICATION

The valve shall be of the type acceptable to the Water Authority for fresh or flush water use as in accordance with its application. Type test certificate / report from certification bodies or accredited laboratories acceptable to Water Authority for the verification of the hydraulic pressure requirements and material used shall be produced.

FWP4.6.060.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the pressure reducing valves for fresh water system delivered to the site or installed.

FWP4.8 MODULATING FLOAT VALVE AT FRESH AND FLUSH WATER SUMP TANK

FWP4.8.010.B GENERAL

1. The modulating float valve shall be hydraulically operated, pilot-control and of diaphragm. The whole valve shall be assembled and tested by the manufacturer;
2. The pilot control system shall be provided with a strainer. The valve shall be flanged-end connection with flange to BS EN 1092-2 PN16. The main valve and its pilot control system shall contain no packing glands or stuffing boxes. The ball float shall be spherical. Lever arm / float connecting rod shall be of direct mechanical linkage type;
3. The valve shall be operated to modulate water flow into the tank in such way as to maintain predetermined water tank level within narrow limits. The valve shall be installed such that there is an air gap between the float and the pilot valve.

FWP4.8.020.A MATERIAL

Material composition of every component of the valve shall be suitable for fresh or flush water use as in accordance with its application, and shall have the minimum standard as specified below for its intended purposes. Equivalent materials may be offered for Approval;

1. Body & bonnet:

   Cast iron to BS EN 1561 EN-GJL-250 or ductile iron to BS EN 1563 EN-GJS-400-15. The body of the valve shall be coated with an epoxy based material both on internal and external surfaces;
2. Disc & Seat:
   a. Solid or trimmed with bronze to BS EN 1982 CuSn5Zn5Pb5 or trimmed with stainless steel to BS EN 10283 Number 1.4308 or 1.4408 for fresh water use;
   b. Solid or trimmed with zinc free bronze to BS EN 1982 CuSn10 or trimmed with stainless steel to BS EN 10283 Number 1.4408 for flush water use.
3. Stem:
   a. High tensile brass or leaded brass to BS EN 12163 or stainless steel to BS EN 10088-3 Number 1.4301 or 1.4401 for fresh water use;
   b. Stainless steel to BS EN 10088-3 Number 1.4401 for flush water use.
4. Ball float:
   a. Spherical or cylindrical;
   b. Constructed of copper alloy or stainless steel for fresh water application and of stainless steel for flush water application.
5. Lever arm/float connecting rod for flush water application:

   Stainless steel to BS EN 10088-1 Number 1.4401.

FWP4.8.030.9 PRESSURE

The valve shall be suitable for both the working and test pressure of the piping system in which they are installed. Unless otherwise specified or Approved, it shall have a working pressure of not less than 16 bar.

FWP4.8.040.9 TEST CERTIFICATE

The valve shall be of the type acceptable to the Water Authority for fresh or flush water use as in accordance with its application. Type test certificate / report from certification bodies or accredited laboratories acceptable to Water Authority confirming that the valve has been tested conforming to this specification shall be produced.

FWP4.8.050.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the modulating float valves for fresh water system delivered to the site or installed.

FWP4.9 BALL VALVES

FWP4.9.010.9 TYPE

Unless otherwise specified, the application of ball valves shall only be used for hose reel control valve in fire services installation and pipeline drain cock for pumpset, pressure switch and pressure vessel in water pump installation. Ball valves shall be of spherical bore with PTFE seats and directly operated by a lever. Lever shall be so mounted that it is parallel to the valve axis when the valve is in the fully open position. When the valve is in the fully closed position, the lever shall be at 90° to the valve axis.

FWP4.9.020.A DESIGN AND CONSTRUCTION

1. Valves shall be robust and capable of withstanding hard wear;
2. Valves shall be constructed to the following minimum specification:
   a. Body and stem
      Brass to BS EN 12165 CuZn40Pb2 with or without nickel/chromium plated;
   b. Seat bore
      Brass to BS EN 12165 CuZn40Pb2;
   c. Lever handle
      Carbon steel or zinc plated steel with red plastic sleeve and open/close operating direction marking.
3. The lever retaining nut or screw of ball valves shall be permanently sealed with industrial type heavy duty threadlocking adhesive/sealant;
4. Valves shall have a working pressure of not less than 20 bar. The test pressures of valve body and seat shall be 1.5 and 1.1 times the maximum permissible working pressure respectively.

FWP4.9.030.9 END CONNECTIONS

1. Ball valves shall be of the screwed female end connection;
2. Threads in screwed end connection shall comply with BS EN 10226-1, 2, 3.

FWP4.9.060.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the modulating float valves for fresh water system delivered to the site or installed.

FWP4.11 OTHER FITTINGS

FWP4.11.010.9 VORTEX INHIBITORS

1. Vortex inhibitors shall be LPC approved type with PN16 flanges and confirm to BS EN 12845. They shall be used for operation under positive head conditions;
2. The Sub-contractor shall provide copies of valid certificates issued by LPCB or other recognized product certification bodies acceptable to the CM;
3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the vortex inhibitors delivered to the site or installed.

FWP4.11.020.9 ORIFICE PLATES

1. Orifice plates for system balancing, pump churning water circuits, where applicable, shall be provided as required for proper commissioning of the systems. Wherever necessary to suit the pump performance in respect of system balance, orifice plates shall be provided even if they are not indicated on drawings;
2. Orifice plates shall be generally constructed and installed according to LPC Sprinkler Rules or other standards acceptable to FSD.

FWP4.12 SUBMERSIBLE BALL FLOAT VALVES

FWP4.12.010.9 DESIGN AND CONSTRUCTION

This valve is a non-modulating valve which controls the liquid level in tanks. This valve shall open fully when the liquid level reaches a preset low point and closes drip tight when the level reaches a preset high point.

FWP4.12.020.9 MAIN VALVE

The valve shall be hydraulically operated, single diaphragm-actuated, globe or angle pattern. The valve shall consist of three major components: the body with seat installed the cover with bearing installed, and the diaphragm assembly. The diaphragm assembly shall be the only moving part and shall form a sealed chamber in the upper portion of the valve, separating operating pressure from line pressure. Packing glands and/or stuffing boxes are not permitted and there shall be no pistons operating the main valve or pilot controls.

FWP4.12.030.9 MAIN VALVE BODY

1. No separate chambers shall be allowed between the main valve cover and body. Valve body and cover shall be bronze to BS EN 1982 CuSn5Zn5Pb5 of cast material. No fabrication or welding shall be used in the manufacturing process;
2. The valve shall contain a resilient, synthetic rubber disc and forming a tight seal against a single removable seat insert. The bronze disc guide shall be of the contoured type to permit smooth transition of flow and shall hold the disc firmly in place;
3. The diaphragm shall be nylon reinforced rubber assembly contains a non-magnetic 316 stainless steel stem, nut and spring of sufficient diameter to withstand high hydraulic pressures and shall be fully guided at both ends by a bearing in the valve cover and an integral bearing in the valve seat. The stem shall be drilled and tapped in the cover end to receive and affix such accessories as may be deemed necessary. The diaphragm assembly shall be the only moving part and shall form a sealed chamber in the upper portion of the valve, separating operating pressure from line pressure;
4. The flexible, non-wicking diaphragm shall consist of nylon fabric bonded with synthetic rubber compatible with the operating fluid. The centre hole for the main valve stem must be sealed. The diaphragm shall be fully supported in the valve body and cover by machined surfaces which support no less than one-half of the total surface area of the diaphragm in either the fully opened or fully closed position;
5. The main valve seat and the stem bearing in the valve cover shall be removable. The cover bearing and seat valves shall be threaded into the cover and body. The lower bearing of the valve stem shall be contained concentrically within the seat and shall be exposed to the flow on all sides to avoid deposits. To insure proper alignment of the valve stem, the valve body and cover shall be machined with a locating lip. Cover bearing, disc retainer, and seat shall be made of the same material. All necessary repairs and/or modifications other than replacement of the main valve body shall be possible without removing the valve from the pipeline.

FWP4.12.040.9 PILOT CONTROL SYSTEM

1. The valve pilot system shall contain a flow clean brass Y-strainer to BS EN 1982 with stainless steel screen to BS EN 10088-3. The strainer shall project into the flow stream. The eddies and current caused by this projection shall self clean the screen;

2. The float and float rod shall be stainless steel and float control shall be a rotary disc, plate-type pilot. The pilot shall direct supply pressure into the cover of the main valve to close it. Then vent the cover of the main valve to atmosphere to open the main valve;
3. The valve shall open wide when the float is at a low liquid level and close drip tight when the float is at a high liquid level. Once the pilot signals the main valve to open or to close, the valve shall travel through its entire stroke without additional movement of the pilot control.

FWP5 WATER TANKS

FWP5.2.056.A STAINLESS STEEL PNEUMATIC PRESSURE VESSEL 4

FWP5.3 CONCRETE WATER TANKS 6

FWP5.3.010.9 RESPONSIBILITY OF MAIN CONTRACTOR 6
FWP5.3.020.9 RESPONSIBILITY OF SUB-CONTRACTOR 6
FWP5.3.030.9 VERIFICATION BY SUB-CONTRACTOR 6

FWP5.1 GENERAL

FWP5.1.010.9 COMPLIANCE WITH RULES/REGULATIONS

1. All fire services water tank installations including gravity tank/pump suction tank provided by the Sub-contractor shall comply with the LPC Sprinkler Rules;
2. All water tank installations provided by the Sub-contractor shall comply with the requirements of the Water Authority.

FWP5.1.020.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the pneumatic pressure vessels delivered to the site or installed.

FWP5.2 PNEUMATIC PRESSURE VESSELS

FWP5.2.055.A MILD STEEL PNEUMATIC PRESSURE VESSEL

1. The vessels shall be constructed of welded mild steel to BS EN 13831 or European Directive 2014/68/EU or other approved standards. The internal mild steel surfaces of the vessels shall be coated at manufacturer's factory with a resin (such as epoxy resin) of anti-corrosion material suitable for use with potable water. The vessels shall be provided with appropriate certificate issued by an approved authority or laboratory to substantiate their suitability in potable water application;
2. The vessels shall be pre-charged with air or nitrogen at factory at a pressure suitable for the application. The pre-charged pressure shall be adjustable and charging port with non-return device shall be provided in each vessel;
3. Gas and water space shall be separated by a bladder made of rubber membrane, which must be acceptable to and acceptable to the Water Authority. There shall be no contact between the water and metal surface of the vessel;
4. The bladder shall be replaceable and made of rugged rubber membrane. Material of the membrane shall be flexible, non-porous, of resistance to acids and alkalis, non-toxic and free of impairing taste and odour;
5. Whereas for potable water use, rubber bladder shall be provided with type-tested certificate(s) issued by approved authority or laboratory acceptable to the Water Authority to substantiate its suitability in contact with potable water;
6. The vessel shall withstand a minimum working pressure according to system configuration and under no circumstances less than 10 bar. A manufacturer's test certificate for the test pressure of the vessel shall be submitted for Approval;
7. The vessels shall be provided with air bleed cock, pressure gauges and drain cock with drain pipe extension to the nearest drain point;
8. A test certificate for the test pressure of the pneumatic pressure vessel issued by the manufacturer shall be submitted to the CM for Approval;
9. An open-up inspection randomly chosen from one of the delivered vessels shall be carried out. If the opened-up vessel is found lack of internal coating of anti-corrosion material or any non-conformance, the Sub-contractor shall open up all delivered vessels for inspection with no additional charge. The conformed vessels shall be re-charged to a pressure suitable for the application. All non-conformed products shall be removed off site for replacement;
10. In addition to the Regular Monthly Visits as stipulated in FWP14.3.040, the Sub-contractor shall inspect every pneumatic pressure vessel bi-weekly to identify any sign of rupture of the internal bladder inside the vessel. The Sub-contractor is required to identify the tones of knocking at the upper and lower portions of the vessel and to check the pressure at the gas inlet point in order to ensure the health of the bladder.

FWP5.2.056.A STAINLESS STEEL PNEUMATIC PRESSURE VESSEL

1. The construction of a welded stainless steel pneumatic pressure vessel shall be to BS EN 13831 or European Directive 2014/68/EU or equivalent international standards. Body, flange, bolts and nuts shall be of AISI grade 304 stainless steel or better in corrosion resistivity. Whereas for salt water use, flange shall be of AISI grade 316 stainless steel;

2. The vessel shall be pre-charged with air or nitrogen at a pressure suitable for the application. The pre-charged pressure shall be adjustable. Gas charging port with non-return device shall be provided in each vessel;
3. Gas and water space shall be separated by a replaceable bag-type bladder. There shall be no contact between water and metal surface of the vessel;
4. The bladder shall be replaceable and made of rugged rubber membrane. Material of the membrane shall be flexible, non-porous, of resistant to acids and alkalis, non-toxic and free of impairing taste and odour;
5. Whereas for potable water use, rubber bladder shall be provided with type-tested certificate(s) issued by approved authority or laboratory acceptable to the Water Authority to substantiate its suitability in contact with potable water;
6. The vessel shall withstand a minimum working pressure according to system configuration and under no circumstances less than 8 bar. A manufacturer's test certificate for the test pressure of the vessel shall be submitted for Approval;
7. The vessel shall be provided with drain cock and drain pipe connected to the nearest drain point;
8. The Sub-contractor shall inspect every stainless steel pneumatic pressure vessel at the Regular Monthly Visits as stipulated in FWP14.3.040. The Sub-contractor is required to identify the tones of knocking at the upper and lower portions of the vessel and to check the pressure at the gas inlet point in order to ensure the health of the bladder.

FWP5.3 CONCRETE WATER TANKS

FWP5.3.010.9 RESPONSIBILITY OF MAIN CONTRACTOR

1. Water tanks forming part of the building construction, or of concrete, including overflow, drains and inlet piping shall be supplied and installed by the Main Contractor;
2. Puddle flanges at the water tank for inlet and outlet pipes shall be supplied and installed by the Main Contractor.

FWP5.3.020.9 RESPONSIBILITY OF SUB-CONTRACTOR

All other piping connections and valves shall be supplied and installed by the Sub-contractor as indicated on Drawings.

FWP5.3.030.9 VERIFICATION BY SUB-CONTRACTOR

The Sub-contractor shall check the construction drawings for concrete water tanks for fire service installations and water pump installations and verify their correctness for his installation purposes, or submit proposals for modification to the design, as necessary.

FWP6.1 DESIGN AND SPECIFICATION

FWP6.1.010.A COMPLIANCE WITH RULES / REGULATIONS

1. Pumps and pump installations for sprinkler systems shall comply with the detailed requirements of the LPC Sprinkler Rules;
2. Pumps and pump installations for hydrant / hosereel systems shall comply with Code of Practice for Minimum Fire Service Installations and Equipment published by Hong Kong Government and BS 5306-1wherever applicable.

FWP6.1.020.9 TYPE

1. The type of pump(s) required for any particular application is detailed in FWP2;
2. Only the type specified should be listed in the tender documents; alternative proposals may be submitted separately, together with a list of advantages for Approval;
3. All pumps shall be electric motor driven centrifugal pumps, unless otherwise specified.

FWP6.1.030.9 DUTY

1. The pump(s) shall be selected to suit the design requirements for capacity as indicated in FWP2 or Drawings;
2. The pump heads stated in FWP2 or Drawings are only for the reference of tendering purposes;
3. The Sub-contractor shall calculate the actual pump heads based upon the characteristics of the pipework systems including fittings, equipment and accessories and carry out such alterations as may be necessary to achieve the specified duty.

FWP6.1.040.9 PUMP CURVES

1. Predicted total Head/Quantity, required NPSH/Quantity, Efficiency/ Quantity, and Power Absorbed/Quantity Curves shall be supplied;
2. The curves shall commence at zero flow and be extended to show the performance at heads lower than the minimum head;
3. In general, the pump shall be selected to operate near its best efficiency point shown on the performance curves;
4. Unless otherwise specified, fresh and flush feed pumps selected to operate below the best efficiency point by a figure of 10% or more (in efficiency) will normally be unacceptable.

FWP6.1.050.9 MAXIMUM PUMP SPEED

1. Maximum speed of fresh and flush water pumps shall not exceed 25r/s;
2. Maximum speed of booster fresh water pumps shall not exceed 25r/s;
3. Maximum speed of fire services feed pumps shall not exceed 50r/s;
4. Unless otherwise specified, maximum pump speed shall not exceed 50r/s.

FWP6.2 CONSTRUCTION

FWP6.2.010.9 GENERAL

1. All pump parts shall be constructed of materials suitable for the required working pressure, temperature and mechanical strength and also the liquid handled by the pump. The materials specified in this Section shall be of the minimum standard required. Better or equivalent materials may be offered for Approval (including alternative international / national standards);
2. Pump seals shall be mechanical seals for fresh water up-feed pumps, fire services water up-feed pumps, fresh water booster pumps, various fire services pumps as well as flush salt water up-feed pumps unless otherwise specified;
3. All dangerous accessible rotating and moving parts which would cause injury upon bodily contact, including but not limited to rotating shafts, couplings etc., shall be effectively guarded against contact of bodily parts with stainless steel see-through guards. All apertures shall be such that finger access to dangerous part is not possible. Removable stainless steel see-through guards shall be used for rotating and moving parts which require inspection during pump running.

FWP6.2.020.A FRESH WATER / FIRE SERVICES PUMPS

1. Casing:

   Grey cast iron to BS EN 1561 EN-GJL-250, or JIS G5501FC250.

2. Impeller:

   a. Bronze casting to BS EN 1982 CuSn5Zn5Pb5, or CuSn10; or

   b. Bronze casting to JIS H5120-CAC406, JIS H5120-CAC502A; or

   c. Austenitic chromium nickel molybdenum stainless steel casting to BS EN 10283 grade 1.4408.

3. Diffuser (detachable):

   Grey cast iron to BS EN 1561 EN-GJL-250, or JIS G5501FC250.

4. Wearing ring:

   a. Grey cast iron to BS EN 1561 EN-GJL-250, or JIS G5501FC250; or

   b. Copper-tin alloy to BS EN 1982, or phosphor bronze to JIS H5120.

5. Shaft:

   Stainless steel to BS EN 10088-3 - 1.4301, or JIS SUS 304.

6. Sleeve:

   Stainless steel same as shaft or cast bronze.

7. Bearing bush (for vertical pump only):

   Tungsten carbide or silicon carbide.

8. Bearing for horizontal pump:

   Stainless steel.

9. Pump seals:

   Mechanical seal.

10. Other parts which may be in contact with water:

Stainless steel or bronze.

11. Prior to the time of material submission for Approval, the equipment shall have proven record of reliability in local application for a minimum continuous period of 12 months to the satisfaction of the CM.

FWP6.2.025.9 FRESH WATER BOOSTER/RAINWATER IRRIGATION PUMPS

Unless otherwise specified, fresh water booster pumps / rainwater irrigation pumps shall be of stamped stainless steel vertical multi-stage in-line type which shall comply with the following requirements:

1. Casing
   a. Casing shall be made of stainless steel of AISI grade 304 or better in corrosion resistivity, accurately machined and assembled with metal-to-metal joints;
   b. Suction and discharge ports shall be in line with one another.
2. Impellers and Diffusers
   a. Impellers and diffusers shall be made of stainless steel of AISI grade 304 or better in corrosion resistivity. They shall be welded to sufficient strength, mechanically balanced, and all water ways to be finished smooth;
   b. Each stage of the pump casing, diffusers and impellers shall be identical and interchangeable;
   c. Individual impeller lock nut with guides shall be of stainless steel.
3. Shaft, Bearing and Seal
   a. Shaft shall be made of stainless steel with water lubricant bearing bush at the suction casing;
   b. Bearings shall be made of ceramic, silicon carbide, and/or tungsten carbide where appropriate;
   c. Shaft seal shall be mechanical seal.
4. Motor Bracket, Mounting Foot, Tie Bolts and Nuts
   a. Motor bracket and mounting foot shall be made of cast iron coated with epoxy paint or of stainless steel;
   b. Tie bolts shall be made of high tensile steel with epoxy paint or of stainless steel;
   c. Nuts shall be made of stainless steel.
5. Pump Strength

   The pump shall be capable of withstanding a pressure of 1.5 times of the operating pressure or minimum 16 bar;
6. Reliability
   a. The pump shall be the product of a pump manufacturer who continuously manufactured similar type of products in the past 5 years;
   b. Prior to the time of material submission for Approval, the pump model shall have proven record of reliability in local application for a minimum continuous period of one year to the satisfaction of the Contract Manager.

FWP6.2.030.A FLUSH WATER PUMPS

1. Casing:

   Stainless steel to BS EN 10283 grade 1.4408, or JIS SCS14 or SCS14A.

2. Impeller:

   Stainless steel to BS EN 10283 grade 1.4408, or JIS SCS14 or SCS14A.

3. Wearing ring:

   Stainless steel of grade 316.

4. Shaft:

   Stainless steel to BS EN10088-3 – 1.4401, or JIS SUS316.

5. Sleeve:

   Stainless steel of grade 316.

6. Diffuser (detachable):

   Stainless steel to BS EN 10283 grade 1.4408, or JIS SCS14 or SCS14A.

7. Bearing for horizontal pump:

   Stainless Steel.

8. Bearing bush for vertical pump:

   Tungsten carbide or silicon carbide.

9. Pump seals:

   Mechanical Seal.

10. Parts which may be in contact with water:

    Stainless steel of grade 316.

11. No external painting is allowed for the pump body.

12. In-service records of stainless steel pumps shall be as specified in FWP6.8.010.

FWP6.2.035.9 JOCKEY PUMPS FOR FIRE SERVICE INSTALLATION

Unless otherwise specified, jockey pumps for fire service installation shall be constructed as per fresh water/fire service pumps as specified in FWP6.2.020, or as per fresh water booster pumps as specified in FWP6.2.025.

FWP6.2.040.9 SEWAGE/WASTE WATER/STORM WATER PUMPS

Sewage, waste water or storm water pumps shall be constructed of:

1. Casing

   Grey cast iron to BS EN 1561 EN-GJL-250 or JIS G5501FC250.

2. Impeller

   Grey cast iron to BS EN 1561 EN-GJL-250 or JIS G5501FC250.

3. Shaft

   a. Stainless steel to BS EN 10088-3 - 1.4301, or JIS SUS 304 for waste/storm water;

   b. Stainless steel to BS EN10088-3 - 1.4401, or JIS SUS316 for sewage.

FWP6.2.050.9 BORE WELL PUMPS

1. Bore well pumps for use with corrosive water shall be constructed of the same material specification as FWP6.2.030;

2. Bore well pumps for use with non-corrosive water shall be constructed of:

a. Casing

Grey cast iron to BS EN 1561EN-GJL-250, or JIS G5501FC250.

b. Impeller

Bronze to BS EN 1982 CuSn5Zn5Pb5, or JIS H5120-CAC406.

c. Shaft

Stainless steel to BS EN 10088-3 - 1.4301, or JIS SUS 304.

FWP6.3 PUMP TYPES

FWP6.3.010.A HORIZONTAL SPLIT CASING PUMPS

1. Casing:
    a. The casing shall be of the volute type, of robust construction, split axially, accurately machined, with the suction and delivery connections mounting feet, bearing pedestals cast integrally in the lower half of the casing;
    b. The water passage ways shall be smooth, free from blow holes, sand pockets and other detrimental defects, to permit maximum efficiency;
    c. Means shall be provided to drain the casing;
    d. An air bleed cock at the upper most point of the casing shall also be provided;
    e. Flanges shall conform to BS EN 1092-1 or BS EN 1092-2, class PN16 or higher pressure rating as required;
    f. The casing bolts shall be of corrosion resistant high strength steel.
2. Impeller:
    a. The impeller shall have sufficient strength at the boss to withstand all possible stresses that may be imposed by the drive;
    b. The impeller shall be machined to close limits, hand finished and balanced dynamically;
    c. The impeller is to be keyed to the shaft, and fixed in an axial position by corrosion resistant fixing nuts of the same material as the shaft, threaded opposite to rotation and secured by set screws or other means;
    d. Renewable guide rings are to be provided in the casing, keyed to prevent rotation by stainless steel pin;
    e. Wearing ring shall be straight type with close tolerance to permit minimum re-circulation.
3. Shaft:
    a. The shaft shall be of sufficient size and strength to withstand the impeller weight, the torque to be transmitted as well as the axial and radial load developed in operation;
    b. Shaft sleeves, if used, shall be keyed to prevent rotation and secured against axial movement.
4. Shaft Seal:
    a. Mechanical seal for pumps shall be provided as specified in FWP6.4.030.

FWP6.3.020.A END SUCTION PUMPS

1. Casing:
    a. The casing shall be of the volute type and of robust construction;
    b. Suction and delivery flanges shall conform to BS EN 1092-1 or BS EN 1092-2, class PN16 or higher pressure rating as required;
    c. Means shall be provided to bleed the air and drain the casing;
    d. The water passage ways shall be smooth, free from blow holes, sand pockets, and other detrimental defects to permit maximum efficiency;

e. The casing bolts shall be of corrosion resistant high strength steel.

2. Impeller:

   a. The impeller shall have sufficient strength to withstand all possible stress that may be imposed by the drive;

   b. The impeller shall be of the shrouded type, dynamically balanced to ensure vibration free operation;

   c. The impeller is to be keyed to the shaft, and fixed in an axial position by corrosion resistant fixing nuts of same material as the shaft, threaded opposite to rotation and secured by set screws or other means;

   d. Renewable guide rings are to be provided in the casing, keyed to prevent rotation by stainless steel pin;

   e. Wearing ring shall be straight type with close tolerance to permit minimum re-circulation.

3. Shaft:

   a. The shaft shall be of sufficient size and strength to withstand the impeller weight, the torque to be transmitted as well as the axial and radial load developed in operation;

   b. Shaft sleeves, if used, shall be keyed to prevent rotation and secured against axial movement.

4. Shaft Seal:

   a. Mechanical seal for pumps shall be provided as specified in FWP6.4.030.

5. Close-coupled Pump:

   For installation with motor rating not exceeding 2.2 kW, close-coupled pumps may be acceptable, subject to the Approval of the CM.

FWP6.3.030.B MULTI-STAGE PUMPS

1. Casing:

   a. Unless otherwise specified, multi-stage pumps shall be of the radially split casing type, with all casing parts kept together by external tie bolts and sealed against each other by gaskets or O-rings, suction and discharge flanges shall conform to BS EN 1092-1 or BS EN 1092-2, class PN16 or higher pressure rating as required;

   b. Wearing / split ring shall be provided between impeller, detachable diffuser and pump casing;

   c. Means shall be provided to bleed the air and drain the casing;

   d. Pumps shall be vertically or horizontally mounted as specified in FWP2. For vertically mounted pump, the bearing bush shall be made of tungsten carbide or silicon carbide to minimise wear. Besides, stainless steel motor stool should be provided for vertically mounted stainless steel flush water pump.

2. Impeller:

   a. The impellers shall have sufficient strength to withstand all possible stress that may be imposed by the drive;

   b. The impellers shall be of the shrouded type, dynamically balanced using grinding machine to ensure vibration free operation;

c. The impellers shall be keyed to the shaft and fixed in an axial position by corrosion resistant fixing nuts of same material as the shaft, threaded opposite to rotation and secured by setscrews or other means.

3. Diffuser (detachable):

   a. The diffuser should be the same material as casing with sufficient strength. It should be so designed to have even water passage to avoid turbulence;

   b. Diffuser shall be detachable and prevented from rotation by an acceptable means;

   c. A pin if so designed to withstand the diffuser from rotation shall be an integral part of the casing. Detachable pin fixed on the casing shall not be allowed.

4. Shaft:

   a. The shaft shall be of sufficient size and strength to withstand the impeller weight, the torque to be transmitted as well as the axial and radial load developed in operation;

   b. Shaft sleeves, if used, shall be keyed to prevent rotation and secured against axial movement.

5. Shaft seal:

   a. Mechanical seal for pumps shall be provided as specified in FWP6.4.030.

6. Stage:

   a. Unless otherwise specified, the maximum number of stages shall not exceed twelve (12).

7. Efficiency:

   a. Multi-stage pumps shall be selected with efficiency as specified in FWP6.1.040. When appropriate pumps are not available, pumps with lower efficiency may be acceptable, subject to the Approval of the CM.

FWP6.3.040.9 SUBMERSIBLE SUMP PUMPS

1. Stage:

   Pump shall be of single stage centrifugal type.

2. Casing:

   a. The casing shall be of the volute type and robust construction;

   b. The water passage ways shall be smooth and free from blow holes and sand pockets;

   c. Casing bolts shall be of stainless steel.

3. Impeller:

   a. For sewage pumps, the impeller shall be of the non-clog type with minimum solid passage of 50 mm diameter, unless otherwise specified;

   b. For waste or storm water pumps, smaller solid passage impeller with suction strainer will be acceptable;

   c. The impeller shall be dynamically balanced for all hydraulic loads within the pumps operating range and shall be keyed to the shaft and secured in an axial position by corrosion resistant fixing nuts;

   d. Renewable wear rings shall be provided and shall be keyed to prevent rotation by stainless steel pin.

4. Shaft:
    a. The pump shall be of mono-block type with the impeller keyed to the motor shaft;
    b. The shaft shall be of sufficient size and strength to withstand the impeller weight, the torque to be transmitted as well as the axial and radial load developed in operation.
5. Shaft seal:
    a. Double mechanical seal lubricated by an oil chamber shall be provided;
    b. Lower seal faces shall be of tungsten carbide or other Approved hard metal;
    c. All components shall be of corrosion resistant materials with high quality stainless steel spring;
    d. Lower seal shall be protected from ingress of grits.
6. Bearing:
    a. The bearings shall be of the ball or roller type, oil or grease lubricated;
    b. Bearings shall have a minimum re-grease interval of 5000 hours.
7. Motor:
    a. Motor shall be of the submersible type and conform to FWP11 of this Specification;
    b. Built-in thermal protection to BS EN 60034-11 shall be provided for motor of rating exceeding 7.5 kW.
8. Cable:
    a. The cable used inside sump shall be multi-core submersible cable and shall be of sufficient length without connections inside the sump;
    b. Cable entry to the junction chamber of the motor shall be provided with strain relief clamp and seal gland.
9. Installation and accessories:
    a. The pump shall be capable of being raised from or fixed back to the sump without the need to enter or drain the sump;
    b. For installation with motor rating exceeding 2.0 kW, the pump shall be provided with slide rails, lifting chain and quick discharge connection;
    c. For smaller installations, lifting chain and flexible hose-coupling connection will be acceptable.
10. Surface treatment:

    All surfaces of pump and motor in contact with the fluid handled shall be treated with anti-corrosion primer or paint for additional protection.

FWP6.3.050.9 MULTI-STAGE SUBMERSIBLE PUMPS

1. Construction:
    a. The pump and motor shall be of small diameter profile to suit the bore well size specified; arranged vertically with the discharge connection on top, followed by the pump, the suction port with strainer and the motor at the bottom;
    b. The assembly is to be submerged below the lowest pumping level and suspended in the well by the discharge pipe;
    c. Pump shall also be suitable for horizontal installation if specified in FWP2.

2. Casing:
    a. Pump shall be made up of independent stage casing bowls, complete with diffuser vanes or inter-stage piece and sleeve bearing for the pump shaft and easily removable for servicing;
    b. The water passage way shall be smooth to provide best efficiency.
3. Impeller:
    a. Impeller shall be of axial, enclosed radial or mixed flow type, machined to close limit with smooth water passage and dynamically balanced;
    b. The impellers shall be secured to the shaft by taper lock bushes or keys and fixed in the correct axial position by distance sleeve, shaft sleeves or the extended boss of the impeller, all keyed to prevent rotation;
    c. Renewable guide rings shall be provided in the pump casing;
    d. Guide rings shall be of straight type providing close radial running clearance.
4. Shaft and sleeve bearings:
    a. Pump shaft shall be carried by sleeve bearings at both ends and intermediate stage positions, all lubricated by the fluid handled;
    b. Downthrust shall be transmitted to and carried by the motor shaft, however, the pump shall be designed to carry momentary upthrust encountered under normal operation.
5. Motor:
    a. The submersible motor shall be a water-fitted squirrel cage induction motor and conform to FWP11;
    b. The motor shaft shall be connected to the pump shaft by a keyed sleeve coupling;
    c. A thrust bearing shall be located at the bottom end of the motor to absorb the axial thrust generated by the pump.
6. Cable:
    a. The cable inside the bore well shall be multi-core submersible cable and shall be of sufficient length without connections inside the well;
    b. The cable shall be secured to the discharge riser by corrosion resistant clips.
7. Accessories:
    a. Each pump shall be provided with a non-return valve immediately connected to the discharge of the pump;
    b. A pipe support clamp shall be provided at the top of the bore well for holding the discharge pipe and the pump.

FWP6.4 BEARINGS AND SEALS

FWP6.4.010.A PUMP BEARINGS

1. All bearings shall be of types readily obtainable;
2. For horizontal mounted pumps, the bearings shall be of the sealed ball or roller type, oil or grease lubricated;
3. Means shall be provided to protect the bearing from ingress of dust and water;
4. Appropriate lubrication nipple / connections or oiler sump with drain plug shall be provided for maintenance purpose;
5. For fresh water pumps, the bearing housings shall be cast iron. For flush water and rainwater pumps, the bearing housing and cover shall be stainless steel to BS EN 10283 grade 1.4408, or JIS SCS14 or SCS14A. The bearing housing and covers shall be easily removable for service;
6. The bearing cover shall provide a suitable seal to contain grease / oil in the housing;
7. For vertical pumps, the bearing bush (thrust bearing) shall be made of tungsten carbide or silicon carbide.

FWP6.4.020.X DELETED

FWP6.4.030.9 PUMP SEALS

1. For various fire services pumps and fresh water pumps, the materials of mechanical seal heads and seal seats, and the materials of seal faces, shall be suitable for conveying fresh water at a speed of 2900 rev/min for non-stop running up to 6 hours unless otherwise specified;
2. For flush water up-feed pumps, the materials of mechanical seal heads and seal seats, and the materials of seal faces, shall be suitable for conveying flush salt water at a speed of 2900 rev/min for non-stop running up to 6 hours unless otherwise specified;
3. For sewage and rainwater pumps, the materials of mechanical seal heads and seal seats, and the materials of seal faces, shall be suitable for conveying waster water at a speed of 2900 rev/min for non-stop running up to 6 hours unless otherwise specified.

FWP6.5 FITTINGS AND ACCESSORIES

FWP6.5.010.9 FITTINGS

Each pump shall be fitted with:

1. Valves: suction and discharge valves, strainer, and non-return valves as shown on the Drawings;
2. Cocks: suction and discharge gauge cocks of 10 mm BSP female thread;
3. Pressure gauges: pressure gauge as FWP11.6.060 complete with cock and coiled connector as sub-clause (2) above at the suction and discharge side of each surface mounted pump;
4. Gland drain where applicable: 25 mm or larger uPVC gland drain pipe which shall discharge to the nearest drain or waste pipe.

FWP6.5.020.9 COUPLINGS

1. Each pump, except "close-coupled" type, shall be fitted with a secure coupling and shaft guard. Mild steel coupling can be provided for stainless steel flush water pumps;
2. The coupling shall be of semi-flexible steel pin and rubber bush type, accurately aligned on site;
3. The Sub-contractor shall be required to demonstrate correct alignment prior to handover of the installation;
4. The couplings shall be totally enclosed by stainless steel see-through guard to prevent any direct contact of bodily parts.

FWP6.5.030.9 LUBRICATION FITTINGS

Each pump shall be fitted with appropriate lubrication fittings, where necessary.

FWP6.5.040.9 AIR BLEED COCKS

Each surface mounted pump shall be equipped with test and/or air bleed cocks of the high pressure type.

FWP6.5.050.9 LIFTING EYES

Vertical pumps of more than 200 kg in weight shall be provided with lifting eyes to facilitate maintenance and future replacement.

FWP6.5.060.9 IDENTIFICATION

A serial number for identification purpose should be indelibly marked or label fixed on the pump casing. An arrow indicating the normal direction of rotation shall be cast clearly on the pump casing or a brass arrow and plate engraved with the words "Direction of Rotation" shall be screwed to the pump casing near the coupling.

FWP6.5.070.9 MOTORS AND WIRING

Electrical motors and wiring shall comply with FWP11 and the relevant sections of the HKHA Electrical Installation Specification.

FWP6.6 INSTALLATION

FWP6.6.010.9 GENERAL

All pumps shall be installed as per manufacturers' recommendations and instructions and shall be carefully levelled and aligned by competent specialist before start-up.

FWP6.6.020.9 BASEPLATE

1. The pump and motor for all horizontal pumpset shall be mounted on a single baseplate constructed of stainless steel of grade 316; vertical pumpset shall be provided with integral base suitable for direct mounting onto the pump plinth;
2. The pump and motor of horizontal pumpset with motor rating exceeding 22 kW shall be secured with jack bolts or dowel pins as recommended by the motor manufacturer;
3. The baseplate shall be a stainless steel plate welded on a stainless steel channel base frame. The stainless steel plate shall not be deformed after welding;
4. The baseplate shall be sufficiently rigid and properly supported such that it will not deflect under the weight of the pump and motor. The pump set and baseplate shall be fixed in place by sufficient number of suitably sized anchor bolts cast or grouted in the concrete inertia block or pump base.

FWP6.6.030.9 VIBRATION ISOLATION

1. Pumpsets shall be provided with Approved vibration isolators to prevent the transmission of vibration to the building structure;
2. Vibration isolators shall be carefully selected and installed in accordance with manufacturers' recommendations and instructions;
3. For horizontal pumpsets, spring isolators shall be provided for all installations;
4. For vertical pumpsets, isolation cork shall be acceptable for all installations;
5. Isolation cork shall be in the form of cork panels installed under and around the whole concrete pump base. Cork panels shall be at least 50 mm thick and shall have a density suitable for the load they carry. Cork panels shall be entirely covered by waterproof paper prior to pouring of concrete for the pump base and after the pump base is formed, all exposed cork shall be sealed by mastic or bitumen;
6. Anti-vibration spring isolators shall have a rated deflection of not less than 38 mm unless otherwise specified. Each spring isolator shall consist of one or multiple steel helical coil springs, seated inside a robust cast iron or steel housing with an external-accessible adjustment bolt and lockout for levelling;
7. Spring isolators shall be laterally stable. Spring diameter shall be no less than 0.8 of the compressed height of the spring at rated load. Spring isolators shall have a minimum additional travel to solid equal to 25% of rated deflection. They shall have identification markings / colour codes for identification of rated load;
8. Spring isolators shall be integral with non-adjustable neoprene sponge inserts between the projections of the upper and lower housing. Non-skid neoprene acoustical isolation pad of no less than 6 mm thick shall be properly bonded to the underside of the lower housing of the isolator;
9. Information as required in Clause 11 of BS ISO 2017-1 shall be submitted for Approval;

10. The Sub-contractor shall advise the Main Contractor of the detailed requirements of the fabricated steel framed reinforced concrete inertia block for pumpset, which shall be provided by the Main Contractor to decrease the vibrational motion. Inertia block shall have a minimum thickness of 150 mm and weight 1½ times that of the pumpset. If there is additional piping rigidly connected to the pump suction inlet and / or discharge outlet before the flexible connectors, the inertia block shall be large enough to accommodate the support to be provided for this piping to prevent its load being imposed onto the pump where applicable;

11. Each pumpset shall be connected to its pipework with flexible connectors to prevent the transmission of vibration to the pipework, and the flexible connectors should be close to the pump as far as practicable;

12. Supports for piping between each pumpset and its flexible connectors shall be properly mounted on the inertia block as required whilst supports for piping after the flexible connectors shall be attached to structural members such as beams, columns or floating / ground floor slabs in preference to walls and shall be provided with rubber or neoprene pads for vibration isolation;

13. For horizontal split-casing pumpset mounted on inertia block with spring isolators for vibration isolation, bends should be used after the flexible connectors, and the piping after the flexible connectors shall be properly supported as specified above and shall not impose additional load onto the pumpset and inertia block;

14. The completed pump installation, when in operation, shall cause no noticeable or objectionable vibration transmission to any part of the building structure. In the event that undue vibration occurs, the Sub-contractor shall rectify the installation or replace the equipment as necessary at his own expenses to the satisfaction of the Contract Manager.

FWP6.7 TESTING AND CERTIFICATION

FWP6.7.010.9 TEST

Pumps shall be type-tested in accordance with the requirement of BS EN ISO 9906 or equivalent. Performance curves under tests shall be submitted for Approval.

FWP6.7.015.9 PROVISION OF TEST PIECE FOR STAINLESS STEEL FLUSH WATER PUMP AND ATTENDANCE FOR INSPECTION AND TESTING

1. A test piece, forming an integral part of the pump casing shall be provided for each stainless steel flush water pump. The size and shape of the test piece shall not be smaller than 25 mm diameter x 150 mm length. The test piece shall be suitable for conducting the following tests:
   a. Tensile test;
   b. Chemical composition analysis.
2. The Sub-contractor shall provide assistance, instruments, machines, labour and other facilities necessary for cutting the test piece, open-up inspection and examining the quality of pump. The pump shall be randomly selected by the the Contract Manager. The Sub-contractor shall arrange such inspection in his workshop or elsewhere if Approved;
3. The expense involved for complying with the above requirements, including any transportation costs, tests etc. shall be borne by the Sub-contractor;
4. The Sub-contractor shall cut the test piece in the presence of the Contract Manager or his representatives and send it to an accredited laboratory for carrying out the chemical composition analysis and tensile test. The laboratory shall be accredited for testing such type of alloy under the “Metallic Materials” or “Steel” sub-category of the “Construction Materials” category in the HOKLAS list;
5. The pumps shall be free from blow holes, sand pockets, cracks, welding, pitting, hammering marks, excessive machining / wearing and other detrimental defects;
6. If the selected pump fails either the tensile test or chemical composition analysis as mentioned in sub-clause (1) above or the open-up inspection, the entire batch of stainless steel flush water pumps shall be rejected. The Contract Manager may at his discretion to call for further open-up inspection and material test on another pump as appropriate. The cost so arisen will be borne by the Sub-contractor;
7. For the rejected pumps, the Sub-contractor shall arrange free replacement of them in accordance with the Conditions of Contract, and no extension of time to the Contract period will be allowed.

FWP6.7.020.9 PUMP CERTIFICATES

1. Each pump shall be provided with a certificate issued and signed by the manufacturer. The certificate shall clearly record the pump model, serial number and the materials of the casing, shaft and impeller;
2. Each pump or each batch of pumps shall also be provided with a certificate on their place of manufacture. The certificate shall be issued by a recognized Chamber of Commerce of the place of manufacture concerned.

FWP6.8 DOCUMENTATION

FWP6.8.010.9 IN-SERVICE RECORDS FOR STAINLESS STEEL FLUSH WATER PUMPS

1. When instructed by the Contract Manager, the Sub-contractor shall submit full details and particular of in-service records established in local application for the pump offered to substantiate conformance with the Specification. Failure to submit full and complete details and particulars of in-service records or failure to allow sufficient time for site inspection may result in rejection of the pump offered;
2. The in-service records shall contain the following information:
    a. Place of manufacture of the materials and parts of the pump;
    b. Rated capacity of the pump, which shall not be less than 6 l/s and 70 m at 1450 rpm unless otherwise accepted by the Contract Manager;
    c. Period of continuous and satisfactory operation and maintenance which shall be at least six months prior to the time of tender submission; and
    d. Provision of a test piece for materials composition and tensile test and open-up inspection.

FWP6.8.020.A WARRANTY FOR STAINLESS STEEL FLUSH WATER PUMPS

1. Each stainless steel pump shall be supplied with a certificate of warranty issued by its manufacturer guaranteeing to provide free replacement for defective parts, components or the pump as a whole against inferior materials, faulty design and/or workmanship for a period of five years commencing from the certified date of completion of the Section of the Works within the scope of which the pump is installed. Consumables items such as bearing, wearing ring and sleeve are excluded from the warranty. The Sub-contractor shall submit the content and format of the letter of warranty for Approval before shipment;
2. Each pump shall also be supplied with a certificate issued by the manufacturer stating the chemical composition for the materials used for the pump casing, impeller, shaft and diffuser etc.;
3. Each pump shall be fixed with a metal nameplate showing the manufacturer's name, serial number, pump head, flow rate, speed, rated power absorbed, material used and warranty expiry date. The Sub-contractor shall be responsible for collecting and punching the information on the nameplate;
4. The Sub-contractor shall also submit an undertaking issued by the local supplier of the pump guaranteeing to provide the following:
    a. Free labour and materials for replacing any parts, components or the pump as a whole found to be defective except consumables items;
    b. Free on-site technical support during testing and commissioning and the 5-year warranty period..

FWP7 HYDRANT/HOSEREEL SYSTEM EQUIPMENT AND FOAM INLET

FWP7.1 SYSTEM EQUIPMENT 3

FWP7.1.010.9 GENERAL REQUIREMENT 3
FWP7.1.020.A FIRE SERVICE INLETS AND HYDRANT OUTLETS 3
FWP7.1.030.9 FIRE SERVICE INLETS 4
FWP7.1.040.9 HYDRANT OUTLETS 4
FWP7.1.050.9 VENTING AND DRAINING 5
FWP7.1.060.9 EARTHING OF RISING MAINS 5
FWP7.1.070.9 PRESSURE REDUCING HYDRANT OUTLETS 5
FWP7.1.080.9 HOSEREELS 5
FWP7.1.100.9 PLASTIC HOSEREEL SHUT-OFF NOZZLE 6
FWP7.1.110.9 OPERATION INSTRUCTION AND WARNING NOTICE FOR HOSEREEL 7
FWP7.1.120.9 CABINETS 8
FWP7.1.130.9 INSTALLATION MATERIALS 8
FWP7.1.140.9 PIPEWORK INSTALLATION 8
FWP7.1.150.9 HYDRANT BOOSTER PUMPS, TANKS, ETC 8
FWP7.1.160.9 CONTROLS 8
FWP7.1.170.9 STOP VALVES MANAGEMENT SYSTEM 8

FWP7.1 SYSTEM EQUIPMENT

FWP7.1.010.9 GENERAL REQUIREMENT

1. The hydrant / hosereel system and the individual equipment installations shall comply with the Fire Services CoP, FSD Requirements and Circular Letter;
2. The Fire Service inlets, hydrant outlet valves, hose reels, related equipment fittings shall be approved by FSD;
3. Copies of valid Approval documents issued by FSD and / or product certification bodies recognized by FSD for the Fire Services inlets, hydrant outlets and hose reels shall be produced for the CM's inspection;
4. Copies of valid Approval documents issued by the Water Authority and test certificates / reports issued by the certification bodies or accredited laboratories acceptable to the Water Authority for the Fire Service inlets, hydrant outlets and hose reels shall be produced for the CM's inspection;
5. Higher standards wherever required are described elsewhere in this Specification or on the Drawings;
6. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the fire services inlet, fire hydrants and hose reels delivered to the site or installed.

FWP7.1.020.A FIRE SERVICE INLETS AND HYDRANT OUTLETS

1. The Fire Service inlets and hydrant outlets shall conform to BS 5041-1 and be of copper alloy construction except for the handwheel which shall be of cast iron or hard aluminium alloy;
2. The inlet and outlet fittings shall be supplied and manufactured to the quality of material, construction, and dimensions as detailed in the British Standard Specification listed:
   a. Globe & check valve of service rating 1000 kPa to BS 5154 or BS EN 12288;
   b. Male and female instantaneous terminals to BS 336;
   c. All fittings shall be tested to at least 2000 kPa.
3. Each hydrant outlet shall be tested at factory in accordance with manufacturer's quality assurance / control system. In particular, testing on the proper connection of hydrant outlet (female coupling) with male delivery hose coupling shall be carried out for each hydrant outlet to verify that the outlet connection is manufactured to BS 336. The dimensions of the male delivery hose coupling for the testing shall comply with BS 336. A water resistant and indelible label bearing the name or logo of the manufacturer and the signature of their quality controller shall be stuck at a conspicuous position on the body of hydrant outlet to denote the outlet has passed the manufacturer's quality assurance / control system;
4. After installation, each hydrant outlet shall be checked at Site by the Sub-contractor and witnessed by the CM or his representatives for verifying whether it can be properly connected to a pair of calibrated male delivery hose couplings provided by the Employer and of dimensions to the lower and upper limits specified respectively in BS 336. Any installed hydrant outlet which cannot pass the site check shall be removed and replaced;
5. The record of site check for individual hydrant outlets shall be included in the testing and commissioning report of the O&M Manual.

FWP7.1.030.9 FIRE SERVICE INLETS

Fire service inlets shall:

1. Be connected to the main riser and located as shown on the Drawings;
2. Be of twin type, comprising screw-down globe type stop valve with male screwed outlet of suitable bore and two horizontal male instantaneous inlet connections, complete with integral spring loaded non-return valves;
3. Have a separate non-return valve behind the inlets;
4. Have a metal plate with minimum 70 mm high marked "FIRE SERVICE INLET 消防入水掣" or "SPRINKLER INLET 花灑入水掣" in RED letters in both English and Chinese characters using raised letterings, hung on each of inlet;
5. For intermediate booster pump systems only, a waterproof box comprising pump start and stop push buttons; pump running indication light and alarm buzzer shall be provided in the FSI cabinet for fire hydrant/hosereel system; (Details shall be submitted for Approval prior to installation.);
6. Have an enclosure constructed by the Main Contractor.

FWP7.1.040.9 HYDRANT OUTLETS

Hydrant outlets shall:

1. Be of single type;
2. Comprise screw-down globe type stop valve with male screwed inlet of suitable bore and female instantaneous outlet;
3. Have the stop valve controlled by a handwheel to close in clockwise rotation with the direction of open and close engraved on the wheel of the valve in both English and Chinese characters;
4. Have outlet branches inclined 70 degrees from the centre line of the handwheel;
5. Have release plunger located at the side of each outlet branch for locking any connecting male delivery hose coupling;
6. Have the letters “HKHA” and the name of the estate and the phase number together with the batch number (e.g. SMP5-1 for Sau Mau Ping Phase 5 batch 1), or a suitable description of the Contract approved by the Contract Manager, indelibly marked on a conspicuous surface of the copper lock nut of the release plunger and on the body of the valve but not on the handwheel for identification;
7. Be selected to carry out and report on dimensional checking and chemical composition analysis against inferior materials and faulty workmanship, as follows:
    a. One hydrant outlet from each batch delivered to site or two hydrant outlets if the batch quantity exceeds 200, shall be randomly selected by the Contract Manager or his representative and then sent to an accredited laboratory to carry out the following tests:
        i. Dimensional checking of the connector section of the hydrant outlet against the matching delivery hose connector specified in BS336. The laboratory shall be accredited to carry out dimensions measurement under the “Specific Test or Property Measured” for a material or product of the “Construction Materials” or “Calibration Services” category in the HOKLAS list;

ii. Chemical composition analysis for the body of the hydrant outlet against the copper alloy specified in BS5041-1. The laboratory shall be accredited for testing such type of alloy under the "Metallic Materials" sub-category of the "Construction Materials" category in the HOKLAS list.

b. The expense involved, including any transportation cost, checking and testing, etc. shall be borne by the Sub-contractor;

c. If the selected hydrant outlet fails in the dimensional checking and / or the chemical composition analysis, the Contract Manager or his representative may at his / her discretion call for the same checking and testing on another hydrant outlet. The cost so arisen shall be borne by the Sub-contractor;

d. If the second hydrant outlet still fails in the checking and testing mentioned in c. above, the entire batch of the hydrant outlets shall be rejected. The Sub-contractor shall arrange replacement free of charge to the Employer and no extension of time to the contract period will be allowed. The batch of rejected hydrant outlets shall not be re-used in any HKHA's projects.

FWP7.1.050.9 VENTING AND DRAINING

All hydrant risers, shall be provided with automatic air relief valves of 25 mm size at the highest points and drain valves at the lowest points of the systems.

FWP7.1.060.9 EARTHING OF RISING MAINS

Rising mains shall be effectively electrically earthed and joints, which are not provided with electrical continuity, shall be bonded. Earthing and bonding shall be in accordance with the Electrical CoP.

FWP7.1.070.9 PRESSURE REDUCING HYDRANT OUTLETS

1. Pressure reducing hydrant outlets shall be adopted at locations where the running pressure at the hydrant outlets exceeds 700kPa. The pressure at any hydrant outlet even at no flow situation shall in no case exceed 850 kPa;

2. In accordance with the Drawings, pressure reducing hydrant outlet shall be either:

   a. Self-contained type without the use of parity valve, which shall be capable of reducing the running pressure and satisfying the flow test requirements. The pressure reducing mechanism of the valve shall be located downstream of the valve seat. Pressure reduction shall be achieved by means of hydraulic pressure balancing with metal diaphragm. The 100% effectiveness pressure reducing performance shall be maintained at all time of operation; or

   b. Achieved by installation of parity valve in conjunction with the hydrant outlet. The parity valve shall have a relief connection to drain of not less than 40 mm in diameter. Material of parity valve body shall be same as that of hydrant outlet. The cover of the parity valve shall be indelibly marked with the letters "HKHA" and the name of the estate and the phase number (e.g. SMP5 for Sau Mau Ping Phase 5) or a suitable description of the Contract approved by the Contract Manager.

3. Specification for hydrant outlets in Clause FWP7.1.040 shall also be applicable to the pressure reducing hydrant outlets.

FWP7.1.080.9 HOSEREELS

1. Hosereels shall be type-tested to BS EN671-1 or other recognized standard(s) and with FSD acceptance letter.

2. A hosereel shall be :

a. of fixed or swinging type to suit site installation conditions or as indicated on the Drawings;

b. drip free for the entire assembly;

c. with drum to be constructed of diecast light alloy, or spindle of rigid construction with equivalent robust material(s), hydraulically balanced, free from denting and twisting, and finished red colour in enamel or epoxy powder coated;

d. with a device to prevent overrun of the hose and a glandless centre seal at the hub and shaft;

e. with permanently and firmly connected reinforced rubber or PVC hose tubing of 30 m in length and 19 mm in internal bore to be capable of withstanding a bursting pressure of not less than 2700 kPa and connected to hose reel shut-off nozzle as specified in FWP7.1.100;

f. unless otherwise specified, with two-way ball valve as hose reel control valve, supported with WSD acceptance letter;

g. with hose guide complete with nylon or similar runners adjacent to fixed type hose reel to enable the hose to be run out in any direction as required;

h. with wall-mounting bracket to be capable of supporting the whole weight of the hose reel and tubing for the fixed type hose reel;

i. with support brackets and swinging arm to enable the whole hose reel assembly to be swung to 180° in a horizontal plan for the swinging type hose reel;

j. with two nos. of 30 mm wide white ring marking of completed circumference with durable paint indelibly marked on hose tubing, making the first marking at the connection point of the hose tightened to the hose reel drum/spindle and the second marking at the required minimum length of the hose, i.e. if the farthest point of the hose reel protected area is 24 m, the second marking shall be at 24 m measured from that of the first marking;

k. with an operation instruction notice affixed to the wall in a prominent position adjacent to the hose reel or affixed on the outer surface of the hose reel door. If the hose reel is located in a recess to which a door is fitted, such notice shall be affixed immediately below the words 'FIRE HOSE REEL 消防喉轆' on the outer surface of the door. The operation instruction notice shall be submitted for Approval prior to installation.

3. The Sub-contractor shall coordinate with the Main Contractor to position a metal/plastic striker and a glass fronted box for housing the hose reel shut-off nozzle so that no undue obstruction will be imposed to the free use of the hose reel. The glass fronted box and the striker shall be supplied and installed by the Main Contractor.

FWP7.1.100.9 PLASTIC HOSEREEL SHUT-OFF NOZZLE

1. Hosereel nozzle shall have a 4.5 mm orifice and be fitted with a lever-operated two-way valve to open or shut off the jet. The valve shall not be spring-loaded;

2. The nozzle shall be constructed of PVC or high quality ABS plastics in red colour or other materials as approved by the Contract Manager. The surface of the nozzle shall be smooth;

3. The nozzle shall be coupled to the F.S. hose by at least four holding threads and further secured by means of a worm-drive clip or other devices as approved by the Contract Manager;

4. The nozzle shall be indelibly marked with the manufacturer's name or trademark for identification purpose;
5. Under the operating condition as specified in the Fire Services CoP issued by FSD, the nozzle shall be capable of delivering water in the form of a water jet with flow rate not less than 24 litre/min. and the range of the jet not less than 6 metres as in accordance with BS EN 671-1;
6. The nozzle shall be tested according to the following procedures:
   a. The nozzle is connected to a 19 mm diameter (internal bore) F.S. hose and secured by means of a worm-drive clip;
   b. Water is supplied to the nozzle with 8.5 bar pressure at inlet of the nozzle;
   c. Fully open the nozzle cock by hand for 5 second and then fully close the nozzle cock by hand for 5 second;
   d. Repeat the cycle of open/close the nozzle cock in item (6)(c) above for 500 times.
7. During the test specified in sub-clause (6) above, there shall not be any sign of water leakage, crack or damage in any part of the nozzle assembly, including connection to the F.S. hose;
8. The nozzle shall be approved by FSD. Type test reports/certificates from an independent and reputable laboratory for verification of compliance with the test requirement in sub-clauses (6) and (7) above shall be produced upon request.

FWP7.1.110.9 OPERATION INSTRUCTION AND WARNING NOTICE FOR HOSEREEL

1. The notice shall be clearly marked with the following standard wording in English and Chinese characters of at least 5 mm high in red lettering on white background. The wording of the Chinese characters shall follow Fire Services CoP and the Water Authority Circular Letter as below.

   TO OPERATE FIRE HOSE REEL

   使用消防喉轆

   (1) BREAK GLASS OF THE FIRE ALARM CALL POINT

   打爛火警鐘玻璃 (or)

   ACTUATE FIRE ALARM CALL POINT

   按動火警鐘掣

   (2) OPEN CONTROL VALVE BEFORE RUNNING OUT HOSE

   先開啟來水掣，再拉出膠喉

   (3) TURN ON WATER AT NOZZLE AND DIRECT JET AT BASE OF FIRE

   將喉咀掣開啟，然後射向火之底部

   (NOT SUITABLE FOR ELECTRICAL FIRES)

   (不適用於電火)

   消 防 用 水

   嚴禁作其他用途

   USE OF WATER FROM FIRE SERVICES

   FOR PURPOSES OTHER THAN FIRE

FIGHTING IS STRICTLY PROHIBITED

水務監督辦事處 Office of the Water Authority

2. The notice shall be made of 3 mm thick plastic material with engraved characters.

FWP7.1.120.9 CABINETS

1. Cabinets for the housing of fire service inlets, hydrant outlets, and hosereels, if specified, shall be provided by the Main Contractor;
2. The Sub-contractor shall furnish all necessary information to enable these cabinets to be designed and constructed including proposed dimensions for the cabinets and the dimensions, weights, etc. of the apparatus supplied by him;
3. Requirements for any special housings for electrical controls shall be included;
4. It should be noted that space may be required in hosereel cabinets for portable equipment, as indicated elsewhere;
5. Where hosereels are located in recesses to which doors are fitted, the doors (whether glazed or otherwise) shall be painted in red with the words "FIRE HOSEREEL 消防喉轆" prominent and easily identifiable from all lines of sight in the surrounding. The lettering of wording shall be of at least 50 mm high;
6. In the case of doors which can only be opened by pushing in first, they shall also be annotated "PUSH TO OPEN 推開";
7. Hosereel cabinets fitted with doors shall not be locked but shall be easily identified and opened in time of emergency.

FWP7.1.130.9 INSTALLATION MATERIALS

All installation materials, fixing bolts etc. for mounting the equipment except for the nozzle box and striker inside the cabinets or on walls as applicable shall be provided by the Sub-contractor.

FWP7.1.140.9 PIPEWORK INSTALLATION

The installation shall include all pipework and fittings fully installed as indicated on the drawings and as specified in Worksections FWP2 and FWP3 of this Specification.

FWP7.1.150.9 HYDRANT BOOSTER PUMPS, TANKS, ETC

Hydrant booster pumps, tanks, etc., where indicated, shall comply with the general requirements of Worksection FWP6 of this Specification.

FWP7.1.160.9 CONTROLS

Hydrant system controls, including control of booster pumps, shall be as detailed in Worksection FWP2 of this Specification.

FWP7.1.170.9 STOP VALVES MANAGEMENT SYSTEM

1. The Subcontractor shall provide stop valves management systems as per FSD’s requirements for all fire services systems including FH/HR system and other fixed installations such as foam system and street fire hydrant system;
2. Stop valves in fire services systems shall refer to all essential valves which have to be kept open for proper functioning of the fire services systems;
3. A stop valves management system (SVMS) shall comprise the following:

a. The maintenance services and operation of the stop valves for each fire services system shall be maintained and recorded as required in the "Log Book" provided and kept by the Estate Management of the employer after handover;

b. Each stop valve shall be provided with a pull-up tamper-proof seal security tag using steel wire-rope with pad lock and labelling with unique tag number and a durable warning label placed inside a durable and readable plastic bag;

c. Each stop valve shall have an identification label with estate code, block code, floor number and valve number assigned by the Estate Management for easy identification and traceability of records. For SVMS hidden inside false ceiling or covered up area, a label shall be posted at a prominent location to show the position of the hidden SVMS;

d. Each SVMS shall have a "Normally Open" weatherproof label attached to the valve body confirming the valve status;

e. A proper registry on the serial numbers of the security tag shall be kept and produced for inspection upon request.

4. The Sub-contractor shall carry out regular maintenance visits to ensure the systems are in sound operating condition as described in FWP14.

FWP8.1 SPRINKLER SYSTEM INSTALLATION

FWP8.1.010.9 STANDARDS AND CERTIFICATION

1. Sprinkler systems shall be installed in accordance with the latest edition of the following standards and with all amendments issued before tendering:
   a. LPC Sprinkler Rules;
   b. Fire Services CoP;
   c. FSD Circular Letters.
2. Copies of valid certificates issued by LPCB or other recognized product certification bodies acceptable to the FSD, including but not limited to sprinkler heads, sprinkler control valves, and subsidiary valves and otherwise as required by the CM shall be produced for CM's inspection;
3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the sprinkler equipment delivered to the site or installed.

FWP8.1.020.9 DEFINITION OF TERMS

For the definitions of terms used for sprinkler systems, reference should be made to the LPC Sprinkler Rules and Fire Services CoP.

FWP8.1.030.9 TYPES OF SYSTEMS

Types of Sprinkler systems are as defined in the LPC Sprinkler Rules and as Worksection FWP2 of this Specification.

FWP8.1.040.9 CLASSIFICATION OF FIRE HAZARD

LPC Sprinkler Rules define various classes of fire hazard according to the occupancy of the building to be protected. Reference should be made to this standard.

FWP8.1.050.9 CLASSIFICATION OF WATER SUPPLIES

Sprinkler systems are graded according to the number and type of water supplies available. Reference should be made to the LPC Sprinkler Rules.

FWP8.1.060.9 TYPE OF WATER

Unless otherwise indicated the sprinkler system shall be suitable for use with fresh water from the Water Authority.

FWP8.1.080.9 BRANCH CONNECTION TO WATER SUPPLY SYSTEM

Whenever a direct feed town mains, gravity tank or other supply systems are used to supply any sprinkler system, no branch connection for any other purpose, hosereels included, will be permitted.

FWP8.1.090.9 ANTI-POLLUTION VALVE FOR DIRECT CONNECTION TO TOWN MAINS

1. For sprinkler systems without water storage tanks and supplied from a direct connection to town mains, an anti-pollution valve to the Water Authority's Specification shall be fitted to the sprinkler installation at a point between the town mains connection and the fire service inlet;
2. The anti-pollution valve shall be installed in accordance with the relevant Circular Letter of FSD and the Water Authority requirements.

FWP8.1.100.9 SPRINKLERS

1. Sprinklers shall be with the approval of the FSD. Sprinkler for general application shall be of LPC approved conventional type or type approved by similar recognised independent regulatory body. Sprinklers shall not be altered in any respect, nor have any type of ornamentation or coating applied after leaving the production factory;
2. Sprinklers shall be constructed with the appropriate characteristics, to suit each particular application. The sprinkler types shall suit the installation requirements in accordance with the LPC Rules for Sprinkler Installations and FSD requirements. Each one may be defined by any of the following characteristics:
    a. Nominal size of orifice;
    b. Type of heat-operated element;
    c. Operation temperature;
    d. Type of deflector.
3. Glass bulb sprinkler shall be constructed with heat sensitive quartzoid bulb with temperature rating as required by the FSD, typically as follows:
    a. General purposes (including Refuse Storage and Material Recovery Chamber): 68℃;
    b. Heated rooms such as kitchen cooking area : 93℃;
    c. At top of refuse chute: 57℃.
4. Sprinklers installed at false ceiling shall be of the flush pattern, pendant type, and be provided with an adjustable screw type metal escutcheon and rosette to be installed flush with the false ceiling with the heat sensitive element exposed below the false ceiling line. The escutcheon and rosette shall be chromium plated or finished to a coating of white colour subject to Approval;
5. For sprinklers installed at false ceiling at locations susceptible to outdoor conditions, the escutcheon and rosette shall be made of gloss stainless steel or formed by metal sheet finished to a rustproof coating of white colour subject to Approval;
6. Where indicated on Drawings, concealed pendant type sprinklers shall be provided at false ceiling. Each concealed pendant type sprinkler head assembly shall include a metal flat cover plate that conceals the sprinkler operating components above the ceiling. Being an integral component of the sprinkler head assembly, the cover plate shall be chromium plated or finished to a coating of white colour subject to Approval.

FWP8.1.110.9 SPRINKLER GUARDS

In situations where sprinklers are liable to accidental or mechanical damage or where otherwise specified by FSD, sprinklers shall be protected by approved metal guards. Guards shall not be used in conjunction with ceiling type sprinklers.

FWP8.1.120.9 SPACING AND LOCATION OF SPRINKLERS

1. The Sub-contractor shall inform the Contract Manager immediately of any spacing or location of sprinklers which he knows will contravene the LPC Sprinkler Rules due to actual site conditions;
2. The Sub-contractor shall provide metal baffles of the correct size between sprinklers wherever required by the LPC Sprinkler Rules.

FWP8.1.130.9 SPARE SPRINKLERS

The Sub-contractor shall provide a cabinet containing a minimum number of spare sprinklers as recommended by the LPC Sprinkler Rules or as required by Worksection FWP2 of this Specification. Sprinkler spanners shall be provided and kept in the painted steel cabinet.

FWP8.1.140.9 PIPEWORK INSTALLATION

1. Pipework installation for sprinkler systems shall be installed in accordance with the LPC Sprinkler Rules and, wherever applicable, with Worksections FWP3 and FWP4 of this Specification;
2. The Sub-contractor shall inform the Contract Manager immediately of any on-site situation which he knows will contravene the LPC Sprinkler Rules.

FWP8.1.150.9 PRESSURE GAUGES, VALVES, ALARM DEVICES

Pressure gauges, various types of valves and alarm devices shall be installed in accordance with the LPC Sprinkler Rules.

FWP8.1.160.9 CABINETS FOR CONTROL VALVE SETS AND FIRE SERVICE INLETS

1. Cabinets for housing the sprinkler control valve sets and fire service inlets will be provided by the Main Contractor. The Sub-contractor shall furnish all necessary dimensional information to enable these cabinets to be designed and constructed;
2. Construction of the Sprinkler Inlet shall be the same as "Fire Service Inlet" described in Worksection FWP7 of this Specification. Labelling and lettering shall be in accordance with Fire services CoP.

FWP8.1.170.9 PUMPS AND TANKS

Pump and tanks where applicable, shall comply with Worksections FWP5 and FWP6 of this Specification.

FWP8.1.180.9 CONTROLS

The control system, where applicable, shall comply with Worksection FWP10 of this Specification. All associated electrical wiring and installation shall comply with Worksection FWP11 of this Specification.

FWP8.1.190.9 NOTICES FOR SPRINKLER SYSTEM

All notices required by LPC Sprinkler Rules and/or Fire Services CoP shall be in both the English and Chinese languages.

FWP8.1.200.9 SPRINKLER SUBSIDIARY STOP VALVES MANAGEMENT SYSTEM

The Sub-contractor shall provide a sprinkler subsidiary stop valves (SSSV) management system including the following:

1. Provide all necessary information of SSSV for each sprinkler system as required in the 'Log Book' provided and kept by the Estate Management of the employer after handover;
2. Each SSSV shall be provided with a pull-up seal security tag using steel wire-rope with pad lock and labelling with unique tag number and a warning label placed inside a durable and readable plastic bag;
3. Each SSSV shall have an identification label with estate code, block code, floor number and valve number assigned by the Estate Management for easy identification and traceability of records. For SSSV hidden inside false ceiling or covered up area, a label shall be posted at a prominent location to show the position of the hidden SSSV;
4. Each SSSV shall have a "Normal Open" weatherproof label attached to the valve body confirming the valve status;
5. A proper registry on the serial numbers of the security tag shall be kept and produced for inspection upon request;
6. The Sub-contractor shall carry out regular maintenance visits to ensure the system is in sound operating condition as described in FWP14; and
7. SSSV Management System shall include valves governing the sprinklers over the top of refuse chute and at ground floor refuse storage and material recovery chamber of the domestic blocks, not forming part of a sprinkler system.

FWP8.2 DRENCHER SYSTEM INSTALLATION

FWP8.2.010.N STANDARDS AND CERTIFICATION

1. The drencher system shall be designed, installed and commissioned in accordance with the Fire Services CoP and international standards acceptable to FSD;
2. Copies of valid certificates issued by recognised product certification bodies acceptable to the FSD, including but not limited to drencher head, deluge valve and otherwise as required, shall be produced for inspection by the CM;
3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the drencher equipment delivered to the site or installed.

FWP8.2.020.N DELUGE VALVE SET

1. Deluge valve sets shall be installed at the locations as shown on the Drawings. Each deluge valve set shall comprise the following:
   a. A diaphragm type main control valve complete with associated trim;
   b. Water discharge / alarm pressure switch;
   c. Water supply and diaphragm chamber pressure gauges;
   d. Solenoid releasing valve;
   e. Hydraulic manual operating device;
   f. Water motor alarm and gong;
   g. Drain valves, check valves, test valves and strainers;
   h. Other components as necessary to suit FSD's requirements.
2. The deluge valve shall be designed to allow external resetting with no need to open the diaphragm cover;
3. Solenoid releasing valve shall be 24V D.C. operated and normally closed. Upon system activation, it shall release water pressure from the differential chamber and open the deluge valve for supplying water into the system piping;
4. All installation, materials and fixing bolts, etc. for mounting the equipment inside a cabinet or on wall as applicable shall be provided by the Sub-contractor;
5. The cabinet for housing the deluge valve set, if applicable, will be provided by the Main Contractor. The Sub-contractor shall furnish all necessary dimensional information to enable the cabinet to be designed and constructed;
6. Deluge valve shall be listed by a product certification body acceptable to FSD.

FWP8.2.030.N MANUAL OPERATING DEVICES

1. Hydraulic type manual operating device with a pull handle mounted in a robust box shall be provided at the drencher deluge valve;

2. Manual operating device(s) at location(s) other than the deluge valve shall be an electric type manual switch, semi-flushed mounted, positioned within 900mm to 1200mm above finished floor level. It shall be with a resettable frangible element and a transparent hinged cover forming integral parts of the device, complying with BS EN 54-11, acceptable to FSD. Where located at outdoor or at location(s) susceptible to weather conditions or where specified on the Drawings, the device(s) shall be weatherproof type to IP66 or better;
3. The Sub-contractor shall provide an operation instruction notice adjacent to each manual operating device. The notice shall be clearly marked with wordings in English and Chinese characters of at least 6mm and 14mm high respectively, in red lettering on white background.

FWP8.2.040.N DRENCHER INLETS

1. The general requirement and construction of drencher inlets shall be the same as "Fire Service Inlets" described in Worksection FWP7 of this Specification;
2. A metal plate with minimum 70 mm high marked " DRENCHER INLET 水簾入水掣" in RED letters in both English and Chinese characters using raised letterings, hung on each of inlet;
3. Cabinet for housing the drencher inlet will be provided by the Main Contractor. The Sub-contractor shall furnish all necessary dimensional information of the cabinet to the Main Contractor.

FWP8.2.050.N TYPE OF PUMP

1. The construction of pumps for drencher installation shall comply with respective parts of FWP6 as appropriate;
2. The drencher pumps / drencher intermediate booster pumps shall be either horizontal split casing, end suction type or horizontal/ vertical multi-stage type having construction permitting removal of back cover, stuffing box and impeller without disturbance of suction/delivery pipework;
3. For jockey pump where applicable, multi-stage pumps shall be used. The maximum number of stages acceptable is seven unless otherwise Approved;
4. For installation with motor rating not exceeding 2.2kW, close-coupled pumps may be accepted as an alternative subject to Approval.

FWP8.2.060.N DRENCHER HEADS

1. Drencher head shall be of brass construction and listed by a product certification body acceptable to FSD;
2. The Sub-contractor shall calculate the number of drencher heads, their separation and their arrangement to provide an even flow of water over the opening to be protected;
3. The spacing of drencher heads shall be not more than 2.4m;
4. The Sub-contractor shall submit hydraulic calculation to justify the selected orifice size and k factor of drencher head to the CM for approval;
5. The Sub-contractor shall take due consideration on the effect of wind and air movement in surrounding environment of the protected area in the design and selection of equipment for drencher system.

FWP8.2.070.N DRENCHER PIPEWORK

1. The installation shall include all pipework and fittings as indicated on the Drawings complying with Worksections FWP3 and FWP4 of this Specification;
2. The Sub-contractor shall check and verify the sizing of pipework by hydraulic calculation and submit fully calculated results to the CM for approval.

FWP8.2.080.N WATER MOTOR ALARM AND GONG

Water motor alarm and gong shall comply with FWP2.1.5.080 of this Specification.

FWP8.2.090.N DRENCHER AND CONTROL SYSTEM

1. The Sub-contractor shall provide concealed PVC conduit system complete with wiring for and in connection with the fire alarm and control system, fire services alarm control panel and drencher pump control cubicle wherever necessary;
2. The drencher system control panel shall comply with FWP10.5 of this Specification as appropriate;
3. The drencher system control panel shall be a standard product of the same manufacturer of the deluge valve and worked in conjunction with solenoid releasing valve to allow a flow of water into the system upon actuation;
4. Whenever necessary, and subject to Approval, parts of the conduit system may be installed in galvanised steel surface conduit/trunking.

FWP8.2.100.N HEAT DETECTORS FOR DRENCHER ACTUTATION

1. Heat detector shall comply with FWP10.3 of this Specification as appropriate;
2. Heat detection system in coincidence connection (cross-zone operation) shall be used to activate the drencher system whenever necessary and as shown on the Drawing, such as for fire compartmentation. The detectors for cross-zone operation shall be arranged each on either side of the drencher heads. The activation of one detector shall energise an alarm with visual and audible warnings on the control panel. The activation of any two detectors arranged in coincidence connection shall operate the drencher installation;
3. Where required by the FSD and approved by the CM, activation of the detectors provided solely for the drencher system shall not activate the general fire alarm and shall not send the fire signal via the fire alarm direct link and alarm transmitter.

FWP8.2.110.N PILOT SPRINKLERS FOR DRENCHER ACTUATION

1. Sprinkler shall comply with FWP8.1.100 of this Specification as appropriate;
2. Pilot sprinklers shall be of quick response type with a short Response Time Index (RTI) value suitable for the hazard to be protected;
3. The Sub-contractor shall submit the RTI value to the CM for approval..

FWP9.1 SYSTEM REQUIREMENTS

FWP9.1.010.9 GENERAL

1. Unless otherwise specified, gas extinguishing systems shall be of the total flooding type with a high pressure open-ended piping installation on the distribution side;
2. The automatic gas release mechanism shall be operated by means of fire detection units at the protected compartment or manually by a pull handle or push button as described below;
3. FM-200 shall be used for total flooding systems in normal occupied areas;
4. Where local application systems are specified they will normally use carbon dioxide gas as the extinguishing agent;
5. Copies of valid Approval documents / certificates issued by FSD and / or product certification bodies recognized by FSD for the components in gas extinguishing system shall be produced for CM's inspection;
6. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the gas extinguishing equipment delivered to the site or installed.

FWP9.1.020.A FM–200 EXTINGUISHING SYSTEM

FM-200 system shall be designed and installed in accordance with UL Standard 2166, NFPA 2001 or BS EN 15004-1 and BS EN 15004-5 or other recognized established standards on Clean Agent Fire Extinguishing Systems acceptable to FSD, FSD requirements and Circular Letters.

FWP9.1.030.9 MATERIAL STANDARDS

Materials shall be to the appropriate British Standard and sized in standard metric dimensions. Where the installation is designed in accordance with NFPA codes/standards, the Sub-contractor shall show that the materials selected are in accordance with a British Standard not inferior to the standard recommended in the NFPA standard and that the metric sized materials are sized to give a performance of the system not inferior to the performance called for this Specification and the NFPA standard. The Sub-contractor shall also show that all components are compatible and that any variations in dimensions due to the use of metric sized components do not adversely affect the balance of the system.

FWP9.3 SYSTEM PERFORMANCE

FWP9.3.010.9 FM-200 TOTAL FLOODING SYSTEM

FM-200 total flooding system shall be designed to achieve an acceptable concentration in the protected compartment as stipulated in NFPA 2001 or any recognized system design manual from the manufacturer at room temperature. Discharge of gas shall be substantially completed within 10 seconds. Following discharge, the concentration of FM-200 shall develop throughout the protected compartment to achieve final extinguishment of fire within 60 seconds.

FWP9.3.020.9 RESPONSIBILITY

1. The enclosure to be protected and the position of the gas cylinders shall be as indicated on the Drawings. The layout of pipework and nozzles indicated on the Drawings is optional but if the Sub-contractor proposes any other layout he remains responsible for ensuring that the proposed layout is acceptable to the Contract Manager, that it will not obstruct any other services, and that necessary openings in the structure are permissible and are provided, by giving sufficient notice for them to be provided by the Main Contractor;
2. Notwithstanding that the Sub-contractor has demonstrated, by calculation, to the satisfaction of the Contract Manager, that the system will perform to the standard required, the Sub-contractor shall remain responsible for ensuring that under test the system does, in fact, perform in accordance with this Specifications.

FWP9.3.030.9 DESIGN CALCULATIONS

1. To justify the selection of components and pipe sizes for the system, the Sub-contractor shall provide with his tender either full mathematical calculations or computer model flow calculations. Where the computer programme does not show all calculation steps it will be necessary for the Sub-contractor to produce evidence that the computer programme produces a design that will perform in accordance with the Specification as indicated by Underwriters' Laboratory listing or approved by any similar widely recognised independent regulatory body acceptable to the Contract Manager;
2.
    a. The calculations shall be based on the equipment offered;
    b. Valves, syphon tubes, distribution valves as well as bends and junctions shall be represented in the calculations as equivalent lengths of pipe;
    c. The actual size and location of pipes and nozzles and the number of nozzles shall be designed on the basis of the calculated flow rates and terminal pressures required to ensure successful operation;
    d. The calculations or computer programme shall provide all the information necessary to complete the installation including the quantity of gas used to flood to the required concentration, the allowance for losses and the total quantity, the flow rate and start and end pressure of each section of pipe and the orifice size for each nozzle.

FWP9.3.040.9 COMPLETE WORKING SYSTEM

The Sub-contractor shall provide all the components necessary for full operation of the system in the automatic or manual mode regardless of whether or not such components are detailed on the Drawings or in this Specification.

FWP9.4 GAS STORAGE PRESSURE

FWP9.4.010.9 STORAGE

All the gas extinguishing agents shall be stored in rechargeable cylinders to hold the pressurized agents in liquid form at ambient temperature.

FWP9.4.020.9 FM-200

FM-200 cylinders shall be charged in accordance with NFPA 2001 or any recognized system design manual from the manufacturer acceptable to FSD.

FWP9.4.030.9 DESIGN

Gas cylinders, distribution pipework, valves, nozzles and fittings shall be manufactured to standards designed to withstand the maximum pressure of stored agent allowing for variations in ambient temperature.

FWP9.5 GAS CYLINDERS

FWP9.5.010.9 FM-200 CYLINDERS

1. FM-200 cylinders shall be of high-strength alloy steel construction that complies with the Department of Transportation regulation for refillable pressure vessels and conform to NFPA 2001;
2. The maximum storage gaseous agent at each gas cylinder shall be not more than 120kg. Each cylinder shall have a permanent nameplate indicates the agent, tare and gross weights, and super-pressurization level of the cylinder.

FWP9.5.020.9 CYLINDER MOUNTING

Cylinders shall be securely mounted in a frame bolted to the wall and arranged so that external parts may be readily inspected and corrosion cannot occur.

FWP9.5.030.9 CYLINDER OVER PRESSURE PROTECTION

Where pressure–operated cylinder valves are used, means shall be provided to vent any cylinder gas leakage. The means of pressure venting shall be arranged so as not to prevent reliable operation of the cylinder valve.

FWP9.5.040.9 CYLINDER ACCESSORIES

Each cylinder shall be complete with gas valve/actuator, pressure gauge, flexible hose, check valve and all other necessary accessories.

FWP9.5.050.9 CYLINDER CONTENTS MEASURING DEVICES

1. A device shall be provided for measuring the amount of liquid in the cylinder at any time;
2. This shall be done by a method which does not require the cylinder to be detached from the remainder of the plant;
3. If a weighing device of the type that requires suspension is proposed, means shall be provided above each cylinder for the attachment of the weighing device;
4. The contents of the cylinders may alternatively be checked by the use of a liquid level indicator of an Approved type.

FWP9.5.060.9 DISCHARGING FROM CYLINDERS

1. The liquid shall be discharged from the cylinder through a syphon tube;
2. The pressure of the liquid stored in the cylinder shall be such that freezing cannot take place at the lowest possible ambient temperature;
3. Means shall be provided to prevent gas discharging into empty containers and to prevent loss if the gas is released when any of the cylinders is disconnected.

FWP9.5.070.9 PAINTING CYLINDERS

Gas cylinders shall be painted signal red as specified in BS 381C in accordance with the requirements of BS 5252. The type of extinguishing agent, the tare weight, gross weight and liquid level at 25°C shall be clearly painted on each cylinder with white paint.

FWP9.6 SYSTEM RELEASE OPERATION

FWP9.6.010.9 AUTOMATIC RELEASE MECHANISM

1. Fire detection in the protected area shall be by means of ionization chamber smoke detectors and heat detectors as detailed in FWP2. The detectors, of sufficient number and suitably positioned to give duplicate coverage of the whole of the protected area, shall be connected in zones so that smoke or heat generated in any part of the area will activate two zones. The fire detection control panel and the detectors shall be compatible and the fire detection system shall comply with FWP10;
2. Activation of a detector on one zone shall cause alarm bells to sound. Activation of detectors on two zones shall cause a siren or Klaxon horn to sound to warn that, if the system is in the automatic mode, the extinguishing agent is about to be released. These warnings will also be activated by operation of the manual release;
3. The gas extinguishing control panel shall control and monitor the release system. It will include an automatic / manual lock-off unit controlled by keyswitches at each entrance to the protected area. Any one keyswitch shall be capable of switching the automatic system on or off. The manual release mechanism will remain operative whether the automatic system is on or off. A time delay unit shall be provided which shall be adjustable and lockable in the range 15 to 30 seconds. Relays shall be provided, to shut down ventilation and air conditioning, to close openings and to switch off equipment as necessary. These relays will operate immediately when two zones of the fire detection system are activated or when the manual release is operated. Release of the gas will follow after the pre-set time delay.

FWP9.6.020.9 MANUAL RELEASE MECHANISM

A manual release unit shall be provided in a suitable position outside each entrance to the protected compartment. The manual release unit shall consist of a pull handle or push button mounted in a box with "break glass" cover. The box shall be so designed that its glass front may be readily replaced and that its front cover can be opened with a key for the purpose of operating the switch without breaking the glass.

FWP9.6.030.9 EMERGENCY RELEASE MECHANISM

An emergency release handle with direct mechanism shall be provided in an accessible position at or near the gas cylinders. The emergency release shall require no power supply to operate and it shall be provided with a removable pin to prevent accidental release of gas. Provision shall be made for operation of the emergency release to activate the relays to cause simultaneous shutdown of ventilation, air-conditioning, equipment etc. and to sound the alarm.

FWP9.6.040.9 GAS RELEASE MECHANISM

1. The operation of the gas release mechanism shall require minimum power from an external electrical, pneumatic or mechanical source and shall preferably be operated by a falling weight device. No springs shall be used in any position where their failure or fracture would prevent the correct operation of the gas release mechanism or cause the inadvertent release of the gas;
2. All release devices and mechanisms shall be designed for the working conditions they will encounter and shall not readily be rendered inoperative or susceptible to accidental operation. They shall have proper protection from mechanical, chemical or other damage that would render them inoperative.

FWP9.7 PIPEWORK AND FITTINGS

FWP9.7.010.9 GENERAL

All pipework shall be non-combustible and able to withstand the expected pressures and temperatures without damage. Specification of materials and installation shall conform to the relevant British Standards for the respective gas extinguishing agent used.

FWP9.7.020.A FM-200 SYSTEMS

Pipes for FM-200 system shall be as follows:

1. For system pressure not more than 25 bars:

a. Up to and including 65 mm :	Galvanized steel pipes conforming to BS EN 10255, heavy grade, butt welded;
b. All other sizes	Carbon steel pipes conforming to BS EN 10216-1 or BS EN 10217-1 with wall thickness not lower than ASME B36.10M Schedule No. 40 pipe and with steel grade P265TR1 or ASTM A53/A53M, seamless, grade A.

2. For system pressure more than 25 bars:

a. Up to and including 100 mm:	Carbon steel pipes conforming to BS EN 10216-1or BS EN 10217-1 with wall thickness not lower than ASME B36.10M Schedule No. 80 pipe and with steel grade P265TR1or ASTM A53/A53M, seamless, grade B.

FWP9.7.030.9 PIPE FITTINGS AND FLANGES

Pipe fittings and flanges shall be as specified in the following relevant Standards for the particular gas extinguishing installations in accordance with the pipe size and pressure of the system. The following British Standards are relevant:

BS 3799	Forged steel pipe fittings, screwed and socket-welding for the petroleum industry.
BS EN 10253-2	Butt-welding pipe fittings. Non alloy and ferritic alloy steels with specific inspection requirements.

FWP9.7.040.9 PIPE JOINTING

1. All pipework and fittings shall be free of burrs, spelter and rust and shall be galvanized inside and out;
2. Screwed threads shall conform to the dimensions specified inBS EN 10226-1, 2, 3;
3. Screwed joints shall be made with PTFE tape or Approved equivalent but chemically inert to the extinguishing agent used;
4. Compressed fibre gaskets free of asbestos shall be used for flange joints.

FWP9.7.050.9 PIPEWORK SUPPORTS

1. Pipework supports shall be arranged as near as possible to joints and changes of direction and each support shall take its share of the load. The maximum space between supports to take into the total mass of pipe and extinguishing agent shall be as tabulated in sub-clause (2) but additional supports shall be provided where there are extra loads such as valves;

2. Maximum space between supports:

Pipe size (mm)	15	20	25	32	40	50	80	100
Span (m)	1.5	1.8	2.1	2.4	2.7	3.0	3.6	4.2

FWP9.7.060.9 DISCHARGE NOZZLES

1. Discharge nozzles shall be of robust construction and designed for use with the expected working pressure and temperature without deformation. The discharge orifices shall be made of corrosion resistant metal and have a permanent marking for identification and to show the equivalent single orifice diameter;

2. Gas discharge nozzles shall be provided to distribute the gaseous agents uniformly throughout the protected spaces, the nozzles shall be discharged in either 180° or 360° patterns, depending on location. The nozzles shall be permanently marked to identify the manufacturer as well as the type and size of the orifice. The flow characteristics, area coverage, height limits, and minimum pressure of discharge nozzles shall be in accordance with the manufacture's listed limitations;

3. Gas discharge nozzles shall be certified by UL / FM and approved by FSD for use in clean agent gas flooding fire extinguishing system.

FWP9.7.070.9 FLEXIBLE HOSE CONNECTIONS

Flexible hose connections shall be selected, inspected and tested only by a suitably trained engineer or technician and shall be designed for service at the pressures and temperatures involved.

FWP9.7.080.9 PRESSURE RELIEF VALVES

1. To prevent entrapment in pipework, a suitable excess pressure relief valve shall be provided at any section of high pressure piping blocked by valves at both ends and shall operate at the following pressures:

   2 times the maximum system pressure

2. Valves shall be capable of being opened when subjected to the maximum operating pressure and shall be so equipped that they can be opened manually. Valves for FM200 system constantly under pressure shall be designed for maximum working pressure plus a 50% safety factor.

FWP9.7.090.9 MANIFOLDS

Manifolds shall be tested for a duration of minimum 5 minutes at the manufacturer's works to the following minimum pressures:

2 times the maximum system pressure.

FWP9.7.100.9 EARTHING

Pipework shall be earthed to prevent build up of electrostatic charge.

FWP9.7.110.9 PAINTING

Pipework shall be painted signal red as specified and illustrated in BS 381C in accordance with the requirements of BS 5252. Brass fittings shall be left unpainted.

FWP9.8 SYSTEM PROTECTION

FWP9.8.010.9 SECURITY OF FIXING

The whole gas discharge system including cylinders, pipework and nozzles shall be securely fixed to the structure with saddles or brackets correctly spaced so that all components will remain in place when subjected to the pressures and forces produced during discharge. Fixings shall allow for movement due to thermal expansion.

FWP9.8.020.9 GUARDING

The system shall be guarded so that it shall be impossible to obstruct the operation of any moving parts.

FWP9.9 INDICATOR LIGHTS, WARNING NOTICES AND LABELS

FWP9.9.010.9 GAS STORAGE COMPARTMENTS AND PROTECTED COMPARTMENTS

1. All gas storage compartments and compartments protected by a gas extinguishing system shall have a warning notice fixed on each entrance door to the compartment;
2. Configuration, lettering, colour and size of the notice shall be in accordance with the requirement of FSD for the respective gas extinguishing system;
3. The notice shall be made of sheet metal plate not less than 1.6 mm thick.

FWP9.9.020.9 TOTAL FLOODING SYSTEM

For a total flooding system, protecting a normally occupied area, which is designed to operate automatically when unoccupied but to be in the manual mode when occupied, the following warning lights shall be installed together with explanatory/warning notices in English and Chinese. Such notices shall be clearly legible and painted or engraved on substantial durable material. Warning lights and notices for systems other than as described above (e.g. local application systems or systems designed to be in the automatic mode when the area is occupied), shall be equally informative and suitably substantial and shall be arranged and worded either as specified in FWP2 or as agreed with the Contract Manager:

1. Inside the protected area: a flashing red light to indicate gas release imminent with a notice which shall read:

   "WARNING - FM-200 gas release imminent. Leave the room at once."

2. Outside each entrance to the protected area:

   a. A green light to show that the system is on manual control with automatic control locked off, with a notice which shall read:

      "Safe to enter. FM-200 fire extinguishing system on manual control. When room vacated switch to automatic control."

   b. An amber light to show that the system is on automatic control, with a notice which shall read:

      "Not safe to enter. FM-200 fire extinguishing system on automatic control. Switch to manual control before entering."

   c. A red light to show that the system has operated, with a notice which shall read:

      "DANGER - Do not enter. FM-200 gas discharged."

3. The manual/automatic lock off key switches, the manual release units and the emergency release handle shall all be labelled in English and Chinese so that it is clear what their purpose is and how to operate them.

FWP9.9.030.9 SYSTEM ODORISERS

Odorisers, where specified in FWP2, shall be capable of automatically treating the gas after release from the cylinder and shall be of citrus odour type, so that a hazardous atmosphere can be recognised at once. Where odorisers are provided, a suitable notice to the effect that anyone detecting the citrus odour should leave the area immediately and report the occurrence to a responsible person shall be provided worded in English and Chinese.

FWP10.1 GENERAL

FWP10.1.010.9 COMPONENTS AND EQUIPMENT COMPATIBILITY

1. All the devices, components and equipment used in the system shall be of highest quality and suitable for humid tropical working conditions;
2. They shall be fully compatible with one another throughout the whole system;
3. Special attention should be drawn to the compatibility between automatic detectors and control equipment and the Sub-contractor shall supply information of the detectors and the required electrical interface with the control and indicating equipment;
4. All the components in such a system shall preferably be from one principal system manufacturer and form one compatible system approved by the relevant widely recognised independent regulatory body with the approval of FSD;
5. Certificate to prove compatibility shall be produced upon request. Confirmation from panel manufacturer on compatibility of connected components will normally be acceptable;
6. Devices mounted at locations susceptible to weather conditions shall be of weatherproof type construction.

FWP10.2 MANUAL FIRE ALARM POINTS

FWP10.2.010.9 CONSTRUCTION

1. Manual fire alarm call point unit shall be of direct operation type equipped with resettable frangible element complying with BS EN 54-11 or other international standards and acceptable to FSD;
2. The unit shall comprise an electrical contact which will operate automatically upon displacing the resettable frangible element at the operating face of the unit;
3. Cover of the unit shall be locked in position with a special tool and the frangible element shall be clipped firmly into place;
4. The words “Fire 火警”and its actuating method in English and Chinese shall be indelibly marked on the operating face of the unit;
5. Suitable means of earth continuity shall be provided at the mounting box of the unit connecting to steel conduits;
6. The unit and its mounting box shall be of pleasing appearance and styling, constructed by non-corrodible materials and finished in signal red colour;
7. Manual fire alarm call point located at outdoor or at location(s) susceptible to weather conditions or where specified on the Drawings shall be of weatherproof type to IP66 or better;
8. The unit shall be permanently marked with the following information:
   a. the number of the standard such as “BS EN 54-11”;
   b. the name or trademark of the manufacturer;
   c. the model designation;
   d. environmental category;
   e. the wiring terminal designations;
   f. any mark or code by which the manufacturer can identify the date or batch and place of manufacture.
9. Manual Fire Alarm Call Point(s) complete with proprietary transparent hinged protective cover shall be provided at the exit location(s) of the building where Door Release Button for Electro-Magnetic Door Lock are installed nearby, or where specified on the Drawings;
10. Manual Fire Alarm Call Point complete with transparent hinged protective cover shall be on the list of LPCB or other Product Certification Bodies recognized by FSD;
11. A permanent operation instruction plate shall be provided next to the Manual Fire Alarm Call point. The instruction plate shall be in red colour and fabricated from 3mm thick acrylic sheet of dimensions approximate 86mm (W) x 55mm (H). The Chinese characters and English letters shall be white colour and etched onto the surface of the acrylic sheet with height not less than 14mm and 6mm respectively.

    MANUAL FIRE ALARM CALL POINT

    火警鐘掣

FWP10.2.020.9 OPERATION

1. The method of operation shall be referred to Type A as specified in BS EN 54-11;

2. The manual fire alarm call points shall be suitable for 24 V DC operation;
3. Contacts shall be of silver or approved non-deteriorating alloy, normally-open or normally-closed type to suit the alarm system;
4. The voltage and current ratings of the contacts shall be marked in the unit, or clearly indicated in the corresponding installation instruction sheet;
5. A concealed test facility and a special tool shall be included. Use of the special tool is necessary to reset the displaced frangible element after operation.

FWP10.2.030.9 CERTIFICATION

1. Copies of type test / approval certificates from product certification bodies recognised by FSD shall be produced to prove the manual fire alarm point complies with BS EN 54-11 or other standards acceptable to FSD;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the manual fire alarm points delivered to the site or installed.

FWP10.2.040.9 MOUNTING

The manual fire alarm call point shall be mounted on wall or as specified in Project Specific Specification at position within 900mm to 1200mm above finished floor level. It shall be suitable for direct connection to the concealed wiring system therein.

FWP10.3 HEAT DETECTORS

FWP10.3.010.9 STANDARD

Automatic heat detectors shall be of point-type complying with, BS EN 54-5 or other standards acceptable to FSD.

FWP10.3.020.9 TYPE

Detectors shall be of combined fixed temperature and rate-of-rise type except in high temperature areas such as kitchens or boiler rooms where, because the risk of false alarms caused by rapidly rising temperatures is high, detectors without a rate-of-rise element should be used.

FWP10.3.030.A INSTALLATION

1. Detector units shall be of flush or surface mounting type as indicated in the Specification or Drawings;
2. Detector units in suspended ceilings shall be flush mounted and shall, in the case of modular constructed ceilings, be coordinated into the ceiling layout;
3. When detectors are provided in inaccessible area such as ceiling void or floor void, remote indicating lamp shall be provided and visible from any unobstructed position of the area. The above is exempted for addressable detectors if clear addressable text display of the location in English or Chinese is available at the Control and Indicating Equipment, without manual intervention or the display, in conjunction with layout plans are provided adjacent to the Control and Indicating Equipment;
4. For non-addressable system, remote indicator lamps can be provided outside doors of lockable rooms such as plantrooms, electrical equipment rooms, store rooms, dangerous good stores etc. which are unoccupied and normally kept locked to reduce the need for a large number of small zones;
5. Where detectors are mounted at levels above 4 m, they shall be capable of being removed and re-fixed from below by means of a special extended arm tool;
6. For detector installed at easily accessible height in public circulation area, detachable detector shall not be used without the CM’s approval and shall be provided with means to guard against theft when required;
7. Removal of individual detector from the mounting base shall not affect operation of other alarm devices in the system;
8. Where the type of detector is not specified, heat detector shall be used except in areas where smoke detectors are required to satisfy FSD Requirements such as places having sleeping risk, for smoke management, compartmentation or ventilation / air-conditioning control system, etc.

FWP10.3.040.A CERTIFICATION

1. Copies of type test / approval certificates from product certification bodies recognized by FSD shall be produced to prove that the heat detector complies with BS EN 54-5 or other standards acceptable to FSD;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the heat detectors delivered to the Site or installed.

FWP10.4 SMOKE DETECTORS

FWP10.4.010.9 STANDARD

1. Automatic smoke detectors shall comply with, BS EN 54-7 or other standards acceptable to FSD;
2. They shall function correctly at continuous ambient temperature between 0℃ to 48℃, relative humidity between 20% to 95% continuous without condensation;
3. They shall be designed to assume protection rating of IP 43;
4. They shall also be suitable for stable operation in the Hong Kong climate especially where high humidity conditions may exist without constant air-conditioning.

FWP10.4.020.A TYPE

1. Detector shall be photoelectric type unless otherwise specified;
2. If ionization type of detector is specified, it shall be of the type responding to both visible and invisible products of combustion and shall be of the radioactive isotope pattern having two ionisation chambers, one for detection and one for reference, connected in electronic circuits. Radiation level from the isotopes shall be within the safety limit specified by EURATOM i.e. less than 0.1 mr/h at a distance of 100 mm. The combined radiation activity of each smoke detector shall not exceed 555 kBq for commercial / industrial buildings and 370 kBq for residential buildings;
3. If multi-sensor type detector is specified, the installation shall comply with the criteria specified in relevant FSD Circular Letters;
4. Multi-sensor detector shall comprise a combination of heat sensor, optical / ionisation smoke sensor, flame sensor, carbon monoxide sensor, ultraviolet / infrared sensors, and / or other sensors as recommended by the manufacturer to suit a particular fire risk and growth of fire. Multi-sensors detector shall comprise at least one photoelectric smoke sensor and one heat sensor. The heat sensor shall be combined fixed temperature and rate-of-temperature-rise type. Multi-sensors detector shall conform to the appropriate standards for smoke detectors such as BS EN 54-7: 2001 or equivalent and shall be listed by Product Certification Bodies in accordance with FSD Circular Letter or approved by FSD. The Contractor shall submit technical details and certificate to the CM for approval. Only multi-sensor type detector suitable for the required application, environmental condition, fire growth characteristic, fire risk and hazard shall be selected and used.

FWP10.4.030.9 CONSTRUCTION

1. Detectors shall be housed in a corrosion-proof plug-in unit designed to be mounted pendant, surface or semi-recessed;
2. Removal of the unit from its base shall cause a fault alarm signal to be given;
3. Built-in wind-shields shall be provided to ensure that air currents of up to 10 m/s do not affect the proper operation of the detectors;
4. Each unit shall be fitted with an alarm condition indicator lamp and shall also have an auxiliary facility for connecting an extended alarm indicator lamp;
5. A built-in wire mesh shall be incorporated to prevent entry of insects into the interior.

FWP10.4.040.9 ELECTRONIC CIRCUITRY

1. For ionization type detector, the electronic circuitry may be of cold-cathode tube type, operating at low voltage d.c., or of solid-state type, operating at extra low voltage d.c.;
2. The quiescent current consumption of the unit shall be minimal and shall not exceed 100 microampere;
3. The printed circuit boards shall be varnished and protected against moisture and dust;
4. The internal electronic circuitry shall be of highest possible reliability and protected against voltage spikes and surges;
5. The detector shall be capable of operating satisfactorily under minimum variation of ±25% in supply voltage;
6. The circuitry shall also be protected against electromagnetic interference.

FWP10.4.050.9 ELECTRICAL CONTINUITY

The detector base shall be sealed with a plate during the installation period. This plate shall facilitate electrical continuity through the base such that the circuits can be tested or maintained.

FWP10.4.060.A INSTALLATION

1. Use of smoke detector in area vulnerable to false fire alarm shall be avoided where the FSD Requirements are complied with;

   Requirements on installation of smoke detectors shall be similar to requirements on heat detectors stated in FWP10.3.030.

2. Where detectors are mounted at levels above 4 m they shall be capable of being removed and re-fixed from below by means of a special extended arm tool.

FWP10.4.070.9 REVERSIBLE RESPONSE TIME DELAY

Where signal integration feature is specified as to avoid the unwanted alarms caused by transient interferences, the smoke detector shall be characterised by a reversible response time delay from 15 to 30 seconds depending on the concentration of smoke continuously present before an alarm is initiated. Upon clearance of the transient interference within the time delay, the smoke detector shall resume its quiescent state without any alarm initiation.

FWP10.4.080.9 RADIATION LEVEL

For ionization type detector, the Sub-contractor shall submit the total American 241 radiation level to Hong Kong Radiation Board for approval on behalf of the Employer where necessary before practical completion of the works. The Sub-contractor shall also make all necessary arrangements, if required by the Hong Kong Radiation Board, for inspection of the installation by the authorized representatives of the Board.

FWP10.4.090.9 PROBE UNITS

Probe units for air duct insertion mounting shall be of robust corrosion-proof construction and capable of accurately sampling the air flowing in the duct over a wide range of velocities. Insertion of the probe shall cause negligible air flow head loss. Probe units shall be suitable for use with smoke detectors as specified above and shall be installed in the centre of a straight section of ducting that has a length at least 6 times its width.

FWP10.4.100.A CERTIFICATION

1. Copies of type test / approval certificates from product certification bodies recognized by FSD shall be produced to prove that the smoke detector complies with BS EN 54-7 or other standards acceptable to FSD;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the smoke detector delivered to the Site or installed.

FWP10.5 CONTROL AND INDICATING EQUIPMENT (CONTROL PANELS)

FWP10.5.010.A DESCRIPTION

1. Control and indicating equipment (control panels) including main fire alarm control panels, sub-panels and repeater panels of conventional electronic type or addressable type for sprinkler system, automatic fire detection system, and manual fire alarm points and signals shall comply with BS EN 54-2 or other standards acceptable to FSD. It shall be of robust construction in non-corrodible materials, with hinged front door having cylinder-type lock and keys;
2. Where installed on external wall or place accessible to public, the control and indicating equipment shall be enclosed by a stainless steel box with glazed lockable door to restrict access to the control switches but allowing a full view of the visual indications;
3. The Sub-contractor shall submit the layout, design and construction of all the fire alarm control panels, sub-panels and repeater panels for the CM's approval.

FWP10.5.020.9 OPERATION

The equipment panel shall be equipped to suit the fire alarm system of which it forms a part and shall be compatible with all other system devices and components. Fire alarm signals may originate from manual fire alarm call points, heat detectors, smoke detectors, flow switches, pressure switches, FM200 extinguishing system alarm contacts, sprinkler system alarm contacts etc. as applicable. The connection of these devices in "zones" (alarm circuits) shall be as scheduled in FWP2 or on the Drawings.

FWP10.5.030.A EQUIPMENT

The control and indicating equipment and the alarm circuits are DC operated with battery backup, should generally include the following basic equipment:

1. "Supply On" visual indicator;
2. "System On" visual indicator;
3. "System Isolated" visual indicator with buzzer;
4. "Fire" alarm visual indicator for each zone, red;
5. Alarm re-set button for each zone;
6. Alarm silencing switch, with local and remote warning buzzers and visual indicating lights;
7. Relays, terminal strips, wiring, labels, etc. for the proper operation of the whole system including detectors and alarm bells, etc.;
8. Auxiliary relay or additional relay contacts for automatic starting of fire booster pump etc. as detailed in FWP2;
9. Test facilities for each alarm zone;
10. Isolating switch for each alarm zone with light indication;
11. Indicator light and warning buzzer showing whether auto-starting of generator (where provided) disabled or not, emergency stop buttons for FS/SP pumps pressed, water tanks empty etc. as shown on the Drawings;

12. Key switch, indicator light and warning buzzer for testing of direct line connection (where provided) to a Fire Services Communication Centre;
13. A minimum of 10% spare zones shall be allowed for conventional fire alarm control panel, sub-panel or repeater panel to cater for future expansion and modification.

FWP10.5.040.A ALARM OPERATION

Upon operation of one or more triggering devices, the fire alarm control panel shall give a fire alarm by:

1. All internal alarm sounders in or near the indicating equipment;
2. All external visual and audible alarm sounders of respective alarm zone;
3. A visible indication for each zone in which a trigger device operates;
4. A signal transmitted to a Fire Services Communication Centre, where a direct line connection is provided.

FWP10.5.050.A FAULT INDICATION

1. Automatic fire detection systems, and manual fire alarm systems where so indicated in FWP2, shall be arranged for continuous monitoring of all alarm circuits, including the wiring and the alarm signalling devices connected thereto;
2. The fire alarm control panel in this case shall be provided with suitable fault warning signals including an amber fault indicator for each alarm zone (alarm circuit) and a warning buzzer for sprinkler and automatic fire detection system;
3. Faults to be detected shall include open-circuits, short-circuits, and removal of signalling devices for sprinkler and automatic fire detection system;
4. Battery-operated systems shall be provided with a battery supply indicator mounted upon the indicating equipment.

FWP10.5.060.A INDICATOR LAMPS

1. Indicator lamps shall be of LED types and of voltage rating 20% higher than the applied voltage, and shall wherever possible be of extra low voltage type;
2. Where A.C. mains operation is required, indicator lamps shall be operated at extra low voltage via a step-down transformer and be suitably rated for long life and reliability;
3. Zone fire alarm visual indicators in conventional type panel shall be of twin LEDs.

FWP10.5.070.9 RELAYS

Relays shall be of "potted" type, or similarly protected against dust, and shall have solenoids with varnish-impregnated or plastic encapsulated windings.

FWP10.5.080.9 CONTACTS

Contacts shall be of silver and adequately rated. Additional contacts shall be provided as required for the operation of auxiliary controls.

FWP10.5.090.A POWER SUPPLIES

1. Power supplies to the fire alarm control panel, sub-panel and repeater panel shall comply with BS EN 54-4 or other standards acceptable to FSD and incorporate safety isolating transformers conforming to BS EN 61558 or other standards acceptable to FSD;

2. The control equipment shall incorporate battery charger set with appropriate voltage regulators suitable for the rating of the interconnected trigger devices and the equipment shall incorporate overload cut-out or limiting devices to protect the external circuit against excess current;

3. Protection against earth leakage currents shall be provided in accordance with the Electrical CoP, latest Edition, if the equipment contains apparatus or conductors operating at a voltage exceeding extra low voltage.

FWP10.5.100.A CERTIFICATION

1. Copies of type test / approval certificates from product certification bodies recognized by FSD shall be produced to prove that the control panel complies with BS EN 54-2 or other standards acceptable to FSD;

2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the fire alarm control panels delivered to the Site or installed.

FWP10.6 BATTERIES AND CHARGERS

FWP10.6.010.9 PERFORMANCE

1. The capacity of the battery and charger unit shall be as stated in FWP2 and the type shall be acceptable to FSD;
2. Unless otherwise specified, the battery and charger units shall be capable of maintaining the system in normal operation for a period at least 24 hours longer than the maximum period for which the premises are likely to remain unattended without recharging and thereafter shall remain capable of operating in the maximum "alarm" condition for at least 30 minutes;
3. If the system is connected by an alternative standby supply such as an automatically started emergency generator approved by FSD, the capacity of the battery and charger unit may be reduced to that capable of maintaining the system in normal operation for 6 hours and thereafter capable of operating in the maximum "alarm" condition for at least 30 minutes;
4. The Contractor shall submit calculation to demonstrate that the capacity of the battery and charger unit is able to cope with the power demand of the whole system.

FWP10.6.020.A BATTERY TYPE

1. The batteries shall be either one of the following types:
   a. Nickel-cadmium accumulator and ultra-low maintenance type requiring no water replenishment throughout the normal service life of the battery. The battery shall be of the highest quality materials complying with IEC 60623 and IEC 62259;
   b. Valve regulated sealed lead acid batteries complying with BSEN60896-21 & -22 and maintenance free.
2. The batteries shall have a minimum design life of 10 years rated at 20℃ and shall be of a type having a life of at least four years under the conditions of use likely to be experienced in the fire detection and fire alarm system;
3. The Sub-contractor shall provide copies of type test certificates from accredited laboratories to prove the batteries are in compliance with the specification requirements;
4. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the battery and charger delivered to the Site or installed;
5. Labels shall be fitted to all batteries indicating their date of installation. The labels shall be sited so that they can be read without disturbing the batteries.

FWP10.6.030.9 BATTERY VOLTAGE

Where applicable the alarm system battery shall be of sufficient voltage to operate the remote indicator unit at the Fire Services Communications Centre via the alarm transmitter unit and the Telephone Company lines. If necessary a separate battery complete with separate charger, not exceeding 50V, shall be provided for this purpose.

FWP10.6.040.A BATTERY CHARGERS

1. Battery chargers shall be of the automatic trickle charge type, suitable for a single phase 220V, 50 Hz A.C. supply with facility for manually-operated boost charge, capable of re-charging the battery from fully discharged to fully charged condition in not more than twenty four (24) hours. Battery overcurrent protection shall be provided to safeguard the battery against short-circuit. Instruments shall include voltmeter for output voltage and ammeter for output current. Auxiliaries shall include fuses, buzzer alarm and mute button, lamp test button, LED indicators for mains and charger supply healthy, battery fault, battery low-volt, and charger fault;
2. The charger unit shall consist of a rectifier with the AC mains input supplied via an isolation transformer and the ripples of its DC output smoothed out by a DC filter for the connected load under normal operation or after the battery having discharged in AC mains failure;
3. Battery chargers shall be compatible with the types of batteries used;
4. Battery chargers shall be capable of detecting AC mains supply failure and its own DC output failure for actuating changeover to battery supply when either one of the failure signals is detected;
5. Charging characteristics are within the battery manufacturer's specification for the range of battery temperatures reached with the ambient temperature (i.e. outside the standby power source enclosure from -5℃ to + 40℃);
6. Except for currents associated with battery monitoring, the battery shall not discharge through the charger when the charging voltage is below the battery voltage;
7. Power supply equipment is capable of recognizing and signalling the fault after loss of the battery charger, within 30 minutes of the occurrence, except when the charger is switched off or limited or interrupted when the power supply equipment is delivering a current greater than the rated maximum output voltage.

FWP10.6.050.9 FAULT WARNING

1. Battery chargers shall give visible and audible fault warnings when any AC mains supply failure, DC output failure, battery fault, battery low-volt, and charger fault is detected;
2. The output of the rectifier shall be sufficient for the system to give fault warnings upon failure of the battery.

FWP10.6.060.9 BATTERY / CHARGER MOUNTING

1. The battery and charger shall each be housed in a well ventilated cabinet made of galvanised sheet steel of at least 1.2 mm thick, complete with two layers of stoved enamel or one layer of stoved epoxy powder paint. Detail of the battery charger set shall be submitted for Approval;
2. In all cases, the battery shall be installed in a compartment separate from the charger.

FWP10.7 FIRE ALARM BELLS AND CIRCUITS

FWP10.7.010.9 BELL LOCATION

The fire alarm bells shall be located as shown on the Drawings. Necessary adjustment to the bell locations and quantities to comply with relevant audibility requirements basing on the alarm bell characteristics shall be proposed and submitted by the Sub-contractor to the Contract Manager for Approval prior to installation.

FWP10.7.020.A BELL PERFORMANCE

1. The sound generated by the bell shall be easily distinguishable from other bells;
2. Unless otherwise specified on the Drawings, each alarm bell shall be capable of producing a sound level of at least 90 dB(A) at 3 m from the location of installation;
3. The alarm bells shall produce an alarm sound level complying with FSD's requirement when the doors of the rooms are closed and with all the windows fully opened. For domestic buildings, the alarm sound level shall not be less than 60dB(A) and not less than 5dB(A) above any background noise likely to persist for a period longer than 30s when the building is in use, whichever is the greater, measured at 3 m from inside of the main entrance door. For non-domestic buildings, the alarm sound level shall not be less than 65 dB(A), and not less than 5dB(A) above any background noise likely to persist for a period longer than 30s, whichever is the greater except in areas not required by the FSD, measured at 3 m from inside of the main entrance door;
4. The contractor shall carry out measurement on Site to verify compliance with alarm sound level as specified above. Should the results do not meet the requirements, the Contractor shall submit alternative proposal to the CM for acceptance and issuance of Site Instruction.

FWP10.7.030.9 BELL CONSTRUCTION

1. Under-dome type iron clad bells, suitable for operation at 24 V DC system as stated on the Drawings and in FWP2 shall be used;
2. Alarm bells shall be of minimum 150 mm diameter gong;
3. Bells shall be of weatherproof construction if susceptible to weather conditions;
4. The bells shall have a suitable conduit entry.

FWP10.7.040.9 BELL FINISH

Bell domes shall be finished in signal red.

FWP10.7.050.9 BELL CIRCUITS

Bell circuits shall be separately fused at the control equipment.

FWP10.7.060.A ALARM TRANSMITTERS

1. The alarm transmitter, where called for in FWP2 shall be of polarity reversal type compatible with the Remote Indicator Unit at FSD Fire Control;
2. All costs of the direct telephone line connection including application, processing connection, installation charged by services provider and rental and maintenance charges within the Maintenance Period for the direct telephone line and for the remote indicating unit, shall be borne by the Sub-contractor.

FWP10.7.070.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the fire alarm bells delivered to the site or installed.

FWP10.8 AUXILIARY SYSTEMS

FWP10.8.010.9 SYSTEM CONTROL

Control for the operation of auxiliary systems, including fire booster pumps, fire damper release mechanisms, door release mechanisms, smoke extraction fans, fireman's lift, etc., where called for in FWP2, shall comply with the general requirements of this Specification and the Sub-contractor shall carry out all associated electrical control wiring and connections unless otherwise indicated.

FWP10.8.020.A AUXILIARY BATTERY

Where battery operation of auxiliary control systems is required, a separate battery and charger for these systems shall be provided and suitably labelled for identification. The main fire alarm system battery shall not be connected directly to any auxiliary circuits other than those essential to the detection and alarm system.

FWP10.9 VISUAL FIRE ALARM

FWP10.9.010.A SYSTEM

The visual alarm signal shall be in the form of a red flashing light and be located at prominent locations such that its effect can be seen from everywhere in the building when the fire alarm is activated. The visual fire alarm system shall conform to NFPA 72 or BS 5839- 1 and acceptable to FSD. Sample of the flashing red light shall be submitted for Approval.

FWP10.9.020.9 LABEL

Each red flashing light of the visual fire alarm system shall be provided with indication showing "FIRE ALARM 火警". The height of the English letters and Chinese characters shall not be less than 10 mm and 15 mm respectively, or the size of the characters is acceptable to FSD.

FWP10.9.030.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the visual fire alarm delivered to the site or installed.

FWP10.10 AUDIO/VISUAL ADVISORY SYSTEM

FWP10.10.010.9 GENERAL

1. The Sub-contractor shall design, supply and install the audio / visual advisory (AVA) system and the selection of proper, correct and compatible equipment and components to achieve the performance specified. Detailed design layouts and full technical information and calculations for the system shall be submitted for Approval;
2. AVA system shall comprise AVA system control panel, complete audio advisory system, audio advisory system power supply module, flashing exit sign boxes inside AVA system protected areas, flashing directional sign boxes, photo-luminous directional signs, batteries and chargers, cables and other items of equipment required for the complete and workable system;
3. All equipment and components offered shall be proven products with good quality to facilitate the safe evacuation of occupants in the premises during a fire condition. They shall be suitable for continuous operation at ambient temperature between 0℃ and 40℃ and relative humidity up to 99% saturation;
4. Labels shall be provided to all indicators, buttons, switches, internal wiring terminals and all other components to facilitate operation and proper maintenance. Descriptions shall be in both English and Chinese where applicable;
5. Servicing facilities and replacement spare parts shall be available locally for future maintenance of the system;
6. The Sub-contractor shall coordinate with other concerned parties for the selection of mixer preamplifiers, power amplifiers and loudspeakers if the loudspeakers are required to be connected to the public address system(s) provided by others. In such circumstance, the arrangement of speaker zones shall also fulfil the requirements of the public address system(s);
7. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the AVA system control and components, flashing exit sign boxes, flashing directional sign boxes and low level directional signs delivered to the site or installed.

FWP10.10.020.9 AUDIO ADVISORY SYSTEM

1. The audio advisory system shall be designed and installed in accordance with the FSD CoP and Circular Letters;
2. The audio advisory system shall comprise mixer preamplifiers, power amplifiers, input selection panel, monitor panel, volume control panel, line fault monitoring units, desktop microphone, loudspeakers, automatic audio input changeover unit (where loudspeakers are also required to be connected to a public address system), etc. and all necessary components;
3. Audio advisory system of digitized system architecture with integrated digital products fulfilling all necessary functions of the system can also be submitted for Approval. The Sub-contractor shall provide proper user interface to mimic the functions of AVA system control panel, mixer preamplifier, power amplifiers, input selection panel, monitor panel, volume control panel, line fault monitoring unit and automatic audio input changeover unit, etc.. Any equipment necessary for establishing the user interface, such as a central operator terminal and display monitor, shall be provided by the Sub-contractor;

4. The audio advisory system shall be designed to ensure matching of amplifier rating and connected equipment load. The variation in available power shall not exceed 3dB between the outlet nearest to the amplifier and any other outlet in the system. Suitable repeaters and signal conditioners shall be installed as necessary to maintain the sound power level. A load variation of 50% shall not affect the quality of sound or cause the output voltage at any outlet to vary by more than 6dB;
5. The arrangement of loudspeakers shall refer to the relevant clauses in BS5839-8;
6. Broadcasts shall be at least 10dB above background noise levels to optimize audibility and intelligibility. The design background noise levels shall refer to a recognized international standard such as BS5839-8 and take into account the conditions of the localities concerned;
7. The loudspeakers shall be so positioned as not to cause adverse interference with each other.

FWP10.10.030.A AVA SYSTEM CONTROL PANEL

1. The AVA system control panel shall comprise all necessary components including power supply module, desktop microphone with manual override switch, attention drawing signal (chime sound) module, voice message module, timers, relays and terminals where appropriate;
2. The AVA system control panel shall:
    a. be capable of receiving the fire alarm signal from fire alarm control panel, and also transmit the AVA system fault signals to fire alarm control panel;
    b. indicate power supply, charger and battery status and report faults such as “System Common Fault”, “Charger Fault” and “Speaker Line Fault”;
    c. be provided with emergency announcement control and “Power ON”, “Fire Signal ON”, “Microphone ON” and “Emergency Message ON” indication;
    d. interface with the fire alarm bells and flashing directional signs and flashing exit signs located at the AVA system protected areas / zones;
    e. be provided with a microphone input socket for connection to the desktop microphone;
    f. be provided with facilities for controlling the operation sequence of alarm devices / emergency announcement;
    g. be provided with other necessary facilities, indications and controls as required by the FSD.
3. Adequate dry contacts controlled by timers and control relays shall be provided and incorporated in the fire alarm bell circuit so as to alternate the alarm bells operation and emergency announcement as required by the FSD. At least 10% spare dry contacts shall be provided.

FWP10.10.040.9 VOICE MESSAGE MODULE

1. Voice message module with voice recording facilities shall be provided for broadcasting of pre-recorded message. The pre-recorded message shall be stored in non-volatile memory chip(s) controlled by the voice message module.
2. The message storage capacity (recording time) shall be at least two times of the capacity required for the recording and broadcasting of the following message in English, Cantonese and Putonghua:

    “This is a fire alarm message. Please keep clam. Follow the flashing light direction to the nearest exit. Do not use the lift.

這是一個火警警報，請保持冷靜，依照閃燈指示方向，走到最近的出口離開，切勿使用升降機。”

FWP10.10.050.A AVA SYSTEM POWER SUPPLY MODULE

1. AVA system power supply module shall conform to relevant requirements in BS5839-8 and comprise standby supply with rechargeable battery and automatic charger. The standby power shall be capable of maintaining normal operation of the AVA system under no-fire-alarm condition for at least six hours, after which sufficient capacity shall remain to provide an evacuation broadcast in all alarm zones for at least 30 minutes;
2. The batteries for the power supply module shall be rechargeable, maintenance free and with a design life of minimum 10 years rated at 20℃. The batteries shall conform to BS EN 60896-21 & -22 for valve regulated sealed lead-acid type or to IEC60623 and IEC62259 for nickel-cadmium accumulator and ultra-low maintenance type;
3. The batteries shall be properly stored in a battery cabinet made of galvanised sheet steel of at least 1.2 mm thick, complete with two layers of stoved enamel or one layer of stoved epoxy powder paint;
4. Calculation of AVA system loads and battery capacity shall be submitted for Approval.

FWP10.10.060.9 MIXER PREAMPLIFIER

1. The mixer preamplifier shall be fully solid-state in design and provided with the following facilities:
   a. Volume control for adjusting the output level;
   b. Individual volume control for voice message and desktop microphone input;
   c. Bass and treble tone controls;
   d. Output terminals complete with volume control with “OFF” position;
   e. Standard sockets with plugs and lock nuts for each input and output terminal;
   f. Facilities for proper operation of all required auxiliary equipment controls.

FWP10.10.070.9 POWER AMPLIFIER

1. The power amplifier shall be fully solid-state in design and provided with the following facilities:
   a. Volume control for adjusting the output level;
   b. A VU meter or LED / LCD indicators to indicate the output level;
   c. Balanced floating outputs of 70V and 100V for loudspeaker connections;
   d. Standard sockets with plugs and lock nuts for each input and output terminal.
2. The total load connected to each individual power amplifier shall be not more than 80% of its rated power output at the time of completion.

FWP10.10.080.9 INPUT SELECTION PANEL, MONITOR PANEL AND VOLUME CONTROL PANEL

1. Refer to ELE25.3.050, ELE25.3.060 and ELE25.3.070 for requirements of input selection panel, monitor panel and volume control panel respectively;

2. The function of input selection panel can be integrated into the mixer preamplifier subject to Approval;

3. The function of monitor panel and volume control panel can be integrated into the power amplifiers subject to Approval.

FWP10.10.090.9 LINE FAULT MONITORING UNIT

1. The line fault monitoring unit shall check the 'non-break' status of wiring of each speaker zone by automatically generating signals at preset time everyday. Open circuitry in speaker line(s) or accidental speaker removal from the line(s) shall be monitored;

2. The line fault monitoring unit shall provide "fault" and "System ON" indications for each speaker zone on the AVA System Control Panel.

FWP10.10.100.9 AUTOMATIC AUDIO INPUT CHANGE-OVER UNIT

1. When the loudspeakers are required to be connected to the audio advisory system and other public address system(s), an automatic speaker change-over unit shall be provided;

2. The loudspeakers shall be set as default speakers for the public address system(s) under no-fire-alarm condition. When a fire alarm signal is received, the audio lines connection shall be switched automatically to the audio advisory system for broadcasting;

3. The function of line fault monitoring unit as specified in FWP10.10.090 can be incorporated into the automatic audio input change-over unit.

FWP10.10.110.9 LOUDSPEAKERS

1. Refer to ELE25.3.090, ELE25.3.100 and ELE25.3.110 for requirements of ceiling speaker, horn speaker and column speaker respectively. Refer to ELE25.4.020 for mounting requirements of ceiling speakers;

2. The loudspeakers shall be of ceiling-mounted type or wall-mounted type as shown on the Drawings. They shall provide a crisp, clear reproduction of voice and alarm tone signal;

3. The loudspeakers casing shall be constructed of sheet steel or high impact ABS plastic in colour matching with false ceiling or wall finishes. Any loudspeaker mounted at outdoor location shall be of weatherproof construction;

4. Each zone of loudspeakers shall cover not more than one floor.

FWP10.10.120.9 DESKTOP MICROPHONE

1. Desktop microphone shall be single zone type complete with condenser microphone on gooseneck and with a built-in push-to-talk switch;

2. The microphone shall have a minimum cable length of 1m. The cable for microphone shall be terminated with a phone plug;

3. The built-in push-to-talk switch (emergency manual override switch) shall be activated to stop the pre-recorded message and alarm bell operation and allow the operator to give particular emergency announcement through the microphone.

FWP10.10.130.A FLASHING DIRECTIONAL SIGN BOXES AND FLASHING EXIT SIGN BOXES

1. Flashing exit sign boxes inside AVA system protected areas and directional sign boxes shall be installed at high level. The sign box shall be of full box or pendant acrylic panel design and shall be submitted for Approval;
2. The flashing exit sign boxes and flashing directional sign boxes shall:
    a. Be complete with coloured graphic, internally illuminated and conforming to BS5499-10;
    b. Be positioned between 2m and 2.5m above finished floor level measured to the base of the flashing lights and complete with suitable mounting brackets;
    c. Be pressed or rolled from quality steel sheet and complete with durable paint to form a rigid, robust, high quality body. The steel sheet thickness shall not be less than 1mm;
    d. Be of weatherproof construction at outdoor locations;
    e. Be of maintained type and internally illuminated evenly by LED lighting and complete with all necessary control gears and flashing modules for receiving fire alarm signal from fire alarm control panel as necessary.
3. Under no-fire-alarm condition, the flashing exit sign boxes and flashing directional sign boxes shall be illuminated in static mode. Upon receiving fire alarm signal, they shall operate in flashing mode. The flashing action of all exit sign boxes inside AVA system protected areas and directional signs on the same floor shall be synchronized;
4. Each zone of flashing exit sign boxes and directional sign boxes shall cover not more than one floor.

FWP10.10.135.A FLASHING EXIT SIGN AND FLASHING DIRECTIONAL SIGN POWER SUPPLY

1. The flashing exit sign boxes and flashing directional sign boxes shall be powered by 24V DC centralized battery and charger on each floor. The battery and charger cabinet shall be incorporated with flashing module as necessary for receiving fire alarm signal from fire alarm control panel and complete with voltmeter, ammeter, and LED alarm indicators;
2. The batteries shall be rechargeable and maintenance free and with a design life of minimum 10 years rated at 20℃ and comply to BS EN60896-21 & -22 for valve regulated sealed lead-acid type, or to IEC60623 and IEC62259 for nickel-cadmium accumulator and ultra-low maintenance type;
3. The capacity of the batteries shall be capable of maintaining the connected flashing exit sign boxes and directional sign boxes in alarm operation for at least 2 hours. Each centralized battery and charger set shall have at least 20% spare capacity over the connected loads. Calculation of battery and charger capacity shall be submitted for Approval.

FWP10.10.140.A LOW LEVEL DIRECTIONAL SIGNS

1. Low level directional signs shall be of non-radioactive photo-luminous type conforming to BS 5499-4 or other standards acceptable to FSD;
2. Low level directional signs shall be installed with the lower edges not higher than 200mm from the finished floor level of the protected areas to indicate the evacuation routes;
3. Low level directional signs shall be made of plastic material with coloured graphic;

4. Low level directional signs shall be framed with rust-proof metal or a material approved by the CM and fixed on walls, columns or fixtures by gloss stainless steel button screws or otherwise concealed fixing. A sample shall be submitted for Approval prior to installation.

FWP10.10.150.9 AVA SYSTEM CABLES AND WIRING

1. All cables of the AVA system for power supply, signalling and audio transmission shall be fire resisting types acceptable to FSD;
2. Wiring circuits for the flashing exit sign boxes and flashing directional sign boxes and the loudspeakers shall be of ring loop configuration such that any damage to the wiring at a single point shall not affect the proper operation of all flashing exit sign boxes and flashing directional sign boxes and loudspeakers;
3. No cable joint or connector shall be permitted between cable originating and terminating points;
4. Unless otherwise specified, audio cables shall be copper, stranded and sheathed type, and compatible with the types of loudspeakers / power amplifiers connected. Twin cables with low power loss and protected against interference shall be used for the amplifier output circuits to the loudspeakers.

FWP10.10.160.9 EQUIPMENT CABINET

1. Refer to ELE25.3.080 for requirements of equipment cabinet;
2. Equipment cabinet shall be equipped with multiple power socket rack, etc., where appropriate, for power supply to the housed equipment.

FWP10.11 ADDRESSABLE SYSTEM

FWP10.11.010.N PRODUCT REQUIREMENTS

1. The addressable system shall comprise all addressable components including fire alarm control panels, zone indication panels, repeater panels, fire detectors of various types, manual fire alarm call points, interface modules, etc. and other non-addressable components such as flow switches, micro-switches (for subsidiary valves), fire alarm bells, strobes and audible / visual notification appliances, batteries and chargers, and other items of equipment required for the complete and workable system;
2. All system components shall be listed by Product Certification Bodies acceptable to FSD;
3. Only the addressable devices supplied from a manufacturer who can provide / release their programming information, hardware locks and password information to the CM and the management and maintenance staff shall be acceptable; nevertheless, the programming information are limited to those required for routine maintenance, diagnosis and repair work, and for future upgrading and modification works such as relocation, change, deletion, addition, etc.;
4. The Sub-contractor shall ensure the compatibility of any devices / components in the system produced by different manufacturers;
5. The Sub-contractor shall provide adequate training courses to not less than ten persons nominated by the CM to enable them to understand and familiarise with the use, programming and re-programming of the addressable system for routine maintenance, diagnosis, and repair works, and also for future upgrading and modification works such as relocation, change, deletion, addition, etc.

FWP10.11.020.N SYSTEM REQUIREMENTS

1. The addressable fire alarm control panel shall be provided with information for continuous monitoring and control of detector status, and annunciates the need for immediate service from the addressable devices for decision of control actions;
2. Addressable devices shall provide loop monitoring for error such as short circuit, open circuit, detector removed and detector communication failure;
3. The system loop design shall be such that the actuation of any detection device or when there is any fault in the loop shall not cause the loop to be disabled for the alarm and trouble signals to be followed;
4. The Sub-contractor shall supply and install surge arresters for the addressable fire alarm control panels to prevent false fire alarms and malfunctioning of the fire alarm and control system due to power and lightning surge.

FWP10.11.030.N ADDRESSABLE FIRE ALARM CONTROL PANEL

1. In addition to the specification for control and indicating equipment as stated in FWP10.5, the addressable fire alarm control panel shall be of intelligent analogue addressable type with its own microprocessor and memory. The panel shall comply with BS EN 54-2 and the system requirements as stipulated in BS 5839-1. The power supplies to be fire alarm control panel shall be an integral product of the control panel and comply with BS EN 54-4;
2. Battery charging shall be a function of the power supplies. Batteries shall be a type fully compatible with the addressable fire services alarm control panel;

3. The panel shall drive four wire loops of addressable analogue fire sensing, signalling, monitoring and communication devices. The loop shall be self-powered for all sensing, signalling, monitoring and communication functions. Upon a communication failure anywhere on the loop or power failure, a failure alarm shall be reported. Each loop shall have a minimum of 20% spare for intelligent sensors / detectors and 10% spare for addressable modules. Each addressable panel shall have minimum one spare loop and the capability to cater for future expansion and modification by connecting to an addressable sub-panel;
4. The panel shall be able to connect to addressable devices and conventional alarm initiating circuits as shown on the Drawings. Independent modules for alarm zones (e.g. manual fire alarm call point zone, detector zone, sprinkler flow switch zone) and trouble zones (e.g. subsidiary valve shut off) shall be provided on a floor-by-floor or zone-by-zone basis;
5. Location, type, address and condition of each device in the system shall be displayed through a built-in LCD panel automatically in case of alarm or trouble. The display on the LCD panel shall be in a user friendly format. It shall also be time stamped;
6. Devices on loop circuits shall be identified by display of their addresses, locations and types, and by their conditions (Alarm, Pre-alarm, Fault) on the built-in LCD panel. Individual red alarm and common yellow trouble LEDs shall be provided for each initiating and for each indicating zone;
7. Zone indication panel(s) shall be provided in adjacent to the main addressable fire alarm control panel to display all individual zone indication lights with description labels in Chinese and English.

FWP10.11.040.N ADDRESSABLE REPEATER PANEL

1. Addressable repeater panel shall be a zone indication panel for alarm indication and status monitoring supplied and installed at location as shown on the Drawings;
2. Power to the addressable repeater panel can be supplied either from the fire alarm control panel or equipped with its own battery and charger depending on the location of the repeater panel as shown on the Drawings. The capacity and details of power supply shall be submitted for Approval.

FWP10.11.050.N ADDRESS SETTING FOR ADDRESSABLE DEVICES

1. The address setting mechanism for each addressable device / detector shall be approved by the CM;
2. The address of each device shall be easily set and changed. The allowable address shall be adequate to cater for the whole fire alarm system with ample spare capacity for future expansion;
3. For one to one replacement or relocation of any addressable device / detector, no re-programming on the fire alarm control panel shall be required. When any installed devices / detectors need to be replaced, no programming tool including notebook computer or field programmer, etc. shall be required. The system shall be resumed to normal within few minutes after the faulty devices are replaced by the new ones;
4. The Sub-contractor shall supply adequate sets of necessary tools, kits, electronic instruments for initial setting, adjustment and subsequent resetting, retesting and re-commissioning of all addressable devices.

FWP10.11.060.N ADDRESSABLE DEVICES

1. Addressable devices shall provide information for continuous monitoring and control of detector status and annunciate the need for immediate services. The decision on the control actions shall be from the fire alarm control panel and not on individual detector;
2. In addition to the specification for heat and smoke detectors as stated in FWP10.3 and FWP10.4, the addressable detectors shall be of intelligent analogue addressable type and fully compatible with the addressable fire alarm control panel;
3. The addressable detectors shall be provided with the following features as a minimum:
    a. Remote adjustment of detector sensitivity to suit the occupancy and / or the environment of a detector at any time;
    b. Sensor monitoring with automatic compensation of sensor alarm threshold due to aging, humidity and accumulation of dirt and dust with time;
    c. Adjusting time lag from the time of reaching alarm threshold to the time of issuing or communicating a fire alarm;
    d. Different alarm levels are provided such as detection level, maintenance or regular servicing level, fire alarm level, etc. to give an early warning for maintenance to avoid false fire alarm;
    e. Alarm condition simulation for testing purpose;
    f. Loop monitoring for error such as short circuit, open circuit, detector removed and detector communication failure.

FWP10.11.070.N INTERFACE MODULES

1. Monitor Module
    a. Monitor module shall allow the addressable fire alarm control panel to interface with and monitor individual non-addressable monitoring alarms such as a non-addressable manual fire alarm call point, sensors, detectors, water flow switches, sprinkler supervisory devices, etc.;
    b. The monitor module shall provide addressable inputs for all N.O. or N.C. contact for continuous monitoring. In addition to the supervised state of the monitored device, the measurement of the supervision shall be sent to the addressable fire alarm control panel;
    c. The monitor module shall be provided with a supervised initiating circuit. An open-circuit or short-circuit fault shall be indicated at the addressable fire alarm control panel.
2. Control Module
    a. Control module shall supervise and monitor wiring to appliances of small connected load like fire alarm bells, flashing light units, indicator units, and interface relays;
    b. Upon command from the addressable fire alarm control panel, the control module shall disconnect the supervision and connect the external power supply to the device and a signal shall then be sent to the panel to indicate that the command was executed;
    c. The connected alarm load shall be closely monitored for any open and short circuit conditions at the control module. The output circuit connected to the loading shall be short circuit protected.

FWP10.11.080.N FAULT ISOLATOR

1. Fault isolator shall detect and isolate a short-circuited segment of a fault-tolerant loop whilst allowing the rest of the addressing circuit to function normally;
2. Fault isolator shall be provided for addressable device including detectors, manual fire alarm call points, monitor modules and control modules in accordance with relevant FSD Circular Letters to limit the number of devices lost in the event of a short circuit.

FWP11.1 GENERAL INSTALLATION

FWP11.1.010.9 SPECIFICATION

1. The electrical equipment, installation materials, cables, wiring, and installation practice, shall comply with the Drawings and Specification;
2. For fire services installations, the use of fire resistant cables shall be in accordance with Fire Services CoP unless otherwise specified.

FWP11.1.020.9 ELECTRICITY SUPPLY

Unless otherwise specified, the complete electrical installation shall be suitable for operation under the supply system with nominal frequency of 50 Hz and nominal voltage of 380 V, 3 phase and 220 V, single phase within the variation limits as declared by the local Supply Companies.

FWP11.1.030.9 SERVICE CONDITIONS

The complete electrical installation shall be suitable for use under Hong Kong climatic condition with relative humidity and ambient temperature as shown below:

1. Relative Humidity: up to 0.99 saturation;
2. Ambient temperature: peak from minus 5℃ to plus 40℃ for 4 hours continuously with an average from 0℃ to plus 35℃ over a 24 hour period.

FWP11.1.040.9 WIRING SYSTEMS

1. All wirings in water pump rooms shall be in surface conduit/trunking system or by armoured cables as detailed in this Specification or as shown on the Drawings;
2. Wiring and cabling systems in other areas shall be of the type or types detailed elsewhere in this Specification and as shown on the Drawings;
3. Unless Approved for the purpose, cables and wires shall not be located in damp, wet and excessively hot locations, or exposed to gases, fumes, vapours, liquids and other agents having a detrimental effect on the conductors.

FWP11.1.050.9 CONDUCTOR SIZES

1. Conductor sizes for alarm circuit wiring to automatic detectors shall be in accordance with AFA Rules and may be smaller than the minimum called for in the Specification provided that satisfactory operation of the system is achieved and that the wiring is capable of being installed, and subsequently maintained, easily and without damage as well as approved by the Contract Manager. The installed conductor size shall also be in accordance with the recommendations of the panel and detector manufacturer;
2. Conductor sizes for other applications shall strictly comply with the Drawings and Specification.

FWP11.1.060.9 CONDUIT SYSTEMS

1. Conduits shall be of steel or PVC as specified in the Specification or Drawings;
2. Conduits shall be completely separated from those for all other services. Separate channels shall be used for any wiring using duct systems;

3. Conduits shall be routed and installed in such a way as to give maximum protection against mechanical damage. Where it is unavoidable to run conduits across other services conduits, water pipes, air conditioning ducts, etc., they shall be installed first and fixed closest to the structure;

4. Conduit routes shall avoid areas of high risk such as lift wells, open staircases and unenclosed vertical shafts;

5. Galvanized iron draw-wires of adequate size shall be provided in all empty conduits.

FWP11.1.070.9 MICC CABLES

1. MICC cables shall not be used on circuits involving the switching of inductive or capacitative loads where there is a possibility of insulation damage due to high voltage surges;

2. Where bare MICC cables are run on galvanized steel cable trays, and in other situations where contact between dissimilar metals may lead to electrolytic corrosion, electrical contact shall be prevented by using plastic-coated fixing saddles supplemented by properly fixed plastic spacers, or by other Approved means.

FWP11.1.080.9 EXPOSED PLASTICS

The use of wiring, cables or installed materials having plastic sheathing or finish or constructed predominantly of plastic, and not enclosed in metal, shall be avoided wherever possible. Plastic cable trunking, etc. will not be acceptable. MICC cables shall be of non-PVC-sheathed type.

FWP11.1.100.9 IDENTIFICATION OF CONDUCTORS, CABLES AND CABLE DUCTS

1. Identification of conductors and cables on L.V. and M.V. power circuits shall be in accordance with the Electrical CoP, except that ELV alarm circuit wiring shall be identified by the basic colour in red. If other colours are to be used, they shall be submitted for Approval. Colour tracers may be used, in addition, to distinguish cables one from another;

2. All surface conduits, cable ducts and cable trays, armoured cables, MICC cables etc., forming part of the Fire Service Installation provide by the Contractor, shall be colour coded in red in such a way as to permit ready identification. Banding by means of paint will be acceptable where this can be carried out permanently and effectively. Durable high quality red plastic self-adhesive tape may be used for armoured and MICC cables, applied at intervals not exceeding 3 m;

3. Suitable identification plates shall be provided on all electrical equipment giving voltage, current, wattage or other ratings and manufacturer's name, trademarks or other descriptive markings by which the organisation responsible for the product may be identified;

4. Each disconnecting means required for all electrical equipment and each electrical source of supply shall be legibly marked to indicate its purpose unless located and arranged such that the purpose is clearly self evident;

5. All markings and identifications shall be of sufficient durability to withstand the environmental effects.

FWP11.1.110.9 CABLES CONNECTED TO OR IN CONTACT WITH BARE CONDUCTORS OR BUSBARS

Cables connected to or in contact with bare conductors or busbars shall be in accordance with ELE8.2.060 of HKHA Electrical Installation Specification.

FWP11.1.120.9 EARTHING AND BONDING PROVISION

The Sub-contractor shall provide all necessary earthing, equipotential and supplementary bonding in accordance with the Electrical CoP. The Sub-contractor shall provide 25 mm^2 PVC insulated copper bonding conductors from the termination gland at the main incoming fuse combination unit to the pump discharge pipes which shall be bonded by Approved clamps.

FWP11.1.130.9 POWER FACTOR AND TOTAL HARMONIC DISTORTION

1. For circuit with circuit protective device rating at or above 400A, single or three phase, the Sub-contractor shall be responsible for providing equipment as necessary to any pump control cubicle or motor for fresh and flush water pump installation, with or without variable speed drives, to improve the power factor to a minimum of 0.85 and restrict the total harmonic distortion of current to the value in accordance with the BEC;
2. Capacitor bank shall comply with IEC 60831-1 and IEC 60831-2 and shall be housed in a separate metal enclosure. Harmonic filter shall conform to IEC 61000-4-2, IEC 61000-4-3, IEC 61000-4-4 and IEC 61000-4-5 or other similar recognised international standards.

FWP11.2 MOTORS FOR PUMP DRIVES

FWP11.2.010.B CONSTRUCTION

1. All electric motors shall be of squirrel-cage induction type and comply with BS EN 60034-1 or IEC 60034-1;
2. The stator windings shall be copper wire with Class F insulation to BS EN 60085 or IEC 60085 terminated in stud terminals;
3. The motors shall be totally-enclosed fan-cooled to BS EN 60034-6 or IEC 60034-6 IC411 and ingress protection to BS EN 60034-5 or IEC 60034-5 IP55 or better with cast iron frame, metal or polypropylene fan cover and metal terminal box. For motors of 15kW or less, aluminium alloy frame will also be acceptable;
4. Unless otherwise specified, the motors shall be foot-mounted to BS EN IEC 60034-7 or IEC 60034-7;
5. For fresh water and flush water supply systems only, the motors for pump drives shall be of minimum Class IE3 to BS EN 60034-30-1 or IEC 60034-30-1 fulfilling the requirements stipulated in the BEC.

FWP11.2.020.9 RATING

The motors driving the fire services pumps including sprinkler and street fire hydrant pumps shall be rated to give 20% more power in addition to the hydraulic power required for the rated flow of the system while other pump motors shall be 15% more unless otherwise specified.

FWP11.2.030.9 METHOD OF STARTING

The method of motor starting shall be selected according to the characteristics of the pump and shall comply with the Electricity Supply Co's limitations on starting current. Unless otherwise indicated, the type of starter shall be as follows:

1. Up to 7.5 kW - Direct-on-line;
2. 11 kW to 55 kW - Star-delta;
3. Over 55 kW - Soft starter, for fresh/flush water pump motors and other pump motors; auto-transformer, for fire services water pump motors.

FWP11.2.040.A NOISE LEVELS

1. The mean sound pressure level at free field conditions over a reflecting plane at one metre from the surface of every single machine due to transmission through air for fresh, booster fresh and flush water installation shall not exceed 70 dB(A) for motors of 75 kW or below;
2. The method of measurement of noise and vibration level generated by the motors shall comply with BS EN 60034-9 or IEC 60034-9 and BS EN IEC 60034-14 or IEC 60034-14 respectively;
3. Manufacturers' type-test certificates and reports to verify the noise levels of motors shall be produced upon request by the CM.

FWP11.2.050.9 WARNING NOTICE

Motors under automatic control shall be provided with a prominent red notice on white ground, of durable material, with a size of not less than 300 x 300 mm inscribed in English and Chinese characters as follows:

DANGER 危險

THIS MOTOR IS AUTOMATICALLY CONTROLLED AND MAY START WITHOUT WARNING - ISOLATE BEFORE INSPECTION

此機乃自動操作 - 維修前請先關掣

Lettering shall be at least 25 mm high. The notice shall be displayed adjacent to each pumpset or each pair of pumpsets.

FWP11.2.060.9 EFFICIENCY

The nominal full-load motor efficiency, tested to BS EN 60034-2-1 or IEC 60034-2-1, shall be no less than those as shown in Minimum Nominal Full-Load Motor Efficiency for Single-Speed Three-phase Totally Enclosed Motor of the BEC.

FWP11.2.070.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence as PRE.BS1.205 to verify the place of manufacture and authenticity of the motors for fire services pump drives delivered to the site or installed.

FWP11.3 MOTOR STARTERS

FWP11.3.010.A DIRECT-ON-LINE, STAR-DELTA AND AUTO-TRANSFORMER STARTERS

1. Type:
    a. Unless otherwise indicated, each motor provided with an independent motor starter shall comply with BS EN IEC 60947-4-1or IEC 60947-4-1;
    b. The coordination requirement shall be type "2";
    c. The short circuit protective device shall be in accordance with the recommendation made by the motor starter manufacturer in order to achieve the specified type of coordination.
2. Contactors:
    a. The contactors in the motor starter circuit shall comply with BS EN IEC 60947-4-1 or IEC 60947-4-1 suitable for a rated operational current at a utilisation category AC-3 of not less than the full load line current of the motor, capable of carrying out an intermittent duty of class 120;
    b. The rating of contactors for the star and delta circuit connections shall be selected in accordance with the contactor / starter manufacturer's recommendation;
    c. The star and delta contactors shall be electrically interlocked so that it is impossible for both contactors to close or be closed at the same time;
    d. The mechanical endurance of the contactors shall not be less than 1 million no-load operating cycles;
    e. The timers for star-delta and auto-transformer starters shall be adjusted for a maximum of 10 seconds with clear calibration;
    f. For auto-transformer starter, it shall comply with BS EN 60076 or IEC 60076 with class E insulation and shall be rated for a duty not less than 15 starts per hour.
3. Thermal overload relay:
    a. A thermal overload relay complying with BS EN IEC 60947-4-1or IEC 60947-4-1 shall be provided in each motor starter;
    b. The thermal overload relay shall have thermal elements for all three phases, trip contacts, adjustable trip current setting and manual reset push. It shall also provide protection against phase failure;
    c. The inverse time operating characteristics of the relay shall be submitted for Approval.
4. Certification and Evidence of Country / Place of Manufacture and Authenticity
    a. The Sub-contractor shall provide copies of type test certificates from accredited laboratories in prove the motor starters are in compliance with the specification requirements;
    b. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the motors starters for fire services pumps delivered to the Site or installed.

FWP11.3.020.A SOFT STARTER

1. The soft starter shall employ microprocessor-controlled power electronics to regulate the starting torque of a motor in order to minimize mechanical shock during starting and stopping;
2. The soft starter shall conform to BS EN 60947-4-2 or IEC 60947-4-2 and utilization category of the soft starter shall be AC-53a or AC-53b. When utilization category AC-53b is adopted for the soft starter as stipulated in BS EN 60947-4-2 or IEC 60947-4-2, a bypass contactor shall be provided in the starter circuit to take up the motor load during the steady state operation of the motor. The transfer of the load from the soft starter to the bypass contactor and vice versa shall be automatically initiated;
3. The soft starter shall be type-tested to of BS EN 60947-4-2 or IEC 60947-4-2. Manufacturer's type test certificate shall be submitted for Approval;
4. The soft starter shall conform to IEC 61000-4-2, IEC 61000-4-3, IEC 61000-4-4 and IEC 61000-4-5, or other similar recognised international standards for electromagnetic compatibility requirements;
5. The duty of the soft starter shall be compatible with the power requirements of the electric motor concerned;
6. The soft starter's control circuit shall be completely independent of the power supply circuit for the motor and the same control module shall be used for all power ratings;
7. The soft starter shall be installed in the concerned motor control panel and protected by fast acting semi-conductor fuses against short circuit faults. The semi-conductor fuses shall conform to BS EN 60269-1 or IEC 60269-1 and BS EN 60269-4 or IEC 60269-4;
8. The pre-set starting current of the soft starter shall be compatible with the starting torque-speed characteristics of the concerned motor and loading;
9. A built-in LCD / LED display shall be provided for the soft starter to assist in setting-up and trouble-shooting. At least the following monitoring functions shall be indicated through the LCD / LED display:
    a. Fault conditions;
    b. Motor current;
    c. Starter operation status.
10. All adjustable parameters shall be set by a keypad on the control module. The keypad shall be accessible without the need to open the cover of the motor control panel;
11. Modes of operation:
    a. The soft starter shall be provided with the following modes of operation and the transition shall be smooth with minimum current inrush and torque surges. Operation shall be as stipulated below:
        i. Soft start:

            The soft starter shall provide an acceleration ramp such that motor shall accelerate linearly with closed loop control during starting. The acceleration ramp time shall be adjustable up to 30 seconds;

        ii. Current limitation:

It shall be provided with current limiting capability on the starting current of the motor. The maximum starting current limit of the motor shall be adjustable up to 5 times rated current;

iii. Soft stop:

A deceleration ramp shall be applied to the motor such that free-wheeling is prevented for a smooth deceleration with closed loop control during motor stopping. The deceleration ramp time shall be adjustable up to 60 seconds.

b. The soft starter shall be rated for a duty not less than 15 starts and 15 stops per hour.

12. Protection:

a. The following protective devices shall be provided for the soft starter:

i. Motor overload even in a bypass configuration (adaptive to the motor thermal characteristics);

ii. Phase unbalance / loss;

iii. Phase reversal;

iv. Underload.

b. All protective features shall be active even when the motor load is transferred to the bypass contactor;

c. The soft starter shall perform self-diagnosis for internal faults during operation.

13. Certification and Evidence of Country / Place of Manufacture and Authenticity:

a. The Sub-contractor shall provide copies of type test / certificates from accredited laboratories to prove the soft starter is in compliance with the specification requirements;

b. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the soft starters for fire services pumps delivered to the Site or installed.

FWP11.3.030.A VARIABLE SPEED DRIVE UNIT FOR BOOSTER PUMP SYSTEM

1. Variable speed drive (VSD) unit for booster pump system shall act as both motor starter and multi-pump sequence controller and be a complete product comprising:

a. A variable frequency drive with static frequency inverter which generates a sinus evaluated pulse with stable modulated output voltage for varying pump motor speed;

b. A multi-pump control microprocessor which provides functions including setting of constant water output pressure, control of motor speed, automatic changeover of pumps, selection of various pump operation modes, protection against various faults, and storage of fault event records.

2. Product requirements:

a. The VSD unit shall perform automatic multi-pump functions and comply with booster pump system operating and installation requirements as described in FWP2.2.2.020;

b. The VSD unit shall comply with the general EMC (electromagnetic compatibility) regulations to BS EN IEC 61800-3 or similar recognised international standards;

c. The VSD unit shall incorporate with appropriate measure(s) to avoid undesirable high frequency noise generated from the driving motor and / or the VSD unit and to prevent interference with other electronic devices;

d. The VSD unit shall contain buttons for switching on / off and allow manual operating mode for individual pump;

e. The VSD unit shall contain buttons to input settings with password protection and LCD panel to display pump control parameters as follows:

i. Discharge pressure value setting;

ii. Operating frequency setting;

iii. Switch interval for cyclic changeover setting;

iv. Power on, run and fault indication;

v. Running pressure value indication;

vi. Running frequency indication;

vii. Hours of operation log indication;

viii. Error messages indication.

f. The VSD unit shall provide automatic protections to the booster pump system as follows:

i. To shut off all pumps at zero suction, high pressure overshoot and loss of pressure at discharge;

ii. To protect pump motor from over-voltage, under-voltage, over-current, overload, overheat and loss of phase;

iii. To protect frequency inverter from overheat;

iv. To conduct automatic test-run at adjustable periods.

g. The VSD unit shall activate audio and visual alarm for the following faults:

i. Low suction pressure;

ii. Pump motor failure;

iii. Frequency inverter failure;

iv. Pressure transducer failure;

v. System failure.

h. The VSD unit shall provide dry contacts for the following remote monitoring outputs:

i. Pump running status;

ii. Common fault signal.

i. The VSD unit shall keep record of at least 5 nos. of last fault events for retrieval;

j. The VSD unit shall have dust and water ingress protection to at least IP55 for enclosure and cable connection;

k. The VSD unit shall be able to recover automatically after power failure.

3. Installation Requirements:

a. Every VSD unit shall be able to set as master and perform full multi-pump control functions independently unless an associated master multi-pump display and control unit forms part of the control system and provides necessary control functions for multi-pump operation. When a master multi-pump display and control unit is necessary, an identical duplicate shall be provided in parallel with selector knob for easy changeover in case the master unit in use is found faulty;

b. Every VSD unit shall be compatible with its connected motor so as not to result in excessive power loss or heat generation at the motor over entire speed range;

c. All VSD units in a booster pump system shall be identical and automatically form an integrated multi-pump control system via interconnecting control cables;

d. Input parameters on any VSD unit in the booster pump system shall be automatically synchronized to other VSD units;

e. Pump running and fault status indications from each VSD unit shall be repeated on the pump control cubicle;

f. VSD units shall be mounted individually on wall or enclosed collectively in a fan-ventilated metal cubicle mounted on wall unless the VSD unit and the pump motor forms an integrated design at factory;

g. All non-armoured cables connecting from VSD unit to unit and from pressure transducer to VSD unit shall be enclosed in watertight flexible conduits and terminated in rigid box with glands and nuts;

h. Control cables connecting to the VSD units shall be separated from power supply cables. The power supply cables shall be kept as short as possible and not be installed in parallel to the control cables;

i. VSD multi-pump control shall be commissioned by the manufacturer's representative and set up with the optimum parameters in order to attain the best operating efficiency of the booster pump system.

4. Maintenance Requirements:

a. User interface of the input panel on VSD unit and master multi-pump display and control unit when provided, shall be clear and simple to use;

b. Complete documentary of user manuals covering operation and maintenance procedures, and where necessary for future maintenance, data disk containing software, firmware, etc. for VSD unit shall be provided in the O&M Manual of Water Pump Installation. An extra on-site user manual shall be properly bound in plastic folder and kept in a durable wall hanging box inside each booster pump room;

c. Training shall be provided by the manufacturer's representatives on equipment setting, operational and maintenance aspects including essential trouble-shooting techniques;

d. In case any mal-function found, replacement of only faulty parts in VSD unit shall be possible, instead of total replacement.

5. Reliability:

a. The VSD unit shall be the product of a manufacturer who has continuously manufactured similar type of products in the past 3 years;

b. The VSD unit shall have proven record of reliability of a minimum continuous period of one year prior to the time of material submission for Approval, in relevant application in local or overseas to the satisfaction of the CM.

6. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the variable speed drive unit for fire services booster pumps delivered to the Site or installed.

FWP11.4 PUMP CONTROL CUBICLE

FWP11.4.010.9 LOCATION

In each fixed fire pump/intermediate booster pump room, sprinkler pump room, water pump room and those as shown on the Drawings, a pump control cubicle for each of the pumping systems shall be provided.

FWP11.4.020.9 CONSTRUCTION

1. The pump control cubicle shall be suitable for wall mounting with a degree of protection of at least IP42to BS EN 60529;
2. The whole cubicle except for its front panels shall be made of galvanized sheet steel not less than 1.5 mm thick and formed in such a way as to give a rigid structure without cross struts. The cubicle opening shall be rolled up with curled edges in order to stop water ingress slipped into inner side of the cubicle. The front panels shall be of double-door construction and made of galvanized sheet steel not less than 2.0 mm thick;
3. The outer doors of the front panels shall be hinged permitting not less than 110 degrees opening and inserted with a durable clear transparent panel sealed by rubber gaskets. They shall be fitted with multi-point swing handle latches of watertight zinc alloy bodies with cam levers and locking bars but with no locks. The edges of the outer doors shall be fitted with neoprene rubber gaskets which at closing position, shall be tightly rested on the curled edges of the cubicle opening;
4. The inner doors of the front panels shall be hinged permitting 90 degrees opening and recessed in the cubicle with indication lights, selector switches, ammeters, isolating switches, etc. fitted on. The back sides of the inner panels shall be fitted with insulation boards to prevent direct exposure of live parts when opened. At closing position, the inner doors shall be fastened on the cubicle by stainless steel screws;
5. The cubicles shall have ventilation louvers for heat dissipation at lateral panels.

FWP11.4.030.9 FITTINGS

The pump control cubicle shall be complete with isolating switch, selector switch, indicating lights, starters, relays etc. as shown on the Drawings.

FWP11.4.040.9 FINISH

The inside and outside surfaces of the pump control cubicle shall be painted with one coat of primer, followed by a coat of stoved polyester-epoxy powder finish of an Approved colour which for fire services installations shall be of gloss signal-red.

FWP11.4.050.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the pump control cubicles for fire services pumps delivered to the site or installed.

FWP11.5 PUMP CONTROL CUBICLE COMPONENTS

FWP11.5.010.A ISOLATING SWITCH

Unless otherwise specified, a triple pole isolating switch with removable neutral link shall be provided for the main supply to each pump motor. The isolating switch shall be in compliance with BS EN IEC 60947-3 or IEC 60947-3 suitable for a rated operational current at a utilisation category of AC 23 of not less than the rated current of the motor circuit. It shall be fixed inside the control cubicle and operated by a handle fitted on the hinged front panel. Positive "ON" and "OFF" indication shall be provided.

FWP11.5.020.B AMMETER AND CURRENT TRANSFORMER

Ammeter of moving iron type complete with a selector switch shall be provided in each control cubicle to indicate the current supplied to the motor. The ammeter shall comply with IEC 60051-1 and IEC 60051-2 with class index 2.5 and shall be of flush mounting type with 75 mm dial and external zero adjustment. The full scale deflection of the ammeter shall be about 200% of the rated current of the motor. Where necessary, current transformers of encapsulated type complying with BS EN 61869-2 or IEC 61869-2 with an accuracy class 1 shall be provided for the supply to the ammeter.

FWP11.5.030.9 PUSH-BUTTON AND SELECTOR SWITCH

Push-button and selector switch for mounting on to control cubicle shall conform to EN 60947-1 and EN 60947-5-1 and shall be of splash-proof type with a thermal current rating of not less than 5A and the contacts shall be silver-plated. Push-button shall have a diameter of not less than 20 mm and shall be flush with its guard ring to prevent inadvertent operation. Selector switch shall be of rotary type with a handle of not less than 25 mm long.

FWP11.5.050.9 TIME SWITCH

Where specified, a time switch used for starting the pumping system at a pre-determined time of a day shall be provided. The time switch shall be provided with 24-hour dial and battery backup or of other types as approved by the Contract Manager.

FWP11.5.060.9 INDICATION LIGHT

Unless otherwise specified or Approved, indication/pilot light shall conform to EN 60947-1 and EN 60947-5-1 and shall have built-in transformer complete with a 6V LED lamp and a plastic lens of suitable colour.

FWP11.5.070.A CONTROL RELAY

Control relay, including time-delay relay shall be of contactor type in compliance with BS EN 61810-1 or IEC 61810-1 or other standards as approved by the CM. The relay shall have a thermal current rating of not less than 5A and its contacts shall be silver-plated. Shading ring shall be provided in the magnetic circuit to eliminate noise and vibration. The relay shall have a mechanical endurance of not less than 5 million operations.

FWP11.5.080.9 TERMINAL BLOCK

All control cables connected to the cubicle shall be terminated in feed-through terminal blocks with screw clamp connections and conforming to the following requirements and sleeve type cable markers shall be fitted to both ends of each length of cable:

1. Electrical and mechanical characteristics to be type tested to BS EN 60947-7-1 or IEC 60947-7-1;
2. Voltage rating 750V;
3. Moulding material to be melamine with low flammability as certified to UL94;
4. Designed for mounting directly on assembly rail to EN 50035;
5. All current carrying parts to be copper coated with tin lead alloy. Clamping yokes and screws to be zinc plated steel with additional protection by a chromate layer.

FWP11.5.090.A PROGRAMMABLE LOGIC CONTROLLER

1. Execution:
   a. Upon Approval, Programmable Logic Controller (PLC) can be used to form part of the pump control wiring circuit in lieu of conventional control relays and time switches;
   b. The Sub-contractor shall complete the programming of the PLC and provide a comprehensive instruction manual for adjusting the pump control such as timer settings, etc. The sequence of control and values of settings in connection with the pump-set operation shall be saved as a switching program in a piece of EPROM (Erasable Programmable Read Only Memory). The steps for programming the switching program shall be literally printed in the instruction manual. Two programmed EPROMs (one socketed in the PLC and one spare) shall be provided for every pump control wiring circuit. Detailed instruction for replacing the EPROM and rebooting the PLC shall be included in the instruction manual;
   c. The Sub-contractor shall provide one spare set of PLC including the associated components such as expansion modules and power supply modules for every three sets of PLC of the same make and model to enable one-to-one replacement. However, one spare set of PLC shall be provided if the number of PLC of the same make and model installed is less than three. The spare unit(s) shall be tested, kept in original packings, and stored in lockable partitioned space inside pump control cubicle(s). Label(s) showing the storage location(s) of spare unit(s) shall be affixed prominently in cubicle(s) not storing the spare unit(s);
   d. The Sub-contractor shall provide two (2) times of free on-site services for modification of the PLC programming upon request of the CM within the Maintenance Period.
2. Product Requirements:
   a. The PLC shall be the product of a reputable manufacturer and commonly available in the local market;
   b. The PLC shall be capable of counting, regulating, archiving and performing timer and logic operation functions;
   c. The PLC shall be expandable in the number of digital and analogue input / output ports, 35mm DIN rail mounted, fitted with socketed EPROM module for ease of replacement, and provided with serial port for personal computer connection if required for programming and control setting adjustment;

d. The programmed PLC shall be password protected and possesses integrated data latch to protect current settings against loss in the event of a power failure;

e. Operating voltage: DC 24V;

f. Operating ambient temperature: 0℃ to 55℃;

g. Operating ambient relative humidity: 5% to 95%; transient condensation permissible;

h. Storage temperature: -10℃ to 70℃;

i. Radio interference suppression to BS EN 55011 (limit value class B);

j. Degree of protection: IP20 to BS EN 60529;

k. Certification to BS EN 60730-1, IEC 61131-2, UL or equivalent.

FWP11.5.100.9 EVIDENCE OF COUNTRY / PLACE OF MANUFACTURE AND AUTHENTICITY

The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the pump control cubicle components for fire services pumps delivered to the site or installed.

FWP11.6 CONTROLS AND GAUGES

FWP11.6.010.9 LEVEL CONTROL SWITCH FOR WATER TANKS

1. Level control for any water tank shall be achieved by the use of weight and ball float, operating a remote mercury switch;
2. Unless otherwise specified, the mercury switch shall be housed in a weatherproof type box to IP 54 or above, which is of non-metallic and corrosion resistant material. The mercury switch inside the weatherproof box shall be accessible for inspection / servicing through an openable cap;
3. Alternatively, or where specified, mercury switch encapsulated in corrosion proof float with "ON" and "OFF" control, as described in FWP11.6.020 below, may be used;
4. Level control switch shall cope with the chlorine concentration when used in the rainwater collection tank. The Sub-contractor shall demonstrate the compliance to the satisfaction of the CM;
5. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the level control switches for fire services system delivered to the site or installed.

FWP11.6.020.9 LEVEL REGULATOR FOR WASTE WATER, STORM WATER AND SEWAGE SUMP TANKS

Mercury switch encapsulated in corrosion proof float shall be used for level control. The float shall be freely suspended in the liquid of the sump tank by a waterproof multi-core PVC sheathed cable.

FWP11.6.030.9 LEVEL REGULATOR FOR DEEP BORE WELLS

Level control for deep bore well shall be of electrode type or magnetic type. Detailed information of the level control device shall be submitted for Approval prior to ordering.

FWP11.6.040.9 FLOW SWITCHES

1. For fire services alarm:
    a. Flow switches for fire services alarm shall be of vane type or as approved by the CM, and shall be approved by LPC and FSD;
    b. They shall be capable of withstanding a test pressure of 15 bar or 1.5 times of the maximum working pressure whichever is higher for not less than 2 hours without showing any sign of leakage;
    c. The sensitivity of the flow switch shall be such that it will respond to the water flow when even only one sprinkler head is in operation;
    d. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the flow switch delivered to the site or installed.
2. For general purposes:
    a. Flow switches for general purposes shall be of paddle type with magnetic switching mechanism or as approved by the CM;
    b. Paddles shall be made of stainless steel;

c. Body materials shall be suitable for the purposes of applications against corrosion;

d. The products shall be robust and durable for daily switching operations;

e. They shall sustain a maximum operating pressure of 20 bar and be taken part in the water system tests mentioned in FWP14.1.060.

3. Contacts shall be suitable for the working voltage and current of the circuits controlled, and shall be plated with silver or Approved alloy.

FWP11.6.050.9 PRESSURE SWITCHES

1. Pressure switches shall have contacts plated with silver or Approved alloy rated to suit the working voltage and current of the circuits controlled and shall have independent adjustments for the cut-in and cut-out points and for the operating differential;
2. For fire services systems, pressure switches shall be LPC approved type or acceptable to FSD;
3. For flush water supply system, pressure switches shall be constructed of corrosion resistant material;
4. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the pressure switch delivered to the site or installed.

FWP11.6.060.9 PRESSURE GAUGES

Pressure gauges shall comply with BS EN 837-1 and have brass cases with dials not less than 100 mm diameter. They shall be calibrated in kPa to a maximum of not less than 1-1/3 times and not more than 2 times the operating pressure. Divisions of scale shall not exceed 20 kPa for a maximum scale value of 1,000 kPa, 50 kPa for a maximum scale value of 1,600 kPa and 100 kPa for maximum values in excess of 1,600 kPa. An isolating valve/cock shall be provided for each pressure gauge.

FWP11.6.070.9 EMERGENCY STOP SWITCH

An emergency stop switch of mushroom head push stop lock out type, coloured red shall be provided adjacent to each pump to stop the motor in case of emergency.

FWP11.6.080.9 PRESSURE TRANSDUCER FOR BOOSTER PUMP SYSTEM

1. Pressure transducer for booster pump system shall match with the variable speed drive (VSD) unit and fully cover the required operating parameters of the booster pump system using VSD control;
2. Unless otherwise Approved, enclosure and wetted parts of pressure transducer shall be made of Grade 316 stainless steel.

FWP11.7 L.V. SWITCHGEAR AND ASSOCIATED EQUIPMENT

FWP11.7.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE3 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP11.8 BUSBAR CHAMBERS AND BUSBAR TRUNKING SYSTEMS

FWP11.8.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE6 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP11.9 CABLES

FWP11.9.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE7 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP11.9.020.9 CABLES FOR FIRE SERVICE INSTALLATIONS

1. Cables for fire service installations shall comply with the requirements stipulated in Fire Services COP, FSD's Circular Letters, and relevant BS or other international standards acceptable to the Director of Fire Services;
2. All cables in concealed conduits for fire services installations such as fire alarm and detection system where applicable, in domestic blocks or premises without sprinkler protection, shall be fire-resistant cables.

FWP11.10 INSTALLATION OF POWER CABLES

FWP11.10.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE8 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP11.11 WIRING SYSTEM INSTALLATION IN STEEL CONDUITS

FWP11.11.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE11 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP11.12 WIRING SYSTEM INSTALLATION IN STEEL TRUNKING

FWP11.12.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE12 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP11.13 WIRING SYSTEM INSTALLATION IN PLASTIC CONDUIT OR PLASTIC TRUNKING

FWP11.13.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE13 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP11.14 EARTHING AND PROTECTION AGAINST INDIRECT CONTACT

FWP11.14.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE17 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP11.15 WIRING ACCESSORIES

FWP11.15.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE20 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP11.16 TESTING AND MAINTENANCE

FWP11.16.010.9 GENERAL

The Sub-contractor shall comply with all the latest requirements on equipment, materials and installation practice/method as specified in Worksection ELE30 of HKHA Electrical Installation Specification, within the scope of the works specified under this Sub-contract. Electrical installation mentioned therein shall mean electrical works for fire services and water pump installation.

FWP12.4.020.9 IDENTIFICATION SYMBOLS 7
FWP12.4.030.9 APPROVAL LETTERS 7

FWP12.1 GENERAL

FWP12.1.010.9 DEFINITION

Portable equipment includes extinguishers, fixed sprayer units, fire blankets and any other fire service equipment used as an independent means for extinguishing a fire.

FWP12.1.020.9 APPROVAL

1. Only portable equipment in the lists approved by the Director of Fire Services shall be accepted;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the portable fire extinguishers delivered to the site or installed.

FWP12.1.030.9 FIXING

All mounting fixtures and labour for installation shall be provided.

FWP12.1.040.9 CONTRACT MAINTENANCE

The Sub-contractor shall include for a Class 3 "Registered Fire Service Installation Contractor" for inspection, repair and maintenance of the portable equipment during the Contract and Maintenance Period.

FWP12.1.050.9 ACCEPTANCE

Portable fire services equipment including fire extinguishers and fixed sprayer units manufactured before the preceding year of contract completion shall not be accepted unless prior Approval from the Contract Manager is obtained.

FWP12.2 FIRE BLANKETS, SAND BUCKETS, ETC.

FWP12.2.010.A LOCATION

Supply and distribute sand buckets etc. in the positions shown on the Drawings.

FWP12.2.030.A SAND AND FIRE BUCKETS

1. Sand buckets shall be of FSD accepted type;
2. Sand buckets with cover shall be of not less than 10 litres capacity and shall be made of galvanized steel and painted red.

FWP12.2.040.A FIRE BLANKETS

Fire blankets shall be heavy duty type to BS 7944 and approved by FSD listed in the latest HKSAR Government Gazette.

FWP12.2.050.9 APPROVAL LETTERS

Approval letters for fire blankets issued by FSD shall be produced for the CM's inspection.

FWP12.3 PORTABLE FIRE EXTINGUISHERS

FWP12.3.010.A TYPE

1. The portable fire extinguishers shall be rechargeable hand operated extinguishers of water, carbon dioxide, dry powder, clean agent or other approval agent type with capacity as specified. Fire extinguishers containing any "Scheduled Substances" under the Ozone Layer Protection Ordinance (Cap. 403) are not acceptable;
2. Water and dry powder type extinguishers shall be cartridge operated and shall be fitted with replaceable gas cartridge inside the extinguisher cylinder;
3. Fire extinguishing agents shall comply with the following maximum allowable concentration of heavy metal:
    a. Cadmium (Cd): <0.003 mg/L
    b. Copper (Cu): <2 mg/L
    c. Lead (Pb): <0.01 mg/L
    d. Mercury (Hg): <0.006 mg/L
    e. Zinc (Zn): <3 mg/L

FWP12.3.020.A STANDARDS

All portable fire extinguishers shall be of FSD approved type listed in the latest HKSAR Government Gazette and shall comply with the standards as indicated below:

a. Water type fire extinguisher:	BS EN 3: Part 7 to 10 or UL 626 or other standards acceptable to FSD
b. Carbon dioxide fire extinguisher:	BS EN 3: Part 7 to 10 or UL 154 or other standards acceptable to FSD
c. Dry powder type fire extinguisher:	BS EN 3: Part 7 to 10 or UL 299 or other standards acceptable to FSD
d. Clean agent fire extinguisher:	BS EN 3: Part 7 to 10 or UL 2129 or other standards acceptable to FSD

FWP12.3.030.9 OPERATION

All extinguishers shall operate without inversion. They shall be so designed with clear indication on whether they have been operated. A device shall be incorporated in the extinguishers to prevent inadvertent operation.

FWP12.3.040.9 APPROVAL LETTERS

Approval letters for portable fire extinguishers issued by FSD, shall be produced for the CM's inspection.

FWP12.3.050.A TYPE TEST CERTIFICATES

Test certificates for each type test complete with reports and drawings, where applicable, shall be produced upon request, to prove compliance with the recognised standards listed above to the satisfaction of the CM.

FWP12.3.060.9 MARKING AND LABEL

1. All portable fire extinguishers shall be secured tightly with a label indicating the updated maintenance information in accordance with FSD's requirements. The label shall be made of durable label approved by the Contract Manager;

2. Extinguishers shall be marked with the abbreviation of Hong Kong Housing Authority i.e. HKHA. The letters of the marking shall be 18 mm high and 12 mm wide and shall be painted on conspicuous position of the body subject to the Contract Manager's Approval.

FWP12.4 FIXED SPRAYER UNITS

FWP12.4.010.A TYPE

Fixed Sprayer units shall be self-contained automatically operated sprayer units to NFPA Standard 2001 not containing any "Scheduled Substances" under the Ozone Layer Protection Ordinance (Cap. 403) or other standards where applicable, acceptable to FSD, clean agent type fitted with a sprinkler head which activates at 74 or 79℃ approximately. Fire extinguishing agents using HCFC Blend A (NAFS-III), HCFC-123 (FE-232), HCFC-124 (FE-241) and PFB (CEA-410) are not acceptable for new fixed installation.

FWP12.4.020.9 IDENTIFICATION SYMBOLS

For rooms fitted with automatic extinguishers, identification symbols prescribed in Director of Fire Services Circular Letters shall be provided and fixed to each entrance door.

FWP12.4.030.9 APPROVAL LETTERS

Approval letters for fixed sprayer units issued by FSD shall be produced for the CM's inspection.

FWP13.4.010.9 WATER PUMP AND RAINWATER HARVESTING SYSTEM INSTALLATION 10
FWP13.4.020.A FIRE SERVICES INSTALLATION 10

FWP13.1 PAINTING

FWP13.1.010.9 SCOPE

1. Pipework, installation and equipment shall be painted for the purpose of corrosion protection, restoration of the paint-work to "as-new" condition and identification of the various services or as specified;
2. Pipework, installation and equipment shall not be painted except the following or where specified:
    a. Ductile iron pipes inside pump rooms and water tank rooms;
    b. Galvanised mild steel (GMS) pipes outside pipe ducts and suspended ceilings; and
    c. Carbon steel pipes and mild steel pipes.

FWP13.1.020.9 GENERAL

1. The Sub-contractor shall comply with the requirements on materials and workmanship for painting as specified in Worksection FIN7 unless otherwise specified;
2. Pipework, installation and equipment shall be painted with the correct identification colours, colour code indications and, where appropriate, directional arrows;
3. Pipework, installation and equipment to be painted shall be cleaned, prime coated with the appropriate primer and completed with two coats of synthetic paint in semi-gloss finishing in accordance with the manufacturer's recommendation. For GMS pipework, anti-corrosive primer suitable for galvanised steel shall be used;
4. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the paints delivered to the site.

FWP13.1.030.9 UPVC PIPES

1. UPVC pipes shall not be painted except those exposed to sunlight, which shall be painted with white acrylic paint;
2. Self-adhesive colour bands shall be applied on each section of pipework for identification.

FWP13.1.040.9 DIRECTIONAL ARROWS

1. Directional arrows shall be painted on the pipes (except sprinkler pipes of less than 100 mm in diameter, drains, valves and fittings) on two visible sides at intervals not more than 6 m apart;
2. Directional arrows shall be white for dark background colours and shall be black for light background colours;
3. The length of the directional arrows shall be 150 mm and can be reduced to 75 mm for pipes equal to or less than 50 mm in diameter. The minimum body width of the arrow shall be 25 mm.

FWP13.1.050.9 IDENTIFICATION COLOUR CODE INDICATION

1. Unless otherwise specified, the identification colours, the colour code indications and the colour codes shall follow BS 1710 and BS 4800.

2. Unless otherwise specified, pipework shall be identified by painting or self-adhesive colour bands at suitable intervals not more than 6m apart as follows:

Service Type	Basic Identification Colour Approx 150 mm wide for each ring	Colour Code Indication Approx 100 mm wide for each ring			Basic Identification Colour Approx 150 mm wide for each ring
Fresh cold water	Green 12 D 45	White 00 E 55	Blue 18 E 53	White 00 E 55	Green 12 D 45
Fresh hot water	Green 12 D 45	White 00 E 55	Crimson 04 D 45	White 00 E 55	Green 12 D 45
Flushing water	Green 12 D 45	Green 12 D 45			Green 12 D 45
Fire Services pipes	-	Red 04 E 53			-
Rainwater pipes	Green 12 D 45	Black 00 E 53			Green 12 D 45
Drain pipes	-	Black 00 E 53			-

3. Equipment and fittings shall be painted as follows:

Service Type	Colour Code Identification
Fresh water pumps	Manufacturer's standard colour or Blue (18 E 53)
Flush water pumps	Manufacturer's standard colour or Green (12 D 45); no painting on stainless steel components
Fire Services pumps	Red (04 E 53)
Rainwater irrigation pumps	Manufacturer's standard colour or Black (00 E 53); no painting on stainless steel components
Valve body and handle	Manufacturer's standard colour
Pump Control Panel (fresh water)	Blue (18 E 53)
Pump Control Panel (flush water)	Green (12 D 45)
Pump Control Panel (fire services water)	Red (04 E 53)
Pump Control Panel (rainwater)	Black (00 E 53)

4. GMS and ductile iron pipes inside pump rooms and water tank rooms shall be painted in lieu of colour bands as follows:

Service Type	Colour Code Identification
Fresh Water	Blue (18 E 53)
Flushing Water	Green (12 D 45)
Rainwater pipes	Green (12 D 45) with black (00E 53) colour ring of approx. 100mm wide at suitable intervals not more than 6m apart

Fire services Water	Red (04 E 53)

FWP13.1.055.9 COLOUR BANDS

1. Colour bands shall be made of good quality, durable and self-adhesive PE sheet;
2. Colour bands for outdoor application shall be coated with UV inhibitor;
3. Colour bands shall be wrapped around the pipes with minimum 25 mm overlap;
4. Colour bands shall have minimum 3 years reputable local job references. The Contractor shall submit all relevant information and samples for Approval prior to ordering;
5. Combustible colour bands shall not be used in the Protected Means of Escape as defined in the Code of Practice for Fire Safety in Buildings published by the Building Department.

FWP13.1.065.9 LETTERING TO RAINWATER COLLECTION AND BREAK WATER TANKS

The following English letters with Chinese characters which shall be 75 mm high shall be painted on one conspicuous side of the rainwater collection tank and break water tank respectively by Main Contractor:

"Rainwater Collection Tank 雨水貯水缸"

"Break Water Tank 分隔水缸"

FWP13.1.070.9 AS-NEW CONDITION

At the time of handover the whole installation shall be in "as-new" condition. The Sub-contractor shall, during the course of the contract, protect all plant and equipment, and shall restore/repaint as necessary before contract completion.

FWP13.2 LABELS AND NOTICES

FWP13.2.010.9 LOCATION

Labels and/or notices shall be provided for all equipment, apparatus, fuses, terminals, lamps, switchgear, gauges, valves etc. wherever their provision will facilitate operation and maintenance of the installation, and where specified elsewhere.

FWP13.2.020.9 STATUTORY REQUIREMENTS

Labels and notices required by statutory requirements shall be inscribed accordingly whereas other labels shall indicate name and purpose of the equipment together with ratings and commissioned set values where applicable.

FWP13.2.030.9 MATERIAL FOR LABELS

Unless otherwise specified, labels shall be made of multi-layer bi-colour plastic material with red outer layer and white inner layer for fire services installation and with black outer layer and white inner layer for water pump installation. The labels shall be resistant to discolouring even under exposure to sunlight. Lettering shall be engraved on the plastic material by cutting away the outer layer to the outline of the required letters, exposing the inner layer underneath. The Sub-contractor shall be responsible for replacement of any label which is found discoloured at any time within Maintenance Period.

FWP13.2.040.9 INSCRIPTION

Inscription of labels and engraving shall be in both English and Chinese characters. Details shall be submitted for Approval prior to engraving.

FWP13.2.050.9 WARNING NOTICES

Notices, with at least 25 mm high lettering, as detailed in FWP11.2.050 shall be prominently displayed adjacent to each surface pump set or pair of surface pump sets, or in a prominent location above underground sumps and wells for submersible or semi-submersible pump sets.

FWP13.2.080.9 FIXING

1. Labels and notices shall be fixed by screws. Where drilling and tapping of the equipment is impracticable, adhesive may be used subject to prior Approval;
2. For pipelines or valves, where applicable, labels shall be fixed on plastic claim loops.

FWP13.3 DRAWINGS AND DIAGRAMS

FWP13.3.010.9 WORKING DRAWINGS AND FRAMED SCHEMATIC DIAGRAMS

Floor plan and sectional elevation of the building showing fire services installations, schematic diagram of the pipe installation and schematic diagram of the electrical control system shall be provided and fixed properly to the satisfaction of the Contract Manager in the locations hereunder. The diagram shall be of A2 size minimum, unless otherwise Approved and each diagram shall be treated, such as with acrylic varnish, to prevent deterioration and mounted in an anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness:

	Diagram		Location of Diagram
1.	Fire Services Installation:		
	a.	Schematic diagram of the piping installation.	Fire control room/ sprinkler control room/ pump room.
	b.	Schematic wiring diagram of fire alarm system.	Adjacent to the fire services alarm control panel.
	c.	Schematic/block diagram of AFA system including alarm initiating zone module, output and input circuit modules	Adjacent to AFA annunciator panel
	d.	Schematic wiring diagram of fire pump control system.	Adjacent to the fire services pump control cubicle.
2.	Water Pump Installation:		
	a.	Schematic diagram of the piping installation.	Adjacent to the pump control cubicle.
	b.	Schematic wiring diagram for water pump control system.	Adjacent to the pump control cubicle.
3.	Rainwater Harvesting System Installation:		
	a.	Schematic diagram of the piping installation	Adjacent to the rainwater harvesting system control panel
	b.	Schematic wiring diagram for water level and pump control system	Adjacent to the rainwater harvesting system control panel

Floor plans and sectional elevations of building showing the locations of the fire services installation provided inside fire control room shall be of A3 size and fixed by folders. The folders shall be housed in a proper container constructed by acrylic plastic and mounted on wall.

FWP13.3.020.9 AS-FITTED DRAWINGS

Separate set of as-fitted drawings including Approved conduit shop drawings shall be provided for each of the systems/installations listed in FWP13.3.010 above, incorporating all amendments made during the course of this Contract on completion of the Works. The complete Approved set shall consist of three (3) print copies, three (3) set of electronic copy in AutoCAD Format and Adobe Portable Document Format and one (1) sepia of each of the drawings conforming approximately to one or other of the following standard sizes:

1. 841 x 1189 mm (AO)

2. 594 x 841 mm (A1)
3. 420 x 594 mm (A2)
4. 210 x 297 mm (A4)

Boxes with proper numbering shall be provided for printed drawings and labelled with the project name, fire services and water pump installation together with comprehensive drawing list.

FWP13.3.030.9 INSTRUCTION MANUALS AND TESTING AND COMMISSIONING REPORTS

1. The Sub-contractor shall submit the following documents and technical literature to the Contract Manager for the whole installation and equipment provided under this Sub-contract, including, but not limited to, the following (See PRE.BS1.200):
   a. Table of Content with numbering and index;
   b. System description;
   c. Operation instructions;
   d. Maintenance instructions;
   e. Highlights on special precautions/procedures/methods required on the use, operation, cleaning, servicing, maintenance, repair and replacement of any proprietary material and equipment installed. Requirements on proper use and operation, durability, safety and statutory side shall also be stated clearly;
   f. Supplier list for major equipments;
   g. Catalogue, user manual, operation and maintenance manual for the installation such as motor, pump (including pump curve showing the operating point), sprinkler control valve, AFA panel and motor starter, etc.;
   h. Plant and equipment catalogue and user manual as required by the Contract Manager;
   i. Priced list of recommended spares (see FWP13.3.040 below);
   j. Priced list of special tools;
   k. Copy of the certificate of warranty for those material, equipment and installation with warranty period last beyond Maintenance Period;
   l. Testing and commissioning reports of the installation and equipment provided;
   m. Emergency call and maintenance services;
   n. Other items as required by the Contract Manager.
2. Draft copies in Box files with proper numbering shall be provided and labelled with the project name and, fire services and water pumps installation for comment and Approval;
3. After Approval, the Sub-contractor shall submit three (3) sets of electronic copy (in compact disc) for all items above in Adobe Portable Document Format to the Contract Manager;
4. For the Rainwater Harvesting System, the Sub-contractor shall submit, in addition to the whole documents and technical literature a “Water Safety Plan” which addresses the requirements stipulated in Section 4.1 of Code of Practice for Prevention of Legionnaires' Disease.

FWP13.3.040.A RECOMMENDED SPARES

The priced list of "Recommended Spares" referred to in FWP13.3.030 above shall include the following:

1. All bearings and bearing bushes;
2. All gaskets and jointing;
3. All seals;
4. All filter cartridge and chemicals for rainwater harvesting system installation, etc.;
5. Other items as required by the Contract Manager.

FWP13.4 SPARES AND TOOLS

FWP13.4.010.9 WATER PUMP AND RAINWATER HARVESTING SYSTEM INSTALLATION

1. The Sub-contractor shall provide, for each Pump Room and rainwater harvesting system treatment facility room, one (1) complete set of spare fuses for each rating of fuse-switches or switch fuses installed including those fuses installed in the control circuit;
2. The Sub-contractor shall provide on the wall inside the Pump Room and rainwater harvesting system treatment facility room a wooden board with brass hooks and other device for holding the spare fuses for fuse switches or switch fuses;
3. The board shall be smoothed on both front and edges, and shall be painted to Approval;
4. Spare fuses for control circuit shall be properly fixed inside the control panel/cubicle;
5. The Sub-contractor shall provide the following spares for the rainwater harvesting system installations:
    a. One (1) complete set of spare filter cartridges for each cartridge filter installed in each rainwater harvesting system treatment facility room.

FWP13.4.020.A FIRE SERVICES INSTALLATION

1. Tenders shall be deemed to have included sets of spare parts and special tools including spare sprinkler heads, replacement break glass plates, indicator lamps, special keys, fuses etc. as required by the Statutory Regulations and Standards in FWP1 of this Specification and for operation and maintenance of the plant and installation within the entire Maintenance Period. In addition, a complete list of all replaceable parts with model number, part number and price shall be submitted together with the tender for purchase and use after the expiration of the Maintenance Period;
2. The Sub-contractor shall provide the following spares for the fire services installations in each building:
    a. Ten (10) of hose reel nozzles for each separate fire hydrant / hose reel system;
    b. Two (2) keys of the manual fire alarm point for each alarm system;
    c. Twenty-four (24) sprinkler heads for Ordinary Hazard installations and two (2) sprinkler spanners for each type of sprinkler used in each sprinkler system;
    d. One (1) complete set of spare fuses for each rating of fuse-switches or switch fuses installed in each Pump Room including fuses for control circuits;
    e. Five (5) percent of the quantities of installed manual fire alarm call points, heat detectors, smoke detectors for each addressable system;
    f. Five (5) percent of the quantities of installed interface modules for each addressable system.

FWP14.6.030.9 REPLACEMENTS 23
FWP14.6.040.9 CONDITIONS OF CONTRACT 23

FWP14.1 INITIAL TESTING AND COMMISSIONING

FWP14.1.010.9 PRE-TEST CLEANING

Before installations are subjected to inspection, testing and subsequent handover, the entire installation shall be thoroughly cleaned internally and externally. All water installations shall be flushed out with clean water. During the flushing operation provision shall be made to exclude filters, pumps, meters and any other item of plant which could be damaged during the cleaning operation.

FWP14.1.020.9 PERFORMANCE TESTS, ADJUSTMENTS AND COMMISSIONING

1. The Sub-contractor shall carry out complete performance tests for all equipment and systems installed by him, make all necessary adjustments, including setting all controls and checking the operation of all protective and safety devices, and commission the installations, in accordance with the manufacturers' instructions, the requirements of the statutory rules and regulations and to the satisfaction of the Contract Manager before the installations will be accepted;
2. Prior to any tests, the Sub-contractor shall submit detailed procedures and a programme for testing and commissioning for Approval;
3. The test shall be witnessed by an authorised representative of the Contract Manager and a report shall be submitted for record purposes.

FWP14.1.030.9 PERIOD OF NOTICE

Forty-eight (48) hours notice shall be given by the Sub-contractor to the Contract Manager of his intention to carry out installation tests.

FWP14.1.040.9 TEST INSTRUMENTS

1. In addition to PRE.BS1.630 which specifies the provision of a set of measuring instruments for BSPASS and the Contract Manager's Representatives' use, which will be under the custody of the CMR, the Sub-contractor shall provide all necessary instruments used for measurement and testing of the installation. Except for manual / electric hydraulic pump with pressure gauge given in sub-clause (2)(o) and smoke canister for testing smoke detectors given in sub-clause (2)(p) below, the instruments used shall be calibrated with traceability to internationally or nationally recognized standards;
2. Instruments required for inspection and testing purpose whenever necessary shall include, but are not limited to, the following:
    a. Measuring tape;
    b. Vernier caliper;
    c. Clamp-on ammeter;
    d. Multimeter;
    e. Multi-function electronic meter for measurement of current, voltage;
    f. Insulation resistance tester;
    g. Earth loop impedance tester;
    h. Pressure gauge;

i. Fire hydrant flow gauge;

j. Sound level meter;

k. Dial gauge;

l. Digital stop watch;

m. Male instantaneous coupling to BS 336;

n. Manual / electric hydraulic pump with pressure gauge;

o. Smoke canister for testing smoke detectors;

p. Carpenter (spirit) level.

3. Each piece of instrument shall carry an indelible identification mark, and a label showing the due date for calibration (except otherwise calibration is specified not necessary);

4. The Sub-contractor shall submit evidence of calibration such as calibration certificates and records of calibration results of the instruments used for the Contract Manager's Approval when required. The Contract Manager may reject any instrument(s) which, in his opinion, is not suitable for the inspection or test and the Sub-contractor shall replace the instruments when required.

FWP14.1.050.9 LABOUR AND MATERIALS

1. The Sub-contractor shall despatch competent and experienced commissioning engineers and technicians to carry out the testing and commissioning of the installations;

2. All labour and materials necessary for carrying out the work shall be provided by the Sub-contractor, except that the Main Contractor will supply electricity and water as required;

3. The Sub-contractor shall supply any necessary diesel or other fuel oil for engine-driven pumps, sufficient test gases required for the discharge tests of the gas extinguishing system installations etc;

4. The Sub-contractor shall also replenish all fire extinguishing media and other materials expended or used during the tests and ensure that the entire installations are in "as new" condition at the conclusion of the tests.

FWP14.1.060.9 WATER SYSTEM TESTS

1. Water systems and circuits shall be tested hydraulically to a minimum pressure of 1000 kPa or 1.5 times the working pressure whichever is higher applied at the highest point of the system and held for a period of not less than 15 minutes for fire services installation (except sprinkler installation) and 24 hours for water feed pump installation without leaks appearing. For sprinkler installation, the hydraulic test for pipework shall be in accordance with the LPC Sprinkler Rules;

2. After flushing out the pipework, a flow test shall be performed on the hydrant/hose reel system in accordance with the Fire Services CoP;

3. A water supply test with the drain and test valves fully opened shall be made on the sprinkler system in accordance with the LPC Sprinkler Rules. An alarm test on the water gong shall also be carried out by opening the test valve to ensure that the alarm shall continuously sound in 30 seconds after the flow in the system is detected;

4. The Sub-contractor shall provide whatever hoses or drainage channels are required to safely remove the test water discharged while carrying out these tests in order to ensure that no damage to the building and property will be caused by the test water;

5. All welded joints shall be hammer tested and remain firm;

6. Following the above, a normal working test shall be carried out, during which time adjustments and regulation of valves shall be effected.

FWP14.1.070.9 ELECTRICAL AND ALARM SYSTEMS TESTS

1. Electrical Wiring systems shall be tested generally as required by the latest edition of the Electrical CoP and the HKHA Electrical Installation Specification. Low-voltage wiring shall be insulation tested to a d.c. voltage of twice the normal working voltage of the system. Any tests that are liable to cause damage to the delicate components such as those incorporating electronic circuits shall be carried out with the components disconnected;
2. For electrical power circuits other than those for fire services, tests shall include but not be limited to the measurement of power ratings, power factor and total harmonic distortion in order to ensure the systems are in compliance with the BEC;
3. Smoke detectors shall be checked for correct sensitivity settings by means of manufacturer's test set and for operation by simulated smoke tests using freon;
4. Rate-of-rise heat detectors shall be tested by gentle application of a heat source such as a hair dryer. Fixed temperature heat detectors must not be tested other than using simulated tests;
5. Battery capacity shall be tested by discharging through the alarm circuits and being charged via the incorporated charger unit. The specific gravity of the electrolyte shall be tested with a clean hydrometer;
6. The input d.c. supply to the alarm supervisory circuitry shall be checked for correct voltage and stability such as to match the signal and alarm triggering devices;
7. Audio / Visual Advisory (AVA) system control panel, audio equipment and speakers shall be adjusted and tested such that sufficient sound pressure level can be achieved in all the protected areas;
8. Flashing directional sign boxes shall be tested to verify the proper operation of the AVA System zoning.

FWP14.1.080.9 GAS EXTINGUISHING SYSTEMS TESTS

1. Gas extinguishing system manifolds shall be tested in accordance with FWP9.7.090. Pipework shall be tested to a minimum of 1.5 times the operating pressure of the system;
2. Apart from the performance and electrical tests as indicated above, a discharge test using 10% of the required quantity of the extinguishing agent shall also be performed to ensure continuity of pipework and freedom of discharge through nozzles.

FWP14.1.090.9 FSD INSPECTION AND WITNESS OF TESTS

Additional tests, where not specified in the Specification, shall also be carried out to meet the requirements of the Fire Services CoP to the satisfaction of FSD. The Sub-contractor shall make all necessary applications to FSD and attend upon their representative for the purpose of these tests and inspections.

FWP14.1.100.9 PUMP ROOM NOISE LEVEL TESTS

1. Pump room noise levels shall be measured at the nearest noise sensitive receiver and corrected in accordance with the requirements stipulated in the "Technical Memorandum for the Assessment of Noise from Places other than Domestic Premises, Public Places or Construction Sites", hereinafter referred to as the "Technical Memorandum", issued by the Environmental Protection Department. A measurement report which shall be endorsed by an independent consultant employed by the Sub-contractor shall be submitted to the Contract Manager for Approval;
2. Sound level meters used for the measurements shall comply with the Standard specified in the "Technical Memorandum";
3. Both air and structure borne noises emanated from pump rooms shall be measured to verify their compliance with the requirements stipulated in the "Technical Memorandum" in all circumstances.

FWP14.1.105.9 72-HOUR RECORDING OF FRESH AND FLUSH WATER PUMP OPERATIONS

1. After completion of installation and tenant intake, 72-hour recording of fresh and flush water pump operations over Saturday and Sunday shall be carried out for each building block by the Sub-contractor using automatic recorders to confirm the properness of the pump control settings. The records shall show clearly the time and duration of individual pump operations and be submitted to the Contract Manager for approval;
2. Any control irregularities identified shall be remedied and further recordings shall be carried out until a proper 72-hour pump operation pattern is achieved to the satisfaction of the Contract Manager.

FWP14.1.110.9 TESTING AND COMMISSIONING REPORT

A testing and commissioning report shall be forwarded to the Contract Manager within fourteen days after completion of commissioning the installation. The report shall be verified and endorsed by the Supervising Engineer in accordance with FWP1.5.020 sub-clause (1).

FWP14.1.120.A WATER QUALITY TESTS FOR RAINWATER HARVESTING SYSTEM INSTALLATION

1. The Sub-contractor shall carry out the first water quality test for the rainwater harvesting system installation after system commissioning to ensure that the water quality requirement has been satisfied. If rain is unavailable for the test, the Sub-contractor shall coordinate with the Contractor to pour fresh water supplied by the Contractor at catchment areas selected by the CM to facilitate the test. The second water quality tests shall be carried out after the tenth rainy day or at a specified date before the Contract Completion as instructed by the CM to monitor the stability of the water treatment performance subsequent to the first water quality test. Afterwards, regular water quality tests shall then be carried out during the Maintenance Period according to the frequency as specified in sub-clause (3) of FWP14.4.060;
2. The Sub-contractor shall make sure the harvested water quality to conform to the parameters of water quality requirement as follows or the latest requirements / standards as specified by the Water Authority, whichever is the stringent:

Water Quality Parameters	Unit	Limits	Standard Method

E. coli	cfu/100 ml	Non-Detectable	DoE(1983) Sec. 7.8 & 7.9 with in-situ urease test
Legionella Bacteria Count	cfu/ ml	< 10	ISO11731 or BS EN ISO 11731 or AS 3896
Heterotrophic Colony Count (HCC)	cfu/ ml	<100,000	AS 4276.3 or BS 6068-4.5 or BS EN ISO 6222 or APHA 9215B
Total Suspended Solids (TSS)	mg/l	≤ 5	APHA 20e 2540 D
Total Dissolved Solids (TDS)	mg/l	≤ 10	APHA 20e 2540 C
Total Residual Chlorine (TRC)	mg/l	1-5 (exiting treatment system) 0.2-5 (at user end)	DPD Colorimetric Based on APHA/USEPA Hach Pocket Colorimeter (Digital)
Dissolved Oxygen	mg O_2/l	≥ 2	APHA 20e 4500-O G, YSI 52 D.O. meter
5-day Biochemical oxygen demand (BOD_5)	mg O_2/l	≤ 10	APHA 20e 5210 B
Turbidity	NTU	≤ 5	APHA 20e 2130 D
pH	--	6-9	APHA 20e 4500-H+ B
Colour	Hazen units	≤ 20	APHA 20e 2120 B
Odour	Threshold Odour Number (TON)	≤ 100	APHA 20e 2150 B
Ammoniacal Nitrogen	mg/l as N	≤ 1	APHA 20e 4500-NH, B, C, E
Synthetic Detergent	mg/l	≤ 5	APHA 20e 5540 B, C, D

All testing parameters as specified above shall be tested by an accredited laboratory. If water sampling results are satisfactory, system can be operated with the current water treatment set point. For any incidence of unacceptable water quality, the system shall be suspended until the problem is solved and to the satisfaction of the CM;

3. The methods for collecting water samples and preservation and handling of water samples for testing Legionella and HCC shall comply with relevant internationally recognised standards, such as AS 2031, BS 7592 or BS EN ISO 5667-3;

4. The test plan and schedule detailing the sampling points and time shall be submitted to relevant government departments or the designated consultant for comments and acceptance if necessary as directed by the CM;

5. A testing report issued by the accredited laboratory shall be forwarded to the CM within fourteen days after completion of the water quality test.

FWP14.1.130.9 TRAINING FOR RAINWATER HARVESTING SYSTEM INSTALLATION

1. The Sub-contractor shall provide 2 training courses as instructed by the CM on the operation and maintenance of the whole rainwater harvesting system installation;
2. The Sub-contractor shall submit the operation and maintenance manual for the rainwater harvesting system installation and obtain an Approval for the manual by the CM prior to the commencement of the training courses;
3. One training course shall cover detailed operational procedures and steps and precautions for training operational and maintenance staff. The other training course shall cover brief description of the system and precautions for briefing management staff and / or non-technical staff. Training notes / manuals are required in both English and Chinese. At least 5 seats shall be given for each training course. Training Venue shall be on Site or other venues as instructed by the CM.

FWP14.2 MAINTENANCE PERIOD

FWP14.2.010.9 DEFINITION

The Sub-contractor shall furnish maintenance for the complete fire services installation and water pump installation for a period of twenty-four (24) months following the certified competition date of the Main Works or any Section(s) of the Main Works.

FWP14.3 GENERAL MAINTENANCE

FWP14.3.010.9 SCOPE

General maintenance shall comprise all items included in this sub-section.

FWP14.3.020.9 REPAIRS AND REPLACEMENTS

All repairs and replacements necessary to maintain the installations in good working order, including supply of materials and labour, carried out in accordance with the manufacturers' recommendations/instructions to the satisfaction of the Contract Manager.

FWP14.3.030.9 CONSUMABLES

Supply of all normally consumable items including lubricants, cleaning materials, fire extinguishing media, fuses, lamps etc. as required.

FWP14.3.040.9 REGULAR MONTHLY VISITS

Regular monthly maintenance visits covering full inspection, lubrication, cleaning, adjustment, testing, and keeping all equipment in first class operating condition.

FWP14.3.050.9 RECORD OF SITE ATTENDANCES

1. To record all site attendance, on arrival and departure, for regular service visits or emergency breakdown call, together with details of the work carried out, in the record book held at the estate office;
2. To note comments, insert in the record book, and action accordingly;
3. A report in duplicate shall be sent to the Contract Manager immediately following a major repair, repeated breakdowns of service due to system or equipment fault of similar nature, or as and when required by the Contract Manager;
4. The report shall include the cause necessitating such a repair, the reasons for such a breakdown of service and the time and date of remedial action taken, of completion of repair and of the resumption of normal service;
5. A list of equipment replaced shall be attached to the report.

FWP14.3.060.9 SIGNING RECORD BOOK

1. For each routine or call out visit, during the Maintenance Period, the workman, on arrival at the Estate, shall report to the Estate Office and sign a "Fire Services and Water Pump Maintenance Record Book", which shall be submitted by the Sub-contractor and shall be kept by the officer-in-charge of the Estate;
2. At the time of signing, they shall note any message written in the book concerning the performance of the Fire Services and Water Pump Installations in the Estate, and shall take such action as may be required;
3. When leaving the Estate, the workman shall report to the officer-in-charge and enter in the "Fire Services and Water Pump Maintenance Record Book" a brief report on any work completed, or on the fact that they have found the system operating satisfactorily;
4. In general, the "Fire Services and Water Pump Maintenance Record Book" shall include, but not limited, to the following items:
    a. The name of the responsible person;

b. Brief details of any servicing arrangement;

c. Dates and times of all alarms (genuine, practices, test or false) together with their causes where known;

d. Dates, times and types of all defects and faults;

e. Dates and types of all test and servicing;

f. Dates and times of all periods of disconnection;

g. All alteration to the system.

FWP14.3.070.9 RESPONSE TIMES

Immediate answering of breakdown calls, whether true or false, and attendance to such calls in accordance with the requirements stipulated below -

Description	Requirements
Arrival for maintenance in the case of interruption of fresh water supply	Within 1 hour
Arrival for maintenance in the case of interruption of flush water supply	Within 2 hours
Resumption of fresh water supply	Within 9 hours after inspection
Resumption of flush water supply	Within 20 hours after inspection
Arrival for maintenance for incidents not affecting fresh or flush water supply	Within 2 hours (3 hours if call from outlying islands) during normal working hours; Within 3 hours out of normal working hours

FWP14.3.080.9 CONTACT POINTS

In connection with FWP14.3.040 to FWP14.3.060 above, the Sub-contractor shall submit the name and telephone number of the responsible persons to be contacted 24-hours a day together with the proposed schedule for the monthly regular maintenance visits at the start of the Maintenance Period.

FWP14.3.090.9 COMPETENCE OF ENGINEERS

1. Despatch competent and experienced maintenance personnel equipped with the appropriate testing instruments, tools, equipment etc. to inspect, service, test, adjust and maintain the fire service, rainwater harvesting system and water pump installation in a satisfactory operating condition. Allow for carrying out such inspection, service, testing, adjustment and maintenance at a time outside normal office hours including general holidays;

2. Particularly in the case of complex fire service, rainwater harvesting system and water pump installations, arrange for at least two senior servicemen being thoroughly familiarised with all aspects of such installation to be responsible for inspection, maintenance and testing of the installation. In this type of installation the Sub-contractor must be prepared to provide a high level of service, allowing for more frequent servicing of environmentally sensitive equipment and when necessary, to ensure prompt rectification of the faults resulting in unacceptably high rate of false alarms all at the expense of the Sub-contractor.

FWP14.3.100.9 24 HOUR ON-CALL SERVICE

1. The Sub-contractor shall provide 24 hour on-call service at any time during the Maintenance Period;
2. The Contract Manager may instruct the Sub-contractor, in the Maintenance Period, via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and Approved by the Contract Manager, to attend to reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel, who shall arrive at site and shall carry out any necessary inspection, testing and repair work within the time specified under FWP14.3.070 and under all weather conditions. In the event that it is not possible to meet the requirement as stipulated in FWP14.3.070, the Sub-contractor shall explain immediately to the Contract Manager or his or her representatives the reason for such non-conformance;
3. The Sub-contractor shall submit to the Contract Manager for this purpose at least two names of English speaking representatives, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for Approval;
4. Prior Approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers etc. during the Maintenance Period at least two weeks before the change is effected.

FWP14.4 PARTICULAR MAINTENANCE

FWP14.4.010.9 FIRE DETECTION AND ALARM SYSTEM

1. The Sub-contractor shall visit the installation at least once every three months to carry out tests, repairs and adjustment. All environmentally sensitive devices e.g. smoke and heat detectors, electronic sensors, relay contacts, plug and socket contacts, printed circuit boards, edge connectors etc. shall be inspected, cleaned, adjusted, and calibrated. During the visits, the following tests and checks should be made:

2. A test sequence shall be carried out in accordance with the manufacturer's instructions. The test sequence shall prove:

    a. That the condition of the wiring, controls and indicating equipment of all zone circuits are in good working order;

    b. That the alarm condition on each zone will activate the common alarm circuits. If manual fire alarm call points are fitted the alarm conditions shall also be initiated by the operation of one such call point in each zone. A different manual fire alarm call point shall be used on each occasion and a record must be kept by the Sub-contractor;

    c. That activating the common alarm circuits will result in the operation of the alarm bells and the satisfactory transmission of the alarm signal to the appropriate Fire Services Communication Centre if equipped with a direct line connection;

    d. Also that activating the common alarm circuits will result in the starting/stopping of the ventilating fans and/or fire booster pumps as desired and result in the operation of any Fireman's lift, if control circuits for such operation are provided in the system.

3. The operation of alarm bells and the transmission of the alarm signal may be suppressed during tests 1 and 2. Tests 3 and 4 will prove that all system alarms and relevant controls are operating correctly;

4. In the course of the test sequence, the correct operation of all indicators including fault warnings and all alarm bells shall be noted and checked. All indicating lamps shall be checked and, if found defective, shall be replaced by the Sub-contractor at his expense;

5. About 20% of the detectors, chosen at random, with at least one unit in each zone shall be subjected to a simulated functional test. Smoke detectors shall be tested with freon and rate-of-rise heat detectors with an artificial heat source e.g. hair dryer respectively;

6. Battery and chargers shall be examined and tested to ensure they are in good and proper serviceable condition. Battery terminals and connectors shall be tightened and the former shall be cleaned and protected with petroleum jelly. Electrolyte shall be topped up as necessary and its specific gravity shall be measured and corrected to the appropriate value if required. Battery shall also be discharged and recharged to ensure compliance with the AFA Rules;

7. The d.c. power supply to the alarm supervisory circuitry shall be checked and adjusted for correct voltage and stability;

8. In addition to above, the direct line connection to the Fire Services Communication Centre shall be tested once every 2 weeks by the Sub-contractor.

FWP14.4.015.9 AUDIO / VISUAL ADVISORY SYSTEM

1. The Sub-contractor shall visit the installation at least once every three months to carry out the following tests including necessary repairs and adjustment:

   a. All components, including cables, panels, power supply equipment and batteries, etc. shall be tested and examined as specified in FWP14.4.010 and ELE30;

   b. The audio advisory system shall be tested and examined as specified in ELE25.5.

FWP14.4.020.9 FIXED FIRE PROTECTION SYSTEMS USING GAS EXTINGUISHING AGENTS

The Sub-contractor shall visit each installation at least once every three months and carry out the following tests including necessary repairs and adjustments:

1. All electrical components, including cables, detectors, relays, alarm panel and bells, batteries etc. shall be tested and examined as specified in FWP14.4.010;
2. All automatic/manual release mechanism shall be checked and serviced in accordance with the manufacturer's instructions to ensure their proper operation. The Sub-contractor shall be responsible for ensuring that all such mechanisms are properly lubricated and kept free from corrosion;
3. All pipes and fittings shall be checked for leakage and corrosion and repaired or repainted as necessary. All valves shall be checked for freedom of operation and nozzles shall be cleaned by removing the dust, dirt and other obstacles deposited on them;
4. All cylinders containing the chemical extinguishing agents shall be checked to ensure that the contents are up to the specified standard and are so marked with paint on the outside of cylinders. The Sub-contractor shall recharge any cylinders to the specified content level if carbon dioxide cylinders are found to exhibit a 10% loss of content by weight except where the discharge (usually total) is due to genuine fire, false alarm or accident caused by others. However, where the discharge is due to a faulty detector or other part of the equipment the Sub-contractor shall recharge the system at his own expense;
5. All warning notices and operating instructions shall be checked to ensure that they are fixed in the proper position, are in a readable condition and are both in English and Chinese unless otherwise confirmed in writing by the Contract Manager;
6. All time delay and lock-off devices shall be inspected and tested to ensure that they are in correct working condition;
7. The coincident unit shall be checked for proper function by actuating detectors of two separate zones;
8. All ancillary functions of the system such as shutting off air-conditioning/ventilation plant, lowering fire shutters or curtains etc. shall be checked for proper operation.

FWP14.4.030.A WATER PUMP INSTALLATION AND FIXED FIRE SERVICES SYSTEMS USING WATER

The Sub-contractor shall submit for the CM’s approval the maintenance schedule indicating the dates for routine maintenance, and inspection check lists, for the quarterly, half-yearly and annual maintenance service before commencement of the Maintenance Period.

The Sub-contractor shall visit the fire services and water pump installation, including water pumps and the associated electrical works and controls, at least once every three months and carry out the following inspection, tests, adjustment and repairs:

1. All electrical components including cables, alarm panel and bells, batteries, control relays, starters etc. shall be inspected and tested as specified in FWP11 and FWP14.4.010 above;
2. All pipes and fittings shall be checked for leakage and corrosion and repaired or repainted as necessary. All valves shall be checked for freedom of operation, all control valves kept locked in the "open" position by strapping as applicable, inlet valves correctly bonded to earth, water supplies maintained in service etc.;
3. Inspection shall be carried out to ensure that all sprinkler heads are maintained in good working condition, clean and free from corrosion and are not covered with distemper, paint, dust, fluff etc.. Any sprinkler heads found defective and suspected of being defective shall be replaced;
4. Water and air pressure gauges must be inspected to ensure that correct pressures are maintained. Gauges shall be calibrated at regular intervals. Water levels and air pressure in pressure tanks must be checked to ensure that they are maintained in proper condition;
5. An alarm test shall be made on the sprinkler system by opening the test valve and the time taken to sound the alarm gong noted. The alarm shall be allowed to ring for about 30 seconds in order to ascertain that it is not ringing intermittently. Any repairs or adjustment which may prove to be necessary after the test shall be carried out with no delay;
6. The alarm and functional signals shall be checked to ensure that they are properly transmitted to the central control and supervisory panel;
7. All metallic elevated, priming and pressure tanks constructed by the Sub-contractor shall be inspected for sediments, rust and corrosion. The Sub-contractor shall remove sediments, rust and repaint the corroded parts as necessary;
8. The Sub-contractor shall grease the valves, the bearing and other relevant mechanical parts of the pumps, motors and engines as recommended by the manufacturers. A test run of at least 10 minutes shall be performed on each pump to ensure the pumping systems are in satisfactory operating condition. Engine driven pumps shall be capable of being started in 30 seconds or less. All manual and automatic starting and control mechanism, components, switches etc. shall be checked for proper functioning;
9. The Sub-contractor shall replace, as required, all parts such as bearings, valve seats, mechanical seal etc. due to wear and tear. In addition the Sub-contractor shall maintain in good working order the engines, the motors and also the electrical power supply to the pumps to and from its electrical isolator or switch-fuse, including changeover switches (if any), starters, fixed and flexible conduits between isolator/switch-fuse and cables therein. The Sub-contractor shall also maintain all pump control pressure and level switches in good order and inspect circuitry as previously indicated for electrical systems;
10. All strainers shall be cleaned by the Sub-contractor;
11. In addition to the above, the Sub-contractor shall carry out half-yearly the following maintenance service, including but not be limited to:
    a. Check condition of tie-rods and vibration eliminator;
    b. Check coupling alignment and cushions wear,
    c. Dismantle, clean and re-fix all ball float valves and replace rubber pad as necessary;
    d. Check and secure mounting of guide pipe and condition of bracket;
    e. Operate pump to check abnormal noise of pump set under operation;

f. Check condition of grease nipple for use;

g. Check abnormal vibration of operating pump set due to deterioration of mounting plate/ spring isolator/concrete plinth;

h. Check abnormal vibration due to breakage of mounting bracket/spring pipe hanger;

i. Operate pump to check proper operation of all pressure switches, level switches including sump tank low level switch and roof tank high/low level switches and adjust them as necessary;

j. Measure the pressure and flow rate of the pump and check the readings with last record to ascertain impeller/diffuser and wearing ring condition;

k. Check abnormal water leakage from the mechanical seal and replace the worn-out seal as necessary;

l. Check and keep free flow in the water drain pipe for seal leakage and clean it as necessary;

m. Check operation condition and any leakage of drain plug and vent cock, etc.;

n. Check the pressure of water hammer arrester, if any, and recharge it according to manufacturer's recommendation when necessary.

FWP14.4.040.9 PORTABLE EQUIPMENT

1. Portable equipment if supplied and installed by the Sub-contractor shall be inspected and checked annually to ensure that they are in good working condition;

2. Any fire extinguishers and fixed sprayer units losing 10% of its nominal content by weight shall be recharged / replaced to the required standard.

FWP14.4.060.9 RAINWATER HARVESTING SYSTEM INSTALLATION

1. The Sub-contractor shall provide the following maintenance service during the Maintenance Period:

   a. Check the condition of all components for the rainwater harvesting system installation according to the schedule as specified in sub-clause (2) of FWP14.4.060 and repair/replace the faulty component(s) as necessary;

   b. Conduct the water quality tests on the testing parameters according to the frequency as specified in sub-clause (3) of FWP14.4.060;

   c. Submit a monthly operation and maintenance report which shall record the operation data of the rainwater harvesting system installation including electricity, rainwater and fresh water consumption and the maintenance activities conducted for each month, every two month or each quarter;

   d. All monthly, bimonthly or quarterly activities shall be recorded in record book as specified in FWP14.3.060;

   e. Replenish all the necessary chemicals for the chlorine dosing system.

2. The maintenance schedules shall include, but not be limited to, the following components. The Sub-contractor shall submit a specific maintenance schedule including all the offered equipment and recommendations from the manufacturers for the Contract Manager's Approval.

System Component	Inspection / Maintenance	Required Schedule
a. Gutters / downpipes	Check that there is no leakage or blockage due to build up of debris;	Monthly (Apr – Sept) Bi-monthly (Oct – Mar) or the other months as

	Clean the gutters if necessary.	advised by the Contract Manager.
b. Gutter mesh / grating	Check the condition of the gutter mesh / grating and clean if necessary.	Monthly (Apr – Sept) Bi-monthly (Oct – Mar) or the other months as advised by the Contract Manager.
c. Vortex filter	Check the condition of the vortex filter and clean if necessary.	Monthly (Apr – Sept) Bi-monthly (Oct – Mar) or the other months as advised by the Contract Manager.
d. Pre-settlement tank	Check that there is no build up of sediments, drain and clean if necessary; Clean and remove all rubbish inside the stainless steel wire mesh bucket.	Monthly (Apr – Sept) Bi-monthly (Oct – Mar) or the other months as advised by the Contract Manager.
e. Cartridge filter	Check the condition of the filter and clean if necessary.	Monthly (Apr – Sept) Bi-monthly (Oct – Mar) or the other months as advised by the Contract Manager.
f. 2-way valves / pressure reducing valves	Check the condition of the 2-way valves / pressure reducing valves and clean if necessary.	Monthly (Apr – Sept) Bi-monthly (Oct – Mar) or the other months as advised by the Contract Manager.
g. Pipeworks and hangers	Check that there is no leakage and overflows are clear of obstruction; Inspect the integrity of hangers.	Annually in March or the other month as advised by the Contract Manager.
h. Rainwater collection tank / break tank	Check that there is no leakage and no build up of sediments; Drain and clean if necessary.	Monthly (Apr – Sept) Bi-monthly (Oct – Mar) or the other months as advised by the Contract Manager.
	Cleansing of water tanks.	Half-yearly in March and October or the other months as advised by the Contract Manager.
i. Chlorine dosing system	Check that there is no leak on the storage tank and check the condition of the chemical feed pump and clean if necessary.	Annually in March or the other month as advised by the Contract Manager.
	Check that the residual chlorine sensor operate properly in response to residual chlorine values.	Annually in March or the other month as advised by the Contract Manager.
	Calibrate the residual chlorine sensor.	As recommended by the manufacturer.

j. Pumps and pump control	Check that there is no leakage and no corrosion; Carry out test run; Carry out maintenance if necessary.	Annually in March or the other month as advised by Contract Manager.
k. Control and monitoring system	Check that the equipments are operating in satisfactory conditions, including the alarm functions where applicable.	Annually in March or the other month as advised by Contract Manager.
l. Water / power meters	Check that the meters can operate properly.	Annually in March or the other month as advised by Contract Manager.
	Replace the meters.	Every 5 years.
m. Level switch	Check that the level switch responds correctly to the water level in the tank.	Annually in March or the other month as advised by the Contract Manager.
n. Markings and warning notices	Check that warning notices, signs and pipework identification are correct and in place.	Annually in March or the other month as advised by the Contract Manager.

3. Sampling and testing of water quality parameters of treated rainwater shall be conducted monthly during rainy season (Apr – Sept) and quarterly during dry season (Oct – Mar).

   a. Testing reports issued by the accredited laboratory shall be forwarded to the Contract Manager within fourteen days after completion of the water quality test;

   b. If the testing results indicate that the testing samples exceeded the water quality standards as specified in sub-clause (2) of FWP14.1.120, the use of the rainwater harvesting system installation shall be suspended until the problem is resolved and to the satisfaction of the Contract Manager. System operation shall be investigated and subsequent re-sampling and testing shall be performed to confirm the results. Investigation report with remedial proposals shall be submitted for the Contract Manager's Approval prior to implementation of the proposed rectification works. The Sub-contractor shall be responsible for all the costs for investigation and rectification works;

   c. Proper measures to prevent health risk or nuisances to the public (e.g. limit the irrigation time and frequency or suspension of the use of Rainwater Harvesting System) shall be carried out according to the nature of the problems and possible consequences.

FWP14.4.070.9 PRV FAULT INDICATION SYSTEM

1. The Sub-contractor shall dispatch competent and trained technicians to carry out routine maintenance and servicing works for the PRV fault alarm indication system in order to maintain its proper working condition to the satisfaction of the CM;

2. A brief outline of the routine maintenance and servicing works required to be carried out by the Sub-contractor is given in this clause, which is by no means exhaustive. The Sub-contractor shall base on his own engineering judgement and recommendation of the manufacturers to include any other items of work which are essential to the proper and efficient operation of the system. Detailed maintenance proposal shall be submitted to the CM for approval;

3. The Sub-contractor shall provide the following maintenance service during the Maintenance Period:

Inspection / Maintenance	Required Schedule
a. Check the general conditions of the PRV fault alarm panel b. Check the proper functioning of indicating lights and buzzers at the central fault indication panels c. Check the connection of controlling cables / pipes d. Check any mechanical damages to cables e. Check any leakage from connection pipes and valves f. Check the setting of pressure switch	Quarterly
g. Check the proper functioning of pressure switch: (i) For ratio type pressure reducing valves at down-feeding pipework, close off the pressure switch valve at downstream side and open the pressure switch valve at upstream side to check if fault alarm is triggered and resume the position of the pressure switch valves after checking (ii) For pilot type pressure reducing valves at the incoming water supply pipework, apply a test pressure from the end cap valve to check if fault alarm is triggered and resume the normal setting after checking. h. Re-adjust pressure setting if required i. Check the proper functioning of local PRV fault indicating light adjacent to the pressure switch	Half-yearly

FWP14.5 ANNUAL AND FINAL MAINTENANCE, TESTING AND HANDOVER

FWP14.5.010.9 FIRE DETECTION AND ALARM SYSTEM

At the annual and final inspection, the Sub-contractor shall, in addition to the quarterly inspection and testing, take down all smoke detectors, clean them "in-situ" in accordance with the manufacturer's instructions, test them for correct operation with the manufacturer's test set before reinstating them for service. Any defective detectors shall be replaced or "factory cleaned" to the manufacturer's recommendation before reinstated for service. Any smoke detectors subjected to dust and dirt accumulating shall also be despatched for factory cleaning as instructed by the Contract Manager. All detectors removed for factory cleaning shall be replaced with spare units or alternatively a separate surveillance system shall be provided to cover the unprotected areas as resulted. All expenses for the above work shall be born by the Sub-contractor.

FWP14.5.015.9 AUDIO / VISUAL ADVISORY SYSTEM

The Sub-contractor shall carry out the same extent of work as the quarterly inspection, testing and maintenance services stipulated in FWP14.4.015.

FWP14.5.020.9 FIXED FIRE PROTECTION SYSTEMS USING GAS EXTINGUISHING AGENTS

The Sub-contractor shall carry out the same amount of work as the quarterly inspection, testing and maintenance services.

FWP14.5.030.9 WATER PUMP INSTALLATION AND FIXED FIRE SERVICES SYSTEMS USING WATER

At the annual and final inspection, the Sub-contractor shall, in addition to the quarterly inspection and testing, carry out the following inspection, tests, adjustment and repairs as required:

1.

a. Inspection and testing and by means of wet drill on the hydrant and hosereel installation shall be carried out in accordance with the FSD requirement. The wet drill shall consist of coupling lengths of hose to two or more hydrants and opening the valve to produce water at the nozzles. Great care and precise liaison with all concerned must be exercised by the Sub-contractor to guard against flooding and water seepage. The Sub-contractor shall be liable to bear the full cost of any damage due to flooding and seepage. Hydrants not used at the wet drill shall each be fitted with a blank cap over the outlet, and checked by opening and closing the valve and spindle to ensure that they are free in operation;

b. Testing of the pressure and flow of the water supply on the hydrant and hosereel installation should be done from the outlets at the highest point. The opening of two or more outlets and directing the water from the roof tanks should be sufficient to indicate the state of the water supply, but if there is any doubt as to the flow or pressure of the water, a more accurate test with suitable gauges should be carried out.

2. Each length of hose shall be uncoiled, laid out straight and examined;

3. The test shall be made with the drain and test valves in accordance with LPC Sprinkler Rules;
4. The concrete water tanks constructed by the Main Contractor shall be inspected for rusting and sediments. The sub-contractor shall inform the Contract Manager in writing if any cleaning and rectification on the tanks are necessary.

FWP14.5.040.9 PORTABLE EQUIPMENT

The Sub-contractor shall carry out annual and final inspection as FWP14.4.040.

FWP14.5.050.9 TESTS AT EXPIRY OF MAINTENANCE PERIOD

At the end of the Maintenance Period the Sub-contractor shall repeat the following tests to the satisfaction of the Contract Manager.

1. All function test for water pumps and pump control cubicles;
2. Cleaning all strainers.

FWP14.5.060.9 FINAL ACCEPTANCE TEST AND CERTIFICATE OF MAINTENANCE FOR FIRE SERVICES INSTALLATIONS

At the end of the Maintenance Period, the Sub-contractor shall ensure that the installations are in an "as-new" condition and shall carry out a final acceptance test for the fire services, rainwater treatment and water pump installation. A Certificate of Maintenance (FS 251) shall be submitted to FSD with a copy to the Contract Manager within 14 days after the annual and final tests. The certificate together with a list of the fire services installation and equipment shall also be copied, framed and displayed in a prominent area of each building concerned under the direction of the Contract Manager.

FWP14.5.070.9 HANDOVER

The services installations will not be deemed as acceptable for handover to the Contract Manager until each installation is in good working order and all "as-fitted" drawings, instruction and maintenance manuals, spare parts lists, test reports, test certificates etc. have been submitted to the Contract Manager.

FWP14.6 RESPONSIBILITIES

FWP14.6.010.9 SAFETY OF INSTALLATIONS

The Sub-contractor shall be responsible for all repairs necessary to maintain the installations in a safe, reliable and operative condition at all times. Ensure that servicing staff carry out necessary repairs immediately, utilising manufacturer's original replacement parts. Any component taken down for servicing shall be reinstated within 2 hours or otherwise replaced by a spare unit at the Sub-contractor's expense.

FWP14.6.020.9 INTERRUPTION OF FIRE SERVICES

The Sub-contractor shall ensure minimum interruption to the functioning of the fire service installation during each inspection, testing, repair or maintenance service. He shall inform FSD of the commencement and completion of each job whenever the disconnection, reconnection or testing of the fire services communication direct line is involved. Where any part of the fire service installation is out of service temporarily during the progress of work, the Sub-contractor shall place a suitable notice in a prominent position on the Control Panel so that the client is aware of the situation and FSD will not be called out unnecessarily. This is, however, not to be construed as an authority to leave any part inoperative for an undue length of time.

FWP14.6.030.9 REPLACEMENTS

1. The Sub-contractor shall, as and when instructed thereof by the Contract Manager, repair or replace at his own cost any part of the system proved to be defective by reason of Sub-contractor's negligence, faulty design, inadequate routine maintenance and supervision, workmanship or materials. No claim whatsoever shall be made by the Sub-contractor for such repair or replacement if it is within the scope of the Sub-contractor's responsibility;
2. Any renewals or repairs necessitated by reason of negligence or misuse of the equipment or by reason of any other cause beyond the Sub-contractor's control (with the exception of ordinary wear and tear) shall be carried out at an additional cost with prior notice to the Contract Manager.

FWP14.6.040.9 CONDITIONS OF CONTRACT

1. The maintenance and servicing works as described in FWP14 form part of the Main Works under Clause 8.3(2)(c) of the General Conditions of Main Contract;
2. The Sub-contractor's attention is drawn to Clause 5.13 of the General Conditions of Main Contract, which appertains throughout the Maintenance Period, and before commencing any work ordered under Clause 10.1 of the General Conditions of Main Contract, the Sub-contractor shall, at his own expense, make all suitable arrangements to avoid damage to property or installations provided by others.

FWP15 SYSTEM COMPONENTS

FWP15.1 SYSTEM COMPONENTS 3

FWP15.1.010.9 CARTRIDGE FILTER 3
FWP15.1.020.9 CHLORINE DOSING 3
FWP15.1.030.A FLOW METER 4
FWP15.1.040.9 WATT-HOUR METERS 4
FWP15.1.050.9 CONTROL SYSTEM 4
FWP15.1.060.9 PRE-SETTLEMENT TANK 5
FWP15.1.070.9 2-WAY VALVE 5

FWP15.1 SYSTEM COMPONENTS

FWP15.1.010.9 CARTRIDGE FILTER

1. Cartridge filter shall be capable to remove 90% of all suspended particulate with diameter equals ten-micron or above;
2. The filter cells shall be assembled in cartridges for easy replacement on site;
3. The filter cells shall be so arranged that the water stream passes uniformly and proportionally through the filter cells. Provision shall be made to retain filter in position and prevent migration and settlement;
4. Filter vessel shall be made of stainless steel of BS EN 10088-1 grade 1.4301 (grade 304) or equivalent. All stainless steel components shall be mirror polished and electro polished to resist adhesion of dirt and scale;
5. Vessel shall be equipped with both automatic air vent and manual air vent;
6. Pressure gauges shall be mounted on vessel for reading the differential pressure before and after the filter for sensing blockage of filter;
7. Working pressure of cartridge filter shall not be less than 10 bar and the testing pressure shall be of 1.5 times of the working pressure;
8. Cartridge filter shall be preassembled and tested by the manufacturer with satisfactory results prior to delivery. Test report for each delivered cartridge filter shall be submitted to the Contract Manager for Approval.

FWP15.1.020.9 CHLORINE DOSING

1. The chlorine dosing system shall comprise of a chemical feed pump, probe type residual chlorine sensor, a chemical storage tank and associated pipework. The chlorine dosing system shall have adequate and adjustable chemical feed rate to achieve the required residual chlorine level under the system flow rate;
2. The chemical feed pump shall be of positive displacement reciprocating diaphragm design with a manually adjustable feed rate;
3. The chemical feed pump shall be gear-driven by close-coupled a.c. motor suitable for operation on the local power supply system. Each pump set shall be a self-contained package unit consisting of a pump, a driving motor and a totally enclosed gear case;
4. The probe type residual chlorine sensor shall conform to the standards of CE, UL listed and CUL;
5. The probe type residual chlorine sensor shall be able to continuously monitor the concentration of chlorine in the collected water at the rainwater collection tank and control the chlorine dosing system to automatically adjust the chemical feed rate once the residual chlorine level deviates from the pre-set values;
6. The probe type residual chlorine sensor shall cope with the concentration of chlorine and the Sub-contractor shall demonstrate the compliance to the satisfaction of the Contract Manager;
7. The chemical storage tank shall be made of a suitable material to contain sodium hypochlorite solution. The tank shall be capable to be replaced without interrupting the rainwater harvesting system installation;
8. Chlorination shall be effected by injecting dosage at the bottom of rainwater collection tank.

FWP15.1.030.A FLOW METER

1. Flow meters shall be provided as shown on the Drawings. The installation of the flow meter shall follow the manufacturer's recommendation with sufficient length of straight pipe run both at the upstream and downstream piping;
2. The flow meter shall be of electromagnetic or ultrasonic type, and of the cumulative type, i.e. a cumulative volume of water passing through the device in litre or cubic meter, and shall be suitable for the chemical and physical properties of the fluids to be measured and suitable for both horizontal and vertical installations;
3. Each flow meter shall consist of the flow sensor, an integral signal converter / transmitter and a digital display unit. The flow sensor shall be installed in / on the water pipework without obstructing the flow. The protection class of the sensor and converter / transmitter housing shall be at least to IP 67 and IP 65 respectively. The flow meter shall have a constant accuracy to a maximum error of ±0.5% of the actual flow for flow velocity of greater than or equal to 0.5 m/s;
4. The flow meter shall conform to BS EN IEC 61000-3-2, BS EN IEC 61000-6-1, BS EN IEC 61000-6-2, BS EN IEC 61000-6-3 and BS EN IEC 61000-6-4 or similar international standards on Electro-magnetic Compatibility (EMC) compliance for industrial and commercial applications.

FWP15.1.040.9 WATT-HOUR METERS

1. Watt-hour meters shall be provided by the Sub-contractor to monitor the electricity consumption of chlorine dosing equipment in Rainwater Harvesting System Treatment Facility Room and rainwater irrigation pumps when installed at strategic locations approved by the Contract Manager;
2. Watt-hour meters shall comply with IEC 62053-11 and shall have Class 2 accuracy calibrated at the normal working voltage and frequency.

FWP15.1.050.9 CONTROL SYSTEM

1. A control and metering system shall be provided and installed in each plant room for rainwater harvesting system installation to allow standalone control and monitoring of the entire rainwater harvesting system installation. The following functions, but not be limited to, shall be available and performed by the control system:
    a. Automatic control and monitoring upon receipt of monitoring signals from different equipment;
    b. Manage all circuits or signals from different equipment to be monitored, including chlorine dosing system, level control switches of the rainwater collection tank, 2-way valves and rainwater irrigation pump sets;
2. The control system shall monitor the status of rainwater collection tank level control switches to provide on/off control for the 2 number of inter-connected 2-way valves to control water being either fed from the rainwater collection tank or fresh water break tank as specified in FWP2.3.2.010;
3. The Sub-contractor shall provide a local control panel to monitor and allow manual control of the equipment at Rainwater Harvesting System Treatment Facility Room, which shall include, but not limited to the following:
    a. Local on/off switches for chlorine dosing system;
    b. Position indication for the 2-way valves (harvested rainwater / potable water / isolation);

c. Audible and visual fault alarms for any fault of equipment monitored by the control panel, chlorine dosing system, rainwater collection tank level control switches and 2-way valves. The fault signal when triggered shall be transmitted to the security guard counter;

d. Full / empty status of rainwater collection tank;

e. Malfunction of chlorine dosing system;

f. Empty status of chlorine dosing system (if bleaching agent tank used);

g. Blockage of cartridge filter;

h. Opening status of inlet valve of rainwater collection tank;

i. Pressure reducing valve clogging.

4. The Sub-contractor shall provide a local control panel to monitor and allow manual control of the equipment at Rainwater Irrigation Pump Room, which shall include, but not be limited to the following:

a. Local on/off switches for rainwater irrigation pump sets;

b. Operation status indication lamps for rainwater irrigation pump sets;

c. Audible and visual fault alarms for rainwater irrigation pump sets. The fault signal when triggered shall be transmitted to the security guard counter;

d. Audible and visual alerts for the need to prime rainwater irrigation pump sets.

FWP15.1.060.9 PRE-SETTLEMENT TANK

1. A pre-settlement tank shall be provided by the Main Contractor inside the rainwater collection tank. Debris and leaves shall be separated from the collected rainwater there with sand and mud settling at the bottom of the pre-settlement tank. The collected rainwater shall overflow into the adjacent storage compartment through a coarse stainless steel screen. Stainless steel shall be of Grade 1.4301 (Grade 304) in accordance with BSEN 100881-1;

2. The Sub-contractor shall provide a perforated or wire mesh stainless steel bucket inside the pre-settlement tank. The bucket shall be easily taken out for removal of the collected debris. Stainless steel shall be of Grade 1.4301 (Grade 304) in accordance with BSEN 100881-1;

3. The bucket of the pre-settlement tank shall be divided into two (or more) mesh buckets each of different mesh sizes if it is too large to perform maintenance. The one closer to the inlet shall have larger mesh and its height shall be lower than the water inlet to avoid possible blocking by accumulated debris. The design of the bucket shall be approved by the Contract Manager.

FWP15.1.070.9 2-WAY VALVE

1. 2-way valve shall be an assembly consist of a valve, an actuator and a controller in a cartridge assembly;

2. 2-way valve shall be of on-off control operated by the actuator via controller and allow/prevent water flowing through the valve at on/off position respectively;

3. Valve shall be controlled by level control switches at rainwater collection tank as specified in FWP2.3.2.010;

4. The valve assembly shall operate at low voltage and be of low power consumption;

5. The valve assembly shall operate silently and without water hammer.

FWP16.5 TESTING COMMISSIONING AND MAINTENANCE 7
FWP16.5.010.9 TESTING AND COMMISSIONING 7
FWP16.5.020.9 MAINTENANCE 7

FWP16.1 SCOPE OF WORK

FWP16.1.010.9 APPLICATION

1. The Specification in this Worksection FWP16 is applicable only for the Lift Pit Dewatering System;
2. During incidental water flooding of the lift pits in the domestic and non-domestic blocks, the lift pit dewatering system shall enable automatic dewatering at sump pit of lift pit access corridor as shown on the Drawings and initiate alarms at the flooding alarm panel.

FWP16.1.020.9 PROVISIONS

1. The Sub-contractor shall supply and install the following items for the Lift Pit Dewatering System for each lift pit access corridor as shown on the Drawings –
   a. Two sets of submersible dewatering pumps completed with integrated float switches at the sump pit;
   b. System components including but not limited to UPVC ball valves, UPVC ball check valves, stainless steel camlock couplings, PVC braided hoses and stainless steel hose clamps. UPVC pipes and fittings connecting the dewatering pumps and the system components shall refer to FWP3.1.2.045;
   c. Flooding sensors completed with stainless steel mounting strip at the sump pit;
   d. A flooding alarm panel completed with battery and charger at G/F guard counter or at a location shown on the Drawings;
   e. Signal wiring of PVC cables in concealed conduits, connecting between the cable changing box and the flooding alarm panel; and
   f. Cable changing box to IP55 constructed of epoxy coated galvanised steel sheet on the wall above the sump pit for connecting the PVC signal cables to the multicore cables for the flooding sensors. The multicore cables shall run on galvanized steel cable tray and anchored on a stainless steel flat strip fixed into the sump pit as shown on the Drawings.
2. The Sub-contractor shall supply the following items for each individual block at G/F fresh water pump room–
   a. One set of residue dewatering pump kept in a lockable cabinet; and
   b. One set of rubber hose of a length of 50 m or the length from the nearest water point at G/F to the sump pit at the lift access corridor whichever is the longer; the rubber hose shall be fitted with heavy duty stop cock and discharge nozzle and rolled in a hose reel trolley; the internal bore of the hose tubing shall be not less than 15 mm.
3. The Sub-contractor shall submit technical literatures and/or samples of the above materials for Approval prior to ordering;
4. The Sub-contractor shall coordinate with the Main Contractor for the connection of the system components to piping provided by the Main Contractor for discharging the pumped water to external drain point;
5. The Sub-contractor shall coordinate with the sub-contractor for electrical installation for positioning of 16 A industrial type and 13 A weatherproof type switched socket outlets provided by the sub-contractor for electrical installation;
6. The Sub-contractor shall perform testing and commissioning of all installed and supplied items and provide routine maintenance during Maintenance Period.

FWP16.2 DEWATERING PUMPS

FWP16.2.010.9 SUBMERSIBLE DEWATERING PUMP

1. The submersible dewatering pump shall be a free standing basin water uplifting pump;
2. The pump shall be of robust and durable construction with epoxy coated cast iron or stainless steel casing and with a top lifting handle;
3. The pump shall be equipped with level adjustable waterproof float switch for automatic pump cut-in and cut-out operation; the activation level of float switch for pump cut-in shall be not more than 600 mm measured from bottom;
4. The pump discharge outlet shall be fitted for connection of a 50 mm diameter PVC hose by stainless steel pipe clamps;
5. The pump shall enable to discharge water at a nominal flow rate of 4 litre/s at a pump head necessary for discharging the pumped water from the level of sump pit at the lift pit access corridor up to the ceiling height of G/F and then to an external drain point. The nominal pump head is shown on the Drawing which subject to the detailed calculation and pump curve submitted by the Sub-contractor;
6. The pump shall be equipped with dry induction motor and mechanical seal;
7. The pump motor shall be of single phase and with built-in thermal auto-cut protection;
8. The pump shall be supplied with factory connected submersible PVC cable of not less than 3 m long with industrial type 16 A power plug.

FWP16.2.020.9 RESIDUE DEWATERING PUMP

1. The residue dewatering pump shall be a portable free standing submersible pump and fitted with a residue adaptor where necessary, to enable draining residue water in a sump pit down to 1 mm water level;
2. The pump shall be of lightweight robust construction with casing of glass-fibre reinforced resin or materials approved by CM, with a top lifting handle;
3. The pump shall be equipped with a top discharge bore with hose coupling of 25 mm in diameter;
4. The pump shall enable to discharge water at a nominal flow rate of 0.5 litre/s at a pump head of 2 m;
5. The pump motor shall be of single phase with built-in thermal auto-cut protection;
6. The pump shall be supplied with factory connected submersible PVC cable of not less than 5 m long with 13 A power plug.

FWP16.3 SYSTEM COMPONENTS

FWP16.3.010.9 UPVC BALL VALVE

1. The UPVC ball valve shall consist of a spherical valve element allowing for a straight flow path and low fluid resistance;
2. The body, stem and spherical valve element of the valve shall be constructed of UPVC;
3. The valve shall be operated by handle lever for shut-off;
4. The valve shall be of true union type so that the valve part can be removed without disconnecting the pipes, by unscrewing the union nuts on both side;
5. The valve shall be of socket end connection by adhesive;
6. The valve shall have a working pressure of not less than 10 bar;
7. The valve shall be affixed with a label indicating "Normally Open 常開".

FWP16.3.020.9 UPVC BALL CHECK VALVE

1. The UPVC ball check valve shall consist of a spherical solid ball element allowing for a straight flow path and low fluid resistance;
2. The valve body and ball of the valve shall be constructed of UPVC;
3. The valve shall be of true union type so that the valve part can be taken down for cleansing without disconnecting the pipes, by unscrewing the union nuts on both side;
4. The valve shall be of socket end connection by adhesive;
5. The valve shall have a working pressure of not less than 10 bar.

FWP16.3.030.9 STAINLESS STEEL CAMLOCK COUPLING

1. The stainless steel camlock coupling shall consist of a pair of male and female fittings;
2. The camlock coupling shall be constructed of stainless steel to AISI 316 grade or equivalent;
3. The female fitting with cam levers shall have screwed male end connection with threads complying with BS EN 10226-1, 2, 3;
4. The male fitting shall have a hose shank for connection of flexible hose;
5. Safety clips shall be equipped to lock cam levers to prevent disconnection.

FWP16.3.040.9 PVC BRAIDED HOSE

1. The PVC braided hose shall be constructed of flexible clear PVC sheath embedded with braided steel reinforcement wire;
2. The sheath shall be not less than 6 mm thick for a hose of bore of 50 mm in diameter;
3. The working pressure of the hose shall be not less than 4 bar;
4. The PVC braided hose shall connect to the dewatering pump and the male fitting of camlock coupling by hose clamps made of stainless steel to AISI 316 grade or equivalent.

FWP16.4 FLOODING ALARM

FWP16.4.010.9 FLOODING SENSORS

1. Each flooding sensor shall be a micro-switch encapsulated in waterproof and corrosion proof float body made of polypropylene or equivalent;
2. Two flooding sensors shall be anchored by submersible multi-core PVC sheathed cables at different levels on a flat strip made of AISI grade 316 stainless steel, fixed into the sump pit at the lift pit access corridor as shown on the Drawings;
3. The flooding sensors shall trigger alarm signals for initial flooding alarm and sump pit overflow alarm respectively.

FWP16.4.020.9 FLOODING ALARM PANEL

1. The flooding alarm panel shall be lockable and made of epoxy coated galvanised steel sheet;
2. The panel shall be equipped with LED alarm indicators, buzzer, mute button, lamp test button and reset key switch;
3. The panel display arrangement of the alarm signals and labelling shall be in accordance with the Drawings;
4. The panel shall be operated from a 24V battery and charger as specified in FWP10.6.020, FWP10.6.040, FWP10.6.050 and FWP10.6.060.

FWP16.5 TESTING COMMISSIONING AND MAINTENANCE

FWP16.5.010.9 TESTING AND COMMISSIONING

Testing and commissioning for the installation shall generally be in accordance with Works Sub-section FWP14.1 where appropriate, with the exception of the following Clauses – FWP14.1.060, FWP14.1.080, FWP14.1.090, FWP14.1.100, FWP14.1.105, FWP14.1.120 and FWP14.1.130 which are not applicable to the installation.

FWP16.5.020.9 MAINTENANCE

1. General maintenance shall be carried out in accordance with Works Sub-section FWP14.3 where appropriate;
2. Particular maintenance shall be carried out in accordance with FWP14.4.030 where appropriate. During the quarterly inspection, notwithstanding the routine maintenance as specified, the Sub-contractor shall undertake the following procedures:
   a. Connect rubber hose of the hose reel trolley to the nearest water point in G/F;
   b. Fill water to the sump pit in the access corridor by the rubber hose;
   c. Test automatic operation of each submersible dewatering pump one by one;
   d. Check proper functioning of ball check valves. Where necessary, unscrew the union nuts and take down the valves for cleansing;
   e. Check proper functioning and indication of the flooding sensors and the flooding alarm panel;
   f. Use the residue dewatering pump to empty residue water out of the sump pit;
   g. Replace any defective items within the Maintenance Period.
3. Annual and final maintenance, testing and handover shall be carried out in accordance with FWP14.5.030, FWP14.5.050 and FWP14.5.070 where appropriate.

FWP17 MULTITRADE INTEGRATED MECHANICAL, ELECTRICAL AND PLUMBING (MIMEP) 3

FWP17.1 SCOPE OF WORKS 3
FWP17.1.010.N EXTENT OF APPLICATION 3

FWP17.2 PARTICULAR REQUIREMENTS OF MIMEP MODULE 4
FWP17.2.020.N WATER PUMP SET MODULE 4
FWP17.2.030.N FIRE HYDRANT RISER MODULE 4
FWP17.2.040.N PRESSURE REDUCING VALVE SET MODULE 5
FWP17.2.050.N SPRINKLER SUBSIDIARY STOP VALVE SET MODULE 5
FWP17.2.060.N SPRINKLER CONTROL VALVE SET MODULE 5
FWP17.2.070.N DRENCHER DELUGE VALVE SET MODULE 5

FWP17 MULTITRADE INTEGRATED MECHANICAL, ELECTRICAL AND PLUMBING (MiMEP)

FWP17.1 SCOPE OF WORKS

FWP17.1.010.N EXTENT OF APPLICATION

1. The Sub-contractor shall design, assemble and install the off-site / on-site prefabricated MiMEP modules, including but not limited to the following items, for on-site assembly and installation:
   a. Two sets of fresh water pump for each domestic block;
   b. Two sets of flush water pump for each domestic block;
   c. A fresh water booster pump system on roof for each domestic block;
   d. Two sets of fire services feed pump for each domestic block;
   e. One set of night duty pump for fresh water for each domestic block;
   f. Fire hydrant risers;
   g. Pressure reducing valves at the incoming water supply pipework;
   h. Pressure reducing valves in Fire Services Systems;
   i. Sprinkler subsidiary valve sets;
   j. Sprinkler control valve sets;
   k. Drencher deluge valve sets.
2. The complete MiMEP module shall mean, not only the major equipment, all associated electrical works, pipework and system components such as pressure switches, pressure gauges, flexible connectors, valves and strainers as shown on the Drawings, but all the incidental supporting frame / hanger, lifting lugs and sundry components necessary for the complete on-site assembly and installation, whether or not these supply components are mentioned in detail in the tender documents.

FWP17.2 PARTICULAR REQUIREMENTS OF MiMEP MODULE

FWP17.2.020.N WATER PUMP SET MODULE

1. The module shall comprise pump, motor, header pipes, sectional pipework, valves, fittings, baseplate and the mounting framework as appropriate;
2. The baseplate and anti-vibration provisions should be integrated into the water pump set module as far as practicable subject to the consideration of volume, weight, transportation and delivery of the modules;
3. The baseplate shall be sufficiently rigid and properly supported as detailed in FWP6.6.020.8 such that it will not deflect during transportation and delivery. The pump set and baseplate shall be fixed in place by locking anchor bolts cast or grouted in the concrete inertia block at Site or pump base and passing through holes accurately pre-drilled in the baseplate;
4. The baseplate shall be fixed with necessary framework of the same construction material for the suitable mounting / support of piping, electrical and piping accessories etc. Footings of framework shall be designed with pre-drilled holes for direct mounting onto the concrete inertia block / floor slab with rubber or neoprene pads for vibration isolation;
5. Suitable mechanical or flange joints shall be allowed for the interface connections between the pump set module and the in-situ water pipes at the plant room. Other pipe joint arrangement can be proposed for the approval by the CM;
6. For fresh water booster pump system on roof, the control cubicle, variable speed drive units, pneumatic pressure vessels and related provisions should be integrated into the pump set module subject to the consideration of volume, weight, transportation and delivery of the modules;
7. The following items may be exempted from MiMEP implementation. The Sub-contractor shall submit respective substantiation to demonstrate the site constraints and limitations for approval by the CM.
    a. Fresh / flush water feed pumps connecting to outlet pipe of nominal size above 80mm;
    b. Fire services feed pumps connecting to outlet pipe of nominal size above 50mm;
    c. Night duty pumps connecting to outlet pipe of nominal size above 50mm.

FWP17.2.030.N FIRE HYDRANT RISER MODULE

1. The module shall comprise pipework and fittings for the on-site assembly of a hydrant outlet or pressure reducing hydrant outlet;
2. The riser shall be pre-cut to the length that suit the floor to floor height of each individual landing for on-site or off-site assembly of a hydrant outlet or pressure reducing hydrant outlet and associated pipe brackets;
3. In case of off-site assembly, the Sub-contractor shall carry out and report on dimensional checking and chemical composition analysis against inferior materials and faulty workmanship on hydrant outlets / pressure reducing hydrant outlets delivered to the off-site workshop / off-site prefabrication yard according to the mechanism as detailed in FWP7.1.040;
4. All hydrant outlets / pressure reducing hydrant outlets shall comply with Clauses FWP7.1.020, FWP7.1.040 and FWP7.1.070.

FWP17.2.040.N PRESSURE REDUCING VALVE SET MODULE

1. The module shall comprise two sets of pressure reducing valve, pipework, fittings, gate valves, pressure gauges, pressure switches, associated accessories including identification plates, earth bonding and steel framework as an integrated assembly for direct mounting to the building structure;
2. All pipework, components and devices shall be assembled and properly fixed to the framework and completed with hangers, brackets, saddles, guide etc. Pipework supports shall be welded, screwed or bolted to the framework. The framework shall be designed with pre-drilled holes for onsite direct fixing to building structures;
3. Pressure reducing valve of nominal sizes above 80mm may be exempted from MiMEP implementation. The Sub-contractor shall submit substantiation to demonstrate the site constraints and limitations for approval by the CM.

FWP17.2.050.N SPRINKLER SUBSIDIARY STOP VALVE SET MODULE

1. The module shall comprise subsidiary stop valve, pipework, fittings, flow alarm switch, monitor modules, gate valves, associated accessories including earth bonding and steel framework as an integrated assembly for direct mounting to the building structure;
2. Sprinkler subsidiary valve of nominal sizes above 100mm may be exempted from MiMEP implementation. The Sub-contractor shall submit substantiation to demonstrate the site constraints and limitations for approval by the CM.

FWP17.2.060.N SPRINKLER CONTROL VALVE SET MODULE

1. The module shall comprise the completed sprinkler control valve set as detailed in FWP2.1.5.070.8 and associated accessories including wirings of completed circuits within the module, identification plates, earth bonding and steel framework as an integrated assembly for direct mounting to the building structure;
2. All pipework, components and devices shall be assembled and properly fixed to the framework and completed with hangers, brackets, saddles, guide etc. Pipework supports shall be welded, screwed or bolted to the framework. The framework shall be designed with pre-drilled holes for onsite direct fixing to building structures. Provisions shall be allowed to facilitate the transportation, delivery, assembly and services connection on Site;
3. Sprinkler control valve of nominal sizes above 100mm may be exempted from MiMEP implementation. The Sub-contractor shall submit substantiation to demonstrate the site constraints and limitations for approval by the CM.

FWP17.2.070.N DRENCHER DELUGE VALVE SET MODULE

1. The module shall comprise the drencher deluge valve set completed with pressure gauges, valves, alarm devices, manual actuation devices, water motor gongs, testing facilities etc. and associated accessories including wirings of completed circuits within the module, identification plates, earth bonding and steel framework as an integrated assembly for direct mounting to the building structure;
2. All pipework, components and devices shall be assembled and properly fixed to the framework and completed with hangers, brackets, saddles, guide etc. Pipework supports shall be welded, screwed or bolted to the framework. The framework shall be designed with pre-drilled holes for onsite direct fixing to building structures. Provisions shall be allowed to facilitate the transportation, delivery, assembly and services connection on Site;
3. Drencher deluge valve of nominal sizes above 100mm may be exempted from MiMEP implementation. The Sub-contractor shall submit substantiation to demonstrate the site constraints and limitations for approval by the CM.

_____/_____

1. Pursuant to sub-clause (3) of Specification Clause No. FWP1.6.050, we attach for CM's processing / signing the following WSD Form(s) –

(please tick the box(s) whichever relevant)

(a) ☐ **WWO 542** Application for Water Supply / Request for Work to be Carried out by the Water Authority

(b) ☐ **WWO 46** ☐ **Part I** ☐ **Part II** ☐ **Part IV** Application for Constructing / Installation, Altering or Removing an Inside Service or Fire Service

2. We confirm that the above WSD Form(s) undercover of this declaration have been checked / verified by the Licensed Plumber, the FS&WP Installation Sub-contractor and the Main Contractor. We hereby declare that -

(please tick the box(s) whichever relevant)

☐ The data entry in the Form is accurate.

☐ The pipes and fittings to be installed and any materials to be used for the construction, installation, alteration or removal of the Approved water services works for fire services and water pump installation covered by this Form, including those as listed on the attached Annex to this Form and those not listed, shall be as prescribed by the Waterworks Regulations.

☐ The pipes and fittings installed and any materials used for the construction, installation, alteration or removal of the Approved water services works for fire services and water pump installation covered by this Form are as prescribed by the Waterworks Regulations.

☐ The water services works for fire services and water pump installation for the captioned Sub-contract have been completed in accordance with WSD Approved Drawings, WSD Circular Letters in force, the Specification and statutory requirements.

1. Pursuant to sub-clause (4) of Specification Clause No. FWP1.6.050, we confirm that water services works for fire services and water pump installation for the captioned Contract have been completed. We hereby declare that -

   a. All pipes and fittings installed on Site have been approved by WSD and registered with WSD under Form WWO 46;

   b. Only cadmium-free category brazing alloy and lead-free category soldering alloy are used;

   c. All pipes and fittings installed and any materials used for the constriction and installation of the water services works for fire services and water pump installation are as prescribed by the Waterworks Regulations and approved by the Water Authority.

2. The Licensed Plumber's inspection report of the completed water services works for fire services and water pump installation is submitted herewith.

LTE1.1 SCOPE OF SPECIFICATION AND DEFINITIONS

LTE1.1.010.9 SCOPE OF SPECIFICATION

This Specification covers the lift and escalator installation undertaken for the Hong Kong Housing Authority.

LTE1.1.020.9 SPECIFICATION AND DRAWINGS

The lift and escalator installation shall comply in every respect with this Specification unless otherwise specified in the Project Specific Specification (PSS) and on the Drawings for a particular project, or modified by the written instructions of the Contract Manager.

LTE1.1.030.9 DEFINITIONS AND INTERPRETATIONS

In this Specification, the word "shall" is mandatory, the word "will" is informative, the word "should" is advisory and the word "provide" means supply and fix, or supply and install including testing and commissioning. In addition, the following words shall have meanings herein assigned:

1. "Sub-contractor"

   The person, firm or company contracting for the Lift Installation, the Escalator Installation or the Lift and Escalator Installation including his or their personal representative, successors or permitted assigns.

2. "Electrical Sub-contractor"

   The person, firm or company contracting for the Electrical Installation including his or their personal representatives, successors or permitted assigns.

3. "Fire Services Sub-contractor"

   The person, firm or company contracting for the Fire Services and Water Pump Installation including his or their personal representatives, successors or permitted assigns.

4. "Regulations"

   Any Ordinances or Regulations published by the Government, by-laws of any local or duly constituted authority and rules or regulations of public bodies and companies which may be applicable to the Sub-contract Works.

5. "Machine-room-less Lift"

   A lift installation where all its driving machinery and safety components are installed inside the lift well and the requirement for a lift machine room is not necessary.

LTE1.2 STATUTORY OBLIGATIONS AND REGULATIONS AND GENERAL PRACTICE

LTE1.2.010.A STATUTORY REGULATIONS

The Sub-contractor shall comply with all Regulations and requirements including those of the Government of the Hong Kong Special Administrative Region, the Hong Kong Fire Services Department (FSD), the Building Authority, the Electrical and Mechanical Services Department (EMSD) and the relevant Power Supply Company, together with any revisions or amendments made thereto, and shall be responsible for giving notifications to the appropriate Authorities and for paying all fees all in accordance with the Sub-contract. The following are particularly relevant:

1. Statutory Obligations:
    a. Lifts and Escalators Ordinance (Cap. 618);
    b. Building (Construction) Regulations, Building (Planning) Regulations and Buildings Ordinance (Cap. 123);
    c. Electricity Ordinance (Cap. 406);
    d. Noise Control Ordinance (Cap. 400);
    e. Security and Guarding Services Ordinance (Cap. 460);
    f. Factories and Industrial Undertakings (Guarding and Operation of Machinery) Regulations (Cap. 59Q);
    g. Building Energy Efficiency Ordinance (Cap. 610);
    h. Fire Service (Installations and Equipment) Regulations and Fire Services Ordinance (Cap. 95);
    i. Occupational Safety and Health Ordinance (Cap. 509);
    j. Other subsidiary legislation made under the above ordinances.
2. Codes of Practice, Circular Letters and Design Manuals:
    a. Code of Practice on the Design and Construction of Lifts and Escalators, issued by the Electrical and Mechanical Services Department (hereinafter referred to as the Lift COP);
    b. Code of Practice for the Design and Construction of Buildings and Building Works for the Installation and Safe Use of Lifts and Escalators, issued by the Building Authority (hereinafter referred to as the Lift Building Works COP);
    c. Code of Practice for Fire Safety in Buildings, issued by the Building Authority (hereinafter referred to as the FS Code);
    d. Circular Letters relating to lifts and escalators, issued by the Electrical and Mechanical Services Department;
    e. Codes of Practice for Minimum Fire Service Installations and Equipment and Inspection, Testing and Maintenance of Installations and Equipment (hereinafter referred to as the Fire Services COP), and Circular Letters issued by the Fire Services Department;

f. Code of Practice for the Electricity (Wiring) Regulations, issued by the Electrical and Mechanical Services Department (hereinafter referred to as the Electrical CoP);

g. Code of Practice for Lift Works and Escalator Works (hereinafter referred to as the Works Code);

h. Design Manual: Barrier Free Access 2008;

i. Code of Practice for Safety at Work (Lift and Escalator), issued by Occupational Safety and Health Branch, Labour Department;

j. Code of Practice for Energy Efficiency of Building Services Installation issued by the Electrical and Mechanical Services Department (hereinafter referred to as the BEC).

LTE1.2.020.9 GENERAL PRACTICE

All materials and workmanship shall comply, where applicable, with all relevant sections, together with any revisions or amendments made thereto, of the following:

1. Hong Kong Housing Authority Specification Library;
2. Approved national/international standards or appropriate British Standard Specifications. The technical standards quoted in this specification are summarized in Appendix LTE/I;
3. The Supply Rules issued by the relevant Power Supply Company currently in operation in Hong Kong;
4. Guidelines on Safety of Lift Shaft Works issued by the Construction Industry Council.

LTE1.2.030.9 CASE OF CONFLICT

1. In case of conflict among the requirements of this Specification and any other requirements referred to in LTE1.2.010 and LTE1.2.020, interpretation shall be in accordance with the following order of preference:

   a. Law of Hong Kong;

   b. The Lift COP, Lift Building Works COP, BEC, Works Code, FS Code and Fire Services COP;

   c. The Drawings;

   d. This Specification Library of Lift and Escalator & its PSS Clauses;

   e. Other Hong Kong Housing Authority Specification Libraries;

   f. Supply Rules;

   g. Approved national / international standards or British Standard Specifications.

2. Notwithstanding sub-clause (1), in the event where the Drawings or this Specification stipulates more stringent requirements than, but still in compliance with, the COPs in sub-clause (1)(b) above, the Drawings or the Specification shall take the precedence over the COPs. Such requirements shall include, but not be limited to, the following clauses:

Clause No.	Description
LTE2.1.010	Guide rail shall have machined guide surface.
LTE2.2.010	Oil buffer for lifts of contract speed exceeding 1.0 m/s.

LTE2.4.030	Compensation shall be provided for lift with travel exceeding 30 metres.
LTE2.6.030	Metal screen for counterweight shall be at least 2500 mm above lift pit floor.
LTE2.8.020	Clear car height below false ceiling shall be 2450 mm or as required.
LTE2.8.040	Lift car ventilation fan shall provide at least 20 air changes/hour.
LTE2.8.050	Lift car ventilation fan shall provide at least 20 air changes/hour.
LTE2.8.080	Lift car lighting level at least 120 lux.
LTE2.8.090	At least two lighting fittings as specified shall be used to provide emergency lighting as well as normal lighting.
LTE2.11.010	The horizontal distance between car sill and landing sill shall not exceed 30 mm. Clear height of car and landing doors shall be not less than 2100 mm.
LTE2.11.060	Electrical safety device to prove positive locking of mechanical car door lock be provided even the horizontal distance between the wall of the well and the sill or entrance frame of the car being within 150 mm. Each car door panel shall be provided with a separate door closed proving device for centre-opening 2–panel car doors.
LTE2.11.110	Emergency landing opening shall be provided with normal landing door.
LTE2.12.050	Audible signals and verbal annunciation.
LTE3.11.020	Auxiliary brake shall be provided for every escalator.
LTE3.20.010	Size of pictograph shall be at least 100 mm x 100 mm.

LTE1.2.040.9 CODE OF PRACTICE FOR ENERGY EFFICIENCY OF BUILDING SERVICE INSTALLATIONS

1. The Sub-contractor shall provide necessary information and documents to the Contract Manager in accordance with BEC's requirements;
2. The Sub-contractor shall attend, provide necessary equipment and carry out on site checks as required by the Contract Manager to verify the electrical measurements of lifts and escalators.

LTE1.3 THE WORKS

LTE1.3.010.9 GENERAL

The Works under this Sub-contract is for the whole of the labour and all materials necessary to form a complete installation and such test, adjustments, commissioning, maintenance and servicing as prescribed. It shall include the responsibility for design work including the selection and suitability of purpose of material or equipment in compliance with the Specification and for the detailed design of the permanent works in accordance with the Sub-contract. It shall also include not only the major item of plant and equipment shown or specified but all the incidental sundry components necessary for the complete execution of the Sub-contract Works and for the proper operation of the installation, including the necessary labour, whether or not these sundry components are mentioned in detail in the Sub-contract.

LTE1.3.020.9 SITE OF THE WORKS

The Site of the Works is specified in Project Specific Specification.

LTE1.3.030.9 SCOPE OF THE WORKS

The Scope of the Works is specified in Project Specific Specification.

LTE1.3.035.9 TIME FOR COMPLETION AND DATE FOR HAND-OVER

The time for completion of the Works and date for hand-over of related working areas are specified in Project Specific Specification.

LTE1.3.040.9 SETTING OUT THE WORKS

The Sub-contractor shall set out the Works and shall be responsible for the accuracy of the same, including the positioning of all doors, guides, machines and machine bases.

LTE1.3.050.A BUILDING WORKS TO BE PROVIDED BY THE SUB-CONTRACTOR

Building works to be provided by the Contractor and others are detailed in Part I - Preliminaries of the Specification included in the Sub-contract documents. The following works in connection with the lift and escalator installation shall be provided by the Sub-contractor:

1. Supporting steel works, inserts, fixing brackets etc. for supporting the lift machine in the lift machine room or in the lift well;
2. Shaft dividing steel work for supporting guide brackets etc.;
3. Mounting brackets, bearing plates etc. required for the installation of the escalator;
4. Anchor bolts, inserts, fixing brackets etc. for landing door and guide rail brackets (except embedded anchor channels including its studs for guide rail installation) etc;
5. Permanent lights and socket outlets in each lift well and escalator machine pit;
6. Ferrules projecting at least 50 mm above finished floor or slab to prevent objects from falling through openings situated above lift well and blind hoistway working platform.

LTE1.3.060.N GUIDED SUSPENDED WORKING PLATFORM FOR LIFT INSTALLATION WORKS

1. For lift installation with travel greater than 15m except lifts with side counterweight configuration, provide Guided Suspended Working Platform (GSWP) for each lift well for lift installation works. Unguided Suspended Working Platform will not be considered unless formal approval is obtained from the CM. For Works inside lift well, complying with all applicable requirements under the Factories and Industrial Undertakings Ordinance, Occupational Safety and Health Ordinance, the Code of Practice for Safety at Work (Lift and Escalator), the Code of Practice for Metal Scaffolding Safety, the Code of Practice on Safe Use and Operation of Suspended Working Platforms and the Guidelines on Safety of Lift Shaft Works issued by Construction Industry Council;
2. Design and provide the GSWP in such a manner that it can be used by the Main Contractor, Nominated Sub-contractors as well as other contractors appointed under separate contract by the Employer including the employees and all other persons having the like right for the purpose of the Works (but not further or otherwise) be entitled, in particular the Main Contractor for the purposes of providing builder's work inside the lift well;
3. Provide training to the representatives of the Main Contractor to operate the GSWP for carrying out the builder's work inside lift well;
4. The CM has the right to request an independent safety consultant to assess and audit the adequacy and suitability of the safety provisions on Site;
5. Design, install, maintain and operate the GSWP complying with all applicable requirements as stipulated in the Factories and Industrial Undertakings (Suspended Working Platforms) Regulation, the Code of Practice on Safe Use and Operation of Suspended Working Platforms, the Guidelines on Safety of Lift Shaft Works issued by Construction Industry Council as well as the relevant requirements issued by the Labour Department and the Electrical and Mechanical Services Department. Adopt safety measures and special precautions, including but not limited to, the following:
    a. The platform, its lower frame, and every member thereof should be of rigid and sound construction;
    b. A climber and an automatic safety device operating with not less than 9 mm-diameter suspension rope and not less than 9 mm-diameter safety rope respectively should be used. The lower part of the travelling suspension ropes that passing through the platform areas shall be provided with protective guard so as to avoid jamming;
    c. The automatic safety device shall be capable of performing the functions of an overspeed governor and a rope slack device;
    d. An overload device shall be installed on the drive mechanism, which is capable of stopping the operation of the platform when it is overloaded;
    e. An opened-outward interlocking door shall be installed at the front edge of the platform. When the door is in open position, the climber could not be set into operation;
    f. A trip bar or similar device capable of stopping the operation of the platform when coming into contact with an obstacle or object shall be installed at the front bottom edge of the platform;
    g. Suspension rope, safety rope and independent lifeline shall be anchored to separate anchorage points;
    h. Suspension rope, safety rope and independent lifeline shall be protected against sparks from welding / hot work process, if any;

i. An upper limit switch shall be installed on the suspension rope or on top of guide rail to stop the movement of the platform when it reaches a position of not less than 2m from the lift well ceiling / top structure;

j. The front edge of the platform shall be designed and constructed such that the gap between the front edge of the platform and the floor edge of a lift well opening will not exceed 100mm. If the gap is more than 100mm, a landing gangway with railing shall be provided. The Lift Nominated Sub-contractor shall allow the safe access to and egress from the platform, and provide all necessary measures such as toe-board, fencing, railing etc. to prevent any working personnel or objects falling from height;

k. If an overhead protection is erected on the platform, the overhead protection shall not be fixed or bolted onto the frame of the platform. The overhead protection shall be freely lifted upwards;

l. A visual and audio signal system shall be installed at bottom of the platform to give visual and audio signs when the platform is travelling inside a lift well;

m. The pedal brake of the platform shall be press-to-release type or equivalent device which should grip the guiderail and stop the movement of the platform;

n. The operating switches and emergency stop on the control station of the platform should be designed against the unintentional or accidental operation by the operator. Clear label shall be provided on the switches on the control panel;

o. The appliance shall be inspected regularly to ensure its safety. It shall be tested and thoroughly examined by a Registered Professional Engineer in Mechanical Engineering or Marine & Naval Architecture. Relevant certificates after inspection, testing and examination indicating that it is in safe working order shall be obtained before it's being operated;

p. The GSWP inside lift well shall be constructed under the supervision of a competent person as interpreted in Factories and Industrial Undertakings Ordinance. Risk assessment and method statement of erection and detail drawings of the GSWP shall be prepared in the initial planning stage for approval by the CM;

q. Do not stack any materials or debris on the working platforms at any times. The GSWP shall be kept clear of debris;

r. The GSWP inside a lift well shall be installed and be able to reach the area inside lift well for lift installation and the building supportive work, including but not limited to, every lift landing opening for works such as door sills, architraves, landing doors installations;

s. Complete the power supply from the isolator located on the lowest landing provided by the Main Contractor to the lift machine room or connection box at designated area in the lift well. Travelling cables shall be used as the power and signal cables connecting between the lift machine room or connection box in the lift well and the GSWP. The installation shall be in accordance with the recommendation of the GSWP's manufacturer.

6. When GSWP has undergone substantial repair or re-erection, including erection following its removal to a different location, the GSWP has to be further load tested and thoroughly examined by the Competent Examiner as stipulated in the Factories and Industrial Undertakings (Suspended Working Platforms) Regulation.

LTE1.3.070.N PROTECTION OF LIFT ARCHITRAVE

The Sub-contractor shall coordinate with the Main Contractor to provide the following works:

1. Submit the method statement for the installation procedure (including builder's work and appropriate protection after installation) of lift architrave by the Main Contractor to the CM for his approval before carrying out the installation of lift architrave on Site.
2. Upon receiving the approval from the CM on the method statement, install the lift architrave as follows:
    a. Construction Sample for lift architrave
        i. Provide and fix lift architrave;
        ii. Provide all necessary builder's work for the lift architrave with associated temporary work by the Main Contractor;
        iii. Review with the CM or his representatives the procedure and workmanship for grouting, installation and finished surface condition of lift architrave;
        iv. Remove the protection sheet on the lift architrave for the CM or his representatives' inspection of any apparent damage or scratch found on the surface finish of the lift architrave;
        v. Provide appropriate protection to the lift architrave after removal of the protection sheet by the Main Contractor;
        vi. Upon receiving approval from the CM on the lift architrave installed on Site, submit all necessary document including site photos of the lift architrave to the CM for record by the Main Contractor
    b. Lift architrave
        i. Provide and fix lift architrave;
        ii. Provide all necessary builder's work for the lift architrave with associated temporary work by the Main Contractor.

LTE1.4 SUPERVISION AND SITE RECORDS

LTE1.4.010.9 APPOINTMENT OF SUPERVISING ENGINEERS AND SITE SUPERVISORS

1. Immediately upon the award of the Sub-contract, the Sub-contractor shall appoint Supervising Engineer(s) and Site Supervisor(s) specified in LTE1.4.020 and LTE1.4.030 who shall be both English and Cantonese speaking and in the Sub-contractor's full-time employment for the supervision of the Sub-contract Works to the satisfaction of the Contract Manager;
2. Immediately after the award of the Sub-contract, the name, qualifications and curriculum vitae of the Supervising Engineer(s) and Site Supervisor(s) shall be submitted for Approval to the satisfaction of the Contract Manager;
3. None of the Supervising Engineer(s) and Site Supervisor(s) shall be removed from their respective duties without prior Approval;
4. In the event of any of them being unsatisfactory, in the opinion of the Contract Manager, or misconducting themselves, they shall be removed forthwith and be replaced by suitable substitutes to the Contract Manager's satisfaction within seven days from the Contract Manager's instruction in writing.

LTE1.4.020.9 SUPERVISING ENGINEERS

1. Unless otherwise specified, the Sub-contractor is to employ for the supervision of all works on Site, at least one qualified Supervising Engineer. The Supervising Engineer shall generally represent the Sub-contractor in all respects of the Sub-contract and assume the following duties:
    a. Coordinate and supervise the work in the Sub-contractor's office and the Site;
    b. Develop, in conjunction with the Main Contractor, schedules of installation drawings, builder's work drawings, material submission and delivery, statutory submissions, the programme of works and testing and commissioning programme, for approval by the CM;
    c. Liaise with the CM and other parties;
    d. Attend at the office of the CM for the finalisation of drawings and equipment selection;
    e. Attend progress meetings and coordination meetings;
    f. Monitor and supervise installation drawings submission, builder's work drawings submission, material submission and delivery, statutory submissions in accordance with the respective submission schedules approved by the CM. Submit progress reports to the CM monthly or at shorter intervals when such requested by the CM;
    g. Check and confirm the installation drawings, builder's work drawings and material submissions are suitable for the installation works and in compliance with the requirements of the Sub-contract;
    h. Examine, verify and confirm in writing to the CM on a monthly basis that the material delivered to the Site under the Sub-contract has been approved by the CM;
    i. Certify all material delivery vouchers in accordance with PRE.B12.280 of the Main Contract;
    j. Prepare, in conjunction with the Main contractor, the delivery method statements for delivery of plant and equipment;

k. Supervise all site test and commissioning of the Sub-contract Works and submit the test and commissioning reports on time to confirm that he is satisfied with the completeness, workmanship and performance of the installations which comply fully with the Sub-contract requirements.

2. Qualification requirements:

   At least one year of proven post qualification experience at supervisory level in the installation and maintenance of lifts and escalators with the following qualification:

   a. Registered Professional Engineer (Electrical, Mechanical, Building Services and Control, Automation and Instrumentation Discipline) under the Engineers Registration Ordinance;

   b. Member of the Hong Kong Institution of Engineers (Electrical, Mechanical, Building Services and Control, Automation and Instrumentation Discipline) elected after 5 December 1975; or

   c. Member (electrical, mechanical, building services and Control, Automation and Instrumentation discipline) of an overseas engineering institution which has signed agreements for the mutual recognition of qualifications with the Hong Kong Institution of Engineers.

3. The Supervising Engineer(s) shall be highly competent and experienced, and shall be given a high level of delegated authority such that they can take decisions, including those involving expenditure.

LTE1.4.030.9 SITE SUPERVISORS

1. Unless otherwise specified, the Sub-contractor is to employ at least one qualified Site Supervisor. The Site Supervisor shall be stationed on site;

2. Qualifications requirements:

   At least three years practical experience in the supervision of the installation and maintenance of lifts and escalators with Diploma/Certificate in Electrical, Electronic, Mechanical or Building Services Engineering.

LTE1.4.040.9 SITE RECORDS

1. The Sub-contractor is to arrange for a full set of prints to be kept on the Site showing the progress of the Works. Such prints shall be kept up-to-date. Daily labour strength report shall be submitted to the Contract Manager after the Sub-contractor's takeover of the lift well, machine rooms or escalator areas;

2. The Sub-contractor shall keep the Site records together with all relevant delivery vouchers of all plant and materials delivered to and removed from the Site for the inspection by the Main Contractor and the representatives of the Contract Manager.

LTE1.5 MATERIALS AND EQUIPMENT

LTE1.5.010.9 GENERAL

1. The design, construction and installation of lifts and escalators shall comply with the Regulations and requirements stated in LTE1.2.010 and LTE1.2.020, in particular the Lift COP, Lift Building Works COP and BEC;
2. Type approval/approval-in-principle for the proposed lifts/escalators and their safety components shall be obtained from the Director of Electrical and Mechanical Services and shall be available before commencement of installation.

LTE1.5.020.9 PROVEN RELIABILITY

1. All lift and escalator materials and equipment shall have proven reliability and in-service records established locally and / or overseas as specified in the ensuing sub-clauses. The manufacturer of individual major lift and escalator materials and equipment as listed in sub-clause (2) and (3) shall have at least 5 years' experience in manufacturing the respective categories of materials and equipment;
2. Major lift materials and equipment refer to traction machine, motor, controller, safety gear, guide rail, ascending car over speed protection means (ACOPM), unintended car movement protection means (UCMPM), governor, buffer, ropes, guide shoes, travelling cable, car sling and cage, car and landing doors and door locking devices;
3. Major escalator materials and equipment refer to motor, reduction gear, controller, truss, landing plate, step, balustrade, steel chain and handrail;
4. The materials and equipment (except those stipulated in sub-clause (5)) which serve as in-service records of the lift / escalator system proposed shall comply with the following:
    a. Be of the same places of manufacture and in the same product ranges as those of the materials / equipment proposed;
    b. Be of the same drive type as that proposed;
    c. Be of the same rated load / capacity and rated speed specified or of higher and comparable rated load / capacity and rated speed;
    d. Comply with the following requirements:

Lift / Escalator Type	Location of In-service Records	Minimum No. of Lifts / Escalators serving as In-service Records	Minimum Time Period of Continuous and Satisfactory Operation and Maintenance up to the Time of Tender Submission
Lift of rated speed below 3.5 m/s and escalator of any speed	Hong Kong, Mainland China or overseas	4 nos. (of which at least 2 nos. are in the same project and any 2 nos. must be installed in Hong Kong) [See Note 1]	1 year [See Note 2]
Lift of rated speed 3.5 m/s	Hong Kong,	4 nos. (of which at least 2 nos. are	1 year

and above	Mainland China or overseas	in the same project)	[See Note 2]
Machine-room-less lift	Hong Kong, Mainland China or overseas	2 nos.	1 year [See Note 2]

Note 1: For traction machine and lift / escalator motor using innovative and green technology that can reduce the running active electrical power below the maximum allowable electrical power value stated in the BEC by 20% or more, the required 4 nos. of lifts / escalators serving as in-service records can be installed in Hong Kong, Mainland China or overseas provided that the electrical power performance can be verified by a test report issued by an approved independent testing institution;

Note 2: For controller and associated equipment such as inverter, converter and filtering facility, compliance to the following requirements can be regarded as an acceptable alternative to the one year in-service record requirement:

i. The Sub-contractor shall provide an undertaking to keep adequate quantity of new spare parts of the controller and associated equipment in stock in Hong Kong for immediate replacement in case of breakdown of the installed controller and associated equipment;

ii. The Sub-contractor shall provide an undertaking to replace immediately instead of repair any faulty parts of the installed controller and associated equipment so as to keep the down-time of the lift / escalator operation to the minimum in case of breakdown during the Maintenance Period;

iii. The Sub-contractor shall provide an undertaking to upgrade / update the controller and associated equipment software whenever upgrades / updates are released by the manufacturer within the Maintenance Period.

e. Be compatible with other materials / equipment of the lift / escalator system proposed.

5. The materials and equipment which serve as in-service records of guide rail, safety gear, buffer (oil / spring type) and car safety gear acting upwards, counterweight safety gear or rope gripper serving as ascending car over speed protection means of the lift system proposed or other equipment of which no part is in operation under normal circumstances shall comply with the following:

a. Be of the same places of manufacture and in the same product ranges as those of the materials / equipment proposed;

b. Be of the same design, rated load / capacity and rated speed specified or of higher and comparable rated load / capacity and rated speed;

c. Have been installed in Hong Kong, Mainland China or overseas in at least two numbers of lifts / escalators;

d. Have been in continuous and satisfactory operation and maintenance for at least six months up to the time of tender submission;

e. Be compatible with other materials / equipment of the lift / escalator system proposed.

6. For new safety requirements which are not required in existing lift / escalator systems but are required as the result of amendment of relevant Code(s) of Practice or Regulation(s), in-service record is generally not required at the time of implementation. However, when either one of the following conditions occurs, satisfactory in-service records shall be required:

    a. The new safety requirements have been provided by the Sub-contractor in the number of lifts / escalators and in continuous operation for the period as stipulated in sub-clauses (4) or (5) above in Housing Authority projects;

    b. Three years after the effective date for implementing the relevant amendment of Code(s) of Practice or Regulation(s).

7. If there is change of place of manufacture for materials / equipment with previously established in-service records, and the Sub-contractor is capable of producing certificates from the original manufacturer confirming that the materials / equipment to be supplied from the proposed new source have exactly the same design, material, construction and quality assurance / control standards together with an undertaking from the original manufacturer that they will be fully responsible for the product despite the change of manufacture, the requirement of two numbers installed in Hong Kong for one year for lifts of rated speed below 3.5 m/s and escalators of any speed as specified in sub-clause (4)(d) shall be waived;

8. The Sub-contractor shall submit full details and particulars of in-service records to substantiate conformance to the above requirements. The Sub-contractor shall arrange, upon request, site inspection of the lift and escalator installations which serve as in-service records. Failure to submit required details or allow sufficient time for assessment and site inspection may result in rejection of the tender;

9. For Mainland China and overseas in-service records, records of any accident, replacement and major repair and photos of the concerned material / equipment and proof of satisfactory operation and maintenance in writing by one of the following parties shall also be provided:

    a. Owner of the lift / escalator installation; or

    b. Property Management Agent of the property served by the lift / escalator installation; or

    c. Supplier / Contractor / Installer of the lift / escalator installation; or

    d. Maintenance Agent of the lift / escalator installation.

10. If the required information for Mainland China and overseas in-service record is provided by any of the parties listed in sub-clause (9)(c), service log of the past 12 or 6 months shall also be submitted depending on the applicability of sub-clause (4)(d) or (5)(d) to the material / equipment concerned. The Sub-contractor shall certify the authenticity of all the documents provided.

LTE1.5.040.9 TEST CERTIFICATES / SUBSTANTIATION DOCUMENTS

Test certificate for lift and escalator equipment complete with test reports and drawings where applicable, or other substantiation documents, shall be submitted to the CM to prove the compliance with the Specification. In case the original documents are not produced in English or Chinese, an English or Chinese translation of the whole document, including related test reports and drawings, shall be produced and duly certified true by the issuing organization or an approved authority when required.

LTE1.5.050.9 SERVICE CONDITIONS

In addition to the service conditions as specified in the relevant BS, all lift and escalator equipment shall also be suitable for use under Hong Kong climatic conditions with relative humidity and ambient temperature as shown below:

1. Relative humidity: up to 0.99 saturation;
2. Ambient temperature: peak from minus 5℃ to plus 40℃ for 4 hours continuously with an average from 0℃ to plus 35℃ over only 24 hours period.

LTE1.5.060.9 ASBESTOS NOT TO BE USED WITHOUT PRIOR APPROVAL

Asbestos or equipment containing asbestos, including asbestos brake lining, shall not be used without the prior approval from the Contract Manager.

LTE1.5.080.9 ON SITE WELDED COMPONENTS

1. The Sub-contractor shall submit a list of on-site welded components that are to be installed inside lift well for Contract Manager's record before commencement of the works;
2. The welding work for those on-site welded components shall be carried out by licensed welder or the holder of the Intermediate Trade Test Certificate in welding issued by Vocational Training Council or such equivalent training bodies as Approved;
3. The worker shall have experience on welding lift components for a period, or an aggregate period of, not less than one year. Experiences before or after passing the trade test are both acceptable;
4. The Sub-contractor shall maintain and submit a register of all the projects handled by individual trade tested welder to substantiate the compliance with the requirements stipulated in sub-clause (3) above for Contract Manager's approval before commencement of the works.

LTE1.5.090.9 STAINLESS STEEL

1. Unless otherwise stated, stainless steel shall be of EN 10088-1 grade 1.4401 (grade 316) or equivalent;
2. Supplier of stainless steel shall provide mill certificates of the material to be used in the works.

LTE1.6 PACKING, STORAGE AND DELIVERY

LTE1.6.010.9 PACKING

1. All equipment, apparatus, materials and parts shall be delivered to the Site in a new condition, properly packed and protected against damage due to handling, adverse weather or other circumstances and they shall be kept in the packing cases or under protective coverings provided by the Sub-contractor until unpacking for use;
2. In the case of items of equipment and materials which originate outside Hong Kong:
    a. All items of equipment and materials shall be adequately and securely packed for safe transportation with due regard to the climatic conditions encountered in transit and on arrival, and also to the site conditions during storage on Site. Suspension ropes and governor ropes shall be put in properly sealed packages to avoid ingress of moisture when delivered from factory and shall be kept sealed until installation on Site;
    b. The Sub-contractor shall, at the time of shipping each consignment of equipment, provide to the Contract Manager in duplicate, packing lists and Bills of Lading which shall contain full statements of the packages consigned, with particulars of the dimensions, weights, contents, shipping marks and approximate value of each package; and
    c. BS 1133 and its Supplements shall be used as a guide for the standard of packing and package required. All bright, polished or plated parts shall be treated with suitable rust inhibitor.

LTE1.6.020.9 STORAGE AND DELIVERY

1. Storage area at the Site for lift and escalator equipment will be made available by the Main Contractor twelve (12) months before the contract completion date for the respective Section of the Main Contract;
2. All lift and escalator equipment for each Section shall be delivered to the Site no later than seven (7) months before the contract completion date for the respective Section of the Main Contract, in order to cope with any possible advanced completion of the Main Works;
3. Notwithstanding the preceding paragraph, the Sub-contractor shall arrange storage and delivery of the equipment to suit the progress of the Main Works.

LTE1.6.030.A PROTECTION OF THE WORKS

1. The Sub-contractor shall liaise with the Main Contractor to suitably protect, encase, cover up etc. as may be appropriate, all equipment, instruments, etc. installed by him against damage due to building operations, adverse weather or other causes and shall hand over the entire installation in a new and perfect condition to the satisfaction of the Contract Manager;
2. Exposed finishing surface of architrave, landing door, call button panel and landing indicator panel for all landings shall be delivered to site with protection sheet.

LTE1.6.040.9 TRANSPORTATION OF EQUIPMENT AND PLANT

1. The Sub-contractor shall liaise with the Main Contractor to ensure that there is adequate access available for transportation and delivery of the equipment and plant to be supplied by him at the time of transportation of the equipment to the required position;
2. The Sub-contractor shall submit the details of equipment delivery and hoisting route including any building work reserves required ten (10) months before the contract completion date for the respective Section of the Main Contract to the Contract Manager, via the Main Contractor, for approval. Should the Main Contractor be delayed or incur additional costs due to the Sub-contractor's failure to submit the required information in time then any expense arising will be the liability of the Sub-contractor.

LTE1.6.050.9 REPLACEMENT

Any items suffering damage in transit or on the Site shall be rejected and replaced without extra cost to the Employer. No item so rejected will be considered as a reason for failure to meet the time for completion of the Sub-contract Works.

LTE1.7 ELECTRICITY SUPPLY AND ELECTRICAL INSTALLATION

LTE1.7.010.9 ELECTRICITY SUPPLY

Unless otherwise specified, the equipment shall be rated for operation under the supply system with nominal frequency of 50Hz and nominal voltage of 380V, 3-phase and 220V, 1-phase within the variation limits as declared by the local Power Supply Companies.

LTE1.7.020.9 WIRING

1. All cables, trunkings, conduits and conduit fittings necessary for the power, lighting and indicator circuits shall comply with and be installed in accordance with the latest issue plus amendments of the Electrical CoP, the Lift COP and Hong Kong Housing Authority Specification Library;
2. All wirings installed in lift machine rooms, lift wells and escalator machine pits, other than travelling cables, shall be enclosed in galvanised steel conduits or steel trunkings.

LTE1.7.021.9 CABLE COLOUR CODES

1. Electric cables complying with a national / international product standard shall have their design, construction and manufacture adhered to that particular standard in all aspects except the cable colour codes which shall be in line with the Electrical CoP unless otherwise stated;
2. For lift and escalator installation based on the new cable colour codes, the workers employed for carrying out the relevant electrical works shall have satisfied the Electrical & Mechanical Services Department's training requirements for the new cable colour codes.

LTE1.7.022.9 CORE IDENTIFICATION OF POWER CABLES

Function of core	Colour code	Number code
Phase conductor of a single phase circuit	Brown	L
Phase conductor of a three-phase circuit	Phase L1: Brown Phase L2: Black Phase L3: Grey	L1 or L2 or L3 according to the phase concerned
Neutral conductor	Blue	N

Note: Cores used as protective conductors shall have an exclusive colour identification of green-and-yellow, unless otherwise stated.

LTE1.7.030.9 BONDING

1. All exposed conductive parts of the lift and escalator equipment shall be effectively bonded by protective conductors in accordance with the Lift COP and Electrical CoP;
2. The exposed conductive parts shall include the machine frames, controller frames, governor frames, guide rails, face plates of landing fixtures, casing of electrical safety devices, and other similar exposed conductive parts which carry electrical equipment;

3. For lift architrave with landing indicator having provided with proper bonding, no additional bonding is required and the Sub-contractor shall ensure the electrical continuity between architrave and landing indicator. For lift architrave without landing indicator, the Sub-contractor shall provide proper bonding through the building structural reinforcement or other appropriate means.

LTE1.7.040.9 LIFT WELL LIGHTING

1. The Sub-contractor shall install lighting in each lift well in surface steel conduit system. The lighting for each lift well shall comprise one lighting fitting not more than 500 mm from the lowest point in the lift well and the highest point of guided travel of the lift car with intermediate lighting fittings at 7 m maximum spacing. The position of each lighting fitting shall be such that servicing personnel can conveniently replace the lamp while standing on the top of the car;
2. The lighting fittings shall be at least 2x11W compact fluorescent bulkhead fittings with polycarbonate diffuser and controlled by 2-way lighting switches at lift machine room or maintenance access panel for machine-room-less lift, and at entrance to lift pit. Lighting switches at lift pit shall be of watertight construction. Sample of the lighting fitting shall be submitted for the Contract Manager's approval.

LTE1.7.050.A EMERGENCY LIGHTS

1. Emergency lights of adequate illuminance shall be provided by the Sub-contractor in the lift machine room or at the maintenance access panel for machine-room-less lift, and in the lift car. These lights shall be operated by batteries automatically on failure of normal power supply and those lights in the lift machine room or at the maintenance access panel for machine-room-less lift shall be capable of being manually operated by a switch located at a convenient position in the lift machine room or at the maintenance access panel for machine-room-less lift respectively;
2. The batteries shall be capable of maintaining a supply to the connected emergency load for a minimum of two hours continuously, and shall be completed with self-contained and self-maintained trickle charger located within the lift machine room or lift well and at least one for each lift. The charger shall be capable of fully re-charging the batteries in not more than 12 hours. A switch shall be provided to simulate normal power failure for testing the emergency operation of the lights which are operated by batteries shall be provided.

LTE1.7.060.9 LIFT TRAVELLING CABLE

1. Lift travelling cable shall be of flat or circular PVC or rubber insulated type complying with BS EN 50214. Test certificate issued by an approved independent testing institution or the manufacturer shall be submitted to the CM to verify the compliance with the required standard;
2. Travelling cable of the flat type shall only be used where the freely suspended length does not exceed 35 m and the rated speed not exceeding 1.6 m/s unless the cable has integral strain-bearing members;
3. The travelling cable terminal box at lift car shall be positioned at car top;
4. Subject to the approval of the CM, travelling cable in full compliance with relevant national / international standards stipulated in the Lift COP, with the exception of constructional configuration, may be acceptable;
5. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the lift travelling cables delivered to the site or installed.

LTE1.7.070.9 SUPPRESSION OF RADIO AND TELEVISION INTERFERENCE

The lift and escalator installation shall be adequately suppressed against radio and television interference to limits laid down in BS EN 55014-1, or EN 12015 and EN 12016. Interference suppression components shall not be used in any part of the circuit where their failure might cause an unsafe condition.

LTE1.7.080.9 ELECTRICAL MEASUREMENTS

1. Multi-function electronic meter shall be provided by the Electrical Sub-contractor for each lift / escalator to facilitate electrical measurements;
2. Electrical measurements including but not limited to those on voltages, currents, kW, kVA, kWh, power factor and total harmonic distortion shall be carried out in the final testing for each lift / escalator according to BEC's requirements.

LTE1.8 TESTING AND MAINTENANCE

LTE1.8.010.A TESTS AND CERTIFICATES

1. The Sub-contractor shall employ lift / escalator engineer(s) registered under the Lifts and Escalators Ordinance to undertake tests and examination of the complete installation, which shall include those specified in Clause 6.3 of BS EN 81-20 and clause 7.3 of BS EN 115-1, where relevant, and those recommended by the lift / escalator manufacturer;
2. A statement of conformity shall be provided relating to type tests issued by an approved independent testing institution for the equipment mentioned in BS EN 81-20 upon the CM's request;
3. For lift installation, progressive safety gear shall be tested with 100% loaded car to be operated by the governor at governor tripping speed unless complete type test certificate of the safety gear in accordance with Clause 5.3 of BS EN 81-50 from an approved independent testing institution is submitted to the satisfaction of the CM. In the latter case, the safety gear may be tested at reduced speed with 125% loaded car. Before the test, the suspension ropes shall have been checked for even tensioning. After the test, the ropes shall be re-checked for even tensioning, the lift installation shall be inspected and the lift components such as guide rail and safety gear gripping elements shall be reconditioned or replaced as necessary. Rope tension measuring device or alternative method by means of measuring the rope termination springs within the acceptable tolerance of 5mm in length or method recommended by the lift manufacturer shall be used to check even tensioning of the ropes;
4. Safety certificate and examination report in a prescribed form as required by the Director of Electrical and Mechanical Services shall be submitted and properly signed by the Sub-contractor and his registered lift / escalator engineer as evidence that the installation has been properly tested;
5. The Sub-contractor shall be responsible for all necessary submissions to the EMSD and / or other authorities for the lift and escalator installation;
6. The Sub-contractor shall be required to separately demonstrate to the satisfaction of the CM the installation complies with the provision of LTE1.2.010 (1) of this Specification and the BEC;
7. All tests shall be conducted at the discretion of and in the presence of the CM;
8. The Sub-contractor shall obtain a use permit for each lift / escalator issued by the Electrical and Mechanical Services Department, before the installation is accepted by the CM;
9. The original lift / escalator use permit shall be permanently displayed inside each lift car or adjacent to each escalator when handed over to the CM on completion of the installation;
10. The Sub-contractor shall arrange for and pay any necessary fees for inspections and shall make such tests as are called for by any Regulations or Authorities and shall obtain all permits required. Any tests carried out shall be in the presence of the authorized representative of any such authority;
11. The CM will notify the Sub-contractor the nature of identity of the management agent(s) of the lifts / escalators at least one month before the completion date of respective lifts / escalators;

12. The Sub-contractor shall employ a Registered Electrical Worker registered under the Electricity Ordinance to prepare, sign and submit the test reports including the "WR1(A)" Form for the following electrical works:

    a. The lift well and escalator pit lighting and power socket circuitries starting from the power supply point installed by the electrical worker employed by the lift contractor.

13. The Sub-contractor shall employ a Registered Electrical Worker registered under the Electricity Ordinance to prepare, sign and submit the test reports for the following electrical works:

    a. The power supply circuitries from the main power supply point to the lift and escalator control panels.

LTE1.8.020.9 FINAL TEST

1. After having satisfied himself of the performance of the installation, the Sub-contractor shall demonstrate to the satisfaction of the Contract Manager that the installation, or part thereof as the case may be, complies with all the requirements of the Sub-contract Works;

2. The Sub-contractor shall provide the Contract Manager with at least seven (7) days' advance notice of such testing and shall provide all necessary facilities and instrument for the witnessing and checking of such tests, but this shall not relieve the Sub-contractor of his responsibility for testing and satisfying himself of the adequacy of the installation beforehand;

3. The Sub-contractor shall make complete records of the tests as carried out and when the tests have been successfully completed, he shall provide the Contract Manager with test records and reports; including those specified in the BEC, in duplicate in a form to be approved by Contract Manager;

4. Should the test results indicate that the plant or equipment is not functioning in a satisfactory manner or providing the requirements of the Specification, the Sub-contractor shall carry out at his own expense any alterations, replacements or adjustments as may be required to correct the faulty work. The Contract Manager's decision as to what constitutes a satisfactory test shall be final.

LTE1.8.030.A MAINTENANCE AND SERVICING

1. The maintenance and servicing work required under this clause shall be deemed to include both preventive and corrective maintenance and servicing. Before commencing any work ordered under GCC Clause 10.1 of the Main Contract, the Sub-contractor shall, at his own expense, make all suitable arrangements to avoid damage to installations provided by others;

2. Further to the Sub-contractor's responsibility under Clause 7.1 of the General Conditions of the Sub-contract to maintain the Sub-contract Works, the Sub-contractor shall provide maintenance and servicing to the entire installation for a period of 24 months from the date of completion to the Main Works or of the relevant Section or part thereof as certified by the CM under the Main Contract Conditions. Such maintenance and servicing works shall include the following:

    a. To be responsible for any repairs necessary to maintain the equipment in good working order at all times;

    b. To dispatch competent and specially trained workmen once weekly during normal working hours to inspect, clean and lubricate as required, and where necessary adjust and maintain all machinery, controllers, doors, locks, guide rails, guide shoes, ropes, bearings and safety devices etc. in a smooth, quiet and safe operating condition;

c. To supply all required lubricants, cleaning materials, rope preservatives etc.;

d. To supply and replace all burnt out indicator lamps;

e. To provide 24-hour on-call service at any time during the Maintenance Period. The CM may instruct the Sub-contractor in the Maintenance Period via telephone, mobile phone, paging service or any other means as advised by the Sub-contractor and approved by the CM, to attend to reported breakdowns, and the Sub-contractor shall dispatch competent technicians or such other suitable personnel to carry out emergency maintenance or to attend to any reported breakdown within 25 minutes where trapping of passengers is involved and within 45 minutes where no trapping of passengers is involved, after receiving the call and under all weather condition. The Sub-contractor shall submit to the CM for this purpose, the contact telephone number(s) of the Service Call Centre or at least two names of English speaking representative, who can be reached at any time of the day, with contact telephone numbers of direct lines, mobile phones or paging service for approval. Prior approval shall also be obtained for any subsequent changes of representatives, contact telephone numbers etc. during the Maintenance Period at least two weeks before the change is effected;

f. To renew wire ropes as necessary to maintain an adequate factor of safety;

g. To provide quarterly reports on the condition of the equipment for approval by the CM;

h. To carry out periodic testing and examination of safety equipment of the installation as may be required by the provisions of any Regulation in force relating thereto and to provide copies of such test certificate, duly signed by a registered lift engineer or a registered escalator engineer as appropriate, regardless whether the lifts / escalators have been exempted from such Regulation;

i. To provide, repair or replace at no cost to the Employer such mechanical and electrical parts of the installation which the Sub-contractor or the CM considers necessary for the safe and proper operation of the installation;

j. To carry out, at the end of the Maintenance Period, a further test to demonstrate the performance characteristic of the installation, and any defects found shall be rectified by the Sub-contractor at his own cost as soon as practicable.

3. The maintenance and servicing works described above form part of the Works under GCC Clause 8.3(2)(c) of Main Contract;

4. Providing always that any renewals or repairs necessitated by misuse of the equipment or by reason of any other cause beyond the Sub-contractor's control with the exception of ordinary wear and tear shall be carried out by the Sub-contractor if so required by the Employer at an additional cost to be valued by the Surveyor;

5. All work under this maintenance and servicing provision shall be performed by competent personnel under the supervision and in the direct employment of the Sub-contractor;

6. A report in duplicate shall be sent to the CM immediately following a major repair, repeated breakdowns of service due to system or equipment fault of similar nature, or as and when required by the CM. The report shall include the cause necessitating such a repair, the reason of such a breakdown of service and the time and date of remedial action taken, of completion of repair and the normal service resumed. A list of equipment replaced shall be attached to the report. At least three months before the end of the Maintenance Period, a report on the rope conditions according to Table 3 of the Works Code shall be sent to the CM. Reports on routine visits are not required except where necessary to draw attention to defects which could not be rectified during the routine visit;

7. The registered engineer / contractor shall ensure that details are properly recorded in the digital log-book in the specified mean as required by the Director of Electrical and Mechanical Services, in accordance with the Lifts and Escalators Ordinance and the Works Code;

8. For each routine or callout visit on arrival at the Estate, the workman shall report to the Estate Management Office and enter in the digital log-book:

    a. At the time of signing, he shall note any message written in the digital log-book concerning the performance of any part of the lifts / escalators in the Estate, and shall take such action as may be required;

    b. The workman shall also inspect the lifts / escalators in the Estate at the time of this regular inspection and make any repairs, replacements of adjustments as required, irrespective of whether or not such repair or re-adjustment is noted in the digital log-book;

    c. When leaving the Estate, the workman shall report to the Estate Management Office and enter in the digital log-book a brief report on any repairs, replacements or adjustments which have been carried out or on the fact that they have found the lifts / escalators operating satisfactorily.

LTE1.9 MISCELLANEOUS

LTE1.9.010.9 SILENCE OF OPERATION

1. The installation shall be reasonably silent in operation under the conditions which they will be called upon to operate and, in any case shall be such that no unreasonable noise or vibration arising from the operation of the installation is discernible from the lift wells, machine rooms, landing doors, escalator machine pits or similar space in which the equipment is housed. The Sub-contractor shall take all necessary steps to ensure that the equipment provided by him is silent as described above and shall include in his Tender for such sound-absorbing, or anti-vibration materials or devices as are necessary to ensure a satisfactory degree of silence and absence of vibration in the structure of the building in full compliance with the Noise Control Ordinance. The Contract Manager's decision as to what constitutes satisfaction in this respect shall be final;
2. The Sub-contractor shall provide anti-vibration devices wherever lift or escalator equipment with moving part(s), including but not limited to diverter pulley, are mounted directly or indirectly onto the building structure;
3. If on completion the installation is not, in the Contract Manager's opinion, sufficiently silent the Sub-contractor shall, at no cost to the Employer, carry out such modifications or additions as may be required, until the system is made silent to the Contract Manager's satisfaction and the compliance with the Noise Control Ordinance.

LTE1.9.020.9 PAINTING AND FINISH

1. All ferrous metal work supplied by the Sub-contractor in out of the way locations such as lift well, lift pit, machine room and exterior of lift car, etc. shall be properly wire-brushed, cleared of rust, scale, dirt and grease prior to the application of rust inhibiting primer, with particular attention paid to the priming of outer surfaces of car doors, inner surfaces of landing doors, metal work associated with door assemblies, the underside and the framework of lift cars. Any part of the equipment, including guide rails, which requires greasing or oiling and any components which for functional reasons are supplied unpainted by the manufacturers shall not be painted;
2. All normally visible ferrous metal surfaces such as car ceiling, landing door and architraves etc. shall, unless otherwise specified, be finished with one coat of rust inhibiting primer and two finishing coats of synthetic paint to a colour to be selected by the CM;
3. Non-ferrous surfaces and stainless steel surfaces shall not be painted;
4. The Sub-contractor shall comply with the requirements on materials and workmanship for painting as specified in Worksection FIN7 unless otherwise specified;
5. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the paints delivered to the site.

LTE1.9.030.9 METRIC UNITS

Only materials in metric units shall be used unless otherwise specified.

LTE1.9.040.9 WEIGHT OF EQUIPMENT

Before ordering equipment the Sub-contractor shall provide the Contract Manager with full details of the weight, dimensions and positioning of the equipment to be installed and the reaction forces imposed on the structural supports for the purpose of determination of floor loadings, etc..

LTE1.9.050.9 TECHNICAL INFORMATION SUPPLIED WITH TENDER AND SUB-CONTRACTOR'S RESPONSIBILITY

1. All technical information supplied with the tender, including the tenderer's proposed design and the materials offered, is for tender assessment only;
2. Acceptance of the tender will not relieve the Sub-contractor of his responsibility for the proper working of the installation to meet the specified requirements in compliance with the Sub-contract documents to the entire satisfaction of the Contract Manager. In the event of the installation being, in the opinion of the Contract Manager, not in compliance with the specified requirements, the Sub-contractor shall modify his design, replace any unsatisfactory materials and do everything necessary for compliance with the specified requirements at his own cost.

LTE1.9.060.9 NUISANCE

The Sub-contractor shall comply with all Regulations and prevent nuisance from noise, water, smoke, dust, rubbish, mosquito breeding and all other similar causes.

LTE1.9.070.9 TEMPORARY USE

The Sub-contractor shall ensure that the installation shall not be used prior to the issue of the Certificate of Completion for purposes other than testing and commissioning of the installation unless otherwise approved by the Contract Manager.

LTE1.9.080.9 INSTRUMENTS

1. In addition to PRE.BS1.630 which specifies the provision of a set of measuring instruments for BSPASS and Contract Manager's Representatives' use, which will be under the custody of the CMR, the Sub-contractor shall provide all necessary instruments used for measurement and testing of the installation. The instruments used shall be capable of carrying out the measurement, test and inspection with the necessary accuracy and precision and calibrated with traceability to internationally or nationally recognised standards;
2. Each instrument shall carry an indelible identification and shall be attached with a label showing the due date for calibration;
3. The instruments shall include but are not limited to the following:
    a. Multi-meter;
    b. Clamp meter;
    c. Multi-function electronic meter for measurement of current, voltage, power factor, kW, kVA, kVAr and kWh;
    d. Equipment for measurement of total harmonic distortion;
    e. Insulation tester;
    f. Lux meter;
    g. Carpenter (spirit) level;
    h. Sound level meter;
    i. Force gauge;

j. Feeler gauge;

k. Measuring tape;

l. Vernier callipers;

m. Tachometer;

n. Test weight;

o. Ride comfort meter.

4. Upon request, the Sub-contractor shall submit calibration certificates or other evidence of calibration and records of calibration results for the Contract Manager's inspection;

5. The Contract Manager may reject any instrument(s) which in his opinion are not suitable for the measurement, test or inspection, and the Sub-contractor shall replace them with Approved types immediately when required.

LTE1.9.090.9 BUILDING SERVICES PERFORMANCE ASSESSMENT SCORING SYSTEM

The Housing Authority has adopted a Building Services Performance Assessment Scoring System (BSPASS) to assess the performance of building services Nominated Sub-contractors undertaking works for the Authority. BSPASS will be operated in this Sub-contract and assessments will be conducted at quarterly intervals or other intervals as required by the Contract Manager. The Sub-contractor shall provide all necessary attendance, and all necessary measuring instruments, in addition to those specified in PRE.BS1.630, etc. to facilitate the BSPASS assessment as stipulated in the relevant BSPASS manuals. In addition, the Sub-contractor shall also provide labours for the opening up and re-fixing of the works, the operation of the equipment and the testing, etc. as required by the assessment.

LTE1.9.100.9 PERFORMANCE ASSESSMENT SCHEME

The Housing Authority has adopted a Performance Assessment Scheme (PAS) to assess the performance of new lift/escalator installations for the Authority. PAS will be operated in this Sub-contract and assessment will be conducted at completion of the lift/escalator installations as required by the Contract Manager. Upon the Contract Manager's notification, the Sub-contractor's authorised representative shall attend such assessment. The Sub-contractor shall also provide labours for the opening up and re-fixing of the work, the operation of the equipment and the testings required by the Contract Manager. The necessary measuring equipment shall also be provided by the Sub-contractor.

LTE1.9.110.9 SAMPLE WING

During the construction for domestic building blocks, a specified sample wing located on a typical floor will be required to be completed by the Main Contractor including the flats, the corridor and the lift lobby etc. The Sub-contractor shall complete the installation of the architraves, the landing doors and landing door sills for the lift lobby in the specified sample wing in coordination with the Main Contractor to cope with the sample wing construction programme. The Sub-contractor shall be responsible to replace any architraves and landing door sills which are found damaged or deformed and to carry out the necessary adjustments to restore to as-new condition before building completion.

LTE1.9.120.9 OPERATION AND MAINTENANCE MANUAL AND "AS-FITTED" DRAWINGS

1. The Sub-contractor shall submit to the Contract Manager, the operation and maintenance manual which should include the following:

a. Manufacturer's operation and service instructions for each item of equipment;

b. Special precautions/procedures/methods required on the use, operation, cleaning, servicing, maintenance, repair and replacement of proprietary materials and equipment installed. Requirements on proper use and operation, durability, safety and statutory side shall be stated clearly;

c. Catalogues and user manuals of equipment as required by the Contract Manager;

d. Electronic and hard copies of the testing and commissioning reports of the installation. Electronic copy of the reports shall be in Adobe Portable Document Format (PDF) in compact disc;

e. Original and duplicate of the certificate of warranty for any material, equipment or installation with warranty period last beyond Maintenance Period;

f. A comprehensive list of spare parts and special tools for individual equipment as recommended by the manufacturer for safe operation and proper maintenance of the complete installation.

2. The Sub-contractor shall submit to the Contract Manager, the "as-fitted" drawings chopped "as-fitted", which should include, but not be limited to, lift schedule, elevation and section, machine room layout plan, installation details with loading indicated at structural anchor points, sectional views of lift wells showing overhead run-bys, positions of safe spaces and locations of limit switches, and a register of major equipment showing the equipment identification, capacity, operating range, setting, power requirement, serial number, etc. "As-fitted" drawings shall be of A1 size only.

LTE2.26.030.N ACCESSORIES AT LIFT CAR TOP 64

LTE2.1 GUIDES AND FIXING

LTE2.1.010.9 GUIDE RAILS

1. The lift car and counterweight shall each be guided by at least two rigid steel guide rails throughout their travel. Oil pans shall be provided and placed underneath the guide rails in the lift pit to collect oil drained from the guide rail in case of guide lubricated by oil;
2. Every such guide rail shall:
    a. Comply with BS 5655: Part 9 or BS EN 81-20 or ISO 7465 or other approved international standards;
    b. Be of adequate strength; and
    c. Have machined guide surface.
3. Test report issued by the manufacturer to verify the guide rail in compliance with BS 5655: Part 9 or BS EN 81-20 or ISO 7465 or other approved international standards shall be submitted to the CM;
4. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the guide rails delivered to the site or installed.

LTE2.1.020.9 GUIDE BRACKETS

1. Guide brackets shall be provided at suitable intervals in accordance with Clause 5.7.2.1.3 of the Lift COP, Section E, Part 1 and shall be embedded into the walls enclosing the liftway or fixed to such walls by one of the following methods:
    a. All holes for anchor bolts shall be drilled by rotary drill - this method shall be used as the standard practice for fixing guide rail brackets in reinforced concrete walls of more than 100 mm thick;
    b. Bolts grouted and embedded into the walls - this method shall only be used in special conditions, e.g. brick walled liftway, or reinforced walls of 100 mm thick or less, or as and when specified in the Project Specific Specification. The Sub-contractor shall submit builder's work drawings detailing the exact dimensions and locations of the holes for the bolts required. The Sub-contractor shall ensure that the holes reserved by the Main Contractor are properly and correctly positioned.
2. Wood or fibre blocks or plugs shall not be used for securing any guide brackets;
3. The fixing of the guides to their brackets and to the building shall permit compensation, either automatically or by simple adjustment, of effects due to normal settling of the building or shrinkage of concrete.

LTE2.2 CAR AND COUNTERWEIGHT BUFFERS

LTE2.2.010.9 BUFFERS

1. Buffers shall be installed at the bottom limit of travel for cars and counterweights in accordance with the following requirements:
   a. Buffers of timber or rubber shall not be used;
   b. Spring buffers or oil buffers shall be used for lifts having a contract speed not exceeding 1.00 m/s;
   c. Oil buffers shall be used for lifts having a contract speed exceeding 1.00 m/s;
   d. Reduced buffer stroke shall not be used unless approved by the CM.
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the buffers delivered to the site or installed.

LTE2.2.020.9 TYPE TEST

The buffers shall be type tested to the requirements of Clause 5.5 of BS EN 81-50 by an approved independent testing institution. Type test certificate to this effect shall be submitted to the CM.

LTE2.3 COUNTERWEIGHTS

LTE2.3.010.9 GENERAL REQUIREMENTS

The counterweight shall be of metal and constructed from multiple sections, contained and secured with a steel frame, and shall equal to the weight of the complete car and approximately 40% of the rated load.

LTE2.3.020.9 GUIDE SHOES

1. At least four guide shoes, capable of being easily renewed or having renewable linings, shall be provided on the counterweight;
2. Guide shoes for counterweight shall be resiliently mounted. For lift speed of 2.5 m/s or above, the guide shoes for the counterweight shall be of the roller type. Any necessary lubrication shall be applied by automatic means.

LTE2.4 SUSPENSION

LTE2.4.010.9 ROPES

1. Lift car suspension shall be by means of steel wire ropes of best quality, the size and number being in accordance with Clause 5.5.1.2 and Clause 5.5.1.3 of the Lift COP, Section E, Part 1;
2. The factor of safety for all suspension ropes shall comply with Clause 5.5.2.2 of the Lift COP, Section E, Part 1;
3. Mill test certificate with test results issued by the manufacturer to verify that the steel wire rope is in compliance with EN 12385-1 and EN 12385-5, or ISO 4344 or other approved international standards shall be submitted to the CM. The Sub-contractor shall provide an undertaking confirming that the submitted mill test certificate specifically refers to the ropes delivered to the Site. The Sub-contractor shall provide supporting photographs and documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the ropes delivered to the site or installed. The mill test certificate, the undertaking, the supporting photographs and the documentary evidence shall be submitted together with the ropes when delivered to the Site. Supporting photographs taken in workshop or warehouse before delivery to site is also acceptable;
4. The breakage or slackening of any one of the ropes shall cause the motor to stop by means of an electrical safety device in accordance with Clause 5.11.2 of the Lift COP, Section E, Part 1;
5. All pulley assemblies in the suspension rope system shall be completed with 'Temperature Indicating Strip' of appropriate temperature rating. The strips shall be of self-adhesive type, give irreversible colour change and permanently record the highest temperature of the pulley assemblies;
6. For lifts where the lift machine is more than 60 m above the lowest landing floor, either of the following requirements shall be complied with:
    a. Not less than 5 independent ropes shall be used for suspension and the nominal diameter of the ropes shall not be less than 10 mm;
    b. Not less than 8 independent ropes shall be used for suspension and the nominal diameter of the ropes shall not be less than 8 mm.
7. Ropes shall be lubricated during manufacture. During operation, the ropes shall be re-lubricated as necessary and the following shall be observed:
    a. The rope manufacturer’s instruction / recommendation on rope lubrication shall be followed;
    b. Surface deposit and dirt accumulated on the rope surface shall be removed prior to the application of the lubricant to ensure that the paths for lubricant penetrations are not obstructed;
    c. The brand and grade of lubricant recommended by the rope manufacturer or their approved equivalent shall be used. Any contaminated lubricant shall not be used;
    d. Rope lubrication shall be carried out prior to other lift maintenance and servicing work in order to allow an adequate idle time after application of lubricant before putting the lift into operation to ensure adequate absorption of lubricant into the core of the ropes;
    e. If automatic lubrication device is used, it shall be proprietary made and the following shall be ensured:

i. The device is applying lubricant over all the ropes;

ii. The lubricant reservoir is not contaminated during use;

iii. The ropes are not over lubricated.

8. If the installed lifts are left idle continuously for 30 days or more after the issue date of the "Permit to Work on a Car Top before its First Run" by Registered Lift Engineer and before use permits are obtained, appropriate measures such as intermittent lift operations and lubrication as necessary shall be taken at least once every month during the lift idling period to prevent wearing of the ropes. Records of the above measure(s) as carried out shall be entered in the log-book.

LTE2.4.020.9 TEST PIECES FOR SUSPENSION ROPES

1. For all suspension ropes to be delivered to the Site, an additional length of at least 3m shall be allowed in each suspension rope to serve as test piece;
2. At a time before or during rope installation, the Sub-contractor shall in the presence and under the supervision of the CM or his representatives cut out from each batch of suspension ropes delivered to site at least 3 numbers of test pieces randomly selected by the CM or his representatives and send one of them to a laboratory for carrying out breaking force test in accordance with EN 12385-1 or BS EN 12385-1 and EN 12385-5 or BS EN 12385-5. The laboratory shall be accredited under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) for breaking force test of steel wire ropes in accordance with BS EN 12385-1. Laboratories accredited under the HOKLAS for tensile test of metallic materials, steel or structural fixings within the test category of construction materials may be accepted if the breaking force test is conducted by 2018. Only local laboratories will be accepted;
3. The test piece to be sent to the laboratory shall be properly packed, signed, sealed and photographed under the supervision of the Contract Manager or his representatives. The test record to be submitted to the Contract Manager shall include the photographic record showing receipt by the laboratory of the intact package before open up and testing of the test piece;
4. The expense and costs of the test shall be borne by the Sub-contractor;
5. If the test piece fails the test, the entire batch of suspension ropes shall be replaced at the Sub-contractor's expense and the CM may at his discretion call for further tests on the replaced ropes. All associated costs so arisen shall be borne by the Sub-contractor and no extension of time to the Contract period will be allowed;
6. After cutting out the test pieces from the ropes, the Sub-contractor shall re-seal the ropes to be installed on Site in order to prevent ingress of moisture and they shall be kept sealed until installation on Site.

LTE2.4.030.A ROPE COMPENSATION

1. For travel over 30 m, compensation shall be provided by the Sub-contractor;
2. For lift speed at or below 2.5 m/s, quiet operating chains can be used as the means of compensation;
3. For speed exceeding 2.5 m/s, steel wire rope shall be hung between car and counterweight, passing round an idler tensioning pulley in lift pit and the tension shall be checked by an electric device in accordance with Clause 5.11.2 of the Lift COP, Section E, Part 1;
4. If rope compensation is used for lift with rated speed at or below 2.5 m/s, it shall also comply with the above requirements;

5. For the use of quiet operating chain for compensation, a guiding device system shall be provided. The guiding device system shall include a set of four rollers at a suitable location on each side of the chain loop at the lift pit, or equivalent and approved by the CM, to guide the movement and restrain excessive sway of the chain. Additional safety wire or wire grips shall be provided at the chain termination fixing to the U-clip, bolt and nuts.

LTE2.5 TERMINAL STOPPING AND FINAL LIMIT SWITCHES

LTE2.5.010.A TERMINAL STOPPING AND FINAL LIMIT SWITCHES TO BE PROVIDED

Each lift shall be provided with terminal stopping and final limit switch(es). They shall be positively operated by the movement of the car. These switches whether mounted on the car frame or in the lift well, shall be properly enclosed.

LTE2.5.020.A TERMINAL STOPPING

TThe switch shall be arranged to stop the lift car automatically from any speed attained in normal operation within the top runby and bottom runby, independently of the operating device, the final limit switch and the buffers.

LTE2.5.030.A FINAL LIMIT

The method of operation of the switch shall comply with Clause 5.12 of the Lift COP, Section E, Part 1.

LTE2.6 GUARDING

LTE2.6.010.9 GENERAL REQUIREMENTS

All dangerous accessible rotating and moving parts which would cause injury upon bodily contact, including but not limited to traction sheave, handwinding wheels, brake drums, pulleys, ropes etc., shall be effectively guarded against contact of bodily parts with metallic see-through guards. Guarding for handwinding wheels shall be easily removable without the use of tools. Removable metallic see-through guards shall be used for rotating and moving parts which require inspection during lift running. Where applicable, components should be designed to be inherently safe, obviating the need for external or removable guards.

LTE2.6.020.9 LIFT WELL PARTITION

1. Where two or more lifts are fixed in a common lift well, the Sub-contractor shall provide a rigid metal screen having a minimum height of 2500 mm across the whole depth of lift pit fixed at the bottom between any two lifts;
2. Where the horizontal distance between the edge of the roof of a car and an adjacent or its counterweight is less than 300 mm, rigid metal screen to partition each lift from the adjacent lift shall be erected by the Sub-contractor from the lift pit to the full height of the lift well and across whole depth of the lift well.

LTE2.6.030.9 COUNTERWEIGHT

1. Counterweights shall be guarded by means of a rigid metal screen extending from a position 300 mm above the lift pit floor to a position at least 2500 mm above the lift pit floor. It is permissible to raise the bottom of the counterweight screen to clear the compensating chain/rope/means or other equipment. The bottom of the counterweight screen shall be as low as possible and shall be at least 300 mm below the lowest parts of the counterweight resting on a fully compressed counterweight buffer;
2. Where oil buffers are fitted in the pit or when the compensating ropes or chains are used, metal screens for counterweight shall be so positioned that access for the maintenance and servicing of oil buffers and compensation ropes shall be provided.

LTE2.6.040.A CAR TOP

1. Balustrade / Guardrail shall be provided to prevent accidental falling of people from car top where the horizontal distance between the edge of the car roof and the corresponding wall of the lift well exceeds 300 mm;
2. If the clearance between car landing sill and the wall of the lift well exceeds 150 mm, front guardrail and toe-board facing the door side, in addition to guardrails and toe-boards at other edges, shall be installed at the car top, and foothold shall be provided on the front of the car top. The guardrail shall be so designed and constructed to allow safe access to and egress from the car top.

LTE2.7 CAR FRAMES

LTE2.7.010.9 GENERAL REQUIREMENTS

1. Every lift car body shall be carried in a steel car frame sufficiently rigid to withstand the forces which will be applied in normal lift operation, in safety gear operation or impact of the car on its buffer without permanent deformation of the car frame;
2. The deflection of the members carrying the platform shall not exceed 1/1000 of their span under static conditions with the rated load evenly distributed over the platform;
3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the car slings delivered to the site or installed.

LTE2.7.020.9 CAR GUIDE SHOES

1. At least four renewable guide shoes, two at the top and two at the bottom of the car frame shall be provided;
2. For lift speed exceeding 1 m/s, the guide shoes shall be resiliently mounted. For lift speed of 2.5 m/s or above, the guide shoes for the lift car shall be of the roller type. Any necessary lubrication shall be applied by automatic means.

LTE2.8 CAR ENCLOSURES

LTE2.8.010.9 NON-COMBUSTIBLE MATERIALS TO BE USED

Lift cars shall be constructed of non-combustible materials.

LTE2.8.020.9 CAR TO BE COMPLETELY ENCLOSED

1. The car of every lift shall be completely enclosed at the sides and on top and shall, save for any opening affording access thereto or for ventilation or emergency trap door, not have any openings or open work panels in the sides;
2. The interior height of car shall be 2,600 mm unless otherwise specified.

LTE2.8.030.9 PLATFORM LOADING

1. Car platforms shall be of framed construction. Platforms for Passenger Lift (P) cars and Passenger Lift (F) cars shall be designed on the basis of rated load, this being evenly distributed. Platforms for freight cars shall be designed to suit the particular conditions of loading;
2. At least two coats of epoxy paint coating primer shall be applied to all parts of car platform, followed by at least two coats of finishing epoxy paint coating for marine application in accordance with the paint manufacturer's recommendation. The same coating system shall also be applied to the internal surfaces of any cavities forming the integral part of the car platform;
3. If the car platform is made of stainless steel, epoxy paint is not required.

LTE2.8.040.9 INTERNAL CONSTRUCTION OF PASSENGER LIFT (P) CARS

1. All Passenger Lift (P) car walls, skirting and doors shall be constructed of at least 1.5 mm thick stainless steel sheet. Mild steel sheet lined with stainless steel shall not be acceptable. Car walls and doors shall be adequately stiffened by stainless steel ribs where required to provide a robust mechanical construction for heavy and rugged usage;
2. Handrails constructed of stainless steel shall be provided on three sides of the lift car extending to within 150 mm of all corners. The top of the handrail shall be at 900 mm above finished car floor The handrails shall comply with Figure 15 of Design Manual: Barrier Free Access 2008;
3. The finishes of the stainless steel sheets shall be hairline, satin, random embossed wavy line pattern or mirror finish, as approved by the Contract Manager and as shown on the Drawings. All fasteners for the fixing of stainless steel sheets shall be of stainless steel;
4. Hairline stainless steel ceiling or other ceiling as specified on the drawings shall be provided by the Sub-contractor. For the emergency trap door where a cladding plate matching the ceiling is provided, the cladding plate shall be securely fixed by stainless steel rivets or stud welding at four points or more. Compact fluorescent or Light Emitting Diode (LED) down lights shall be recess mounted;

5. A concealed high / low speed fan / blower shall be recessed above the car ceiling. Stainless steel air diffuser(s) complete with suitably angled deflectors shall be provided to discharge air evenly to the lift car. The opening of the diffuser should be adequately sized such that the air flow of the fan will not be obstructed. The fan shall be guarded against contact by finger from inside the lift car and from the lift car top. The fan shall be able to produce at least twenty air changes per hour of lift car volume with the lift car stationary and car door closed. The sound pressure level inside lift car with car door closed shall not exceed 60 dB(A) when the fan is producing air flow rate at twenty air changes per hour;
6. Car floor homogeneous tiles as indicated in the Drawings shall be supplied, cut to sizes and laid by the Main Contractor. The Sub-contractor shall make allowance for the weight of tiles and tile adhesive in sizing of lift equipment and shall obtain the exact weight from the Main Contractor. The Sub-contractor shall calculate the exact decoration load based upon the design materials and fixing details that suit the particular lift design in sizing of lift equipment;
7. A floor cover plate of at least 1 mm thick stainless steel sheet shall be provided on top of the car platform;
8. Prior to the application of tile adhesive by Main Contractor to the floor cover plate, the joint between car wall / skirting and the floor cover plate shall be sealed with a suitable mastic sealant or by other approved means to make a watertight joint.

LTE2.8.050.9 INTERNAL CONSTRUCTION OF PASSENGER LIFT (F) AND FREIGHT LIFT CARS

1. Lift car walls, skirting, car doors, handrails and floor cover plate shall be constructed of stainless steel sheet. Mild steel sheet lined with stainless steel shall not be acceptable;
2. Thickness of the stainless steel sheet for car wall, skirting and car door shall be not less than 1.5 mm. The finishes of stainless steel sheet shall be of hairline, satin, random embossed or wavy line pattern, as approved by the Contract Manager. The car walls and doors shall be adequately stiffened by stainless steel ribs where required to provide a robust mechanical construction for heavy and rugged usage;
3. Floor coverings shall be slip-proof stainless steel chequer plate of at least 3 mm thick;
4. All fasteners for the fixing of stainless steel sheets shall be stainless steel;
5. The ceiling shall be painted finish with cream white colour. For the emergency trap door where a cladding plate matching the ceiling is provided, the cladding plate shall be securely fixed by stainless steel rivets or stud welding at four points or more;
6. The joint between the skirting and car panels, and between the skirting and car frame, shall be sealed with a suitable mastic sealant or by other approved means to make a watertight joint;
7. Handrails shall be provided on the three sides of the lift car extending to within 150 mm of all corners. The top of the handrails shall be at 900 mm above car floor. The handrails shall comply with Figure 15 of Design Manual: Barrier Free Access 2008;
8. Fully recessed fluorescent lights shall be completed with vandal-proof polycarbonate, white opal diffuser fixed to the casing with secret-head screws.

LTE2.8.060.9 TOE GUARD

1. Each lift car shall be fitted with a toe guard in accordance with Clause 4.4 of the Lift COP, Section E, Part 1;

2. The toe guard shall be constructed of stainless steel, at least 1.5 mm thick and hairline finish;

3, A 150 mm high black and yellow warning strip by spray painting shall be provided at the top edge of the toe guard as shown on the Drawing.

LTE2.8.070.9 MAINTENANCE FACILITIES

1. A 13A 3-pin shuttered type socket outlet to BS 1363-1 and BS 1363-2 shall be provided on both the top and bottom of the lift car;

2. A permanent light, suitably protected and separately switched, shall also be fitted on both the top and the bottom of the lift car.

LTE2.8.080.9 CAR ILLUMINATION AND PARKING

1. Lift car shall be illuminated to a level of not less than 120 lux at car floor level and on control devices. At least two independent sets of lighting control gear circuits and fittings shall be used;

2. The car shall park at the landing of its final call unless otherwise specified;

3. When no call is registered within an adjustable period of 2 minutes with the lift doors closed, the lift car's ventilation fan shall be shut off automatically until the lift car is activated again by passenger call. The automatic switch-off function to the ventilation fan shall not be operative during breakdown of the lift and with any passengers being trapped inside the lift car.

LTE2.8.090.9 EMERGENCY LIGHTING

1. Every lift car shall be provided with emergency lighting automatically illuminated in the event of failure of power supply to the lift;

2. At least two lighting fittings of independent control gear circuits in lift car shall be used to provide emergency lighting as well as normal lighting. The lamps shall be fed from the battery (in LTE1.7.050) automatically upon failure of normal lighting supply;

3. The emergency lighting shall be able to provide an illumination level of at least 5 lux at car floor level and on control devices.

LTE2.8.100.9 EMERGENCY SIGNAL

1. Every lift car shall be provided with an emergency signal which shall be operative from the lift car, visible and audible at the lift lobby on the main entrance floor;

2. The power supply to the emergency signal shall be fed from the batteries complying with LTE1.7.050 sub-clause (2).

LTE2.8.110.A EMERGENCY TRAP DOOR

1. Each lift car shall be provided with an emergency trap door of minimum size 400 mm x 500 mm, which shall be in the roof. Construction details of the emergency trap door shall be submitted for the CM's approval prior to fabrication;

2. Emergency trap door shall:

   a. Not open towards the inside of the car;

   b. Be clear of any apparatus mounted above the roof of the lift car;

   c. Be held by suitable locking device which can be opened from outside the lift car without a key and from inside the lift car with a key suited to the triangle defined in Clause 5.3.9.3 of Lift COP, Section E, Part 1;

d. Be provided with an electric safety device which functions as follows:

   i. Operate the alarm sounder and prevent operation of the lift and ventilation fan at car top under any one or both of the following conditions:

      - When the locking device in sub-clause (2)(c) ceases to be effective;
      - When the panel is open.

   ii. Stop the alarm sounder and restore operation of the lift and ventilation fan only when the locking device is effective and has been manually relocked.

LTE2.9 CONTROL AND INDICATOR IN CAR

LTE2.9.010.9 CONTROL PANEL IN CAR

1. Each lift car shall have a flush mounted control panel on the right hand side of the car door when viewed from the car. The control panel shall be mounted such that essential lift control buttons (call registration buttons, alarm button and door open/close buttons) on this main control panel or the secondary car control panel shall be not less than 900 mm and not more than 1200 mm above the finished car floor;
2. The material for the panel shall be stainless steel with a thickness not less than 2.5 mm. The control panel shall be fixed onto the car panel by stainless steel secret-head screws;
3. The control panel shall comprise:
   a. Push buttons for the landings served;
   b. The alarm button shall be yellow in colour and identified by the symbol 🔔 in accordance with Clause 5.4.2.3.4 of the Lift COP, Section E, Part 1 and with protection from being pushed accidentally. The alarm button shall also be in tactile bell shape;
   c. Door open and door close push buttons;
   d. The alarm, door open, and door close push buttons shall have labels, either engraved or embossed in both English and Chinese characters as follows:

      "Alarm 警鐘"

      "Door Open 開門"

      "Door Close 關門"

   e. A service ON/OFF key switch shall be provided, and shall have label, either engraved or embossed in both English and Chinese characters as follows:

      "Service Switch 維修掣"

      When the service switch is operated, the lift shall remain inoperative to facilitate service, cleaning and standby mode. The service switch shall be rendered ineffective unless the car has stopped or parked at a lift landing;

   f. A secondary car control panel shall, where shown on the Drawings, be flush mounted on the left hand side of the car door when viewed from the car. The panel shall comprise all control buttons as the main panel. Essential lift control buttons (call registration buttons, alarm buttons and door open buttons) on this secondary car control panel or the main car control panel shall be not less than 900 mm and not more than 1200 mm above the finished car floor.

LTE2.9.020.9 ATTENDANT CONTROL

1. Lifts shall be equipped with attendant control. The control panel mentioned in LTE2.9.010 shall also incorporate the following with proper labels:
   a. An attendant control switch; and
   b. A non-stop button for the purpose of by-passing landing calls, but the landing calls shall remain registered until answered. This button shall only be operative when the above attendant switch is switched on; and
   c. An adjustable with step / modulating control fan speed switch.

i. Fan speed switch shall be proprietary made by the switch manufacturer or of a type approved by the manufacturer. It shall be installed in accordance with the recommendation from the switch manufacturer;

ii. Fan speed switch shall be of a type suitable for use as speed control for ventilation fan;

iii. Fan speed switch shall be properly fixed on the control panel by screw or other fixing method as recommended by the switch manufacturer.

2. The button and switches specified in this clause shall be housed in a recessed stainless steel box with hinged lid which shall be key-locked.

LTE2.9.030.9 ILLUMINATED INDICATOR

An illuminated indicator, indicating the landing at which the car is stopped or passing, and up and down directional indication, and displaying pre-programmed messages/symbols shall be provided in the car. The indication fixture shall comply with LTE2.12.030 and pre-programmed with additional messages same as those verbal annunciations specified in LTE2.12.050 sub-clauses (5) and (6).

LTE2.9.040.9 OVERLOAD DEVICE

An overload device shall be installed for each lift (see LTE2.16).

LTE2.9.050.A PUSH BUTTONS

1. Unless otherwise specified, all push buttons shall be flush with the control panel, and shall be vandal-resistant design and suitable for heavy duty. The push buttons shall have a minimum dimension of 20 mm and shall be vandal-resistant design and suitable for heavy use and integral with tactile braille and LED illuminators and shall be approved by the Contract Manager;

2. Except for lift(s) serving both domestic and non-domestic floors, the control of buttons for lift(s) in non-domestic premises shall be equipped with contact-less function/feature, i.e. built-in sensor type and unless otherwise specified in the Specification. The contact-less function/feature shall be excluded for alarm button inside lift car and shall be disabled for fireman's lift when the fireman's switch is activated;

3. Braille and tactile markings of Arabic numerals and symbols shall be placed on the control buttons. Tactile markings shall have a minimum dimension of 15 mm high and be raised 1 mm minimum, and shall be of high contrasting colour background. Tactile marking in "star" shape shall be provided at the left hand side of the push button for the main entrance floor;

4. The Sub-contractor shall confirm with supporting document that a confirmation letter has been issued from a recognised organisation of the visually impaired to certify that the messages of the Braille and tactile markings on the model or type of the push buttons to be provided have already been proof read to be correct and readable for use by the visually impaired.

LTE2.9.060.9 CAR TOP CONTROL

A control station shall be fitted on top of the car and shall include:

1. A lighting switch and fan switch, with on/off position indicators, to control the lights and the fan in the lift car;

2. A bi-stable inspection switch marked "NORMAL" (正常) and "INSPECTION" (慢車) which when operated shall ensure that:

a. It is not possible to control the car, including any automatic doors, from any other position;

b. The car shall only travel at a speed not exceeding 0.63 m/s;

c. The car shall not move until all safety devices are in, and remain in, the safe position;

d. The movement of the car shall be dependent on a continuous pressure simultaneously on a "Common" push button and a "Up" or "Down" push button. These push buttons shall be protected against accidental operation and with the direction of movement clearly indicated. The words "UP" (上), "DOWN"(落) and "COMMON"(共通) or "U", "D" and "C" indicating the intended direction of motion shall be provided on or near the buttons.

3. A stopping device of "mushroom head, push to stop, pull to run" type, coloured red and marked with the word "STOP" (停止) which when operated shall stop the car immediately and it shall not be possible to move the car, including any automatic doors, from any other position, so placed that there can be no risk of error as to the stop position;

4. A switch lock on the inspection/operation switch at the car top or other similar device shall be installed.

LTE2.9.070.9 STOP SWITCH TO BE PROVIDED

Stop switches as specified in LTE2.9.060 (3) shall also be provided at the following locations:

1. Compartment separate from motor room or lift well where lift equipment is housed;

2. Where a lift machine and its controller are installed at different levels exceeding 600 mm, a stop switch shall be provided near the machine;

3. In the pit for each lift;

4. At the top of the pit cat ladder adjacent to the pit lighting switch.

LTE2.9.080.9 SOCKET TO BE PROVIDED IN PIT

A 13A 3-pin watertight socket outlet of the type specified in ELE20.3.020 shall be provided at the lift pit in compliance with Clause 5.10.7.2 of the Lift COP, Section E, Part 1.

LTE2.9.100.9 INTERCOM SYSTEM

1. Separate intercom system powered by battery shall be installed for each lift for communications between the lift car, the guard counter or location(s) as shown on the Drawings, the lift machine room or maintenance access panel for machine-room-less lift, and the lift car top. The intercom system shall be activated for communications by either pressing the alarm push button in the lift car once or by lifting the intercom handset(s) at the guard counter or location(s) as shown on the Drawings, or the lift machine room or maintenance access panel for machine-room-less lift, or the lift car top. Intercom handset shall be provided at each lift car top;

2. The associated equipment inside the lift car shall be flush mounted and complete with the intercom symbol shown in Fig. 3 of BS 5655: Part 7;

3. The intercom system shall function together with the lift alarm system as detailed in LTE2.21.

LTE2.9.110.9 LIFT CONTROL FEATURES IN CASE OF FAILURE OF NORMAL POWER SUPPLY FOR BUILDING WITH THE PROVISION OF EMERGENCY GENERATOR

1. In the event of failure of normal power supply and the emergency generator being actuated, all fireman's lifts in a building shall resume their normal operation immediately. Non-fireman's lifts in the same building shall be stopped and be sequentially started within 45 seconds to return to the home landing one at a time before the next lift is started and remain stationary at that level to release the passengers. The lift doors shall be opened to release passengers and shall then be closed and remain closed while the "DOOR OPEN" button shall remain operative. Emergency power will be available for the sequential returning of the lifts to the home landing while the fireman's lifts are in operation. To prevent the simultaneous starting of the non-fireman's lift and all the fireman's lifts, the starting of the non-fireman's lift shall be momentarily delayed when all the fireman's lifts are being started or about to be started. However, momentary delay of the movement of a non-fireman's lift during sequential returning is not allowed after the lift has started to move. The operation of the fireman's lifts shall not be affected in any case;
2. Under surge and starting load condition, the emergency generator provided by the Electrical Sub-contractor will maintain the transient state voltage dip within 15% with 1.5 seconds recovery time. The lift system shall be capable for operation in safe working order under this transient variation limit;
3. A pair of voltage-free contacts actuated when the emergency generator is ready to pick up the connected load will be provided by the Electrical Sub-contractor. A pair of voltage-free contacts actuated by fire alarm signal will be provided by the Fire Services Sub-contractor. These pairs of voltage-free contacts will be terminated inside respective surface mounted boxes inside the lift machine room or near the lift control panel;
4. After the lift homing operation has completed, all non-fireman's lifts shall remain stationary at the home landing. They shall resume their normal operation automatically upon the reset of the above voltage-free contacts of the emergency generator system due to resumption of normal power supply. However, lift operation shall not be resumed before the reset of the above voltage-free contacts of fire alarm signal;
5. The Sub-contractor shall be responsible for all connection and control after these voltage-free contacts;
6. For each non-fireman's lift, the Sub-contractor shall provide a pair of voltage-free contacts actuated when the lift homing operation has completed. Connection and control after these voltage-free contacts will be carried out by the Electrical Sub-contractor to trip off the power supply of the corresponding sub-distribution board serving the lighting and small power of the lift.

LTE2.9.120.9 LIFT CONTROL FEATURES IN CASE OF FAILURE OF NORMAL POWER SUPPLY FOR BUILDING / LIFT TOWER WITHOUT THE PROVISION OF EMERGENCY GENERATOR NOR OTHER EMERGENCY POWER SUPPLY

For lifts in a building / lift tower without the provision of emergency generator nor other emergency power supply, a complete battery back-up system normally maintained by trickle charger from A.C. source shall be provided to support passenger release operation in case of failure of normal power supply. The battery back-up system shall be of adequate capacity to move the lift car as described below and shall be capable of being fully recharged from total depletion within 24 hours:

1. For building – move the lift car to a landing for passenger release;

2. For lift tower – move the lift car to the landing at entrance / exit level for passenger release.

LTE2.9.130.9 LIFT CONTROL FEATURES IN CASE OF SUPPLY VOLTAGE DIP WITHOUT ACTUATION OF EMERGENCY GENERATOR

1. In the event of supply voltage dip to less than 90% of normal and the emergency generator is not being actuated, the lifts in a building shall either continue their normal operation during the voltage dip or automatically resume normal operation after the voltage dip. In the latter case, the controller should carry out self-diagnosis and run other safety automatic routines as required by the manufacturer immediately after the voltage dip, return to home or the nearest landing either in up or down direction to resume normal operation. If self-diagnosis tests fail, the lift should not resume normal operation unless the system is checked by maintenance personnel;

2. When the lift restarts after resumption of normal supply, audio message specified in LTE2.12.050 sub-clauses (5) and (6) and visual signal must be provided in the lift car to inform the trapped passengers the status of the lift. The visual signal shall be the messages same as those verbal annunciations specified in LTE2.12.050 sub-clauses (5) and (6) shown in dot-matrix LED type car position indicator.

LTE2.10 CCTV SYSTEM FOR LIFT CAR

LTE2.10.010.9 GENERAL

1. Colour Closed Circuit Television System (CCTVS) shall be provided for monitoring the lift cars with CCTV monitors in the lift machine room or at the maintenance access panel for machine-room-less lift. The Sub-contractor shall provide for each lift a CCTV camera at car top and a CCTV monitor in the lift machine room or at the maintenance access panel for machine-room-less lift complete with the associated wiring, video cables, amplifier, splitters, conduits etc. as required for lift car monitoring;
2. The Sub-contractor shall also provide for each lift a video cable terminated at a connection unit at high level of the main entrance floor lift lobby or otherwise as shown on the Drawings for connection to the local CCTV monitoring system by Electrical Sub-contractor. The corresponding CCTV monitors will be provided at the location(s) as shown in the Drawings by Electrical Sub-contractor;
3. If the Sub-contractor does not have a licence under the Security and Guarding Services Ordinance (Cap. 460) to carry out the CCTV installation and maintenance works in lifts described in this Specification, he shall sub-contract the works to a licensed security company and shall submit the name of the licensed security company to the Contract Manager.

LTE2.10.020.A CCTV VIDEO CAMERA

The Sub-contractor shall supply and install in each lift a CCTV camera complete with a spur unit fused at 5A at the car ceiling as the power supply;

1. General
    a. The camera shall be recess mounted under the lift car ceiling / false ceiling as shown in the Drawings. The metallic dome shaped vandal resistant camera housing shall be in the form of three-quarter of a sphere not greater than 120 mm diameter. The camera lens is fixed at the bottom of the spherical housing. The direction of the camera can be adjusted by turning the spherical housing with respect to the base through an eyeball action. It shall be small and housed in a robust camera housing. There shall be locking mechanism to fix the angle. Sample of the housing shall be submitted to the CM for approval prior to ordering;
2. Lens
    a. All video camera shall be equipped with auto-iris lenses;
    b. If the lens is motorised for remote control, the response time of the following adjustment shall not be more than:
        i. Full range iris control : 1.5 seconds;
        ii. Full range focus control (1 m to infinity) : 11 seconds;
        iii. Zoom control : speed of zoom shall be such as to double the field of view in 2.5 seconds.

    Operation of motorised drives for these controls shall not cause any radio frequency radiation or interference to the video signal, e.g. patterning, noise streaks, etc;

c. All video camera shall be equipped with fixed focal length lens unless otherwise specified. If motorized varifocal lens is required, the focal length shall not be less than 2.8mm to 12mm.

3. All power, control and video cables entering or leaving the camera externally shall be protected by a conduit;

4. The environmental protection rating of CCTV camera in lift car shall be at least IP42;

5. Compatibility

   The camera in lift car shall be compatible with the CCTV monitoring system provided by the Electrical Sub-contractor.

LTE2.10.030.A CCTV MONITOR

1. The Sub-contractor shall provide for each lift a LED type CCTV monitor adjacent to each lift alarm panel in the lift machine room or maintenance access panel for machine-room-less lift for monitoring the lift car. The CCTV monitor shall be compatible with the CCTV camera in lift car;

2. The video monitor shall be capable to handle both digital and analogue television / video signal. It shall be of either LCD panel lit with LED backlight or self-illuminated OLED panel;

3. The LED colour video monitor shall meet, but not be limited to, the following performance requirements:

(a)	Screen Size	24 inch (minimum viewable not less than 23.8") or otherwise specified on the Drawings
(b)	Horizontal and Vertical Viewing Angle	150° or larger
(c)	Native Resolution	1920 (H) x 1080 (V) or better
(d)	Brightness	Not less than 250 cd/m^2
(e)	Contrast Ratio	1000 : 1 or better
(f)	Input Terminal	HDMI, VGA
(g)	Power Source	220V AC $\pm$ 10%, 50/60 Hz
(h)	Support Languages for On-screen instruction	English and Traditional Chinese

4. The CCTV monitor shall be completed with adjustable tilting angle wall mounted bracket and desk mounted support depending on the application on Site.

LTE2.10.040.A VIDEO CABLE INSIDE LIFT WELL

1. The Sub-contractor shall provide all necessary cabling and accessories including video cables, conduits, connection units, amplifier, splitters etc. as required so that the video signal from the CCTV cameras can be adequately transmitted to the CCTV monitors in the lift machine room or at the maintenance access panel for machine-room-less lift for monitoring the lift car;

2. The Sub-contractor shall provide for each lift a video cable from a connection unit at lift car ceiling to the lift travelling cable termination box. The Sub-contractor shall then connect the video cable in surface conduit from the lift travelling cable termination box to a connection unit at high level of the main entrance floor lift lobby or as shown on the Drawings. The video cable shall be integrated with the lift travelling cable or clipped to the lift travelling cable by cable tie clips at separation not exceeding 1000 mm. Sample of the cable tie clip shall be submitted to the CM for approval;
3. Video cable shall be of CAT/5, CAT/6 or fibre optic;
4. High-definition multimedia interface (HDMI) cables

   The HDMI cable shall be of premium high-speed HDMI cable. The cable shall be suitable for reliable transfer of 4K@60Hz resolution video. The cable bandwidth support is 18Gbps and is optimized for HDMI version 2.0.

LTE2.10.050.9 PROVISION FOR LIFT FLOOR NUMBER DISPLAY SYSTEM FOR DOMESTIC BUILDING BLOCKS

1. For interfacing with the lift floor number display system, the Sub-contractor shall provide, for each lift in domestic building blocks, lift signals for floor location, up/down travel direction and lift alarm in the form of the following voltage free contacts rated at 500 mA maximum current and 25V maximum voltage, terminated in an interface metal box in Meter Room on Ground Floor or otherwise as shown on Drawings:
   a. One pair of N.O. contacts for each landing floor, to be closed only when the lift is at the floor which the contact is assigned. At any one time, only one pair of these contacts shall be closed;
   b. Two pairs of N.O. contacts for lift travel up/down directions, one to be closed when the lift is going up and the other to be closed when the lift is going down. Simultaneous closing of the two contacts shall not occur;
   c. One pair of N.O. contacts for lift alarm, to be closed when the lift emergency alarm push button is pressed.
2. An additional voltage free contacts for each lift shall also be provided in the interface metal box for connection to the central alarm system:
   a. One pair of N.O. contacts for lift alarm, to be closed when the lift emergency alarm push button is pressed.
3. All terminals for the dry contacts shall be properly labelled to indicate their functions;
4. The Sub-contractor is allowed to locate, if required, the equipment for converting serial data link from the lift controller to dry contact format in Meter Room on Ground Floor, subject to approval by the Contract Manager;
5. Subject to the Contract Manager's approval, it is acceptable that digital signals are used in lieu of the above dry contact signals, should an agreement be reached between the Sub-contractor and the Electrical Sub-contractor. In this case, the details of communication protocol, data format and the hardware interface shall be clearly defined by the two parties and submitted to the Contract Manager for approval.

LTE2.11 CAR DOORS AND LANDING DOORS

LTE2.11.010.A GENERAL REQUIREMENTS

1. Any projections or recesses in the exposed parts of the car doors or landing doors shall not exceed 3 mm in order to avoid shearing and the clearance between sliding parts of the door and any fixed part of the car or landing entrance shall not exceed 6 mm to avoid trapping that may cause bodily injury;
2. Sliding car doors and landing doors shall be guided on two parallel edges of the door. The distance between the car and landing sills shall not exceed 30 mm;
3. The clear height of all car doors and landing doors shall be not less than 2100 mm unless otherwise specified;
4. Under normal circumstances, lift car doors shall not be opened automatically unless the car has attained the levelling accuracy specified in LTE2.20.050;
5. Door hangers and tracks together with their fixing for car and landing door shall be of steel or approved material of equivalent strength and be of robust construction. Means shall be provided to prevent the hangers from misaligning, jumping the tracks and jamming or displacement at the extremities of their travel;
6. Two guide blocks shall be fitted at the bottom of each door panel at appropriate positions to prevent twisting of door panel even after wear. Each guide block unit shall incorporate a robust safety flange extending downwards in the event of the collapse or breaking a drift of the normal rubbing surface of the guide block, the safety flange will prevent the bottom of the door panel from being pushed into the lift well. The guide blocks and the associated fixing screws shall be constructed with durable and corrosion resistant materials;
7. Rollers shall be constructed of steel with sealed ball or roller bearings. An outer plastic lining on roller is acceptable;
8. Ropes shall be steel wire ropes to BS EN 12385-4 or equal and approved;
9. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the car doors and landing doors delivered to the Site or installed.

LTE2.11.020.9 CAR DOOR

1. Each car entrance shall be provided with a car door which shall extend the full height and width of the car opening. The top track of the door shall not obstruct the car entrance. The stainless steel car door finishes shall be of hairline, satin, random embossed or wavy line pattern, unless otherwise stated in the Project Specific Specification or Drawings;
2. Anti-hand/Anti-finger trapping device for minimizing the risk of dragging children's hands/fingers into the gaps between the car door panels and uprights shall be provided. The device shall immediately send a signal to stop the car door operation when it detects an obstacle in the door opening operation. The device shall be the type accepted by EMSD.

LTE2.11.030.9 LANDING DOOR

1. All landing openings in lift well enclosures shall be protected by doors which shall extend the full height and width of the landing opening. The top track of landing door shall not obstruct the entrance to the lift car. Every such door shall have a fire resistance rating of not less than 120 minutes with regard to integrity;

2. The landing doors on all floors, including G/F, shall be constructed of at least 1.5 mm thick stainless steel. The finishes of the stainless steel landing door shall be of hairline, satin, random embossed or wavy line pattern, as approved by the Contract Manager. Mild steel sheet lined with stainless steel shall not be acceptable. Sample of stainless steel shall be submitted for Approval prior to manufacture. The landing doors shall be adequately stiffened by stainless steel ribs where required to provide a robust mechanical construction for heavy and rugged usage.

LTE2.11.040.9 PASSENGER LIFT (P)

Doors shall be two panels, centre opening with fully automatic power opening and closing. The speed of the door panels shall be reduced when approaching the ends of their travels during closing. Car door shall be re-opened upon actuation of the landing call button and before the car door has fully closed.

LTE2.11.050.9 PASSENGER LIFT (F) AND FREIGHT LIFT

1. Doors shall be centre opening, fully automatic power operated, horizontally sliding. For lifts with a rated load less than 1600 kg, the doors shall be two panels. The speed of the door panels shall be reduced when approaching the ends of their travels during closing. Car door shall be re-opened upon actuation of the landing call button and before the car door has fully closed;
2. The door panel shall be framed and reinforced to form a robust construction suitable for heavy and rugged usage;
3. For freight lifts, a timer shall be incorporated in the door opening circuitry to function as follows:
    a. Whenever the "DOOR OPEN" button on the car control panel is pressed, the doors shall remain open for a pre-set period of time adjustable by a timer between 30 seconds and 5 minutes. By the end of the period, a buzzer shall sound prior to the closing of the doors;
    b. Pressing of the "DOOR OPEN" button a second time shall set the timer for another period of time. However, pressing of the "DOOR CLOSE" button on the same control panel shall cause the doors to close immediately. The doors shall not remain open for the pre-set period of time, but operate normally unless the "DOOR OPEN" button is pressed.
4. An instruction in Chinese and English characters not less than 13 mm high engraved on a stainless steel plate of at least 1.5 mm thick notifying the user of this facility, shall be displayed conspicuously adjacent to the car control panel for freight lift.

LTE2.11.060.9 CAR DOOR LOCKING DEVICE

1. Every set of car door shall be provided with electrical safety device(s) which shall prevent the lift car from being started or kept in motion unless all car door panels are closed. It shall not be possible under normal operation to open a car door whilst the car is in motion. Operation of the lift with car door open is permitted under the conditions laid down in Clause5.3.8.2 and 5.3.15.1 of the Lift COP, Section E, Part 1;
2. For centre-opening 2-panel car doors, each car door panel shall be provided with a separate door closed proving device;
3. Every set of car door shall be provided with an effective mechanical locking device and mechanically locked by at least 7 mm so that the door cannot be opened from inside the car unless the car is within the levelling zone (i.e. stopped or is levelling);

4. The positive locking of the mechanical car door lock shall be proved by an electrical safety device in conformity with Clause 5.11.2 of the Lift COP, Section E, Part 1 and shall precede the movement of the car;
5. The car door locking device shall be protected against deliberate misuse. The locking elements and their fixings shall be resistant to shock and shall be made of, or reinforced with, metal;
6. The engagement of the locking elements shall be achieved in such a way that a force in the opening direction of the door shall not diminish the effectiveness of locking. In the event that the locking action is effected by the action of spring, the spring shall act by compression and shall be guided and of such dimension that the coil is not compressed solid at the moment of unlocking. In the event of the spring no longer fulfilling its function, gravity shall not cause unlocking;
7. The locking device shall be protected against the risk of accumulation of dust, and tampering by external objects from below which could hinder its proper functioning;
8. The car door locking device shall comply with the minimum mechanical strength requirement as detailed in Clause 5.3.9.2 of the Lift COP, Section E, Part 1 such that at its locked position, the car door cannot be opened by itself, or by forcing open the door panels at any position by hands from inside the car, and/or by shaking of car door.

LTE2.11.070.9 LANDING DOOR LOCKING DEVICE

1. Landing door locking device shall be provided as detailed in Clause 5.3.8.1 and 5.3.9.1 of the Lift COP, Section E, Part 1;
2. The locking device shall be protected against the risk of accumulation of dust, and tampering by external objects from below which could hinder its proper functioning.

LTE2.11.080.9 DOOR LOCKING DEVICES TO BE INACCESSIBLE FROM LANDING AND CAR

All door locking devices and door switches, together with any associated actuating rods, levers or contacts, shall be so situated or protected as to be reasonably inaccessible from the landing and the car.

LTE2.11.090.A PROTECTIVE DEVICE

1. Safety edge shall be fitted to the leading edge of each car door panel to stop, reverse and fully re-open the car door panel in the event that the safety edge strikes an obstruction while closing. The requirements for the safety edge are as follows:
    a. The safety edge shall be so designed and installed that for centre opening doors the striking of an obstruction by either leading edge when closing shall cause it to function;
    b. The safety edge shall extend from not more than 25 mm above the sill (measured to the extended position of the safety edge) to a height of at least 1800 mm above the sill;
    c. The safety edge shall be fully retractable;
    d. The effect of the safety edge shall not be neutralized until the last 20 mm of travel of each door panel;
    e. The safety edge when striking an obstruction shall reverse the doors within the compliance (retractable length) of the safety edge;
    f. The safety edge when fully extended shall not protrude the door by more than 50 mm;

g. The safety edge shall not reduce the clear entrance width specified on the Drawings when the car door is fully open;

h. The force necessary to operate the safety edge shall not exceed 14.7 N;

i. The safety edge shall be of robust ridged surface aluminium construction.

2. In addition to the safety edge, a non-contacting detection device with multiple infrared beams shall be provided to give full protection along the leading edge of the car doors. Upon detecting an obstruction the device shall cause the closing door to stop before hitting the obstruction and reverse immediately to the fully open position. The requirements for the detection device are as follows:

a. The detection device shall be of curtain type composed of not less than 24 infrared beams, or other technology approved by the CM;

b. The detection field of the curtain shall cover the entire car opening width and extend from not more than 50 mm above the sill to a minimum height of 1800 mm above the sill;

c. The detection device shall be inoperative when the fireman's switch of the fireman's lift is activated.

LTE2.11.100.9 LANDING DOOR KEY

The Sub-contractor shall supply two landing door keys for each block upon completion of the installation.

LTE2.11.110.9 EMERGENCY LANDING OPENING IN LIFT WELL

1. Where emergency landing openings are required in the lift well, these openings shall be securely locked and electrically interlocked with the lift safety circuit. These openings shall be of same size as the normal landing entrance and be provided with normal landing doors complete with architraves;

2. The following warning notice in English and Chinese characters not less than 25 mm high shall be embossed onto a 1 mm thick stainless steel plate which shall be fixed onto the door by strong adhesive, with the lower edge of the notice plate at least 1500 mm above finished floor level:

DANGER

UNAUTHORIZED ACCESS PROHIBITED

LIFTWELL RESCUE DOOR

CLOSE AND LOCK THIS DOOR

危險

不得擅進

升降機槽救生門

請關閉並緊鎖此門

LTE2.11.120.9 ARCHITRAVES

1. The Sub-contractor shall provide on all landing entrances, unless otherwise specified, architrave fabricated from at least 1.5 mm thick stainless steel sheet. Finishes of the landing architrave shall be of hairline, satin, random embossed or wavy line pattern, as approved by Contract Manager;

2. All surfaces of architrave shall be formed true and gaps between sections shall not be allowed. Bolts shall not be visible on the exposed surfaces of the architraves;

3. A stainless steel tactile-braille plate for the blind people shall be provided and fixed on both sides of the architraves on all floors at 1200 mm above finished floor level. The tactile markings shall be Arabic numerals of minimum 60 mm high and raised 1 mm. The tactile-braille plates shall be 100 mm square with raised letter or numeral and corresponding Braille. The Braille messages provided on the tactile-braille plates at the architraves on each floor shall also tally with those provided on the lift push buttons. The tactile-braille plates shall be fixed by both strong adhesive and spot-welding or stainless steel rivet at four corners of the plate;
4. The design and construction of the architrave shall have no sharp edges or projections which will cause bodily injury to passengers.

LTE2.11.130.9 APRON SHEET BELOW EACH LANDING

1. The Sub-contractor shall provide a galvanized steel sheet of at least 1.5 mm thick below each landing threshold to comply with Lift COP and Clause 3.5 of the Lift Building Work COP;
2. A 150 mm high black and yellow warning stripe by spray painting shall be provided at the top edge of apron sheet as shown on the Drawing.

LTE2.11.140.9 DOOR SILLS

1. Door sills shall be of robust construction and shall be rigidly fixed to withstand the passage of loads to be introduced into the car. The thickness of any section of the sill shall be not less than 3 mm;
2. Car door sills shall be constructed of stainless steel;
3. Landing door sills for Passenger Lift (P) shall be constructed of extruded aluminium except the ones at ground floor or at main entrance access which shall be constructed of stainless steel;
4. Landing doors sills for Passenger Lift (F) and freight lift shall be constructed of stainless steel.

LTE2.11.150.9 MAXIMUM LIFT DOOR OPENING AND CLOSING TIME

Maximum lift door opening and closing time shall not exceed the following time specified:

Total Door Width	Opening Time	Closing Time
800 mm	2.0 sec.	2.0 sec.
900 mm	2.2 sec.	2.3 sec.
1000 mm	2.3 sec.	2.7 sec.
1100 mm	2.5 sec.	3.0 sec.

LTE2.11.160.9 TYPE TEST

The landing door locking device shall be type tested to the requirement of Clause 5.2 of BS EN 81-50 by an approved independent testing institution. The landing door shall be certified in accordance with the certification requirement in the FS Code. In addition, fire test report for stainless steel landing door with at least 1.5 mm thick and 1100 mm wide by 2100 mm high achieving the required fire resistance rating shall be provided. Documentary evidence on the above certification shall be submitted to the Contract Manager.

LTE2.11.170.9 WORKING PLATFORM INSIDE BLIND HOISTWAY FOR HOISTING ROPE INSPECTION

1. The access door to the working platform shall be a normal lift landing door complete with door locking device and architrave. The door shall be electrically interlocked with the lift safety circuit. The landing sill shall be installed such that the top level of the landing sill shall be the same level as that of the structural level of the working platform;

2. To avoid unauthorized entry to the working platform, on opening of the access door, the alarm sounders in the lift pit and the main entrance floor lift lobby shall sound continuously. A key-operated access door alarm overriding switch complete with appropriate label shall be provided in the lift machine room to override the door alarm system of the access door to the working platform. When the switch is put on the "override" position, the alarm sounders in the lift pit and the main entrance floor lift lobby shall not be activated by the operation of the access door to the hoisting rope inspection platform. A buzzer shall be provided adjacent to the door alarm overriding switch and the buzzer shall sound when the access door alarm overriding switch is put on the "override" position. The buzzer shall be silent if the overriding switch is put back to the "normal" position. The normal operation of the alarm button(s) inside the lift car cage shall not be affected by the operation of the access door alarm overriding switch;

3. On the access doors to the working platforms, the following warning notice in English and Chinese characters not less than 25 mm high and engraved on a 1 mm thick stainless steel sheet shall be provided. The notice plate shall be fixed by strong adhesive or rivets onto the access door, with the lower edge of the notice plate at least 1500 mm above finished floor level:

DANGER

UNAUTHORIZED ACCESS PROHIBITED

LIFTWELL

CLOSE AND LOCK THIS DOOR

危險

不得擅進

升降機槽

請關閉並緊鎖此門

4. Protection guards up to a height of 2.5 metres should be provided for all accessible moving hoisting or governor ropes. The design of the guards shall not affect the inspection work on the related ropes;

5. Ferrules which project at least 50 mm above the slab shall be provided for openings on the floor of the working platform. The gaps between the slab and the ferrules shall be water-sealed to prevent any water from directly dropping into the lift pit;

6. An emergency stopping device accessible on opening the access door, approximately 1.3 m above the floor of the working platform shall be provided to stop the lift and keep it stopped. This device shall be of the "push-to-stop, pull-to-run" type;

7. Wall mounted fluorescent light fittings shall be provided and mounted at 1800 mm above the working platform finished floor level such that the lux level on the floor level of the working platform should be at least 200 lux. A 5A lighting control switch accessible on opening the access door shall be provided;

8. A 13A socket outlet shall be provided.

LTE2.11.180.9 APRON SHEET BELOW CAR PLATFORM

A 150 mm high black and yellow warning strip by spray painting shall be provided at the top edge of apron sheet as shown on the Drawing.

LTE2.12 LANDING FIXTURES AND INDICATORS

LTE2.12.010.9 POSITIONING

1. A landing fixture shall be mounted adjacent to each lift landing entrance or between the landing entrances of duplex control lifts or group control lifts on the same floor or as shown on the drawings;
2. Landing indicators shall be provided at each lift landing and on other floors as shown on the Drawings.

LTE2.12.020.A CALL BUTTON

1. The landing fixture shall consist of landing call button(s) and illuminated call acceptance signal. The landing call button(s) with LED illuminators shall be mounted such that the call button top is 1200 mm above finish floor level unless otherwise specified on Drawings and shall be vandal-resistant and suitable for heavy use and approved by Contract Manager;
2. Except for lift(s) serving both domestic and non-domestic floors, the control of button(s) for lift(s) in non-domestic premises shall be equipped with contact-less function/feature i.e built-in sensor type and unless otherwise specified in the Specification. The design and mechanism of contact-less function/feature shall be the same as that provided inside the lift car;
3. The buttons shall be flush mounted on a stainless steel plate of with thickness not less than 2.5 mm. The plate shall be fixed by stainless steel secret-head screws;
4. The base box for call button shall be galvanised steel of thickness not less than 1.5 mm. Sample of the call button with the base box shall be submitted for the Contract Manager's approval;
5. Up/Down directional indications shall be engraved or embossed on the buttons or the mounting plate.

LTE2.12.030.9 LANDING INDICATORS

1. Landing indicator of dot-matrix type amber colour LED display, minimum 128 x 16 dots, actuated by reliable solid state circuitry shall be provided above each lift landing. The indicator shall be of robust design and impact resistance to a degree equivalent to that of polycarbonate material;
2. The indicator shall be able to display at least 32 messages. The dot-matrix display system shall be pre-programmed with the following messages/symbols to inform passengers the corresponding status of the lift:
    - Landing at which the car is stopped or passing
    - '超載 Overload';
    - '滿載 Full Load';
    - '暫停使用 Out of Service';
    - '消防員使用中 Used by Firemen';
    - '求助警鐘 Lift Alarm';
    - '例行保養,暫停使用 Routine Maintenance (Out of Service)';

- '維修中,暫停使用 Under Maintenance (Out of Service)';
- '清潔中,暫停使用 Cleaning in Progress (Out of Service)';
- '停置狀態,暫停使用 Parking Mode (Out of Service)';
- '升降機故障 Lift Breakdown';
- '火警,請勿使用升降機 Fire (Do Not Use The Lift)';
- Scrolling [UP] and [DOWN] arrow to indicate the lift travelling direction; and
- Other messages/symbols as required by the Contract Manager.

The height of each character in the dot-matrix indicator shall be 50 mm minimum. The luminous intensity of the indicator shall be at least 3500 μcd.

3. Fire alarm dry contact /signal shall be provided by FS contractor in lift machine room for displaying the message '火警,請勿使用升降機 Fire (Do Not Use The Lift)';
4. Messages/symbols of dot-matrix indicator shall be re-programmable such that changes, if required, can be effected to suit requirements arise after completion of the Works. Two (2) times of free messages/symbols revision within the Maintenance Period for the Contract shall be deemed to be included;
5. On floors served by only one lift, the landing indicators as described above for the other lifts shall be installed at their normal position where shown on the Drawings;
6. The base box for the landing indicators shall be galvanised steel of thickness not less than 1.5 mm thick. The box shall be adequately stiffened as necessary to avoid deformation after grouting by the Main Contractor. Sample of the floor indicator with the base box as well as the dot-matrix graphic layout and the pre-programmed messages shall be submitted for the Contract Manager's approval.

LTE2.12.040.9 MANUAL HOMING SWITCH

1. For each lift, a manual homing ON/OFF bi-stable switch to effect the home landing operation in compliance with Clause 5.12.1.12 of the Lift COP, Section E, Part 1 shall be provided at home landing floor for each lift;
2. The switch shall be flush mounted, and properly labelled in both English and Chinese on a stainless steel cover plate of at least 1.5 mm thick with glass vision panel. The cover plate shall be hinged and lockable with a key;
3. Common key shall operate all locks on the cover plates for the homing switches of the same building block. Two master keys shall be provided for each building block to the Contract Manager upon completion of the earliest Section of the Sub-contract Works.

LTE2.12.045.9 MANUAL PARKING SWITCH

1. Except for single lift, a manual parking ON/OFF key switch to effect lift parking mode in compliance with the BEC shall be provided for each lift at the position immediately below the manual homing switch;
2. The manual parking ON/OFF key switch shall be flush mounted on a stainless steel cover plate of at least 1.5 mm thick, and shall have label, engraved or embossed in both English and Chinese characters as follows:

   "Parking Switch 停置掣"

3. Common key shall operate all parking switches of the same building block. The master keys for the parking switches shall be provided for each building block to the Contract Manager upon completion of the earliest Section of the Sub-contract Works;

4. When the parking switch is operated, the following automatic functions shall be performed for the lift:

   a. The message/symbol '停置狀態, 暫停使用 Parking Mode (Out of Service)' shall be displayed at all landing indicators;

   b. Car call buttons and landing call buttons shall become inoperative, and new car calls and landing calls shall not be registered;

   c. The lift shall continue to operate until the already registered car calls and landing calls are answered;

   d. The lift shall then return to the home landing for parking;

   e. The lift doors shall open, then close after a few seconds and remain closed;

   f. The alarm button and the door open button in the car shall remain operative;

   g. The ventilation fan in the car shall be shut off;

   h. Only one lighting circuit for the car shall remain on and the rest shall be shut off;

   i. The CCTV camera in the car shall remain operative;

   j. The fireman's switch upon operation shall override the functions of the parking switch.

LTE2.12.050.9 AUDIBLE SIGNALS AND VERBAL ANNUNCIATION

1. An audible signal shall be provided at the lift entrance to indicate the lift car arrival and its direction of travel. The audible signal shall sound once for up direction and twice for down direction, and shall activate before the arrival of the lift;

2. Before arrival and opening of lift doors, a verbal annunciation of "樓層 stopping floor; 請勿貼近機門 stand clear of door" in Cantonese, Putonghua and English shall be initiated inside the lift car;

3. An audible signal, distinguishable from that for sub-clause (1), such as buzz sound, shall be provided to signify the closing action of the doors on departure to alert people;

4. After closing of lift doors on departure, another verbal annunciation of "往上/下 going up/down" in Cantonese, Putonghua and English shall be provided before initiating the verbal annunciation in sub-clause (2);

5. When the lift restarts after resumption of normal supply, a verbal annunciation of " 升降機正在重新啟動 Lift is restarting" in Cantonese, Putonghua and English shall be initiated inside the lift car repeatedly until the lift restarted;

6. When the lift is searching for or going to home/the nearest landing to resume normal operation, another verbal annunciation of "升降機正前往最近樓層 Lift is travelling to the nearest landing" in Cantonese, Putonghua and English shall be initiated inside the lift car repeatedly until the car arrived home/the nearest landing. When home/the nearest landing is arrived, another verbal annunciation of "升降機已回復正常操作，請按開門或目的地樓層按鈕 Lift has resumed normal operation, please press door open or destination floor button" in Cantonese, Putonghua and English shall be initiated once inside the lift car;

7. Script content of the verbal annunciations shall be re-programmable such that changes, if required, can be effected to suit requirements arise after completion of the Works. Two (2) times of free script revision within the Maintenance Period for the Contract shall be deemed to be included;

8. Volume of the audible signals and verbal annunciations in sub-clauses (1), (2), (3), (4), (5) and (6) shall be adjustable such that changes can be effected at no cost to the Employer to suit operational needs after completion of the Works. For sub-clauses (1) and (3), an automatic timer-controlled volume adjusting device shall be provided to produce two pre-set volume levels respectively for day and night operation modes;

9. The speaker for the audible signals and verbal annunciations shall be located at high level above the car control panel in the lift car.

LTE2.13 CAR CAPACITY AND LOADING

LTE2.13.020.9 PASSENGER LIFT (F) AND FREIGHT LIFT

The minimum rated load for Passenger Lift (F) and freight lift shall be based on a load of not less than that for a Passenger Lift (P) of the same net inside floor area.

LTE2.13.030.9 ADJUSTABLE DEVICE FOR BY-PASSING OF INTERMEDIATE LANDING CALLS

An adjustable device for bypassing of intermediate landing calls without their cancellation during a lift journey shall be provided for the lifts and preset to operate at 90% of the contract load value.

LTE2.14 LOAD PLATES, NOTICE BOARDS AND INSTRUCTIONS

LTE2.14.010.9 LOAD PLATE

1. A load plate giving the rated load of the lift shall be fitted in each lift car in a conspicuous position;
2. For passenger lifts the rated load shall be given in kilograms and persons, each of which is regarded as weighing 75 kg.

LTE2.14.020.A NOTICES AND WARNING SIGNS

The following notice boards and warning signs shall be provided as detailed in the Project Specific Specification and Drawings:

1. In each car, the name of the lift company, telephone number, lift number, use permit, emergency instructions, inter-com symbol and user instruction shall be engraved onto stainless steel plate not less than 1.5 mm thick and fixed at the car panel by stainless steel secret-head screws as shown on the Drawings. Use permit shall be placed under clear acrylic plastic plate at least 5 mm thick and fixed rigidly by stainless steel secret-head screws at the location as shown on the Drawings;
2. In each car, the following English and Chinese characters not less than 15 mm high with graphic symbol shall be engraved onto stainless steel plate not less than 1.5 mm thick and fixed at the car panel by stainless steel secret-head screws as shown on the Drawings.

   "IN CASE OF FIRE DO NOT USE THE LIFT"

   "如遇火警 切勿使用升降機"
3. In each car, the following English and Chinese characters not less than 10 mm high and a pictograph shall be engraved onto stainless steel plate of size as shown on the Drawings, not less than 1.5 mm thick and fixed rigidly onto the car panel by stainless steel secret-head screws at the location as shown on the Drawings.

   "KEEP CLEAR OF LIFT DOORS"

   "小心升降機門"
4. The following information shall be engraved on a stainless steel plate not less than 1.5 mm thick fixed rigidly over the main entrance floor landing of each lift:
   a. Lift Number;
   b. Floors served;
   c. Name of lift company and contact telephone no in case of emergency repair and breakdown, etc..
5. In each Passenger Lift (F) car, the following additional warning notices in English and Chinese characters not less than 25 mm high shall be engraved onto a stainless steel plate not less than 1.5 mm thick and fixed at the rear panel by stainless steel secret-head screws at the locations as shown on the Drawings:
   a. "LOADING AND UNLOADING BY INDUSTRIAL POWERED TRUCK IN LIFT CAR PROHIBITED"

      "嚴禁使用機動鏟車在升降機裝卸貨物"
   b. "A SINGLE PIECE OF GOODS SHOULD NOT EXCEED xx kg"

(Note: a quarter of the rated load of the lift)

"每件貨物不准超過 xx 公斤"

6. In each freight lift car, the following additional warning notices in English and Chinese characters not less than 25 mm high shall be engraved onto a stainless steel plate not less than 1.5 mm thick and fixed at the rear panel by stainless steel secret-head screws at the locations as shown on the Drawings:

   a. "LOADING AND UNLOADING BY INDUSTRIAL POWERED TRUCK IN LIFT CAR PROHIBITED"

      "嚴禁使用機動鏟車在升降機裝卸貨物"

   b. "THIS IS A FREIGHT LIFT AND SHALL NOT BE USED AS A PASSENGER LIFT"

      "此乃載貨升降機, 不准用作運載乘客"

   c. "A SINGLE PIECE OF GOODS SHOULD NOT EXCEED xx kg"

      (Note: a quarter of the rated load of the lift)

      "每件貨物不准超過 xx 公斤"

7. In each freight lift car, an instruction plate as detailed in LTE2.11.050 shall be provided;

8. At each landing the following English and Chinese characters not less than 15 mm high for sub-clause (8)(a) and not less than 10 mm high for sub-clause (8)(b) and a pictograph shall be engraved onto a stainless steel plate not less than 1.5 mm thick and fixed by the Contractor at the location as shown on the Drawings.

   a. "IN CASE OF FIRE DO NOT USE THE LIFT"

      "如遇火警 切勿使用升降機"

   b. "KEEP CLEAR OF LIFT DOORS"

      "小心升降機門"

9. At each landing of freight lift the following warning notices in English and Chinese characters not less than 25 mm high shall be provided by the Contractor:

   a. "LOADING AND UNLOADING BY INDUSTRIAL POWERED TRUCK IN LIFT CAR PROHIBITED"

      "嚴禁使用機動鏟車在升降機裝卸貨物"

   b. "THIS IS A FREIGHT LIFT AND SHALL NOT BE USED AS A PASSENGER LIFT"

      "此乃載貨升降機, 不准用作運載乘客"

   c. "A SINGLE PIECE OF GOODS SHOULD NOT EXCEED xx kg"

      (Note: a quarter of the rated load of the lift)

      "每件貨物不准超過 xx 公斤"

10. In each car a 'DANGER, DO NOT FORCE OPEN LIFT DOORS' sign in English and Chinese characters with pictograph shall be engraved onto a stainless steel plate of not less than 1.5 mm thick and fixed rigidly by stainless steel secret-head screws at the location as shown on the Drawings. The size of the English and Chinese characters shall be as follows:

English Letters	Chinese Characters	Minimum Size

"DANGER"	危險	10 mm
"DO NOT FORCE OPEN LIFT DOORS"	切勿強行打開升降機門	10 mm

11. In each lift car, a use permit board of design and construction as shown on the drawings and with size suitable for housing the use permit in compliance with EMSD's requirements shall be fixed rigidly onto the car panel and at a height level so that the bottom of the board is at least 1 m above floor level and the top of the board is not higher than 1.8 m above floor level;
12. At each lift lobby where entry to the building can be gained, an appropriate number of International Symbol for Access for People with a Disability will be provided by the Contractor;
13. Approved electric shock treatment notice mounted in an anodised aluminium frame with transparent plastic front plate of 3 mm minimum thickness and wooden backing board of 5 mm minimum thickness shall be prominently displayed in each lift machine room;
14. The lift machinery and the lift control panels shall be properly labelled and identified with the lift number to facilitate working on the correct equipment safely;
15. Black and yellow warning stripes by spray painting shall be provided on the floor trunking in lift machine room, and the ferrules of liftwell top vent;
16. Approved notice of safe working at lift pit shall be fixed with ties, screws or other suitable fasteners to the counterweight screen located at the lift pit of each lift;
17. At the highest landing entrance and rope inspection room for each lift, a lift identification plate of not less than 1.5 mm thick stainless steel onto which the lift number is engraved shall be provided by the Contractor;
18. At the building entrance, the following English and Chinese characters in engraved wording on plate of minimum size 200 mm × 200 mm shall be provided by the Contractor:

注意

在本 (大廈 / 停車場 / 商場 / 辦事處) 設置的閉路電視系統會收錄影像作保安及管業用途，所收錄的資料將會依照個人資料 (私隱) 條例的規定處理。

ATTENTION

The CCTV System installed in this (building / carpark / shopping centre / office) will record video images for security and building management purposes. The recorded data will be processed in accordance with Personal Data (Privacy) Ordinance.

LTE2.14.030.9 EMERGENCY RELEASE EQUIPMENT AND INSTRUCTIONS

A board or suitable container for the necessary tools, together with clear instructions on the method for moving the lift car and releasing passengers in an emergency shall be positioned in the machine room in a conspicuous manner. At least one set of such equipment and instruction shall be provided in each lift machine room. For machine-room-less lift, such equipment and instruction shall be provided at a location acceptable to the Contract Manager.

LTE2.15 SAFETY GEAR AND GOVERNOR

LTE2.15.010.9 PROVISION OF SAFETY GEAR

1. Every lift shall be provided with a safety gear attached to the car frame and place beneath the car platform;
2. Where any space located below any liftway is accessible to persons, the counterweight, as well as the car, shall be provided with a safety gear if there is no solid pier below the counterweight extending down to solid ground.

LTE2.15.020.9 GENERAL REQUIREMENTS OF SAFETY GEAR

1. Safety gear shall comply with the following general requirements:
   a. It shall only be possible to release car (or counterweight) safety gears by raising the car (or counterweight);
   b. Each car or counterweight safety gear shall be operated by means of its own overspeed governor;
   c. The application of the safety gear shall not cause the car platform to slope at more than 1 in 20 to the horizontal;
   d. It shall not be possible for vibration of the car frame to cause a safety gear to be applied.
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the safety gears delivered to the site or installed.

LTE2.15.030.9 TYPE TEST OF SAFETY GEAR

The safety gear shall be type tested to the requirements of Clause 5.3 of BS EN 81-50 by an approved independent testing institution. Type test certificate to this effect shall be submitted to the CM.

LTE2.15.040.9 OVERSPEED GOVERNOR

1. The overspeed governor shall be of the centrifugal type and shall operate the safety gear in case the speed of the car reaches the tripping speed in accordance with Clause 5.6.2 of the Lift COP, Section E, Part 1;
2. The overspeed governor installed inside lift machine room shall not return, after tripping, automatically into the normal position as the car / counterweight is moved in the upward direction;
3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the overspeed governors delivered to the site or installed.

LTE2.15.050.9 ELECTRICAL CHECKING ON OPERATION OF OVERSPEED GOVERNOR

The overspeed governor shall initiate the stopping of the lift machine before the car speed, either up or down, reaches the tripping speed of the governor in accordance with Clause 5.6.2.2.1.6 of the Lift COP, Section E, Part 1.

LTE2.15.060.9 GOVERNOR ROPES

1. The governor ropes shall not be less than 6 mm in diameter and shall be tensioned by a tensioning pulley. This pulley (or its tensioning weight) shall be guided;

2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the governor ropes delivered to the site or installed.

LTE2.15.070.9 TYPE TEST OF GOVERNOR

The overspeed governor shall be type tested to the requirements of Clause 5.4 of BS EN 81-50 by an approved independent testing institution. Type test certificate to this effect shall be submitted to the CM.

LTE2.15.080.9 ASCENDING CAR OVERSPEED PROTECTION MEANS

1. Every traction drive lift shall be provided with ascending car overspeed protection means in accordance with the Lift COP. The ascending car overspeed protection means shall be type tested to the requirements of Clause 5.7 of BS EN 81-50 or other approved international standards;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the ascending car overspeed protection means delivered to the site or installed.

LTE2.15.090.9 UNINTENDED CAR MOVEMENT PROTECTION MEANS

1. Every traction drive lift shall be provided with unintended car movement protection means in accordance with the Lift COP;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the unintended car movement protection means delivered to the site or installed.

LTE2.16 OVERLOAD DEVICE

LTE2.16.010.9 PROVISION OF OVERLOAD DEVICE

Every lift shall be provided with an overload device which shall be of fail safe design, or of such a design that the device shall not be damaged by excessive overloading, and shall operate when the load in the car is ten percent or more in excess of the rated load in respect of such lift.

LTE2.16.020.9 OPERATION OF OVERLOAD DEVICE

1. The overload device, when in operation, shall:
   a. Prevent any movement of the car;
   b. Prevent the closing of any power operated door whether fitted to the car or to the landing at which the car is resting;
   c. Give audible and visible signals;
   d. The audible and visual signals shall be positioned at the same level as the car position indicator;
   e. The visual signal shall have characters that are not visible when not operating and shows amber in colour when illuminated from behind with a flashing light when in operation; and
   f. The visible signal shall be in both English and Chinese characters as follow:

      "OVERLOAD"

      "超重"
2. The lift shall resume normal operation automatically on removal of overload. The overload device shall be inoperative whilst the lift car is in motion.

LTE2.16.030.9 FLOATING PLATFORM TYPE NOT ACCEPTABLE

Overload device installed on a floating platform is not acceptable.

LTE2.17 LIFT MACHINERY FOR ELECTRIC LIFT

LTE2.17.010.9 LIFT MOTOR

1. The main driving motor shall be of quiet running type, and shall be designed to operate for an unlimited period according to the expected duty of the lift;
2. Lift motor ratings in terms of number of starts per hour shall be not less than those in the following Table:

Rated speed, v in m/s	Number of starts per hour
$v \leq 1.0$	150
$1.0 < v \leq 1.75$	180
$v > 1.75$	240

3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the lift motors delivered to the site or installed.

LTE2.17.020.9 REDUCTION GEAR

Conventional worm reduction gear shall be employed for geared lift machine. Helical or planetary reduction gear may be accepted provided that the gear system of the same speed range has proven satisfactory in-service record stipulated in LTE1.5.020.

LTE2.17.030.9 BEARINGS

Bearings for motor shall be of the sleeve ring type or ball bearing type with oil ring. Reduction gear box shall be provided with journal and thrust bearings suitable for the application.

LTE2.17.040.9 HAND WINDING FACILITIES

1. Provision shall be made for each lift whereby the lift car can be raised or lowered in an emergency by manual operation. The direction of winding corresponding to the raising and lowering of the lift car shall be clearly indicated;
2. The hand winding apparatus, when detachable and portable, shall be mounted in an accessible and conspicuous position in the machine room. If the detachable/portable apparatus is suitable for use with four or more lifts installed in the machine room, at least two sets of such apparatus shall be provided;
3. For lift where the manual effort to raise the car with its rated load exceeds 400 N, an emergency electrical operation device to permit emergency electrical operation in accordance with Clause 5.12.1.6 of the Lift COP, Section E, Part 1 shall be provided for each lift.

LTE2.17.050.9 BRAKES

Every lift machine shall be provided with a brake that is mechanically applied and electrically held off. The brake shall be capable of stopping the machine when the car is downward travelling at its rated speed with 125% rated load. It shall be fitted with an emergency release which shall remain open only while manual pressure is being applied.

LTE2.17.060.9 ELECTRIC SERVICE LIFT

Please refer to the specification requirements specified in the Project Specific Specification.

LTE2.17.080.9 REGENERATIVE POWER

1. For every lift with lift motor rating of 8kW or above, controller / inverter / converter with appropriate facilities shall be provided to condition and feed the regenerative power induced during operation of the lift back to the power line for use by other lifts or electrical installations in the building;
2. Filtering facility shall be incorporated to ensure proper regenerative power quality such that the voltage and frequency shall not exceed ±6% and ±2% respectively of the rated supply in accordance with the Supply Rules of the concerned power supply company and that the extent of harmonic distortions shall comply with the concerned power supply company's requirements;
3. The Sub-contractor shall submit to the CM a report on the quality of the regenerative power upon completion of testing and commissioning of each lift to demonstrate compliance with the requirements of the concerned power supply company.

LTE2.18 CONTROLLER

LTE2.18.010.9 CONSTRUCTION

1. Unless otherwise specified, the controller shall be mounted in a ventilated steel cubicle with hinged doors at the front, in which all contactors, solenoids, relays, electronic cards and motor starting equipment, etc. shall be fitted;
2. Panels at the rear of the cubicle shall be of removable hinged type if access for routine maintenance at the rear is required.

LTE2.18.020.9 GENERAL REQUIREMENTS

1. The controller shall comply with the general requirements as stated in the Lift COP, Section E, Part 1 and the following features shall be included:
    a. Materials used in the construction of the control equipment shall not support combustion;
    b. The components shall be designed and mounted in a manner which facilitates inspection, maintenance, adjustment and replacement. Wirings shall be terminated in such a way that the wires are not damaged. Accessible terminals suitably marked, shall be provided for all cables;
    c. Control circuits shall be supplied through a double wound isolating transformer to BS EN 61558-1, and BS EN 61558-2-23 or IEC 61558-2-23;
    d. Where rectifier is used it shall be of the full wave silicon type fed from a transformer;
    e. The control circuits shall be protected by suitably rated miniature / moulded case circuit breakers or fuses to BS EN 60269-1 or BS 88-1, and BS HD 60269-2 or BS 88-2 independent of the protection of the mains circuits;
    f. The brake solenoid and any retiring cam shall operate on direct current;
    g. Motors connected to polyphase a.c. power supplies shall incorporate means to prevent the motor from being energised in the event of phase failure and / or phase reversal;
    h. A main switch shall be provided by the Electrical Sub-contractor for each lift capable of breaking the supply to the lift on all conductors and interrupting the highest current involved in normal conditions of use in accordance with Clause 5.10.5 of the Lift COP, Section E, Part 1;
    i. Interruption of the power supply or isolation of the main switch and / or other isolation / switching devices pertaining to one of the lifts under duplex control or group control shall not affect the normal operation of the other lift(s);
    j. In the event of out of service of one of the lifts under duplex control or group control, the other lift(s) shall be able to remain in normal service while the out-of-service lift is under repair or servicing.
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the controllers delivered to the site or installed;
3. Insulation rubber mat complying with BS 921 shall be provided on the floor in front of, and also at the rear of the lift control panel and other electrical switchboards in the lift machine room, if access for routine maintenance at the rear is required, for better protection against electric shock.

LTE2.18.030.9 MICROPROCESSOR-BASED CONTROL

Microprocessor-based control shall include the following design features:

1. Interruption of the electrical supply to the lift shall not affect the system memory or software;
2. It shall be possible to change the supervisory control algorithm to meet a change in building use by re-programming the instruction memory;
3. It shall be possible to display information on the operational status of the lift and to locate fault by having means of access/test points on the controller, self-diagnosis circuits with visual indicator or equivalent means to facilitate ease of maintenance and quick repairing, and printed circuit board modules shall be used;
4. Multiplexing techniques may be employed to reduce the number of trailing cables normally required, if considered cost effective to do so.

LTE2.19 AUTOMATIC CONTROL SYSTEM

LTE2.19.010.9 DOWN COLLECTIVE CONTROL FOR SINGLE LIFT ("SIMPLEX" DOWN COLLECTIVE CONTROL)

1. All calls shall be stored in the system and answered in sequence regardless of the order in which they are registered;
2. When travelling in the "Up" direction, the car travels to the highest call, stopping at any intermediate floor for which a car call has been registered. On stopping for the highest call, preference is established for the "Down" direction;
3. When travelling downwards the car stops for all car and landing calls that have been registered. When all calls have been answered, the car remains with doors closed at the floor to which it last travelled.

LTE2.19.020.9 DOWN COLLECTIVE CONTROL FOR TWO INTER-CONNECTED LIFTS ("DUPLEX" DOWN COLLECTIVE CONTROL)

In addition to the features as required in LTE2.19.010, it shall include the following control features:

1. When both cars are away from the terminal floor and all calls have been answered, one car shall return automatically to the terminal floor and referred to as the "Next" car. The second car remains at the floor which it last deposited passengers and is referred to as the "Free" car. Both cars stand with doors closed;
2. With the cars standing with doors closed as described in sub-clause (1) above the first landing call shall be answered as follows:
    a. If a terminal floor call, by the "Next" car;
    b. If from any other floor, by the "Free" car.
        i. With the "Free" car answering calls, the "Next" car shall not start for "Down" calls behind the "Free" car until the "Free" car is descending;
        ii. Should the "Free" car return to the terminal floor and the doors close after a passenger comes in, the passenger shall be able to register a call and travel to any destination. With both cars standing at the terminal floor with doors closed, the "Next" car (i.e. the one that arrived first) shall answer the first landing call. Directional preference shall be maintained when a car stops for its last call until the doors close.

LTE2.19.025.9 DOWN COLLECTIVE CONTROL FOR MORE THAN TWO INTER-CONNECTED LIFTS

In addition to the features required in LTE2.19.010, the control shall include features similar to those in LTE2.19.020 and shall include also, but not be limited to, the following features:

1. Group supervisory control system which shall incorporate a micro-computer or other similar solid state devices which continuously monitor the transportation demand and automatically adjust the group operation to suit the prevailing traffic pattern and to optimise passenger waiting time;
2. Control system features as described below:
    a. Heavy ‘Up’ traffic

When heavy 'Up' traffic is detected, at least two lift cars shall be assigned automatically to the terminal floor. Car(s) not assigned to the terminal floor shall continue to answer demands elsewhere in the building in the normal manner;

b. Heavy 'Down' traffic

When heavy 'Down' traffic is experienced, the despatching system shall ensure that lift service is equally distributed through the building and fully loaded car(s) shall automatically bypass landing calls in order to prevent unnecessary stops;

c. Light traffic

As traffic requirements diminish, car(s) shall complete their assignments and park with closed doors wherever they happen to be;

d. Car preference

It shall be possible to withdraw any car(s) from service for maintenance purposes or for attendant control by means of a key operated switch. Under this condition, other car(s) in the bank shall continue to answer calls in the system;

e. Car separation

Out-of-order car(s) shall be automatically separated from the group, while the remaining ones shall continue to operate under group supervision.

LTE2.19.030.9 FULL COLLECTIVE CONTROL FOR SINGLE LIFT

1. All calls shall be stored in the system and answered in sequence regardless of the order in which they are registered;
2. When the car is in motion in a given direction it shall travel to the further-most call, stopping at any intermediate floor for which a car call or landing call for the corresponding direction of travel has been registered;
3. Landing calls for the direction opposite to that in which the car is travelling shall be by-passed but will remain stored in the system to be answered when the car returns in the opposite direction;
4. When the car stops for the last call in its direction of travel, car preference is established for an adjustable period;
5. When all calls have been answered the car remains with doors closed at the floor to which it last travelled.

LTE2.19.040.9 FULL COLLECTIVE CONTROL FOR TWO INTER-CONNECTED LIFTS

In addition to the features as required in LTE2.19.030, it shall include the following supervisory feature:

1. When both cars are away from the terminal floor and all calls have been answered, one car shall return automatically to the terminal floor and is referred to as the "Next" car. The second car remains at the floor to which it last travelled and is referred to as the "Free" car. Both cars stand with doors closed;
2. With the "Free" car answering calls, the "Next" car shall not start for "Up" calls or "Down" calls behind the "Free" car until the "Free" car is descending. If the "Free" car is delayed the controller shall operate to dispatch the "Next" car;
3. With both car standing at the terminal floor with doors closed the "Next" car shall answer the first landing call;
4. Should the "Free" car return to the terminal floor and the doors close after a passenger comes in, the passenger shall be able to register a call and travel to any destination; and

5. For lift serving lift tower or podium, the terminal floor as referred in sub-clauses (1) to (4) above for the purpose of lift car control shall mean the entrance / exit floor connecting to the domestic building it serves.

LTE2.19.045.9 FULL COLLECTIVE CONTROL FOR MORE THAN TWO INTER-CONNECTED LIFTS

In addition to the features required in LTE2.19.030, the control shall include features similar to those in LTE2.19.040 and shall include also, but not be limited to, the following features:

1. Group supervisory control system which shall incorporate a micro-computer or other similar solid state devices which continuously monitor the transportation demand and automatically adjust the group operation to suit the prevailing traffic pattern and to optimise passenger waiting time;
2. Control system features as described below:
   a. Heavy 'Up' traffic

      When heavy 'Up' traffic is detected, at least two lift cars shall be assigned automatically to the terminal floor. Car(s) not assigned to the terminal floor shall continue to answer demands elsewhere in the building in the normal manner;

   b. Heavy 'Down' traffic

      When heavy 'Down' traffic is experienced, the despatching system shall ensure that lift service is equally distributed through the building and fully loaded car(s) shall automatically bypass landing calls in order to prevent unnecessary stops;

   c. Light traffic

      As traffic requirements diminish, car(s) shall complete their assignments and park with closed doors wherever they happen to be;

   d. Car preference

      It shall be possible to withdraw any car(s) from service for maintenance purposes or for attendant control by means of a key operated switch. Under this condition, other car(s) in the bank shall continue to answer calls in the system;

   e. Car separation

      Out-of-order car(s) shall be automatically separated from the group, while the remaining ones shall continue to operate under group supervision.

LTE2.19.050.9 DOUBLE DUPLEX DOWN COLLECTIVE CONTROL

1. Double Duplex Down Collective Control shall be provided as shown on the Drawings for three lifts arranged in two groups serving two different floor zones (i.e. lower zone and higher zone). Two of the three lifts shall serve the high and low zones respectively while the remaining one serves both zones;
2. The Double Duplex Down Collective Control system shall be capable of achieving the following:-
   a. In case of landing call(s) registered at the lower zone, the group control system shall deploy the low-zone lift or the two-zone lift or both to answer the call(s) with due consideration of the current car locations, car calls registered and travelling directions so as to optimize the passenger waiting time and even out the lift usage;

b. In case of landing call(s) registered at the higher zone, the group control system shall deploy the high-zone lift or the two-zone lift or both to answer the call(s) with due consideration of the current car locations, car calls registered and travelling directions so as to optimize the passenger waiting time and even out the lift usage;

c. In case there are simultaneous landing calls registered at the lower zone and at the higher zone, the group control system shall deploy one or two or all of the three lifts to answer the landing calls with due consideration of the current car locations, car calls registered and travelling directions so as to optimize the passenger waiting time and even out the lift usage.

LTE2.20 LIFT POWER SYSTEM AND LEVELLING

LTE2.20.010.9 GENERAL REQUIREMENT

Lift power system shall be AC variable voltage variable frequency (ACVVVF) system using gearless drive.

LTE2.20.050.9 LEVELLING ACCURACY

Levelling accuracy of the lift system shall not exceed ± 10 mm.

LTE2.20.060.9 AUTOMATIC RE-LEVELLING

Automatic re-levelling shall be provided for lift of rated speed of 2.5 m/s and above and for lift where the lift machine is more than 60 m above the lowest landing door, to maintain the accuracy of stopping at landing within ± 10 mm such that the transient overshooting value of ± 20 mm should not be exceeded at any time including during loading and unloading of the lift car.

LTE2.20.070.9 MAXIMUM ALLOWABLE ELECTRICAL POWER, TOTAL HARMONIC DISTORTION AND TOTAL POWER FACTOR OF LIFTS

The maximum allowable electrical power, total harmonic distortion and total power factor of each lift shall comply with the requirements stipulated in the BEC.

LTE2.20.080.A MAXIMUM STARTING KVA, MAXIMUM STARTING KW AND MAXIMUM REGENERATIVE POWER OF LIFTS

The maximum starting kVA, maximum starting kW and maximum regenerative power of lifts shall comply with the table below:

Rated Load	Rated Speed (m/s)	Maximum Starting (kVA)	Maximum Starting (kW)	Maximum Regenerative Power (kW)
900kg / 1000kg	1	41	40	8
	1.75	58	44	12
	2.5	60.7	48.5	16
	3.5	76	76	20
1250kg	1.75	64	55	16
	2.5	83	67	21
	3.5	102	82	26
1600kg	1.75	72.2	71	19.3

LTE2.21 LIFT ALARM SYSTEM

LTE2.21.010.9 GENERAL REQUIREMENTS

1. The Sub-contractor shall supply and install a lift alarm system including all sensing devices, cabling, flexible conduits, alarm sounders, batteries, indication panels and accessories;

2. This system shall operate as follows:

   a. Alarm sounders shall be provided on top of the lift car, in the main entrance lift lobby, at the lift pit, in the guard counter or location(s) as shown on the Drawings, and in the lift machine room or at the maintenance access panel for machine-room-less lift. These alarm sounders shall be connected to the emergency battery normally maintained by trickle charger from A.C. source;

   b. Theses alarm sounders shall be arranged to sound as long as the alarm push button inside the car is being pressed;

   c. Alarm sounders shall be of electronic type with the following two-tone pattern:

      Low frequency: 600Hz (±15%) Duration: 600 ms (±20%)

      High frequency: 920Hz (±15%) Duration: 300 ms (±20%)

      The alarm sounders shall be impact resistant, suitable for conduit entry and with a finish colour approved by the Contract Manager. Alarm sounders for outdoor installation shall be weatherproof to IP 65;

   d. An emergency alarm push button together with an intercom shall be provided in the lift car and be connected to the guard counter or location(s) as shown on the Drawings, and the lift machine room or maintenance access panel for machine-room-less lift. Alarm sounder, indication light and intercom connected to the lift car shall be provided in the guard counter or location(s) as shown on the Drawings, and in the lift machine room or maintenance access panel for machine-room-less lift. An alarm sounder connected to the alarm push button in the lift car shall also be provided at the main entrance lift lobby and at the lift pit;

   e. The alarm sounders shall sound and the indication lights shall be lit if the alarm push button is pressed. The indication lights shall remain on until they are manually reset by activation of a reset button inside the guard counter/main entrance lift lobby or as shown on the Drawings upon releasing of trapped passengers. The hook switch of an intercom handset shall not be used as the indication lights reset button. The sound generated by the alarm sounders shall be distinguishable from that of fire alarms;

   f. An indication light for acknowledgment shall be provided in the lift car. The indication light for acknowledgment shall be in the form of a blinking light adjacent to the intercom speaker and the following notice shall be provided next to the blinking light:

      "When light blinks, it indicates your emergency call has already been received. Please be patient and wait for the rescue."

      "此燈閃亮時，表示已收到求救信息，請耐心等候救援"

      The indication light for acknowledgment shall blink after the manual activation of an acknowledgment switch located in the guard counter/main entrance lift lobby. The blinking shall continue until the acknowledgment switch is reset;

g. Separate lift alarm/indication/intercom system shall be provided for each lift. In the lift machine room, separate lift alarm/indication/intercom panels constructed of 1.5 mm thick hairline stainless steel shall be provided for each lift adjacent to each lift control panel. In the guard counter/main entrance lift lobby, a combined lift alarm/indication/intercom panel constructed of 1.5 mm thick hairline stainless steel shall be provided;

h. A pair of voltage free contacts for each lift shall be provided and terminated as shown on the Drawings for connection to the local alarm system by others. The contacts shall be normally open and shall close when the alarm push button in lift car is being pressed;

i. The lift alarm system for all lifts shall be provided as detailed in Clause 5.12.3 of the Lift COP, Section E, Part 1;

j. For each of the lifts, a lift failure indication light shall be provided in the guard counter/main entrance lift lobby as shown on the Drawings. The lift failure indication light shall be lit and the alarm sounder in the guard counter/main entrance lift lobby mentioned in LTE2.21.010 (2)(a) shall sound when the lift is caused to stop under the following fault conditions:

   i. Actuation of any safety devices, e.g. the stopping device and inspection operation switch on the car roof, but excluding the lift door safety devices;

   ii. Power supply failure for lifts; or

   iii. Malfunction of ventilation fan for the lift well, when applicable.

The alarm sounder shall continue to sound until manually muted by activation of the reset button in LTE2.21.010 (2)(i). The lift failure indication light shall remain on until the fault is cleared and the actuated safety devices resume to the normal condition.

LTE2.21.020.9 CABLING FACILITIES BY ELECTRICAL SUB-CONTRACTOR

The Electrical Sub-contractor will be responsible for the provision of the portion of concealed conduit and accessories for the lift alarm system as shown on the Drawings.

LTE2.21.030.9 FLOOD ALARM SYSTEM FOR LIFT TOWER

1. In addition to requirements of lift alarm system specified in clause LTE2.21.010, the Sub-contractor shall supply and install a flood alarm system for lift tower to detect the occurrence of flooding in lift pit and alert the management office / maintenance personnel to take remedial action;

2. The alarm sounder at the main entrance lobby of lift tower and guard counter of nearby domestic block shall sound upon actuation of water level sensor of the flood alarm system at the pre-set high level due to flooding of the lift pit. The alarm sounder at guard counter shall continue to sound until manually muted by activation of the reset button at guard counter of nearby block. The alarm sounder at the main entrance lobby of lift tower shall remain on until manually muted by activation of the reset button at local lift alarm indication panel in the lift machine room of lift tower or at the maintenance access panel for machine-room-less lift;

3. Separate flood alarm indication light for each lift pit shall be provided at master lift alarm indication panel at guard counter of the nearby domestic block/estate management office and local lift alarm indication panel in the lift machine room of lift tower or at the maintenance access panel for machine-room-less lift. The flood alarm indication light shall remain on until water level sensor resume to normal condition;

4. A pair of voltage free contacts for flood alarm of each lift pit shall be provided and terminated as shown on the Drawings for connection to the local alarm system of the nearby domestic block by others. The contacts shall be normally open and shall close when the water level sensor at lift pit is actuated.

LTE2.22 FIRE SERVICES REQUIREMENTS

LTE2.22.010.9 FIREMAN'S LIFTS

Where called for in the Project Specific Specification or on the Drawings, fireman's lift(s) shall be provided which shall satisfy the following conditions:

1. Lift well openings shall be provided with automatic self-closing fire-resisting doors;
2. It shall be of a minimum size of 1.35 m^2 net internal floor area of car, with a minimum rated load of 680 kg;
3. It shall be provided with a suitable control switch at the designated point of entry to enable the Fire Services Department to gain immediate control over the lift and return it to the designated point of entry, such switch shall isolate the lift from control by the public. The fireman switch shall be flush mounted on a stainless steel plate of thickness not less than 2.5 mm;
4. The speed of the lift shall be such that it shall reach the highest landing in not more than one minute;
5. It shall be suitably indicated by the words "Fireman's Lift" in English and Chinese characters;
6. All landings doors shall be automatic self-closing;
7. For every refuge floor except that provided at the main roof of a building, the lift doors of the fireman's lifts shall not be open onto the refuge floor in normal operation and shall be locked at all times until automatically released on actuation of the fireman's switch.

LTE2.23 REQUIREMENTS ON RIDING COMFORT

LTE2.23.010.9 RIDING COMFORT

1. All lift installation shall comply with the following riding comfort criteria:

Maximum Jerk (m/s^3)	Maximum Lift Car Vibration (cm/s^2)		
	X - Axis	Y - Axis	Z - Axis
2.2	25	25	25

2. The Z-axis is along the lift travel direction and the X-axis and Y-axis are on the horizontal plane;
3. Upon completion of the lift installation, the Sub-contractor shall carry out riding comfort measurement for each lift. Measurement results shall be submitted to the Contract Manager for record. The Sub-contractor shall propose and carry out remedies to the installation if the measurement result exceeds the criteria in sub-clause (1);
4. Riding comfort measurement shall be conducted with the lift car carrying rated load and travelling in both upward and downward directions;
5. Re-measurement shall be carried out by the Sub-contractor after any remedy to show compliance with the criteria in sub-clause (1).

LTE2.24 REQUIREMENTS ON HOMING OPERATION IN LIFT TOWER

LTE2.24.010.9 HOMING OPERATION IN LIFT TOWER

1. The lifts at lift tower shall home at the terminal floor;
2. For lifts at lift tower provided with flood alarm system, the lifts shall go to upper floor and the lift car doors shall be opened for passenger release upon activation of water level sensor of flood alarm system. The lifts then stop at that landing level with lift car doors closed and lift car lighting on. The door open push button inside lift car can still remain functional;
3. The lifts shall start to resume operation only until the water level sensor of flood alarm system resume to normal;
4. In case the lift(s) in lift tower also serve as fireman's lift(s), the above operation shall still be applied to the lift(s) provided that the lift(s) can resume operation upon the activation of Fireman's Switch.

LTE2.25 PARTICULAR REQUIREMENTS FOR MACHINE-ROOM-LESS LIFT

LTE2.25.010.9 STATUTORY REQUIREMENTS

1. The machine-room-less lift shall be of a type approved by the Electrical and Mechanical Services Department;
2. The passenger rescue operation for the machine-room-less lift shall be accepted by the Fire Services Department;
3. The Sub-contractor shall be responsible for preparing and arranging all necessary submissions to the relevant authorities and providing all necessary information and assistance to the Contract Manager for applying for approval and exemptions/modifications of the statutory codes and requirements, where applicable.

LTE2.25.020.9 GENERAL REQUIREMENTS

1. Maintenance, repair, major alteration, replacement and examination of the overspeed governor and machine shall be able to be carried out on the car roof safely and efficiently;
2. Tripping and re-setting of the overspeed governor shall be able to be remotely controlled outside the lift well or where required at a position approved by the Contract Manager;
3. The motor brake shall be able to be remotely released by hand outside the lift well or where required at a location approved by the Contract Manager. A constant manual effort is required to keep the brake open;
4. In any case, the over-travel of the lift car above the upper terminal landing floor level shall not exceed a dimension that will hinder the release of passengers in a safe manner;
5. Sufficient energy efficient lighting with battery back-up shall be provided for illumination of the overspeed governor, motor brake and machine in the lift well;
6. Lift motor located in lift pit is not acceptable.

LTE2.25.030.9 LIFT WELL VENTILATION

1. A ventilation system for the lift well of machine-room-less lift shall be provided as shown on the Drawings. A ventilation fan adequately sized to maintain the temperature inside the lift well below 40℃ shall be provided as shown on the Drawings. The motor of the ventilation fan shall be protected to IP55 minimum and suitable for continuous running;
2. The operation of the ventilation fan shall be controlled by both a temperature sensor installed in the lift well and a timer in the maintenance access panel. The status and fault indication of ventilation fan shall be provided at the maintenance access panel. An independent by-pass ON/OFF switch in maintenance access panel for each ventilation fan for the lift well shall be provided for maintenance purpose;
3. For ventilation system to be installed by the Sub-contractor, the Sub-contractor shall submit calculation to verify that the proposed ventilation fan can maintain the temperature inside lift well below 40℃. The Main Contractor will provide relevant building information and heat load data of the lift well to facilitate the design calculation. The calculation together with the control arrangement of the ventilation fan shall be submitted to Contract Manager for approval;

4. For ventilation system to be installed by the Main Contractor, the Sub-contractor shall provide information for heat dissipation of the lift machine.

LTE2.25.040.9 LIFT CONTROL PANEL

1. The controller for machine-room-less lift shall be mounted in a ventilated stainless steel lift control panel, in which all contactors, solenoids, relays, electronic cards and motor starting equipment, etc. shall be fitted;
2. When the lift control panel is located outside the lift well, a maintenance access panel constructed of stainless steel frame and stainless steel sheet of minimum 1.5 mm thick shall be provided by the Sub-contractor to enclose and protect the lift control panel, the lift alarm/indication/intercom panel, the CCTV monitor, the 2-way lift well lighting switch, the emergency light switches, the lift well ventilation fan switches, timer and indication lights, flood alarm indication lights etc.. Position of the lift control panel and enclosure shall be as specified in the specification and/or on the drawings. The door(s) of the enclosure shall be hinged at the front, shall not open towards the lift control panel, shall be fitted with a lock which can be locked without a key from outside and only accessible by authorised person. It shall bear on the outside face a notice in English and Chinese in letters and characters not less than 25 mm high as follows:

UNAUTHORISED OPENING PROHIBITED
LIFT CONTROL PANEL
CLOSE AND LOCK THIS DOOR

不得打開
升降機控制箱
請關閉並緊鎖此門

3. When the lift control panel is located inside the lift well, it shall be located at a position that will enable the lift maintenance personnel to carry out inspection and maintenance work in a safe and efficient manner. All necessary working platform and access to the lift control panel shall be provided by the Sub-contractor. A thermal protection device shall be provided by the Sub-contractor to stop the lift car and return to a landing when the lift control panel has reached a pre-set temperature level. At a suitable location outside the lift well, a maintenance access panel constructed of stainless steel frame and stainless steel sheet of minimum 1.5 mm thick with hinged lockable door(s) shall be provided by the Sub-contractor to enclose and protect the lift alarm/indication/intercom panel, the CCTV monitor, the 2-way lift well lighting switch, the emergency light switches, the lift well ventilation fan switches, timer and indication lights, flood alarm indication lights etc.;
4. The door of the enclosure located outside the lift well shall be so constructed that the CCTV monitor inside the enclosure can be visible from the outside through safety glass of 6 mm minimum thickness complying to BS 952-1 and BS 952-2, BS EN 81-20 or equivalent;
5. Additional wall thickness to embed the enclosure located outside the lift well while maintaining the fire resistance period requirement for the wall will be provided by the Main Contractor as necessary.

LTE2.25.060.9 LIFTS FOR OUTDOOR APPLICATION

1. When the lift is susceptible to outdoor weather, all the lift equipment of the lift shall be suitable for outdoor use;

2. The metal work of the lift installation other than moving parts shall be adequately protected against corrosion by suitable and approved epoxy paint coating system, hot dip galvanising or factory applied finish;
3. Lift components, such as limit switches, car door and landing door locks etc., shall be protected by drip-proof enclosure or suitable watertight cover;
4. Electrical wirings and accessories shall be of water-proof type at least IP54.

   Please refer to the specification requirements specified in the Project Specific Specification.

LTE2.26 MULTITRADE INTEGRATED MECHANICAL, ELECTRICAL AND PLUMBING (MIMEP)

LTE2.26.010.N EXTENT OF APPLICATION

1. The Sub-contractor shall design, assemble, install and test the off-site prefabricated MiMEP modules, including but not limited to the following items, for on-site assembly and installation:
   a. Accessories at lift pit;
   b. Accessories at lift car top.

LTE2.26.020.N ACCESSORIES AT LIFT PIT

1. The module shall comprise electrical assembly including, but not limited to alarm, emergency stop switch, socket outlet and well lighting switch, other accessories and the mounting framework as appropriate;
2. Electrical cabling works of a completed circuit / sub-circuit within the individual MiMEP module shall be pre-installed off-site. Interconnection of cables between the MiMEP modules and other electrical installation shall be conducted on-site;
3. All components and devices shall be assembled and properly fixed to the framework. The framework shall be designed with pre-drilled holes for on-site direct fixing to building structures;
4. Provisions shall be allowed to facilitate the transportation, delivery, assembly and services connection on Site.

LTE2.26.030.N ACCESSORIES AT LIFT CAR TOP

1. The module shall comprise electrical assembly including, but not limited to alarm, emergency stop switch, socket outlet, car ceiling fan switch and car top & bottom lighting switch, other accessories and the mounting framework as appropriate;
2. Electrical cabling works of a completed circuit / sub-circuit within the individual MiMEP module shall be pre-installed off-site. Interconnection of cables between the MiMEP modules and other electrical installation shall be conducted on-site;
3. All components and devices shall be assembled and properly fixed to the framework. The framework shall be designed with pre-drilled holes for on-site direct fixing to building structures;
4. Provisions shall be allowed to facilitate the transportation, delivery, assembly and services connection on Site.

LTE3.23.020.9 MOTION SENSOR AT EXIT 32
LTE3.23.030.9 VISIBLE SIGNAL SYSTEM 32

LTE3.1 STEPS

LTE3.1.010.9 HORIZONTAL STEPS

1. The surface of the steps shall be horizontal at all positions exposed to passenger;
2. Yellow demarcation on minimum three borders of each step shall be provided by durable and wear resistant material such as yellow moulded resin demarcation cleats. The width of the demarcation strips on step shall be at least 20 mm for the strips at the back and shall be at least 13 mm for the strips on the two sides.

LTE3.1.020.9 INTEGRAL DIE-CAST ALUMINIUM OR STAINLESS STEEL STEP TREAD AND RISER

1. The step treads shall be die-cast aluminium with closely spaced cleats designed to provide a secure foothold, the latter being grooved parallel to the travel of the steps to mesh with the comb at the entrance and exit. Alternative material of stainless steel of EN 10088-1 grade 1.4301 (grade 304) may be acceptable if not exposed to weather conditions;
2. The step risers shall also be die-cast aluminium integral with the step treads and shall include vertical cleats designed to pass between the cleats of the tread in the adjacent steps thus providing a combing action with minimum clearances. Alternative material of stainless steel of EN 10088-1 grade 1.4301 (grade 304) may be acceptable if not exposed to weather conditions;
3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the steps delivered to the site or installed.

LTE3.1.030.9 ROLLERS

Each step shall be supported on four synthetic or rubber tyred ball bearing rollers, grease sealed for life and so mounted that tilting and rocking of steps is prevented whilst ensuring smooth and quiet operation in service.

LTE3.1.040.A END TRAVELS

At the ends of the escalators (including public service escalators at rated speeds not exceeding 0.65m/s, as specified on the Drawings) the steps shall be guided in such a way that the front edges of the steps leaving the comb and the rear edges of the steps entering the comb are moving horizontally for a length of at least 1.20m measured from the root of the comb teeth.

For public service escalators at rated speeds above 0.65m/s, as specified on the Drawings, the steps shall travel in a substantially horizontal direction for the minimum distances in accordance with Clause 5.7.2 of the Lift COP, Section E, Part 4.

LTE3.1.050.A RUNNING CLEARANCE

All steps running clearances shall comply with the requirements as laid down in Clauses 5.3.5 and 5.5.5 of the Lift COP, Section E, Part 4.

LTE3.1.060.9 TYPE TEST

1. The steps shall be type tested in accordance with clause 5.3.3.2 and 5.3.3.3 of BS EN 115-1 by an Approved independent testing institution;
2. Type test certificate to this effect shall be submitted to the CM.

LTE3.1.070.9 NOMINAL WIDTH OF ESCALATOR STEPS

The nominal width of escalator steps shall be 1000 mm unless otherwise specified in the Project Specific Specification.

LTE3.2 STEP CHAINS

LTE3.2.010.9 STEP CHAINS

1. The steps shall be driven by at least two steel link chains of which at least one shall be located on each side of the step;
2. The step chains shall be of endless roller type and modular construction. Each module shall comprise not more than 4 rollers.

LTE3.2.020.9 MATERIALS

1. The step chains shall be made of high tensile steel links with hardened and ground pins;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the step chains and drive chains delivered to the site or installed.

LTE3.2.030.9 QUIET OPERATION

The rollers shall accurately engage with the drive sprockets to ensure smooth and quiet operation.

LTE3.3 TRACKS

LTE3.3.010.9 CURVED SECTIONS

All the curved sections of the tracks shall be manufactured in aluminium pressure die-castings or steel.

LTE3.3.020.9 STRAIGHT SECTIONS

The straight sections of the tracks shall be of steel or aluminium extrusions. These extrusions shall essentially be channels forming both running surfaces and guards over the trailing rollers.

LTE3.3.030.9 DESIGN

The entire tracking system shall be so designed that in the unlikely event of a step chain breaking, there shall be no likelihood of the steps lifting out of place.

LTE3.4 LANDING OPENINGS AND LANDING PLATES

LTE3.4.010.9 OPENINGS

Floor openings will be provided by the Main Contractor on both upper and lower landings. The Sub-contractor shall submit builder's work drawings detailing the exact dimensions and locations of the openings.

LTE3.4.020.9 LANDING PLATES

1. Removable floor landing plates to harmonise with the comb shall be provided by the Sub-contractor over the openings to give access to the machinery for maintenance purpose. These landing plates shall be of stainless steel or wear-resistant aluminium alloy and shall afford a secure foothold;
2. The Sub-contractor shall provide documentary evidence in accordance PRE.BS1.205 to verify the place of manufacture and authenticity of the landing plates delivered to the site or installed.

LTE3.5 COMB

LTE3.5.010.9 COMB

Comb shall be provided at the top and bottom landings and shall be of wear-resistant aluminium alloy or stainless steel with anti-slip pattern.

LTE3.5.020.9 COMB TEETH SECTION

1. The comb sections shall have fine pitch teeth to allow the cleats of the step tread to pass them with minimum clearance. The comb teeth sections shall be made of synthetic resin or metal or equivalent materials, and shall be adjustable vertically and horizontally, and readily replaceable. The width of each comb teeth section shall be not more than 200 mm;
2. The teeth of every comb teeth section shall be so meshed with and set into the slots of the step tread and pallets that the points of such teeth are always below the upper surface of such tread surface.

LTE3.6 BALUSTRADING

LTE3.6.010.A BALUSTRADES

1. Solid balustrades possessing sufficient mechanical strength in compliance with Clause 5.5.2.3, 5.5.2.4 and 5.5.3.3 of the Lift COP, Section E, Part 4 shall be installed on each side of the escalator and shall consist of the following components:
   a. The skirting panels shall be vertical and constructed of smooth hairline finish stainless steel with thickness of not less than 2 mm. Embossed, perforated or roughly textured materials shall not be used;
   b. The interior profile shall be of hairline finish stainless steel with thickness of not less than 2 mm. The interior profile and the balustrade interior panelling shall have an angle of inclination of at least 25° to the horizontal;
   c. Unless otherwise specified, the interior panelling shall be of hairline finish stainless steel with thickness of not less than 1.5 mm. The balustrade panel shall be of splinter free one-layer safety glass of thickness not less than 6 mm. Lighting shall be provided along and underneath the handrails except for slim type balustrade decking design and stainless steel type balustrade decking design;
   d. The balustrade decking shall be of hairline finish stainless steel. The decking is to be situated under the handrail and forms the top cover of the balustrade panelling;
   e. The newel including the handrails shall project beyond the root of the comb teeth by at least 600 mm in longitudinal direction;
   f. Stainless steel specified for skirting, interior profile, interior and exterior panelling and decking shall be stainless steel of EN 10088-1 grade 1.4301 (grade 304) or equivalent.
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the balustrades delivered to the Site or installed.

Please refer to specification requirements specified in Project Specific Specification.

LTE3.6.020.9 BRUSH BRISTLE TYPE DEFLECTOR DEVICE

Approved brush bristle type deflector devices shall be provided along the full length of the lower part of the skirting panels on each side.

LTE3.6.030.A EXTERNAL CLADDING

1. Unless otherwise specified, metal enclosure with sufficient mechanical strength in compliance with Clause 5.2 of the Lift COP, Section E, Part 4 shall be provided. The extent of metal enclosure shall cover the balustrade exterior panelling, machine pits and underside of the truss;
2. Unless otherwise specified, the Contractor will install stainless steel cladding onto the metal enclosure. The Sub-contractor shall coordinate with the Contractor and submit the method and details of fixing of stainless steel cladding onto the metal enclosure for the CM's approval. The Sub-contractor shall also allow reasonable time in his programme for the Contractor to complete the external cladding.

Please refer to the specification requirements specified in the Project Specific Specification.

LTE3.6.040.A OBSTRUCTION GUARD FOR ESCALATOR

Obstruction guard will be provided by the Contractor for adjacent building obstacles and criss-cross escalators. The Sub-contractor shall indicate on the builder's work drawings the constructions and positioning of the guards in accordance with Clause A2.4 of Annex A of the Lift COP, Section E, Part 4.

Please refer to the specification requirements specified in the Project Specific Specification.

LTE3.6.050.9 SILICONE SPRAY

Approved silicone spray or platform coating shall be applied before substantial completion. Silicone spray shall be applied during the Maintenance Period at a regular interval of not more than 2 months to the escalator balustrade where it may come into contact with feet and shoes to reduce the friction at these areas for passenger safety unless platform coating is applied.

LTE3.7 HANDRAILS

LTE3.7.010.9 RUBBER HANDRAIL

1. The handrails shall be constructed of multi-layered canvas with the exposed surface covered with smooth black abrasion resistant rubber which shall be vulcanised into an endless loop;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the handrails delivered to the site or installed.

LTE3.7.020.9 SPEED

The handrails shall move in the same direction of the steps. The speed of the handrail is permitted to deviate from the speed of the steps within the limits of 0% to +2%.

LTE3.7.030.9 SAFETY GUARD

Safety guards shall be provided where the handrails enter and leave the escalator newels. In addition to being protected by the automatic operation of the handrail entry safety guard, the point of entry of the handrail into the newel shall be so configured as to prevent the pinching of fingers, hands or other objects. Handrail entry designs which form part of the continuous profile of the balustrade decking or which are considered by the Contract Manager as vulnerable to the pinching of fingers, hands or other objects are not acceptable.

LTE3.7.040.9 HANDRAIL GUIDES

The handrail guides shall be in specially formed aluminium or steel section to allow easy movement of the handrail but properly shaped as to retain the handrail in its place.

LTE3.7.050.N CONCEALED TYPE SELF-CLEANING DEVICES

The handrails shall be equipped with automatic concealed type Ultra Violet (UV- C) light sterilizer unless otherwise specified. Test reports or other substantiation documents to verify the disinfection capability and effectiveness of the self-cleaning devices, e.g. sterilization rate or eradication rate not less than 99%, shall be submitted to the CM. The self-cleaning devices shall be compatible with the escalators and shall not interfere with the operation and maintenance of the escalator.

LTE3.8 TRUSS

LTE3.8.010.9 CONSTRUCTION

1. The lattice type structural steel truss shall be a rigid steel fabricated structure and shall be capable of carrying a full complement of passengers together with the machinery of the escalator, the balustrades and the exterior covering. The factor of safety used in the design of the truss shall not be less than 5 basing on the static load;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the trusses delivered to the site or installed.

LTE3.8.020.9 MACHINERY PIT

The upper section of the truss shall contain the drive machine and shall be fitted with a trap door.

LTE3.9 LUBRICATION

LTE3.9.010.9 LUBRICATION

Effective means for lubricating the bearings and moving parts as required shall be provided with easy access. Oil pump shall be provided for the automatic lubrication of steel chains.

LTE3.9.020.9 OIL PANS

Oil tight drip pans shall be provided for the entire length of the escalator to contain any wasted lubricant within the truss. When necessary, the oil tight drip pans shall be removable to give access to both the machinery space and the return station for maintenance.

LTE3.10 DRIVING MACHINERY

LTE3.10.010.9 INDEPENDENT DRIVING MACHINE

Each escalator shall be independently driven.

LTE3.10.020.9 REDUCTION GEAR

1. The driving machine shall be a worm reduction gear, helical reduction gear or planetary gear with a drive motor situated in the machinery pit at the upper landing. It shall be connected by chains or other proven means to the main drive shaft of the escalator;
2. The reduction gear shall be housed in a substantial cast iron housing which shall also hold the lubricant;
3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the reduction gears delivered to the site or installed.

LTE3.10.030.9 MOTOR

1. The motor shall be three-phase A.C. squirrel cage, induction motor of continuous rating, reversible type with high starting torque and low starting current and specially designed for escalator application;
2. The motor speed shall not exceed 1,500 revolutions per minute;
3. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the motors delivered to the site or installed.

LTE3.10.040.9 CAPACITY

The A.C. squirrel cage motor shall be of ample capacity, free from objectionable noise and vibrations when in operation.

LTE3.10.050.9 ESCALATOR SPEED

The escalator speed shall be continuously adjustable from a minimum value of 0.17 m/s to a maximum value of 0.5 m/s. A key switch shall be provided in or near the control panel to adjust the speed manually and on continuous basis.

LTE3.10.060.9 BEARINGS

The motor shall be fitted with grease lubricated ball bearings.

LTE3.11 BRAKING SYSTEM

LTE3.11.010.A OPERATIONAL BRAKE

1. Each escalator shall be provided with an operational brake which is mechanically applied and electrically held off type and of sufficient capacity to effectively bring the escalator to rest within the stopping distance in accordance with Clause 5.4.2.1.3.2 of the Lift COP, Section E, Part 4 when travelling at full contract speed in either direction;
2. Operational brake shall be located on the driving machine or the main drive shaft;
3. When springs are used to apply brake shoes, such springs shall be in compression and adequately supported and guarded.

LTE3.11.020.A AUXILIARY BRAKE

Auxiliary brake of mechanical (friction) type shall be provided and function in accordance with Clause 5.4.2.2 and Clauses 5.12.3.5.3 of the Lift COP, Section E, Part 4.

LTE3.11.030.9 HANDWINDING

If a handwinding device is provided, it shall be suitably marked for "UP" and "DOWN" operation in both English and Chinese characters. The handwinding device shall be used in conjunction with a brake release device for the operational brake and shall be easily accessible and safe to operate.

LTE3.12 FOOTLIGHTS AND STEP LIGHTS UNDER LANDING

LTE3.12.010.9 FOOTLIGHTS

Footlights shall be provided on either side of the interior of the skirting at both upper and lower landings and energy efficient fluorescent or LED luminaries shall be used.

LTE3.12.020.9 STEP LIGHTS UNDER LANDINGS

Energy efficient fluorescent or LED lighting shall be provided underneath landings to illuminate the clearance between steps, steps and skirting, steps and comb, at the horizontal step portion of the escalator. The colour of these lights shall be automatically switched to green at landings where passengers can gain entry, and red at landings where passengers cannot gain entry. Green and red coloured lightings shall be provided at each landing to allow change of escalator travelling direction.

LTE3.12.030.9 REPLACEMENT OF LAMP BULB/TUBE

Facility shall be incorporated for the replacement of lamp bulb or fluorescent tube.

LTE3.13 SUPPORT BEAMS

LTE3.13.010.9 STRUCTURAL SUPPORTS

Structural supporting beams will be provided by the Main Contractor at the top and bottom landings. Intermediate support will not be provided unless otherwise shown on the Drawings. The Sub-contractor shall submit for the Contract Manager's approval the exact locations and dimensions of the structural supports and the reaction forces to be imposed on the same.

LTE3.13.020.9 MOUNTING FACILITIES

All other supports and mounting facilities, e.g. mounting brackets, bearing plates, etc. required for the installation of the escalator shall be provided by the Sub-contractor.

LTE3.13.030.9 INTERMEDIATE SUPPORT FOR ESCALATOR

Please refer to the specification requirements specified in the Project Specific Specification.

LTE3.14 SAFETY DEVICES

LTE3.14.010.A SAFETY DEVICES

Safety devices shall be provided in accordance with the Lift COP, Section E, Part 4 and comprise the following minimum features:

1. A stopping device shall be provided at the driving and return stations and machinery space inside the truss where means of access is provided. The stopping device does not need to be provided in the machinery space if a main switch according to Clause 5.11.3 of the Lift COP, Section E, Part 4 is located therein and is sufficiently close to the machinery. The stopping device shall:
   a. Be of mushroom head, push to stop, pull to run type, coloured red and suitably protected against accidental operation;
   b. Be conspicuously and permanently marked "STOP" in both English and Chinese characters.
2. An emergency stopping device shall be provided in conspicuous and easily accessible position at or near to each landing of the escalator. The emergency stopping device shall be a red button suitably protected against accidental operation and conspicuously and permanently marked "STOP" in both English and Chinese characters;
3. A broken step chain safety device shall be incorporated as part of the tension carriage, and it shall operate if the bottom sprocket moves unduly in either direction in the event of either or both step chains breaking or becoming unduly lengthened due to wear of the pins, or tension in either chain dropping below a pre-determined value. The operation of this device shall remove power and applies the operational brake;
4. If the chain or belt between the driving machine and the escalator main drive shaft breaks, a broken drive chain device shall be provided which shall cause the electrical supply to motor to be disconnected and shall cause the operational brake as well as the auxiliary brake to operate;
5. Broken handrail device shall be situated inside the balustrades on either side at the lower end of the incline, and shall actuate and cause the escalator to stop if either or both handrails break;
6. A non-reversing and overspeed protective device shall be arranged to prevent a travelling escalator to slow unduly or attempts to reverse its direction of travel or to overspeed in accordance with Clauses 5.4.2.3 of the Lift COP, Section E, Part 4;
7. Comb obstruction device shall be provided on either side of each comb to stop the escalator if any object is caught between a step and the teeth of the comb;
8. Skirting switches, actuated by a passenger’s foot or other foreign object trapped between a step and the skirting, shall be provided to stop the escalator. Skirting switches shall be provided at each side of the skirting at the points of upper lower transition from incline to horizontal, and at the inclined section in accordance with Clause 5.5.3.4(e) of the Lift COP, Section E, Part 4;
9. A handrail switch shall be provided at each handrail entry guard which shall stop the escalator if foreign objects are trapped;
10. A protective device for sagging of steps shall be provided to stop the escalator when any part of the steps is sagging such that meshing of the combs is no longer ensured at the point at which the steps enter the landings;

11. Escalators connected to 3-phase A.C. power supply shall incorporate phase protective relay to prevent the units running in the event of phase failure and phase reversal;

12. Motor overload relay shall be fitted to protect the motor against overload;

13. Monitoring devices for synchronisation of handrails and steps shall be provided to detect out of synchronism of handrails and steps. In the event of out of synchronism, an alarm shall be sounded to alert the security guards in the vicinity to stop the escalator manually.

LTE3.14.020.A OPERATION OF SAFETY DEVICE

The operation of any of the safety devices mentioned in LTE3.14.010 shall cause the electrical supply to the driving motor to be disconnected and the operational brake to operate bringing the escalator to rest. All switching-off operations mentioned in sub-clauses (1) to (10) of LTE3.14.010 shall be effected by electrical safety devices in conformity with Clause 5.12.2 of the Lift COP, Section E, Part 4.

LTE3.15 CONTROL AND INSPECTION STATION

LTE3.15.010.9 STATION POSITION

A control station shall be provided at both the upper and lower landing newel, which shall contain a directional switch, an alarm and a foot light switch. The station shall be so positioned as to enable any person operating any of the switches to afford a full view of the escalator.

LTE3.15.020.A INSPECTION CONTROL DEVICE

1. Inspection control device shall be provided at the upper and lower landing by means of portable control device in accordance with Clause 5.12.3.13 of the Lift COP, Section E, Part 4;
2. When the portable control device is operated, the movement of the escalator shall be dependent on a continuous pressure simultaneously on a "Common" push button and a "Up" or "Down" push button. A stopping device of "mushroom head, push to stop, pull to run" type and coloured red shall be provided in the inspection control device. These push buttons and stopping device shall be protected against accidental operation and with the direction of movement clearly indicated.

LTE3.15.030.9 TYPE OF SWITCHES

The up and down directional starting switch and the footlight switch shall be of key-operated spring off type.

LTE3.15.040.9 MARKINGS

All switches shall be clearly marked in both English and Chinese characters.

LTE3.16 CONTROLLER

LTE3.16.010.9 CONTENTS

1. The controller shall be a self-contained unit containing all the necessary electrical switchgear, contactors, relays and electronic controller cards, etc.;
2. The Sub-contractor shall provide documentary evidence in accordance with PRE.BS1.205 to verify the place of manufacture and authenticity of the controllers delivered to the site or installed.

LTE3.16.020.9 LOCATION

The controller housed in a cabinet shall be located in the upper landing, and provision shall be made for easy access for maintenance.

LTE3.17 MAINTENANCE FACILITIES

LTE3.17.010.9 MACHINE PIT LIGHT

A permanent light, suitably guarded, shall be provided in each machine pit by the Sub-contractor, and which can be switched without passing over or reaching over any part of the machinery.

LTE3.17.020.9 SOCKET OUTLET

A 13 amp. 3 pin socket outlet of the type specified in ELE20.3.020 shall be provided in each escalator machine pit by the Sub-contractor.

LTE3.17.030.9 NOTICE

1. A permanent notice reading "Danger, unauthorised access prohibited" and the equivalent in Chinese characters shall be conspicuously fixed on each access door to machinery space. The characters shall not be less than 25 mm high;
2. The name of the manufacturer, the Sub-contractor's name and telephone number and the escalator identification number shall be displayed at the landings.

LTE3.18 ALARM DEVICE

LTE3.18.010.9 ALARM SOUNDER

An alarm sounder shall be provided in the machinery space and shall sound when any of the safety devices mentioned in LTE3.14.010 operates.

LTE3.18.020.9 TYPE OF ALARM SOUNDER

1. The alarm sounders shall be of electronic type with the following two-tone pattern:
   a. Low frequency: 600 Hz (±15%) & duration: 600 ms (±20%);
   b. High frequency: 920 Hz (±15%) & duration: 300 ms (±20%).
2. The alarm sounders shall be impact resistant, suitable for conduit entry. Alarm sounder for outdoor installation shall be weatherproof to IP 65.

LTE3.19 REQUIREMENTS FOR WEATHER-PROOF ESCALATORS

LTE3.19.010.9 GENERAL

Weather-proof escalators shall comply with the specification requirements as detailed in LTE3.19.020 to LTE3.19.090.

LTE3.19.020.9 PROTECTION

Unless otherwise specified, the escalator(s) will be protected by canopy or other similar structure constructed by the Main Contractor as shown on the Drawings.

LTE3.19.030.9 PROTECTION AGAINST CORROSION FOR TRUSS AND METAL WORK OF ESCALATOR

1. The entire truss and metal work of the escalator other than moving parts shall be adequately protected against corrosion for service in wet conditions either by epoxy paint coating system designed for marine application or by hot dip galvanising;
2. When epoxy paint coating system is employed, the surface of the complete truss and metal work shall be prepared and treated in accordance with the epoxy paint coating manufacturer's recommendation:
    a. All rust and dirt on the surface of the truss and metal work shall be removed by wire brushing, and the truss and metal work shall be thoroughly degreased by degreasing solvent prior to the application of any paint coating;
    b. The number, thickness and method of application of paint coating shall be in accordance with the epoxy paint coating manufacturer's recommendation and at least three coats of epoxy paint coating system primer shall be applied followed by at least three coats of finishing epoxy paint coating;
    c. Each coat of paint shall be thoroughly dried before application of next coat.
3. When hot dip galvanising is employed, the complete truss and metal work shall be thoroughly cleaned and degreased by degreasing solvent, and followed by hot dip galvanising to BS EN ISO 1461;
4. Information of the epoxy coating system or hot dip galvanising including details of surface preparation, method of application, number of coatings and details of paints shall be submitted for the Contract Manager's approval prior to manufacture;
5. All the cleansing, degreasing, painting and galvanising processes shall be carried out at the factory, and painting of truss and metal work at site is not permitted except for touching up of damaged coating during installation on Site:
    a. Welding carried out on site on the truss or any metal work that will damage the protective coating is not permitted unless prior approval is given by the Contract Manager;
    b. Where rust appears on the truss or metal work due to damage of protective coating, it must be thoroughly removed by wire brush, degreased and followed by the application of the same number of paint coatings as in the factory or the application of two coats of cold galvanising paints to the satisfaction of the Contract Manager.

LTE3.19.040.9 PROTECTION AGAINST CORROSION FOR MOVING PARTS

1. Moving parts of the escalator including step driving chains, sprocket gears, etc. which require greasing or oiling and any metal components which for functional reasons shall not be painted. These parts shall be constructed of non-corrosive materials such as stainless steel or heavily electroplated with non-corrosive materials such as nickel or chromium. These moving parts shall be adequately lubricated all the time by automatic oilers and suitably protected against water from entering into them;
2. All ball or roller bearings such as those installed on the step driving chain and driving mechanism shall be of sealed type.

LTE3.19.050.9 WATER-OIL SEPARATOR

Device for separation of oil and water shall be provided when water ingress into the escalator can mix with the oil in the lubrication system or the lubrication system is of re-circulating type.

LTE3.19.060.9 MOTOR AND CONTROLLER

The motor and the controller cabinet shall be at least of IP54 protection. Watertight cover shall be provided on all bearings.

LTE3.19.070.9 ELECTRICAL WIRINGS AND ACCESSORIES

All wiring subject to water ingress shall have water-proof terminations. Junction boxes, switches, sockets and alarm bells shall be water-proof type at least IP54.

LTE3.19.080.9 DRAINAGE

The Sub-contractor shall provide proper drainage facilities for the escalator. A permanent drain point will be provided by the Main Contractor at the bottom escalator pit;

An alarm giving a warning of flooding at the lowest escalator pit coupled with a timer to stop the escalator after a preset time shall be provided by the Sub-contractor.

LTE3.19.090.9 LEVEL SWITCH AT BOTTOM LANDING MACHINE PIT

A level switch shall be provided at the bottom landing machine pit to switch off the escalator in the event water collected in pit reaches a pre-determined level.

LTE3.20 SIGNS AND PICTOGRAPHS

LTE3.20.010.A PICTOGRAPHS

1. Pictographs and notices in accordance with Clause 7.2.1.2 of the Lift COP, Section E, Part 4 shall be provided in a conspicuous position at each escalator landing and at either sides of the mid-point of the inclined section of the escalator;
2. Pictographs for "Do not ride on escalator handrail" shall also be provided;
3. The minimum size of the pictographs shall be 100 mm x 100 mm;
4. Corresponding instruction for use of hand winding device and brake release device shall be available in the driving station, and the direction of travel of the escalator shall be indicated clearly.

LTE3.21 MAXIMUM ALLOWABLE ELECTRICAL POWER, TOTAL HARMONIC DISTORTION AND TOTAL POWER FACTOR

LTE3.21.010.9 MAXIMUM ALLOWABLE ELECTRICAL POWER, TOTAL HARMONIC DISTORTION AND TOTAL POWER FACTOR OF ESCALATORS AND PASSENGER CONVEYORS

The maximum allowable electrical power, total harmonic distortion and total power factor of each escalator and passenger conveyor shall comply with the requirements stipulated in the BEC.

LTE3.22 AUDIBLE DEVICE OF ESCALATOR FOR THE VISUALLY IMPAIRED

LTE3.22.010.9 AUDIBLE DEVICE FOR THE VISUALLY IMPAIRED

1. A device generating audible "ticking" signals shall be provided for each escalator to enable the visually impaired to distinguish between escalator steps moving towards and away from them. The device shall also enable the visually impaired to distinguish between adjacent escalators with steps moving in different directions;
2. The driving unit of the audible device shall be housed in a rigid enclosure and mounted inside the escalator machine pit. The speakers of the device shall be flush mounted at the skirting or balustrade interior panelling of the upper and lower landings of each escalator and at the left hand side facing the escalator;
3. The audible device shall be suitable for operation at an ambient temperature of not less than 60℃;
4. The sound level of the audible "ticking" signal emitted by the speaker of the audible device at each landing shall be adjustable, with a maximum output of 70 dB, such that changes can be effected at no cost to the Employer to suit operational needs after completion of the Works. For outdoor escalators, automatic timer-controlled volume adjusting device shall be provided to produce two pre-set volume levels respectively for day and night operation modes;
5. Frequency of the "ticking" sound shall be adjustable from 70/minute (step moving towards the visually impaired) to 800/minute (steps moving away from the visually impaired). The frequency of the "ticking" sound shall be automatically reversed when the direction of step movement of the escalator is reversed;
6. Technical data and fixing location of the audible device shall be submitted to the Contract Manager for approval;
7. The audible device shall be disabled manually if required.

LTE3.22.020.9 AUDIO ALERT SYSTEM

1. The Contractor shall provide audio alert system for each escalator consisting of an MP3 player, an audio amplifier, loudspeakers and associated equipment for safety messages broadcasting. Each message shall be announced in the order of Cantonese, Putonghua and English;
2. The system shall consist of an MP3 player which acts as the storage of message to be broadcast and as the signal source of the system, an audio amplifier to drive loudspeaker(s) in the escalator, and a built-in monitoring loudspeaker for system testing;
3. A loudspeaker shall be installed on the right side (in direction of escalator) of the balustrade at both landings of the escalator but only the one at the "entry" landing (in accordance with the direction the escalator is running in) shall be active. For high rise escalator with emergency stop button(s) installed at the inclined section, additional loudspeaker(s) shall be provided at the location(s) where the emergency stop button(s) are installed;
4. The MP3 player shall be set to "repeat play" the pre-recorded safety message continuously with the operation direction of the escalator for 'going up', 'going down' and 'please hold the handrail';

5. A pre-recorded message to alert passengers to hold the handrail that the escalator is going to stop shall be broadcasted from all the loudspeakers when the escalator is stopping. This message shall override the safety message as mentioned in sub-clause 4 above;
6. A 24 hour on/off timer shall be provided to enable/disable the message broadcast as described in sub-clause 4 at the predetermined time automatically;
7. An override switch shall be provided inside the newel control box at the lower landing of escalator for turning off the system manually when required;
8. Message change is effected through downloading the new message to the flash memory of the MP3 player;
9. The MP3 player shall comply with the following requirements:
    a. Storage space : minimum 20 minutes of message time when encoded in Windows Media Audio (WMA) format at 80kbps or MP3s at 128kbps.
    b. Supported Formats : MP3, WMA
    c. Play Mode: repeat all
    d, Signal-to-Noise Ratio: 90 dB or higher
    e. Frequency range : 20 Hz to 20 kHz
    f. Line or headphone output: 0 dBm min.
    g. USB (1.1 or 2.0) Transfer: 2 GB memory
    h. Operating System Supported: Microsoft Windows 98/ME/2000/XP/Vista/Window 7
10. The amplifiers shall comply with the following requirements:
    a. Frequency Response: 100Hz-15kHz (-3dB)
    b. S/N ratio: >80dB
    c. Output Power: 10 Wrms min. at 8Ω
    d. Output Protection: Overload & short circuit
    e. Sensitivity: 0 dBm at rated power at 1 kHz
    f. Distortion: <1% at rated power at 1 kHz

    Volume control shall be provided to facilitate playback level adjustment.

    Built-in monitoring loudspeaker with on/off switch shall be provided for system testing.
11. The loudspeakers shall have water-proof diaphragm meeting the following requirements:
    a. Frequency Response: 125Hz-13kHz (-10dB)
    b. Impedance: 8Ω or higher
    c. SPL at 1 kHz, 1 m, 1 W: 90 dB±3 dB
    d. Power Handling: 3 W minimum
12. The audio alert system shall be disabled manually if required.

LTE3.23 SERVICE-ON-DEMAND ESCALATOR CONTROL

LTE3.23.010.9 GENERAL REQUIREMENTS

1. All Escalators shall be of service-on-demand (SOD) by means of motion sensor. The motion sensor shall be installed at least 1.3 m before the comb intersection line. The escalator shall accelerate from crawling to its rated speed automatically and shall start to accelerate before the person reaches the comb intersection line of escalator. Construction measures shall discourage circumvention of the control elements. The escalator shall start automatically from crawl speed upon detection of personnel movement within landing zone of the escalator;
2. The escalator shall be reduced to a crawl speed automatically after a preset period of time (which shall be adjustable) which shall be at least the anticipated passenger transfer time plus 10 seconds after the passenger has actuated the motion sensor at exit.

LTE3.23.020.9 MOTION SENSOR AT EXIT

Motion sensor shall also be installed at exist of the service-on-demand escalator to detect whether there is any passenger approaching the escalator in opposite direction. Upon detection of passenger approaching the escalator in opposite direction, the escalator shall immediately start up from crawl speed to rated speed and run in the predetermined direction for an adjustable period of not less than 10 seconds. Concurrently audible signal shall be provided to alert the passenger not to step onto the escalator.

LTE3.23.030.9 VISIBLE SIGNAL SYSTEM

1. A clear visible signal system shall be provided at both ends indicating to the user whether the escalator is available for use, and its direction of travel. Electronic signage display shall also be provided at each of the ingress/egress point of escalator in order to notify the users of the travel direction;
2. The indicator for the visible signal system shall be dot-matrix type tricolour (red, green and amber) LED display, minimum 128 x 16 dots, actuated by reliable solid state circuitry. The indicator shall be of robust design and impact resistance to a degree equivalent to that of polycarbonate material;
3. The indicator shall be able to display at least 32 messages. The dot -matrix display system shall be pre-programmed with the following messages/symbols to inform passengers the corresponding status of the escalator:
   a. '暫停使用 Out of Service';
   b. '例行保養,暫停使用 Routine Maintenance (Out of Service)';
   c. '維修中,暫停使用 Under Maintenance (Out of Service)';
   d. '清潔中,暫停使用 Cleaning in Progress (Out of Service)';
   e. Symbols to indicate the escalator travelling direction; and
   f. Other messages/symbols as required by the Contract Manager.

   The height of each character in the dot-matrix indicator shall be 50 mm minimum. The luminous intensity of the indicator shall be at least 3500 μcd.

4. Messages/symbols of dot-matrix indicator shall be re-programmable such that changes, if required, can be effected to suit requirements arise after completion of the Works. Two (2) times of free messages/symbols revision within the Maintenance Period for the Contract shall be deemed to be included.

5. The box for the indicators shall be galvanised steel of thickness not less than 1.5 mm thick. Sample of the floor indicator with the base box as well as the dot-matrix graphic layout and the pre-programmed messages shall be submitted for the Contract Manager's approval.

BRI BRIDGE WORKS

DESIGN

GENERAL

BRI.D010.9 DEFINITIONS

1. Schedule of bearings: the schedule of bearings stated in the Contract;
2. Type of bridge bearing: a term used to identify bridge bearings of exactly the same design and same capacity for all bearing loads, movements and rotations;
3. Fabricated movement joint: a manufactured assembly, including nosings, designed to carry traffic smoothly over a movement joint and to seal the joint against the ingress of water and debris;
4. Movement joint: a permanent joint or hinge throat which allows expansion, contraction or angular rotation to occur;
5. Movement joint formed in place: a movement joint formed during construction of a structure to permit adjacent structural elements to move relative to each other without damage.

BRIDGE BEARINGS

BRI.D110.9 GENERAL

1. Bridge bearings shall be designed by the Contractor;
2. The design and manufacture of bridge bearings and the materials used shall comply with BS 5400:Part 9:1983, including the guidance notes, except as stated in BRI.D120 and BRI.D130. Inspection and maintenance of bridge bearings shall be easy to carry out and the bearings shall be easily replaceable;
3. The maximum bearing stress in concrete underlying or overlying a bridge bearing under the design load at the ultimate limit state shall not exceed 40% of the specified grade strength of the concrete. Higher bearing stresses may be adopted provided that in the opinion of the CM sufficient steel reinforcement is provided to resist the resulting bursting forces and that the bearing stresses are within the limits stated in Clause 7.2.3.3 of BS 5400:Part 4:1990;
4. The deflection of bridge bearings which have a specified zero horizontal movement in a particular direction shall not exceed 1 mm in that direction under the maximum horizontal loadings.

BRI.D120.9 SLIDING BEARINGS

1. Clause 4.3.4.2 of BS 5400:Part 9: 1983:Section 9.2 shall not apply to sliding bearings;
2. Stainless steel sliding surfaces of sliding bearings which are attached to backing plates by mechanical fasteners instead of continuous welding along the edges shall be bonded to the backing over the full area and supplemented with peripheral sealing if necessary. Mechanical fixing with peripheral sealing only shall not be used.

BRI.D130.9 ELASTOMERIC BEARINGS

The requirements for use of elastomer in elastomeric bearings at sub-zero temperatures stated in Clause 3.7.1 of BS 5400:Part 9:1983:Section 9.2 shall not apply.

BRI.D140.9 GUIDES FOR BEARINGS

The clearance between guides and complementary sliding surfaces of a guide bearing shall not exceed 1 mm.

BRI.D150.9 FIXINGS FOR BEARINGS

1. Except for elastomeric bearings, bridge bearings, including bearings which are not required to provide horizontal restraint, shall be fixed to the superstructure and substructure with mechanical fixings or by other methods approved by the CM. The friction between the bearing and the superstructure or substructure may be used to resist the horizontal forces provided that a factor or safety of at least 2 is applied to the proven coefficient of friction and that the worst combination of vertical load and horizontal load is considered;
2. The ultimate capacity of the mechanical fixings for bridge bearings shall not be less than the worst combination of loading at ultimate limit state stated in the schedule of bearings.

BRI.D160.9 PROTECTIVE COATINGS

Metal components of bridge bearings shall be protected against corrosion by a protective coating complying with, and selected in accordance with, BS 5493:1977. For the purpose of selecting the coating system, the environment shall be classified as 'exterior exposed - polluted coastal' and the typical time to first maintenance shall be 'very long' (20 years or more).

BRI.D170.9 MARKING

1. Bridge bearings shall be marked by the manufacturer either with the type numbers stated in the schedule of bearings or with the manufacturer's own type or other numbers. A schedule shall be provided which relates the manufacturer's own type or other numbers to the type numbers stated in the schedule of bearings;
2. The design movement directions and magnitudes and the axes of bearing shall be marked on the upper faces of bridge bearings to facilitate checking of the installation. Movement indicators shall be provided for sliding and roller bearings to permit checking of movement of the bearings before and after installation.

MOVEMENT JOINTS

BRI.D210.9 MOVEMENT JOINTS FORMED IN PLACE

Movement joints formed in place shall comply with Worksection CON6 except as stated in this Worksection.

BRI.D220.9 DESIGN CRITERIA FOR FABRICATED MOVEMENT JOINTS

1. Fabricated movement joints shall be a proprietary type approved by the CM;
2. Fabricated movement joints shall be capable of withstanding the following loads, either separately or in combination:

a. Vertically: two 112.5 kN wheel loads, 1 m apart, each spread over a contact area giving an average pressure of 1 MPa and applied in such a manner as to produce the worst possible effect;

b. Horizontally: a traction force of 75 kN/m run of the joint applied perpendicular to the alignment of the joint, together with any forces arising from strain of the joint.

Allowance for additional loading due to impact is not necessary.

3. Fabricated movement joints shall be capable of accommodating the movements and rotations as specified in the Project Specific Specification without damaging the joint and without loading the supporting structure with forces which arise from strain of the joint exceeding 5 kN/m run of the joint;

4. Facilities shall be provided in fabricated movement joints for easy clearance of grit or silt entering slots, grooves or channels forming or associated with the joint;

5. Surfaces of fabricated movement joints which will be exposed at finished road level shall be treated to provide a resistance to skidding not less than that of the adjacent road surface;

6. Fabricated movement joints shall not impair the riding quality of the road surface for vehicular traffic and the passage of vehicular traffic shall not cause undue noise or vibration. The size of gaps, including gaps sealed with flexible material, on the riding surface of the joint shall not exceed 65 mm;

7. The passage of pedestrians and cyclists shall not be impeded or endangered by fabricated movement joints.

BRI.D230.9 FIXINGS FOR FABRICATED MOVEMENT JOINTS

1. The holding down and fixing arrangements for fabricated movement joints shall be capable of withstanding the loads stated in BRI.D220 (2). The diameter of bolts fixed as double row bolts on one side shall be at least 12 mm and the diameter of other holding down bolts and studs shall be at least 16 mm;

2. Fixings for fabricated movement joints shall be compatible with the reinforcement in the underlying concrete. Any revisions to the reinforcement required to suit the fixings shall be designed by the Contractor and submitted to the CM for Approval.

SUBMISSIONS

BRI.D310.9 BRIDGE BEARINGS

Certificates shall be submitted for each batch of bridge bearings delivered to the Site. The following particulars shall be submitted to the CM at least 28 days before Approval of the bridge bearings is required:

1. Details of type of bridge bearings, including materials, and the name and address of the manufacturer;

2. Design calculations, including:

   a. Calculations of bearing stresses above and below the bearings;

   b. Calculations for bursting or other necessary additional or revised reinforcement;

   c. Calculations to show that the bearings comply with the requirements of BS5400:Part 9:1983.

3. Shop drawings and drawings of any additional or revised reinforcement details;

4. Certificate for each type of bridge bearing showing the manufacturer's name, the date and place of manufacture and showing that the bridge bearings comply with the requirements stated in the Contract and including results of:
    a. Friction tests;
    b. Load tests;
    c. Tests on elastomers;
    d. Quick production tests;
    e. Stiffness tests.
5. Values of stiffness in compression and in shear of elastomeric bearings;
6. Details of fixings to superstructures and substructures;
7. Details of protective coatings;
8. Methods of installation;
9. Programme of manufacture, testing and delivery, including name and address of testing laboratory.

BRI.D320.9 MOVEMENT JOINTS

The following particulars shall be submitted to the CM at least 28 days before construction of the movement joints starts:

1. Details of type of movement joints and the name and address of the manufacturer;
2. Design calculations and drawings;
3. Details of fixings, including the size, length and spacing of holding down bolts and any necessary revisions to the reinforcement;
4. Details of materials for making good adjoining road surfaces and nosings, including reinforcement, jointing and curing details;
5. Programme of manufacture, testing and delivery;
6. For fabricated movement joints, a written undertaking from the supplier that he will install the proposed movement joint.

MATERIALS

WATERPROOFING

BRI.M010.9 PREFABRICATED SHEETING

1. Prefabricated sheeting for waterproofing shall be a proprietary type approved by the CM;
2. Prefabricated sheeting shall not rot or support the growth of mildew and shall be compatible with the materials with which it is in contact. Prefabricated sheeting which will be exposed to sunlight after installation shall be of a type which is unaffected by ultraviolet light;
3. Prefabricated sheeting shall have a tensile strength, pliability and puncture resistance such that the sheeting will withstand the stresses induced during handling and laying without damage. The elongation properties of prefabricated sheeting shall be such that the sheeting can accommodate the creep, shrinkage and thermal movements of concrete without distress;
4. Prefabricated bituminous sheeting shall be a self-adhesive, self-sealing type and shall have a thickness of at least 1.2 mm;
5. Prefabricated rubberised base sheeting shall be of a type which is unaffected by fuel, oils or grease;
6. Primers and mastic for prefabricated sheeting shall be a proprietary type recommended by the sheeting manufacturer and approved by the CM.

BRI.M020.9 BENTONITE PANELS

1. Bentonite panels shall consist of bentonite filler enclosed in self-degradable boards. The panels shall have a permeability of less than 1×10^{-7} mm/sec under simulated test conditions similar to those of the as-built conditions. The performance of bentonite panels shall not be affected by contaminants present in the groundwater;
2. Bentonite panels for slabs less than 200 mm thick or with soil cover of less than 450 mm shall be special panels with specific provision for swelling to prevent lifting of the slab;
3. Bentonite joint seal and bentonite granules shall be a proprietary type recommended by the bentonite panel manufacturer and approved by the CM;
4. Polyethylene sheeting for use with bentonite panels shall be a heavy duty type.

BRI.M030.9 BITUMINOUS PAINT

Bituminous paint for waterproofing shall be cut-back bitumen complying with BS 3690:Part 1:1989. The bitumen shall have a viscosity grade as determined by a standard tar viscometer within the range 25-50 seconds with a coverage of 0.5 L/m². Primers for bituminous paint shall be a proprietary type recommended by the bituminous paint manufacturer and approved by the CM.

BRIDGE BEARINGS

BRI.M110.9 HOLDING DOWN BOLTS

Holding down bolts for bridge bearings shall be of stainless steel and a proprietary type approved by the CM.

BRI.M120.9 CEMENT MORTAR, GROUT AND ADHESIVE

1. Cement mortar for bedding and construction of unreinforced plinths for bridge bearings shall be a proprietary non-shrink type approved by the CM having a grade strength of at least 50 MPa;
2. Chemical-resin mortar for the construction of plinths for bridge bearings shall be a proprietary non-shrink type approved by the CM having a grade strength of at least 50 MPa;
3. Grout for grouting base plates and holding down bolts shall be a proprietary non-shrink cementitious type approved by the CM having a grade strength of at least 50 MPa. The grout shall be flowable and shall not bleed or segregate. The suitability of the grout shall be demonstrated by site trials to the satisfaction of the CM. Chemical-resin based grout shall not be used;
4. Adhesive and chemical resin mortars for locating and bedding elastomeric bridge bearings shall be a proprietary type approved by the CM. They shall be compatible with the elastomer.

BRI.M130.9 DOWEL BARS

Dowel bars for bridge bearings shall be grade 1.4401 stainless steel complying with BS EN 10084:2008, BS EN 10085:2001, BS EN 10087:1999, BS EN 10095:1999, BS EN 10250-4:2000 and PD 970:2005.

VEHICULAR PARAPETS

BRI.M210.9 GENERAL

Vehicular parapets shall be of the types shown on the Drawings.

BRI.M220.9 STEEL

1. Steel for vehicular parapets, including weldings, shall comply with Worksection STW except clauses STW.T410 to STW.T430 and clauses STW.T450 to STW.T910. The requirements for testing of materials and welded components shall follow clauses BRI.T410 to BRI.T840;
2. Protective treatment to steel for vehicular parapets shall comply with Worksection STW and shall be applied after welding, drilling and cutting is complete.

BRI.M230.9 ALUMINIUM

1. Aluminium for vehicular parapets shall comply with the following or equivalent approved by the CM:
    a. Wrought aluminium and aluminium alloys for general engineering purposes:
        i. Plate, sheet and strip: BS EN 485:Part 1:1994, BS EN 485:Part 2:2004, BS EN 485:Part 3:2003;
        ii. Rivet, bolt and screw stock: BS 1473:1972;

iii. Bars, extruded round tubes and sections: BS EN 755:Part 1:1997, BS EN 755:Part 2:1997, BS EN 755:Part 3:1996, BS EN 755:Part 4:1996, BS EN 755:Part 5:1996.

2. Aluminium shall be anodised to Grade AA 25 in accordance with BS EN 12373:Part 1:2001 or equivalent approved by the CM;
3. Welding of aluminium for vehicular parapets shall comply with BS EN 1011:Part 4:2000 or equivalent approved by the CM.

BRI.M240.9 STAINLESS STEEL NUTS, BOLTS AND WASHERS

Stainless steel bolts, nuts and washers for vehicular parapets shall be grade A4 - 80 and shall comply with BS EN ISO 3506:Part 1:1998 and BS EN ISO 3506:Part 2:1998 or equivalent approved by the CM.

BRI.M250.9 HOLDING DOWN BOLTS

Holding down bolts for vehicular parapets shall be a proprietary type approved by the CM.

BRI.M260.9 GROUT

Grout for holding down bolts for vehicular parapets shall be based on polyester resins and shall be a proprietary type approved by the CM. Epoxy resin based grout shall not be used.

MOVEMENT JOINTS

BRI.M310.9 JOINT FILLER

Joint filler for movement joints formed in place shall be non-absorbent.

BRI.M320.9 JOINT SEALANT

1. Joint sealant for movement joints formed in place shall be a polysulphide-based sealant. Polyurethane-based sealant shall not be used unless approved by the CM;
2. Joint sealant shall be resistant to attack by petrol, diesel oil, dilute acids and alkalis, synthetic and mineral oils, hydraulic fluids and paraffin. The sealant shall have a transverse butt joint movement range for repeated cyclic movement of at least 25% of the width of the joint.

BRI.M330.9 COMPRESSION SEALS

Compression seals shall be a proprietary type approved by the CM and shall be manufactured from natural rubber, neoprene or other synthetic material. Compression seals shall have the dimensions specified by the manufacturer for each joint width.

BRI.M340.9 PVC CAPPING STRIP

PVC capping strip shall be a proprietary type approved by the CM.

BRI.M350.9 HOLDING DOWN BOLTS

Holding-down bolts for movement joints shall be a proprietary type approved by the CM.

BRI.M360.9 GROUT

Grout for holding-down bolts for movement joints shall be based on polyester resins and shall be a proprietary type approved by the CM. Epoxy-resin based grout shall not be used.

SUBMISSIONS

BRI.M410.9 WATERPROOFING SYSTEMS

Certificates shall be submitted for each batch of the material delivered to the Site. The following particulars, including certificates, shall be submitted to the CM at least 14 days before the first delivery of the material to the Site:

1. Manufacturer's literature and a certificate for prefabricated sheeting showing the manufacturer's name, the date and place of manufacture and showing that the prefabricated sheeting complies with the requirements stated in this Specification including results of tests for:
    a. Tensile strength;
    b. Pliability;
    c. Puncture resistance;
    d. Elongation.
2. Manufacturer's literature and a certificate for bentonite panels showing the manufacturer's name, the date and place of manufacture and showing that the bentonite panels comply with the requirements stated in this Specification and including results of tests for permeability;
3. Manufacturer's literature and a certificate for bituminous paint showing the manufacturer's name, the date and place of manufacturer and showing that the bituminous paint complies with the requirements stated in this Specification and including results of tests for viscosity;
4. Particulars of primers and mastic for prefabricated sheeting, bentonite joint seal and bentonite granules and primers for bituminous paint;
5. Method of laying prefabricated sheeting and bentonite panels.

BRI.M420.9 SAMPLES FOR WATERPROOFING SYSTEMS

Samples of the following proposed materials for waterproofing systems shall be submitted to the CM at the same time as particulars of the materials are submitted:

1. Prefabricated sheeting;
2. Bentonite panels.

BRI.M430.9 SAMPLES FOR VEHICULAR PARAPETS

Samples for the proposed posts and rails for vehicular parapets shall be submitted to the CM at least 14 days before installation of the parapets starts.

WORKMANSHIP

DELIVERY AND STORAGE

BRI.W010.9 DELIVERY OF BENTONITE PANELS FOR WATERPROOFING

Bentonite panels shall be delivered in original unbroken packages bearing the manufacturer's label.

BRI.W020.9 STORAGE OF WATERPROOFING MATERIALS

1. Prefabricated sheeting and bentonite panels shall be stored in accordance with the manufacturers' recommendations in a dry weather proof store with a raised floor;
2. Bituminous paint shall be stored in sealed containers marked to identify the contents and protected from exposure to conditions which may affect the bituminous paint. The bituminous paint shall be stored in accordance with the manufacturer's recommendations and shall not be used after the recommended shelf life has been exceeded.

BRI.W030.9 STORAGE OF BRIDGE BEARINGS

Bridge bearings shall be stored off a levelled, well drained and maintained hard-standing ground on level supports and in a manner which will not result in damage or deformation to the bearings or in contamination of the bearings.

BRI.W040.9 STORAGE OF VEHICULAR PARAPETS

Vehicular parapets shall be stored off a levelled, well drained and maintained hard-standing ground on level supports and in a manner which will not result in damage or deformation to the parapets or in contamination of the parapets.

BRI.W050.9 STORAGE OF FABRICATED MOVEMENT JOINTS

Fabricated movement joints shall be stored off a levelled, well drained and maintained hard-standing ground on level supports and in a manner which will not result in damage or deformation to the movement joint or in contamination of the movement joint.

INSTALLATION OF WATERPROOFING SYSTEMS

BRI.W110.9 GENERAL

Waterproofing systems shall be laid in accordance with the manufacturer's recommendations.

BRI.W120.9 PREPARATION

1. Surfaces on which waterproofing systems will be laid shall be clean, dry and free from voids, loose aggregate, sharp protrusions, projecting tying wire, release agents and other substances which are likely to damage or affect the waterproofing system;

2. Before waterproofing systems are laid on concrete surfaces the concrete surface shall have been cured for at least 7 days and shall be cleaned with a broom and sealed with one coat of primer. Primed surfaces shall not be covered until the solvent constituent has evaporated. Water shall be allowed to evaporate from primers containing bituminous emulsion before the surface is covered. Primed surfaces shall be protected from contamination.

BRI.W130.9 PREFABRICATED SHEETING

1. Prefabricated sheeting shall be laid one sheet at a time from low points and drains towards high points. The sheeting shall be firmly and tightly brought into contact with the primer or underlying sheeting;
2. Laps shall be formed at joints between individual sheets of prefabricated sheeting. Unless otherwise approved by the CM, end laps shall be at least 150 mm and side laps shall be at least 100 mm. Joints shall be arranged in such a manner that the number of layers of sheeting at any joint does not exceed three;
3. The perimeter of prefabricated sheeting laid each day shall be sealed with a trowelled bead of mastic;
4. A double layer of prefabricated sheeting shall be laid around pipes, posts or other components which pass through the sheeting and the edges shall be sealed with a trowelled bead of mastic.

BRI.W140.9 BENTONITE PANELS

1. Bentonite panels shall not be laid in water or during wet weather;
2. Immediately before bentonite panels are laid on a surface, joints and cracks in the surface shall be sealed with bentonite joint seal;
3. Polyethylene sheeting shall be laid below and above bentonite panels to prevent prehydration. Laps of at least 100 mm shall be formed at joints in the sheeting;
4. Laps shall be formed at the edges of bentonite panels or the edges shall be closely butted together and the seam filled with loose bentonite granules;
5. Bentonite panels shall not be fixed to the underlying surface unless permitted by the CM, if permitted, the method of fixing shall be by 25 mm masonry washerhead nails or by other methods agreed by the CM;
6. Bentonite panels shall be laid continuously around wall bases and corners. Flat panels shall not be folded or bent if the panels will be damaged or bentonite filler will be lost;
7. Bentonite which is exposed at the edges of bentonite panels cut to fit around pipes, posts or other components which pass through the panel shall be taped or sealed by other methods agreed by the CM to prevent loss of the bentonite filler. The joint between panels and the pipe, post or components shall be sealed with a continuous bentonite seal;
8. Exposed bentonite panels shall be protected from moisture by polyethylene sheeting unless panels with a water repellent coating are used. The sheeting shall be removed before fill materials is deposited. As soon as practicable after each course of panels has been laid, fill material shall be deposited and compacted up to a level which is within 50 mm of the top edge of the panel;
9. Damaged or expanded bentonite panels shall be replaced before being covered by the permanent work.

BRI.W150.9 BITUMINOUS PAINT

Surfaces to which bituminous paint will be applied shall be treated with a primer before the paint is applied if recommended by the paint manufacturer. Bituminous paint shall be applied in two coats; the first coat shall be allowed to dry before the second coat is applied.

INSTALLATION OF BRIDGE BEARINGS

BRI.W210.9 GENERAL

Bridge bearings shall be installed as recommended in BS 5400:Part 9:1983 and as in this sub-section.

BRI.W220.9 PRE-ASSEMBLED BEARINGS

Bridge bearings which have been pre-assembled shall not be dismantled unless approved by the CM.

BRI.W230.9 LEVELS

The levels of substructures shown on the drawings, on which bridge bearings will be installed shall be adjusted to suit the thickness of the bearing so that the superstructure will be at the specified level after completion.

BRI.W240.9 SETTING AND LOCKING BEARINGS

1. Bridge bearings, other than elastomeric bridge bearings, shall be set level on substructures using only a thin layer of cementitious mortar, unless the CM permits the bearings to be set on plinths. If setting on plinths is permitted, the plinths shall be constructed of cementitious mortar or grout, unless otherwise approved by the CM, and the thickness of such plinths shall be at least 25 mm and shall not exceed 40 mm. If approved by the CM, the plinths may not be constructed of chemical resin mortar, having a thickness of at least 5 mm and not exceeding 10 mm;
2. Elastomeric bearings shall be set directly on the substructure. A thin layer of cementitious mortar may be used to level the surface if the substructure is concrete. Elastomeric bearings shall not be set in position by grouting between the substructure and the underside of the bearing;
3. The top surface of bridge bearings which will support precast concrete or other prefabricated beams shall be covered with a thin layer of cementitious mortar immediately before the beam is placed. The beam shall be temporarily supported on folding wedges or by other methods agreed by the CM until the mortar has achieved sufficient strength to transmit the weight of the beam to the bearings; the temporary supports shall then be removed;
4. Temporary locking devices for bridge bearings shall be removed before post-tensioned superstructures are stressed. Temporary locking devices for other types of superstructures shall be removed at times agreed by the CM.

INSTALLATION OF VEHICULAR PARAPETS

BRI.W310.9 GENERAL

Vehicular parapets shall be installed to a smooth alignment and with the posts vertical.

BRI.W320.9 FIXING AND GROUTING

Grouting shall be carried out by setting the vehicular parapets in position and grouting the gap between the vehicular parapets and the structure. Vehicular parapets shall be held in position until connections and fixings are complete and until the fixings have gained sufficient strength.

INSTALLATION OF FABRICATED MOVEMENT JOINTS

BRI.W410.9 GENERAL

Fabricated movement joints shall be installed in accordance with the manufacturer's recommendations. The installation shall be carried out by the supplier of the movement joint.

BRI.W420.9 PREPARATION

The vertical faces of recesses in bridge decks for fabricated movement joints shall be formed by saw-cutting. Holding-down bolts shall be cast into the concrete for direct mounting of the joints unless the CM permits the bolts to be grouted. If grouting is permitted, the grouting shall be carried out by setting the movement joint in position and grouting the gap between the movement joint and the structure. Rebates and pockets for subsequent trimming to line and level or for holding-down bolts shall not be used unless permitted by the CM.

BRI.W430.9 BEDDING AND FIXING

1. The bedding to fabricated movement joints shall be formed such that there shall be no gaps between the joints and the bedding;
2. Relative movement between components and supports of a fabricated movement joint shall be prevented during installation of the joint and during placing and hardening of concrete and mortar under the components. Joint components shall be free to move longitudinally relative to each other;
3. When one side of a fabricated movement joint is being set, the other side shall be free from longitudinal restraint. Strongbacks or templates used to locate the side of a joint shall not be fixed to both sides at any one time.

BRI.W440.9 ROAD SURFACES ADJOINING JOINTS

1. The gap between fabricated movement joints and the adjoining road surface or nosing shall be made good after installation of the joint with material which has properties as similar as practicable to those of the material in the adjoining road surface;
2. Bituminous road surfaces shall be made good with a bituminous mixture or elastomeric concrete. Concrete road surfaces shall be made good with a cementitious matrix reinforced with metal or glass fibres or with elastomeric or polymer concrete. Epoxy resin mortar shall not be used;
3. Elastomeric and polymer concrete shall be prepared, laid and cured in accordance with the manufacturer's recommendations.

BRI.W450.9 PROTECTION

1. The permission of the CM shall be obtained before constructional plant or other vehicles cross a fabricated movement joint or the adjacent road surface;

2. Constructional plant or other vehicles shall not cross fabricated movement joints or adjacent road surfaces until installation of the joint is complete unless permitted by the CM. If permitted, ramps shall be provided to allow the vehicles to cross without loads being applied to the joint.

MOVEMENT JOINTS FORMED IN PLACE

BRI.W510.9 FORMING JOINTS

Gaps forming part of movement joints formed in place shall be filled with joint filler fixed in position with adhesive. The edge of the joint filler shall be covered with bond breaker tape or a PVC capping strip.

BRI.W520.9 FORMING GROOVES

Grooves for joint sealant and compression seals for movement joints formed in place shall be formed by saw cutting.

BRI.W530.9 SEALING GROOVES

Grooves for movement joints formed in place shall be sealed with joint sealant or with a compression seal.

TOLERANCES

BRI.W610.9 GENERAL

Refer to Appendix H 'Schedule of Tolerances' to this Specification.

TESTING

TESTING BRIDGE BEARINGS GENERALLY

BRI.T010.9 DEFINITION OF BATCH

A batch of bridge bearings is any quantity of bridge bearings of the same type fabricated by the same manufacturer and which for the purpose of testing elastomeric bearings contains the same type of elastomer.

BRI.T020.9 LABORATORY

Bridge bearings shall be tested by the Contractor at a laboratory approved by the CM.

BRI.T030.9 NOTICE TO THE CM

The Contractor shall inform the CM of the date and place of testing at least 28 days before testing starts.

BRI.T040.9 CHANGES TO PROCEDURES

The specified procedure for testing bridge bearings shall not be changed unless permitted by the CM.

BRI.T050.9 REPORTS

The reports of tests on bridge bearings shall include load/deflection graphs and shall be submitted to the CM for Approval at least 28 days before installation of the bridge bearings starts.

FRICTION TESTS ON BRIDGE BEARINGS

BRI.T110.9 SAMPLING

One sample of bridge bearing shall be provided from each batch of sliding bearings and from each batch of other types of bridge bearings which contain sliding parts.

BRI.T120.9 TEST METHOD

The friction test shall be carried out on each sample of bridge bearing to determine the coefficient of friction, flatness, bonding properties and resistance to mechanical damage. The method of testing shall be in accordance with this sub-section.

BRI.T130.9 TEMPERATURE

The friction test shall be carried out at room temperature.

BRI.T140.9 EQUIPMENT

The following equipment is required:

1. Compression testing rig;
2. Test loads;
3. Equipment for measuring the loads applied, readable and accurate to within 2% of the measured load;

4. Equipment for measuring movement, readable and accurate to 0.01 mm;
5. Lubricant of the same type as will be used in service.

BRI.T150.9 PROCEDURE

The procedure shall be as follows:

1. The PTFE surface of the bearing shall be lubricated with the lubricant;
2. Two sets of sliding surfaces shall be mounted back to back between the platens of the compression testing rig with the stainless steel sliding surfaces in the centre. A vertical load equal to the permanent load stated in the schedule of bearings shall be applied for 1 hour;
3. A horizontal load shall then be applied steadily and without shock to the pair of stainless steel sliding surfaces and shall be increased at a rate of 0.2% of the vertical load per minute until movement occurs between the sliding surfaces. The maximum horizontal load sufficient to cause movement of at least 25 mm between the stainless steel and PTFE sliding surfaces at a rate not exceeding 50 mm/min shall be recorded;
4. The loads shall be removed;
5. The sliding surfaces shall be removed from the rig and inspected.

BRI.T160.9 CALCULATION

The coefficient of friction shall be calculated from the equation:

$$\text{Coefficient of friction} = \frac{\text{maximum horizontal force}}{2 \times \text{vertical load}}$$

BRI.T170.9 REPORTING RESULTS

The following shall be reported:

1. Name of bearing manufacturer;
2. Details of bearing and sliding surfaces;
3. The vertical load applied;
4. The maximum horizontal force applied;
5. The total movement and rate of movement at the maximum horizontal force applied;
6. The coefficient of friction to two significant figures;
7. Details of any damage to the sliding surfaces;
8. That the test method used was in accordance with this Specification.

BRI.T180.9 COMPLIANCE CRITERIA

The results of friction tests for bridge bearings shall comply with the following requirements:

1. The coefficient of friction in any test position shall not exceed 0.04;
2. The flatness of the stainless steel shall be within the specified limits after testing;
3. The bond to the backing plate shall be unaffected by the friction test;
4. The PTFE shall be free from mechanical damage after testing.

TESTING NON-ELASTOMERIC BEARINGS

BRI.T210.9 SAMPLING

One sample of bridge bearing shall be provided from each batch of bridge bearings other than elastomeric bearings.

BRI.T220.9 TEST METHODS

1. Carry out vertical load tests and horizontal load tests on each sample of bridge bearing. The test loads shall be the serviceability limit stated loads;
2. Carry out additional tests with test loads up to the ultimate limit state loads, if stated in the Project Specific Specification;
3. The method of testing shall be in accordance with Clause 7.2(b)(1) of the guidance notes to BS 5400:Part 9:1983:Section 9.2.

BRI.T230.9 COMPLIANCE CRITERIA

The results of tests on bridge bearings other than elastomeric bearings shall comply with the requirements stated in Clause (b)(1) of the guidance notes to BS 5400:Part 9:1983:Section 9.2.

TESTING ELASTOMERIC BEARINGS

BRI.T310.9 SAMPLING

1. Except as stated in sub-clause (2), one sample of elastomeric bearing shall be provided from each batch of elastomeric bearings for testing by the "Quick Production Test";
2. Samples shall not be provided for the "Quick Production Test" if in the opinion of the CM there is sufficient evidence that tests have been carried out within the previous 18 months on identical materials and that the results of the tests comply with the specified requirements for the test;
3. Two samples of elastomeric bearings shall be provided from each batch of ten or part thereof of elastomeric bearings to determine the stiffness in compression and stiffness in shear.

BRI.T320.9 TEST METHODS

1. Each sample of elastomeric bearing shall be tested to determine the physical and weathering properties of the elastomer and the bond of the elastomer to metal. The method of testing shall be the "Quick Production Test" in accordance with the guidance notes to BS 5400:Part 9:1983:Section 9.2;
2. One sample of elastomeric bearing provided as BRI.T310 (3) shall be tested to determine the stiffness in compression and the other sample shall be tested to determine that stiffness in shear. The method of testing to determine the stiffness in compression shall be in accordance with Clause 7.2(b)(2) of the guidance notes to BS 5400:Part 9:1983: Section 9.2. The method of testing to determine the stiffness in shear shall be in accordance with BS 5400:Part 9:1983:Section 9.2, Appendix A.

BRI.T330.9 COMPLIANCE CRITERIA

The results of tests on elastomeric bearings shall comply with the following requirements:

1. There shall be no evidence of surface flaws in the bearings during or after the test;
2. There shall be no irregularities in the deflected shape of laminated bearings during or after the test;
3. The stiffness in compression shall be within 20% of the value quoted by the manufacturer and approved by the CM;
4. The stiffness in shear shall be within 20% of the value quoted by the manufacturer and approved by the CM.

TESTING VEHICULAR PARAPETS GENERALLY

BRI.T410.9 DEFINITION OF BATCH

A batch of vehicular parapets is the amount of parapet materials which is completed or delivered to the Site at any one time. Submit to the CM a list of the parts of vehicular parapets included in each batch at least 7 days before testing starts.

BRI.T420.9 SAMPLING

Select samples from positions which in the opinion of the CM are representative of the batch as a whole. CM shall inform the Contractor of the samples selected for testing at least 3 days before testing starts.

BRI.T430.9 TEST PROCEDURE

1. Carry out the relevant tests stated in BRI.T510 to BRI.T840 on each batch of vehicular parapets;
2. Inform the CM at least 7 days before tests are carried out.

TESTING PARAPET MATERIALS

BRI.T510.9 SAMPLING

The frequency of tests and results of material test shall conform to BS 6779:Part 1:1998, Table 3 for steel parapets and Table 4 for aluminium parapets.

BRI.T520.9 TENSILE AND IMPACT TESTING

Carry out the tensile test and Charpy impact test of materials for vehicular parapets in accordance with BS EN 10002:Part 1:2001 and BS EN 10045:Part 1:1990 respectively or equivalent approved by the CM.

BRI.T530.9 QUALITY GRADING

Carry out quality grading of vehicular parapet materials which have not been tested for quality grades by the manufacturer in accordance with BS 5400: Part 6:1980 as appropriate.

TESTING FASTENERS

BRI.T610.9 TENSILE TESTING

Carry out the tensile test of stainless steel fasteners for vehicular parapets in accordance with BS EN ISO 3506:Part 1:1998 and BS EN ISO 3506: Part 2:1998.

TESTING WELDED COMPONENTS OF VEHICULAR PARAPETS

BRI.T710.9 GENERAL

1. Carry out inspection and testing of welds for components of vehicular parapets on each batch after cleaning and before application of hot dip galvanising and other protective treatment. Carry out de-burring, dressing, grinding, machining and peening after the visual inspection for cracks, surface pores and joint fit-up and before other inspections and tests are carried out;
2. Visual examination and testing shall be carried out by a testing consultant approved by the CM.

BRI.T720.9 NON-DESTRUCTIVE TESTING

Inspect all welds visually and examine 10 % of welds for vehicular parapets visually in accordance with the techniques in BS EN 970:1997 or equivalent approved by the CM. Carry out non-destructive testing on a proportion of welds after visual inspection.

1. Non-destructive testing of welds for components of vehicular parapets shall comply with the following:
    a. For the components of vehicular parapets which are butt welded or fillet welded with nominal leg length greater than 12 mm, 10% of welds for each type of components shall be examined by ultrasonic testing in accordance with BS EN 1714:1998 or equivalent approved by the CM;
    b. 10% of the welds other than that mentioned in sub-clause (a) shall be tested as follows:
        i. Magnetic particle flaw detection to joints in steel parapet in accordance with BS EN ISO 9934:Part 1:2001 or equivalent approved by the CM; or
        ii. Liquid penetrant method to welds in aluminium parapet in accordance with BS EN 571: Part 1:1997 or equivalent approved by the CM.
2. Inspect welds for vehicular parapets which have been fabricated and tested by non-destructive testing in the fabricator's works visually for cracks when the vehicular parapets are delivered to the Site. If welding quality of the vehicular parapets is in doubt, test 5% of the welds by magnetic particle flaw detection in accordance with BS EN ISO 9934:Part 1:2001 or equivalent approved by the CM. Make good the surface protection of vehicular parapets to the satisfaction of the CM after the tests.

BRI.T730.9 COMPLIANCE CRITERIA

1. Welds shall be inspected, examined and tested for compliance with BS 6779:Part 1:1998, Clauses 9.4.3.1.2 to 9.4.3.1.4;
2. For the butt welds to be tested, the individual pores shall be less than 2.5 mm diameter and the localized pores shall be less than 3% by the area;
3. The width of defect of buried slag shall be less than 1.5 mm;
4. Linear groups of inclusions are acceptable provided that adjacent groups shall be separated by a distance of at least 4 times and 6 times the length of longest defect for parent metal thickness less than 20 mm and larger than 20 mm respectively.

BRI.T740.9 NON-COMPLIANCE

1. If result of any test on weld does not comply with the requirements stated in BRI.T730, carry out the test on additional samples from the batch. The number of additional tests shall be twice the number of original tests;
2. The batch is considered as not complying with the compliance criteria if the result of any additional test does not comply with the compliance criteria;
3. If the batch is not complying with the compliance criteria, the Contractor may propose to carry out 100% testing on the batch at his own costs and no extension of time shall be entertained;
4. If the result of every additional test complies with the compliance criteria, only those parts of the samples from which the testing samples selected have failed in the original tests shall be considered as not complying with the compliance criteria.

TESTING METAL VEHICULAR PARAPET POSTS

BRI.T810.9 SAMPLING

The frequency of destructive testing shall be as stated in the following table:

No.of posts per batch	No. of posts to be tested per batch
<150	1 (The CM may waive this testing requirements if satisfactory tests within 3 months are provided)
150-300	1
>300	1 for each 300 posts or remaining part thereof

BRI.T820.9 TEST METHODS

Carry out destructive static testing of metal vehicular parapet posts in accordance with the procedures stated in Annex E of BS 6779:Part 1:1998.

BRI.T830.9 COMPLIANCE CRITERIA

The results of test on post shall comply with the following criteria:

1. The post shall sustain a moment of 1.05 times its theoretical moment of resistance (product of nominal yield stress and plastic modulus) at its critical section without failure;
2. The material thickness, effective weld throat sizes and external dimensions of the post shall be within the tolerances.

BRI.T840.9 NON-COMPLIANCE

1. In the event that any of the compliance criteria as stated in BRI.T830 are not met, select further two posts from the same batch of posts and test;
2. If any further test fails to meet the compliance criteria, the whole batch shall be rejected.

BSW WORK FOR ELECTRICAL AND MECHANICAL INSTALLATIONS

MATERIALS

GENERAL

BSW.M010.9 APPLICATION OF OTHER WORKSECTIONS

The following works and materials shall comply with the Worksections stated, unless otherwise stated in this Worksection:

1. Earthworks shall comply with Worksection EAR1;
2. Materials for grout shall comply with Worksection GRO.

BSW.M020.9 DEFINITIONS

Concealed electrical conduit system is an electrical conduit system, including all bends, couplers, bushes, saddles, boxes, covers, plugs, draw wires and other conduit fittings, which is cast into concrete or fixed in chases in brickwork with a minimum cover of 20 mm or which is laid directly in the ground.

CONDUITS, DUCTS AND ANCILLARY MATERIALS

BSW.M110.9 ELECTRICAL CONDUITS AND FITTINGS

1. Electrical conduits and fittings shall comply with BS 4568:Parts 1 and 2:1970 and shall have Class 4 heavy protection inside and outside. Conduits shall be heavy gauge with screw-end construction in steel and shall have an external diameter of at least 20 mm. Conduits shall be longitudinally welded;
2. Metal boxes for enclosing electrical accessories shall comply with BS 4662:1970 and shall have heavy protection inside and outside. The boxes shall be of preferred sizes and shall be 35 mm or 47 mm deep as appropriate. Circular ceiling boxes of deep pattern shall comply with BS 4568:Part 2:1970 and shall have Class 4 heavy protection inside and outside. The boxes shall be at least 60 mm deep internally;
3. Circular boxes, dome covers and hook covers shall be cast iron. Bushes and plugs shall be brass.

BSW.M120.9 CABLE DUCTS AND FITTINGS

1. UPVC cable ducts for installation above ground or for casting into concrete shall be Class 0 UPVC pipes complying with BS 3506:1969. Cable ducts for installation below ground shall be Class B UPVC pipes complying with BS 3506:1969;
2. Joints and fittings for use with UPVC cable ducts shall comply with BS 4346:Part 1:1969 and BS 4346:Part 2:1970. Solvent cement for UPVC pipes and fittings shall comply with BS 4346:Part 3:1982;

3. Steel cable ducts shall be steel tubes complying with BS 1387:1985, medium series, screwed and socketed tubes and shall have screwed sockets suitable for screwing to BS 21:1985, Table 2 pipe threads. The tubes, sockets, clamps and saddles for ducts shall be galvanized in accordance with BS EN ISO 1461:1999 complying with STW.M410.

BSW.M130.9 PAINT FOR CONDUIT AND DUCT SYSTEMS

1. Bituminous paint for steel conduits and steel cable ducts shall comply with BS 3416:1991, Type 1;
2. Anti-rust paint for concealed electrical conduits systems shall be a proprietary type approved by the CM;
3. Zinc chromate primer for cable duct systems shall comply with BS 4652:1971;
4. Galvanizing paint for cable duct systems shall be a proprietary type approved by the CM.

BSW.M140.9 FIRE BARRIERS

Internal fire barriers shall be a type offering adequate fire resistance for the application. The material shall be approved by the CM in compliance with Fire Services Department requirements and shall be resistant to fire, smoke, gas and water.

BSW.M150.9 CEMENT GROUT

The different types of cement grout for electrical and mechanical installations shall consist of Portland cement, sand and PFA in the proportions by mass stated in the following table, together with the minimum amount of water necessary to achieve a consistency suitable for completely filling the voids. The mix shall contain a non-shrink admixture:

Mix proportions of cement grout			
Type	Mix proportions by mass		
	Cement	Sand	PFA
G1	1	-	-
G2	1	3	-
G3	1	10	-
G4	1	-	7

WORKMANSHIP

STORAGE OF MATERIALS

BSW.W010.9 CONDUIT AND CABLE DUCT SYSTEMS

Materials for concealed electrical conduit systems and for cable duct systems shall be stored in accordance with the manufacturer's recommendations in a dry weatherproof store.

HOLES AND RECESSES

BSW.W110.9 GENERAL

Holes and recesses shall be left in structures for electrical and mechanical installations. If instructed by the CM, holes and recesses shall be cut in structures for electrical and mechanical installations.

BSW.W120.9 TEMPORARY COVERS

Holes and recesses in internal floors, stairways and platforms shall be protected with temporary covers or by other methods agreed by the CM until the electrical and mechanical installation starts. Holes and recesses in roofs, external walls and external floors shall be sealed with watertight temporary covers until the electrical and mechanical installation starts.

BSW.W130.9 MAKING GOOD

Holes in structures shall be filled and made good after electrical and mechanical installations are complete. Holes left in structural elements designated as fire barriers shall be sealed to at least the same degree of fire resistance as the structural element.

FIRE BARRIERS

BSW.W210.9 LOCATION

Internal fire barriers shall be constructed in service channels, service shafts and service ducts for electrical and mechanical installations at the following locations:

1. At points of intersection with structural elements designated as fire barriers;
2. At 5 m centres in vertical and inclined shafts, and at intersections with floor slabs;
3. At termination points and open ends.

CONCEALED ELECTRICAL CONDUIT SYSTEMS

BSW.W310.9 CONSTRUCTION

Concealed electrical conduit systems which are shown diagrammatically in the Contract shall be constructed as follows:

1. Concealed electrical conduit systems shall be mechanically and electrically continuous and shall be effectively earthed;

2. Principal conduit runs shall be either vertical or horizontal. Tee pieces and elbows, including those with provision for inspection, shall not be used unless approved by the CM;
3. Joints shall be made using coupler units into which the ends of the conduits shall be inserted and tightened. Running couplings shall not be used unless permitted by the CM. If permitted, the couplings shall be made by screwing each of the conduits half way into the coupler with a hexagonal lock nut against each end of the coupler;
4. Adaptable boxes shall be provided at:
   a. Every second bend;
   b. After a bend and a straight run of 10 m or less;
   c. Every 15 m in straight runs.
5. Adaptable boxes for conduits installed in floor screeds shall have lids set flush with the adjacent floor. The boxes shall be covered with the same material as the remainder of the floor and shall remain accessible at all times;
6. The clearance between conduits entering adaptable boxes and between adjacent or parallel conduits shall be at least the nominal maximum coarse aggregate size of the concrete plus 5 mm.

BSW.W320.9 INSTALLATION

1. Concealed electrical conduit systems shall be arranged and installed in accordance with best trade practice and in such a manner that all cables can be drawn with ease and without damage;
2. Bends in concealed electrical conduit systems shall be formed by using proprietary bending equipment of a type agreed by the CM. Connections and other work shall be carried out using purpose made equipment;
3. Conduits shall not be bent by more than 90° and the internal radius at bends shall be at least 2.5 times the external diameter of the conduit. Conduits shall not be flattened at bends;
4. Burrs and sharp edges shall be removed from the ends of conduits before installation;
5. Concealed electrical conduit systems which are to be cast into concrete shall be fastened to the reinforcement with tying wire of the same type used for the reinforcement. The conduit systems shall not be positioned between the reinforcement and the outside face of the concrete unless permitted by the CM;
6. Conduit boxes shall be of a compatible size and shall have a single extension ring of the required depth if the plaster finish exceeds 13 mm thick. Multiple extension rings shall not be used.

BSW.W330.9 TERMINATIONS

Screw fitting couplers shall be provided at each end of conduits which terminate in distribution boards, busbar chambers, motor starters, cable ducts, boxes or similar termination points. The item at which the conduit terminates shall be drilled with an unthreaded clearance hole to receive a brass male bush. The bush shall be screwed into the coupler from the inside of the item in such a manner that the surface of the item is gripped between the coupler and the bush. The threads shall be at least half the length of the coupler.

BSW.W340.9 PROTECTION

1. Concealed electrical conduit systems shall have special arrangements designed by the Contractor to permit movement of conduits to take place on each side of movement joints in structures. A separate circuit protective conductor shall be installed to maintain effective electrical continuity across the joint. The protective conductor shall have a cross-sectional area rated to suit the largest live conductor to be drawn into the conduit;
2. Steel conduit systems laid in contact with or adjacent to other metal work shall have efficient and permanent metallic connection made between the conduit and the metal work;
3. Underground steel conduits and conduits in contact with soil shall be painted with two coats of bituminous paint before installation;
4. Exposed threads and damage to protective coatings of conduit systems shall be painted with two coats of anti-rust paint;
5. Conduits shall be laid in such a manner that accumulation of condensed moisture in the conduit system is prevented. Measures shall be taken to prevent water from entering the system;
6. Water, moisture and deleterious material shall be prevented from entering permanent and temporary terminations in concealed electrical conduit systems, including conduit boxes, by using conduit stopping plugs of a type approved by the CM. Paper or rags shall not be used.

BSW.W350.9 CLEANING SYSTEMS

After installation, concealed electrical conduit systems shall be swabbed out with draw-in tapes and absorbent cloth of a type agreed by the CM. All obstructions shall be removed and draw wires shall be installed. After cleaning, exposed conduit ends shall be sealed as BSW.W340 (6).

CABLE DUCT SYSTEMS

BSW.W410.9 INSTALLATION

1. Changes in direction in cable duct systems shall be constructed in such a manner that the cables in the duct will have radii of curvature of at least 800 mm. Ducts entering draw-in pits shall be on the same horizontal plane as the draw-in pit;
2. UPVC cable ducts shall be jointed in accordance with the manufacturer's recommendations;
3. Steel cable ducts shall be jointed using screwed galvanized sockets and spun yarn or by an equivalent method approved by the CM such that the jointed pipes abut. The threads shall be painted with two coats of bituminous paint. Internal rags and burrs shall be removed to provide a smooth bore through joints in the cable duct system;
4. Surface mounted cable ducts shall be secured by galvanized steel clamps or saddles at spacings not exceeding 3 m.

BSW.W420.9 PROTECTION

1. After jointing, exposed bare metal in cable duct systems shall be cleaned and painted with two coats of zinc chromate primer and two coats of galvanizing paint;
2. Surface mounted galvanized steel cable ducts shall be cleaned and painted after fittings and jointings have been completed.

BSW.W430.9 CLEANING

After jointing, cable duct systems shall be cleaned internally by scrubbing with a cylindrical brush of a type agreed by the CM. The ends of ducts, including ends of ducts in draw-in pits and spare ducts, shall be fitted with tapered hardwood plugs to prevent water, moisture and deleterious material from entering the system and a 6 mm diameter nylon draw line shall be installed. The plugs shall be centrally drilled for the draw line and the draw line shall be secured by a knot tied on the outer face of the plug to leave at least 1500 mm of surplus line at each plug.

EXCAVATION AND FILLING FOR EARTHING SYSTEMS

BSW.W510.9 EXCAVATION

Pits and trenches for electrical earthing systems shall be excavated at positions and at the times instructed by the CM.

BSW.W520.9 BACKFILLING

After the electrical earthing systems have been installed fill material shall be deposited and compacted in the pits and trenches to a depth of 300 mm above the electrical earthing system. Fill material shall be sand or fine fill material which has been selected from the excavated material, and which is free from stones retained on a 20 mm BS test sieve. Fill material shall be compacted by handrammers in a manner approved by the CM.

GROUTING

BSW.W610.9 GENERAL REQUIREMENTS

Grouting to structural steelwork, machine bases, crane rails, electrical and mechanical equipment and other electrical and mechanical installations shall comply with the following;

1. Grouting shall be carried out at the times instructed by the CM and shall be completed within 7 days of the instruction unless otherwise permitted by the CM;
2. The permission of the CM shall be obtained before items or equipment are grouted. The Contractor shall inform the CM 3 days, or such shorter period agreed by the CM, before grouting starts and shall allow the CM sufficient time to inspect the work which is to be grouted;
3. Concrete surfaces shall be scabbled to remove laitance and loose material and to expose the aggregate before the item or equipment is installed in position;
4. The voids to be grouted shall be cleaned and thoroughly wetted immediately before grouting. Excess water shall be removed by using a compressed air jet or by other methods agreed by the CM;
5. Grout shall be mixed and placed by methods agreed by the CM;
6. If grouting is to be carried out in two operations, holding down bolts shall be grouted into preformed pockets and sufficient time shall be allowed for the grout to cure and for the bolts to be tensioned before the remaining voids are grouted;
7. Exposed grout surfaces shall have a uniform, dense and smooth surface free from trowel marks and which is produced by steel trowelling the surface under firm pressure. The exposed surfaces shall be cured by either:

a. Using a liquid curing compound applied to the surface by a low-pressure spray until a continuous visible covering is achieved; or

b. Covering the surface with hessian or sacking. The hessian or sacking shall be lapped and securely held in position and shall be kept damp for at least 4 days.

COMPLETION AND PROTECTION

BSW.W710.9 COMPLETION

Work shall be completed to the following conditions before structures are made available to others for electrical and mechanical installations:

1. The structures shall be clean, dry and free from dust. Work which in the opinion of the CM will produce large quantities of dust shall be complete;
2. Holes and recesses, concealed electrical conduit systems and cable duct systems required for the installation shall be complete. Concrete surfaces on which items and equipment are to be installed shall be scabbled;
3. Plinths, trenches, louvres, openings and similar work shall be complete and shall have hardened sufficiently to allow the installation to proceed;
4. Floors and slabs shall be complete to the specified finishes except that floor tiles shall not be laid until after the installation is complete;
5. Plant rooms shall be complete, including fixtures and fittings, to a secure and weatherproof condition. Two sets of door keys for the plant room shall be provided for the CM;
6. Paintwork and similar finishes in plant rooms shall be complete to undercoat level. Final coats shall not be applied until after the installation is complete;
7. Temporary power supplies and connections required for the installation shall be complete. The supply shall be metered and shall be 346V, 3 phase supply of 20A maximum rating. Temporary power supplies shall be provided for the periods stated in the Project Specific Specification.

BSW.W720.9 PROTECTION

1. Structures in which electrical and mechanical installations are being carried out shall be maintained in a clean, dry condition, free from dust, during the installation;
2. The dust level in plant rooms shall be kept to a minimum by using industrial dust extractors of a type agreed by the CM during and after the installation. Temporary screens shall be installed to separate dust-affected areas from the installations or temporary covers shall be installed around the installation.

TOLERANCES

BSW.W810.9 GENERAL

Refer to Appendix H "Schedule of Tolerances" to this Specification.

INSPECTION

BSW.W910.9 GENERAL

1. The Contractor shall allow the CM to inspect the following work for electrical and mechanical installations:

a. Completed concealed electrical conduit systems, cable duct systems, electrical earthing systems and items and equipment which are to be grouted or covered up;

b. Items and equipment which are to be tested;

c. structures which are to be made available for electrical and mechanical installations.

2. The Contractor shall inform the CM three days, or such shorter period agreed by the CM, before work is covered up, tested or made available.

TESTING

EARTHING CONTINUITY

BSW.T010.9 TIMING

Concealed electrical conduit systems shall be tested to determine the earthing continuity. The system shall be tested:

1. Before the system is cast in concrete or covered up;
2. After the system is cast in concrete or covered up;
3. After electrical wiring which is installed by the Contractor is complete.

BSW.T020.9 TEST METHODS

Unless otherwise approved by the CM the method of testing shall be in accordance with Appendix 15 to the IEE Wiring Regulations, 15th Edition, 1981 issued by the Institution of Electrical Engineers.

BSW.T030.9 COMPLIANCE CRITERIA

The results of tests for earthing continuity shall comply with the IEE Wiring Regulations, 15th Edition, 1981 issued by the Institution of Electrical Engineers.

LOAD TESTS ON BEAMS AND JOISTS

BSW.T110.9 GENERAL

1. Load tests shall be carried out on lifting beams, rolled steel joists and lifting hooks which are installed by the Contractor;
2. Testing shall be carried out by an independent testing consultant approved by the CM and by using methods approved by the CM;
3. A certificate showing the results of the load tests and signed by the testing agent shall be submitted to the CM within 14 days of the test.

BSW.T120.9 COMPLIANCE CRITERIA

The results of tests on lifting beams, rolled steel joists and lifting hooks shall comply with the Factories and Industrial Undertakings (Lifting Appliances and Lifting Gear) Regulations, 1978 issued by the Labour Department.

CLE SITE CLEARANCE

MATERIALS

MATERIALS ARISING FROM SITE CLEARANCES

CLE.M010.9 MATERIALS ARISING FROM SITE CLEARANCES REQUIRED BY THE AUTHORITY

Take up, take down, transport to store, as applicable, the items resulting from the site clearance that are required by the Authority as specified in the Project Specific Specification.

WORKMANSHIP

DEMOLITION

CLE.W010.9 EXTENT

1. The Contractor shall demolish, break up and remove walls and superficial obstructions down to ground level on the Site in the way of or otherwise affected by the Works and ensuring compliance with the requirements of CLE.W130 and CLE.W160. He shall clear each part of the site at times and to the extent required or approved by the CM;
2. Where the Contractor is required to demolish buildings and structures, he shall demolish down to ground level only those parts which are scheduled for removal on the Drawings or which he is directed to remove by the CM.

CLE.W020.9 SURVEY

Structures which are to be demolished shall be surveyed by the Contractor, and the result given to the CM for information, before demolition starts.

CLE.W030.9 METHOD

Particulars of the proposed methods of carrying out demolition work shall be submitted to the CM for information at least 14 days before the demolition starts.

CLE.W040.9 PROTECTION

1. Areas adjacent to demolition work shall be protected from damage resulting from the demolition;
2. During demolition the Contractor shall take every precaution to protect the roadway, embankment and all other existing works from damage and to ensure the safety of his workmen and the general public;
3. Any damage beyond that so required shall be made good by the Contractor at his own expense.

CLE.W050.9 SALVAGED MATERIALS

The maximum quantity of material shall be salvaged and all material for re-use shall be cleaned and stacked on the Site, and the debris removed to an Approved dump.

SITE CLEARANCE

CLE.W110.9 STORAGE OF AND DAMAGE TO MATERIALS FOR RE-USE

1. Items which are to be re-used or taken to store shall be dismantled and removed by a suitable method so as to avoid damage or minimise the damage if this is unavoidable. The items shall be cleaned before re-use or taking to store;
2. Items which are to be re-used in the Works shall be kept in stores provided by the Contractor;
3. Items which are to be taken to the Authority's store shall be delivered by the Contractor. See CLE.M010;

4. Materials or equipment which are to be re-used or taken to store and which are damaged due to the Contractor's negligence shall be repaired by the Contractor by a method agreed by the CM. Materials or equipment which are lost or which in the opinion of the CM are not capable of being repaired satisfactorily shall be replaced by the Contractor.

CLE.W120.9 DISCONNECTION OF UTILITIES

The Contractor shall make all arrangements with and obtain the necessary approvals from the relevant authorities for disconnecting utilities inside and outside the Site. The ends of disconnected utilities shall be made good and sealed; the positions of the ends shall be marked with marker posts or by other methods agreed by the CM.

CLE.W130.9 UNDERGROUND STRUCTURES AND CHAMBER

Disused underground structures and chambers shall be filled and compacted as directed by the CM.

CLE.W140.9 ABANDONED PIPES AND MANHOLE

Comply with the requirements of Worksection DRA as appropriate.

CLE.W150.9 EARTHWORKS AND BLASTING

Comply with the requirements of Worksection EAR as appropriate.

CLE.W160.9 EXISTING TREES

1. The roots of trees and shrubs which have been cut down shall be grubbed up. Branches shall not be removed from trees which are to be retained unless permitted by the CM, if permitted, the branches shall be removed in accordance with BS 3998:1989 and the cut surfaces shall be treated with a wound sealant approved by the CM;
2. Where shown on the Drawings or directed by the CM trees shall be uprooted or cut down as near to ground level as possible. All felled timber shall be removed from the Site;
3. Holes left by stumps and roots shall be filled with suitable material and compacted as specified.

CLE.W170.9 DISPOSAL

Except for items which are to be re-used or taken to store; demolished items, trees, shrubs, vegetation, boulders, debris, rubbish and other items arising from site clearance shall be disposed of by the Contractor and become the property of the Contractor when they are removed from the Site.

CLE.W180.9 REINSTATEMENT

Unless otherwise permitted by the CM, areas affected by site clearance shall be reinstated as follows:

1. Fine fill material shall be deposited and compacted in voids which are left in the ground;
2. Holes which are left in structures and pavements shall be made good using materials similar to that in the adjoining area;
3. The ends of fences, walls structures, utilities and other items shall be made good in such a manner that the affected part will not corrode or deteriorate, and will remain stable;

4. Straining posts shall be fixed at the end of strained fences which have been cut and the fences shall be restrained.

FEN FENCING

MATERIALS

GENERAL

FEN.M010.9 OTHER RELATED SPECIFICATION WORKSECTIONS

The appropriate materials and workmanship requirements specified in the following Worksections apply to this Worksection unless otherwise stated herein:

1. Handrailing shall comply with Worksection MEW;
2. Earthworks shall comply with Worksection EAR1;
3. Pedestrian guardrailing shall comply with Worksection MEW;
4. Formwork and finishes to concrete shall comply with Worksection FOR;
5. Reinforcement shall comply with Worksection CON3;
6. Concrete shall comply with Worksection CON1;
7. Steelwork, including protective treatment, shall comply with Worksection STW;
8. Vehicular parapets shall comply with Worksection BRI.

FEN.M020.9 DETAILS OF FENCING

1. The following particulars of the proposed fencing shall be submitted to the CM:
   a. Drawings showing the fabrication details of gates; and,
   b. Details of the source, type and properties of the proposed materials.
2. The particulars of the proposed fencing shall be submitted to the CM at least 14 days before the fencing is erected.

FEN.M030.9 SAMPLES

The following samples of the proposed materials shall be submitted to the CM at the same time as the details of the proposed fencing are submitted:

1. Each type of wire and fitting;
2. Chain link;
3. Plywood;
4. Precast concrete, steel and timber posts;
5. Fixings.

FENCING MATERIALS

FEN.M110.9 WIRE

1. Wire for fencing shall be galvanized mild steel complying with BS 4102:1990;
2. Barbed wire shall consist of two line wires and point wire formed in accordance with BS 4102:1990, Clause 4.1;

3. Galvanized coatings to steel wire shall comply with BS EN 10244-2:2001.

FEN.M120.9 CHAIN LINK FENCING

Chain link fence shall comply with BS 1722:Part 1:1986 unless otherwise stated in this Worksection.

FEN.M130.9 PLYWOOD FOR HOARDINGS

Plywood for hoardings shall comply with BS 6566:1985 and shall have a Grade 2 veneer. The bonding adhesive between veneers shall be phenol formaldehyde resin adhesive classified as weather-proof and boil-proof in accordance with BS 1203:1979.

FEN.M140.9 TIMBER

1. Timber for fencing shall be of mature growth and shall be seasoned and free from large, loose or dead knots, wood wasp holes, infestation, splits and other defects which will reduce the strength or produce blemishes. The moisture content in timber at the time of fabrication shall not exceed 20%;
2. Hardwood shall be 'San Cheung' (Kapore) and shall have a density of at least 720 kg/m^3 at 15% moisture content;
3. Softwood shall be cedar, spruce or China fir;
4. Timber which is not to be painted shall be preserved with coal tar creosote. The creosote shall comply with BS 144 and shall be applied by pressure impregnation in accordance with BS 144.

FEN.M150.9 STEEL

Steel for fencing shall comply with the following:

1. Hot rolled sections: BS 4:Part 1:1980;
2. Hot rolled structural steel sections:
    a. Equal and unequal angles: BS 4848:Part 4:1972;
    b. Hollow sections: BS 4848:Part 2:1991.
3. Weldable structural steel: BS 4360:1986.

FEN.M160.9 FIXINGS

1. Bolts, nuts and washers for fencing shall comply with the following:
    a. ISO metric black hexagon bolts, screws and nuts: BS 4190:1967;
    b. ISO metric black cup and countersunk head, bolts and screws with hexagon nuts: BS 4933:1973;
    c. Metal washers for general engineering purposes: BS 4320:1968;
2. The length of bolts shall be such that the threaded portion of each bolt projects through the nut by at least one thread and by not more than four threads;
3. Fittings, including eye bolt strainers, cleats, winding brackets, stretcher bars, extension arms, hook bolts and base plates shall be galvanized mild steel;
4. Bolts, nuts, washers and fittings for fixing to concrete and timber shall be galvanized. Bolts, nuts, washers and fittings for fixing to steel shall have the same protective treatment as the steel;
5. Staples shall be D-section galvanized wire.

FEN.M170.9 CONCRETE POSTS

1. Concrete posts and struts for fencing shall be precast using Grade 30/10 concrete as Worksection CON1. The finish to formed surfaces shall be Class F4 and the finish to unformed surfaces shall be Class U5 as Worksection FOR. The tops of posts and all arrises shall be rounded or chamfered;
2. Reinforcement for concrete posts and struts shall be Grade 250 plain round steel bars as Worksection CON3.

FEN.M180.9 GATES

1. Steel gates shall be of welded construction. The frame shall be square with the corners mitred or saddled;
2. Chain link infilling in gates shall be of the same type and size as in the adjoining fence and shall be attached to the framework by stretcher bars.

POST FOUNDATION CONCRETE

FEN.M210.9 CONCRETE

Grade 30/20 concrete as Worksection CON1.

WORKMANSHIP

GENERAL

FEN.W010.9 STORAGE AND PROTECTION

1. Plywood and timber posts, rails and struts for fencing shall be stored on level supports in a dry weatherproof store;
2. Gates and concrete and steel posts and struts for fencing shall be stored off the ground on level supports and in a manner which will not result in damage or deformation to the materials or in contamination of the materials;
3. Fencing shall be protected from damage and damaged fencing shall not be used in the permanent work unless permitted by the CM.

FABRICATION OF FENCING

FEN.W110.9 FABRICATING STEELWORK

Steelwork for fencing shall be fabricated in accordance with BS 5950:Part 2:1992.

FEN.W120.9 GALVANIZING STEEL

1. Steel which is to be galvanized shall be hot-dip galvanized in accordance with BS EN ISO 1461:1999 to a minimum coating thickness of 70 µm;
2. Unless Approved, all components are to be galvanized after welding, drilling and cutting are complete;
3. All hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
    a. Project title/number;
    b. Name of galvanizer;
    c. Types and dimensions of articles;
    d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

FEN.W130.9 WELDING STEEL

1. Welds to steel for fencing shall be full depth fillet welds. Weld surfaces shall be clean and flush before application of the protective coating;
2. Steel shall not be welded after galvanizing unless permitted by the CM, if permitted, the welded areas shall be free from scale and slag and shall be treated with an alternative galvanizing or zinc coating system approved by the CM.

ERECTING FENCING

FEN.W210.9 LOCATION

Erect fencing to lines and levels shown on the Drawings.

FEN.W220.9 ALIGNMENT

Fencing shall be erected to a smooth alignment with no abrupt irregularities. The ground shall be trimmed or filled in such a manner that the bottom of the fence will approximately follow the level of the ground. The distance between the bottom of chain link mesh and hoardings and the ground shall not exceed 100 mm.

FEN.W230.9 LOCATION OF POSTS

1. Straining posts for fencing shall be provided at all ends and corners, at changes in direction, at abrupt changes in level, at gate posts and at intervals not exceeding 30 m along straight lengths of fencing. Struts shall be fitted to straining posts in the direction of each wire secured to the post;
2. Intermediate posts shall be provided at intervals not exceeding 3.5 m.

FEN.W240.9 ERECTING FENCING POSTS AND STRUTS

1. Posts and struts for fencing shall be set in excavations for foundations and the excavations shall be filled with concrete as FEN.M210 up to 50 mm below ground level;
2. Struts shall be fitted into slots in timber posts and concrete posts; struts shall be bolted to steel posts;
3. The ground surface around posts shall be made good with the same material as in the adjoining area.

FEN.W250.9 FIXING FENCING WIRE

1. Line wire, chain link mesh and barbed wire for fencing shall be strained tightly between straining posts. Winding brackets shall be used for straining between steel posts and winding brackets or eye bolt strainers shall be used for straining between concrete and timber posts. The tension in the wire on each side of straining posts shall be equal. Wire shall not be strained until at least 14 days after concrete has been placed in the foundation;
2. Chain link mesh shall be secured at each straining post by a stretcher bar and shall be tied to the line wire by tying wire at 150 mm intervals;
3. Each line wire and each line of barbed wire shall be secured to each intermediate post by one of the following methods as stated in the following table:
    a. A hairpin staple shall be passed through a hole in the post and secured to the wire by three complete turns on each side of the post;
    b. A stirrup shall be passed through a hole in the post and the ends bent over twice;
    c. The wire shall be threaded through a hole in the post;
    d. The wire shall be stapled to the post;
    e. A hook bolt shall be passed through a hole in the post and secured with a nut and washer.

Method of securing wire to intermediate posts			
Type of fence	Type of wire	Type of post	Method of securing wire
Strained wire	Line wire	Concrete	1, 2 or. 3
		Steel	1, 2 or 3
		Timber	1, 3 or 4
	Barbed wire	Concrete	1 or 2
		Steel	1
		Timber	1 or 4
Chain wire	Line wire Mesh wire	Concrete	1, 2 or 5
		Steel	1 or 3
		Timber	4
	Barbed wire	Concrete	1, 2 or 5
		Steel	1
		Timber	4

FEN.W260.9 FIXING TIMBER FENCING

The ends of timber rails for fencing shall be closely butted together and the rails shall be securely nailed to each post. The ends of plywood sheets in hoardings shall be closely butted together and the sheets shall be securely nailed to each post and to the horizontal rails.

FEN.W270.9 FIXING GATES

1. Gates shall be installed after the fence wire is in place and strained, so as to eliminate the possibility of the gates being pulled out of alignment;
2. Gates shall be hung truly plumb to ensure they will open and close easily.

FEN.W280.9 TOLERANCES

Refer to Appendix H "Schedule of Tolerances" to this Specification.

FOR FORMWORK

DESIGN

GENERAL

FOR.D010.9 STANDARD

Comply with the requirements of BS 5975:1982 regarding design, construction and dismantling of falsework and formwork.

FOR.D020.9 DEFINITIONS

In this Specification, the following definitions apply:

1. Class: a term used to identify the different types and standards of formed, unformed and treated finishes;
2. Falsework: a temporary structure used to support formwork and a permanent structure until the permanent structure is self-supporting;
3. Formed finish: the finish of the concrete surface produced by the use of formwork;
4. Formwork: the mould against which concrete is cast and which gives the shape and finish to the concrete surface;
5. Permanent formwork: formwork designed to remain in position as part of the permanent work;
6. Profiled formwork: formwork designed to produce a ribbed or patterned finish on the concrete surface;
7. Sealed plywood: plywood which has been sealed with a factory-applied film of phenolic resin or plastic material;
8. Spatterdash: a mixture of cement, coarse sand, granite fines and water, used as a rendering on concrete surfaces;
9. Treated finish: the finish of the concrete surface produced by a treatment applied to a formed or unformed finish;
10. Unformed finish: the finish of the concrete surface produced without formwork and by working the concrete surface before the concrete has hardened.

FOR.D030.9 BRIDGE CONSTRUCTION

1. Appoint a Registered Structural Engineer to design and control the temporary works for the construction of the bridge;
2. The submission shall include drawings and supporting calculations and shall be submitted to the CM not less than 4 weeks before the Contractor proposes to put such work in hand. Do not commence the proposed work without the prior consent of the CM. Such consent shall, however, in no way relieve the Contractor of any of his responsibilities for the design of the falsework;
3. Monitor falsework levels and make any necessary adjustments for settlement or other deflection or movements.

FOR.D040.9 SUBMISSIONS

See FOR.M310.

DESIGNED PARAMETERS

FOR.D110.9 GENERAL

Falsework and formwork shall be designed and constructed to maintain the position and shape of the formwork such that the hardened concrete surface complies with the characteristics of finish and other requirements of this Specification. Allowance shall be made for cambers.

FOR.D120.9 LOADINGS

Design and construct falsework and formwork to withstand any combination of the following loadings and to maintain the position and shape of the formwork to achieve the required shape and finish of the hardened concrete:

1. Total weight of formwork, falsework and wet concrete;
2. Construction loads including dynamic effects of placing, compacting and construction traffic;
3. Wind loads in accordance with the Code of Practice on Wind Effects in Hong Kong 2004 issued by the Buildings Department;
4. Any other relevant loading described in BS 5975:1982.

FOR.D130.9 INCLINED SURFACES

Formwork shall be used to form the top surface of concrete inclined at a slope exceeding 15° to the horizontal unless it can be demonstrated that the specified finish will be produced without the use of formwork. Formwork to top surfaces shall be anchored to prevent flotation.

FOR.D140.9 DISMANTLING AND REMOVAL

Falsework and formwork shall be capable of being dismantled and removed without shock, disturbance, damage or loading to the concrete and in such a manner that the specified requirements for removing or leaving in position side formwork, soffit formwork and props will be achieved without disturbing other formwork or props.

FOR.D150.9 PANEL JOINTS

Formwork panels for Class F2, F3, F4 and F5 finishes shall be the same size and shall form a regular pattern approved by the CM. The lines of joints between panels shall be straight and continuous, horizontal and vertical, or inclined to suit the pattern of profiled formwork, and shall be coincident with construction joints and other joints and with recesses in the concrete surface. The number of make-up pieces shall be kept to a minimum.

FOR.D160.9 TIE HOLES

Holes left by formwork ties and components in concrete surfaces with Class F2, F3, F4 and F5 finishes shall be in line horizontally and vertically and shall form a regular pattern approved by the CM. Unless otherwise permitted by the CM, holes in profiled formwork shall be located in such a manner that the holes are completely within recesses in the concrete surface.

FOR.D170.9 EXTERNAL ANGLES

Unless otherwise stated in the Contract or permitted by the CM, chamfers shall be provided for all external angles of 90° or less in concrete surfaces with Class F2, F3, F4 and F5 finishes shall not be made up of a series of flats unless permitted by the CM.

FOR.D180.9 CURVED SURFACES

Formwork for curved concrete surfaces with Class F2, F3, F4 and F5 finishes shall not be made up of a series of flats unless permitted by the CM.

FALSEWORK SPANNING PUBLIC HIGHWAYS

FOR.D210.9 DESIGN RESPONSIBILITY

Employ a Registered Structural Engineer to take responsibility for the design and construction of all temporary works and falsework spanning public highways. No consent or dissent of the CM will relieve the Contractor of his sole responsibility for the falsework design, construction and obtaining Approval.

FOR.D220.9 GENERAL DESIGN REQUIREMENTS

Ensure the falsework system does not interfere with normal traffic flow and does not reduce the width of the traffic lanes. Design clearances to falsework spanning a public highway in accordance with Section 35 of the Transport Planning and Design Manual Volume 2 - Highway Design Characteristics.

FOR.D230.9 APPROVALS

1. Take responsibility for obtaining all necessary approvals of any proposed falsework design and construction, through the Authority, from the Highways Department, the Commissioner of Police and the Commissioner for Transport;
2. Do not commence any temporary works, including falsework spanning a public Highway, unless the falsework design and construction method has been approved by the Highways Department, Commissioner of Police and Commissioner for Transport.

FOR.D240.9 SUBMISSIONS

Submit proposals for falsework spanning a public highway to the CM in the form of proper, numbered, fully dimensioned drawings accompanied by full structural calculations endorsed by the Contractor's Registered Structural Engineer. Make any amendments required by the CM and submit copies to the CM in order to obtain all necessary approvals from the Highways Department, Commissioner of Police and Commissioner for Transport.

MATERIALS

SHEATHING MATERIALS

FOR.M010.9 GENERAL

Formwork shall be timber, metal, plastic or other material which will produce the specified finish. Materials used as formers for profiled formwork, chamfers, splays, rebates and other features shall be such that they produce the same finish as the main formwork. Tropical hardwood is strictly prohibited for use in the formwork and falsework.

FOR.M020.9 PLYWOOD

Plywood for formwork shall have a close, uniform grain and the edges shall be sealed with barrier paint, polyurethane varnish or other impermeable material.

FOR.M030.9 FACES FOR CLASS F4 AND F5 FINISHES

The faces of formwork for Class F4 and F5 finishes shall have a uniform texture and a matt, not a shiny or polished, surface. The edges of the formwork shall be straight and square.

RELEASE AGENTS

FOR.M110.9 GENERAL

Release agents shall be:

1. A proprietary type approved by the CM. Release agents containing mineral oils shall not be used. Barrier paint, polyurethane varnish, wax or other materials shall not be used instead of a release agent;
2. A type which will not stain or colour the concrete and which will not affect the bond between the concrete and subsequent coverings. Release agents other than those which incorporate a surface retarder to produce a Class T1 finish shall be a type which will not affect the hardening of the concrete.

FOR.M120.9 POTABLE AND FRESH WATER RETAINING STRUCTURES

Release agents used on formwork for water retaining structures for potable and fresh water shall be non-toxic and shall not impart a taste to the water.

FOR.M130.9 STEEL FORMWORK

Release agents used on steel formwork shall contain a rust-inhibiting agent.

FOR.M140.9 CLASS F4 AND F5 FINISHES

1. Release agents used on formwork for Class F4 and F5 finishes shall be a chemical release agent;
2. On areas of formwork which in the opinion of the CM are likely to be affected by pedestrian traffic, rain or dust, release agents for Class F4 and F5 finishes shall be a type which evaporates to leave a dry film on the formwork, unless protection from such effects is provided;

3. Each type of release agent used on formwork for Class F4 and F5 finishes shall be obtained from one manufacturer and different types of release agent shall not be used on formwork for the same element.

ANCILLARY MATERIALS

FOR.M210.9 FORMWORK TIES

1. Formwork ties and components shall be a type such that any removable part can be removed without damaging the concrete; any part left in the concrete shall be at least 40 mm or the specified nominal cover to the reinforcement, whichever is greater, from the concrete surface;
2. Unless otherwise permitted by the CM, formwork ties and components used with profiled formwork shall be a type such that holes left by the ties and components are small enough to be located completely within the recesses in the concrete surface;
3. Formwork ties for use in water-retaining structures and waterproof structures shall incorporate a diaphragm welded to the mid-point of the tie, designed to prevent water from passing along the tie. Ties shall be degreased before being placed and shall not touch or foul the reinforcement.

FOR.M220.9 COVER SPACERS

See Worksection CON3.

FOR.M230.9 CEMENT MORTAR FOR REMEDIAL WORK

Materials for cement mortar shall comply with Worksection CON1 and:

1. Cement mortar for filling blowholes shall consist of cement and fine aggregate together with the minimum amount of water necessary to achieve a consistency suitable for completely filling the blowholes;
2. Cement mortar for filling holes left by formwork ties and components shall consist of 1 part of cement to 3 parts of fine aggregate, together with the minimum amount of water necessary to achieve a consistency suitable for compacting the mortar into the holes; the mix shall contain a non-shrink admixture;
3. Cement mortar for filling blowholes and holes left by formwork ties and components in concrete surfaces with Class F4 and F5 finishes shall be the same colour as the hardened concrete; light-coloured sand or white cement may be used for this purpose.

FOR.M240.9 SURFACE RETARDERS

Surface retarders shall be a proprietary type approved by the CM and shall be a type which will not stain or colour the concrete.

FOR.M250.9 ABRASIVES

Abrasives for blasting shall be grit or other materials approved by the CM and shall not contain any iron, clay or other materials which will stain or colour the concrete.

FOR.M260.9 SPATTERDASH

Spatterdash shall consist of cement and coarse sand or granite fines in the proportion 1:2 by volume mixed with the minimum amount of water necessary to achieve the consistency of a thick slurry.

SUBMISSIONS

FOR.M310.9 SCHEDULE OF SUBMISSIONS

1. General

   a. Particulars and samples of the proposed materials and methods of construction for Class F4, F5, U5 and T finishes shall be submitted to the CM as marked 'x' in the following table:

Particulars to be submitted	Formed finishes	Unformed finishes	Treated finishes
Formwork drawings:			
Panel Construction:	x	-	x
Layout and pattern of panels, joints and formwork ties:	x	-	x
Method statement:	-	x	x
Samples: Formwork:	x	-	-
Formwork ties:	x	-	x
Cover spacers:	x	-	x
Brand name and Manufacturer's literature:			
Release agent:	x	-	x
Curing compound:	x	x	x
Surface retarder:	-	-	x
Programme:Removing formwork:	x	-	-
Applying treated finishes:	-	-	x
Details: Sources of formwork, Formwork ties and cover Spacers:	x	-	x
Curing:	x	x	x
Filling blowholes:	x	-	-
Filling formwork tie holes:	x	-	x
Protecting finishes:	x	x	x

   b. The same particulars shall be submitted for other Classes of finish if required by the CM;

   c. Where the sheathing is timber plywood, submit for approval, details of the method of identifying and recording the number of uses to which the sheathing will be subjected to. Upon approval, provide all labour and equipment and carry out marking and recording to the satisfaction of the CM.

2. Bridge construction

   Submit the following details of formwork and falsework to the CM:

   a. Details of the system, including drawings and calculations;

   b. Details of holding down and stabilising the system including horizontal ties;

   c. Method statement for construction of the bridge;

d. Proposal for curing and protecting the concrete; and

e. Method statement for placing and compacting the concrete.

FOR.M320.9 TIMING OF SUBMISSIONS

1. General

   The particulars and samples for formed finishes shall be submitted at least 14 days before the relevant formwork, including formwork for trial panels, is fabricated. The particulars and samples for unformed and treated finishes shall be submitted at least 14 days before the relevant element, including trial panels, is concreted.

2. Bridge Construction

   Refer to Project Specific Specification.

WORKMANSHIP

STORAGE OF MATERIALS

FOR.W010.9 FORMWORK GENERALLY

Formwork shall be stored off the ground on level supports and in a manner which will not result in damage or deformation to the formwork or in contamination of the formwork.

FOR.W020.9 CLASS F4 AND F5

Formwork for Class F4 and F5 finishes shall be covered and protected from exposure to conditions which may affect the formwork.

FOR.W030.9 RELEASE AGENTS AND SURFACE RETARDERS

Release agents and surface retarders shall be stored in sealed containers marked to identify the contents and protected from exposure to conditions which may affect the material. The materials shall be stored in accordance with the manufacturers' recommendations and shall not be used after the recommended shelf life has been exceeded.

CONSTRUCTING AND ERECTING FORMWORK GENERALLY

FOR.W110.9 GENERAL

Formwork shall not have any splits, cracks or other defects. The faces and edges of formwork shall be clean and formwork faces shall be free of projecting nails.

FOR.W120.9 REUSE OF FORMWORK

Formwork which has been previously used shall be repaired and the edges resealed before it is erected. Formwork which in the opinion of the CM has deteriorated to an extent such that it will not produce the specified finish shall not be used for that Class or a higher Class of finish.

FOR.W130.9 JOINTS AND GAPS

Formwork shall be firmly supported and individual panels shall be rigid. Joints between formwork panels, stop ends and adjoining concrete shall be tight and shall not permit grout loss. Gaps shall be sealed with gaskets, filler, sealant or tape before the application of release agents.

FOR.W140.9 CUTTING FORMWORK

Formwork shall be cut in such a manner that reinforcement and built-in components passing through the formwork are maintained in position; the joints shall be tight and shall not permit grout loss.

FOR.W150.9 FORMERS ETC

Formers for profiled formwork, chamfers, splays, rebates and other features shall be rigidly and evenly fixed to the formwork along the complete length and shall not permit grout loss.

FOR.W160.9 BUILT-IN COMPONENTS, VOID FORMERS AND BOX-OUTS

Built-in components, void formers and box-outs shall be fixed in position before concreting. Unless permitted by the CM, void formers and box-outs shall not be used instead of built-in components. Polystyrene shall not be used for void formers and box-outs unless permitted by the CM.

FOR.W170.9 FORMWORK TIES AND COMPONENTS

Formwork ties and components shall be fixed in such a manner that they do not touch reinforcement or built-in components. Formwork ties and components shall fit rigidly against formwork faces and shall not permit grout loss.

FOR.W180.9 TEMPORARY OPENINGS

If required for cleaning or inspection, temporary openings shall be provided in the formwork.

CLASS F4 AND F5 FINISHES

FOR.W210.9 GENERAL

Each type of formwork for Class F4 and F5 finishes shall obtained from one source and different types of formwork shall not be mixed unless permitted by the CM. Damaged formwork shall not be used unless permitted by the CM. Parts of steel formwork which will be in contact with concrete shall be free from rust.

FOR.W220.9 JOINTS

For concrete surfaces with Class F4 and F5 finishes, joints between formwork panels shall be sealed with foamed rubber strips. The foamed rubber strips shall be sufficiently compressible to form a grout-tight joint. The width of the resulting gap between the panels shall not be greater than 1 mm and the sealing strips shall not protrude proud of the surface of the formwork panels. Alternatively, subject to the approval of the CM, joints between formwork panels may be sealed with an Approved filler provided the butting edges of the panels are smooth and the resulting gap between the panels is not wider than 1 mm. Joints between formwork panels shall not be sealed by tape fixed to the formwork faces.

FOR.W230.9 PROTECTION

Formwork for Class F4 and F5 finishes shall be protected from spillages, rust marks and stains.

APPLYING RELEASE AGENTS

FOR.W310.9 USE OF RELEASE AGENTS

A release agent shall be used on all formwork other than permanent formwork and formwork on which a surface retarder is used to produce a Class T1 finish.

FOR.W320.9 PREPARATION

Formwork faces shall be cleaned before release agents are applied. Concrete, reinforcement and built-in components shall not be contaminated by release agents.

FOR.W330.9 APPLICATION

The release agent shall be applied by the method and at the rate of application recommended by the manufacturer or as demonstrated to be satisfactory by use in the trial panel.

FOR.W340.9 CLASS F4 AND F5 FINISHES

Release agents shall be applied to formwork for Class F4 and F5 finishes after the formwork has been erected and before the reinforcement is fixed or, if this is not practicable, immediately before the formwork is erected. The release agent covering shall be complete and uniform.

INSPECTION

FOR.W410.9 GENERAL

The Contractor shall allow the CM to inspect the complete formwork and reinforcement, including trial panels, before carrying out any work, including fixing reinforcement adjacent to formwork and erecting formwork adjacent to reinforcement, which will make access to erecting formwork adjacent to reinforcement, which will make access to the formwork faces or reinforcement difficult. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out such work.

FOR.W420.9 CLASS F4 AND F5 FINISHES

The Contractor shall allow the CM to inspect formwork for Class F4 and F5 finishes before it is erected and shall inform the CM 24 hours, or such shorter period agreed by the CM, before erecting the formwork.

REMOVAL OF FALSEWORK AND FORMWORK

FOR.W510.9 MINIMUM TIMES BEFORE REMOVAL

Except as stated in FOR.W530, falsework and formwork shall not be loosened or removed before the minimum times stated in the following table:

Type of falsework or formwork	Class F1, F2, F3 and F4 finishes		Class F5 finish
	Concrete without PFA	Concrete with PFA	Concrete with or without PFA
Vertical (non-profiled) (profiled)	12 hours 7 days	15 hours 7 days	48 hours 7 days
Inclined to top surfaces	12 hours	15 hours	48 hours
Soffits of slabs (props left in)	4 days	4 days	10 days
Soffits of beams (props left in)	7 days	7 days	14 days
Props to slabs	10 days	10 days	10 days
Props to beams	14 days	14 days	14 days

Props to cantilevers	28 days	28 days	28 days

The times stated are for a minimum ambient temperature of 15℃, for elements without superimposed loads and for concrete containing PC, PFAC or both PC and PFA not exceeding the PC replacement level as specified in the Contract. If other conditions apply, particulars of proposed changes to the minimum times shall be submitted to the CM for approval.

FOR.W520.9 WATER RETAINING STRUCTURES

For the purpose of determining the minimum times for loosening or removing falsework and formwork, copings at the tope of columns in water retaining structures shall be classified as slabs and roof slabs in water retaining structures shall be classified as beams.

FOR.W530.9 CONCRETE IN FLEXURE

Falsework and formwork supporting concrete in flexure may be loosened or removed when the strength of the concrete in that element is 10 MPa or twice the stress to which it will be subjected, whichever is greater, provided that deflection which in the opinion of the CM is unacceptable will not result and that superimposed loads will not be applied. The strength of the concrete shall be determined from tests on test cubes which have been made with concrete from the same pour and which have been cured by the same method and under similar conditions as the concrete in the element.

FOR.W540.9 REMOVING FORMWORK

1. Formwork shall be removed without hammering or levering to the concrete and in such a manner that there is no shock, disturbance, damage or loading to the concrete. Side formwork shall be removed without disturbing soffit formwork and soffit formwork shall be removed without disturbing props except as provided for in sub-clause (2);
2. Individual props may be removed to allow the removal of soffit formwork provided that the formwork has been designed accordingly and that each prop is replaced as soon as the formwork has been removed.

FOR.W550.9 CLASS F5 FINISHES

Falsework and formwork for Class F5 finishes shall be loosened and removed in a continuous operation and in accordance with a consistent programme agreed by the CM. All formwork shall be loosened before individual panels are removed and all formwork shall be removed and all formwork shall be removed within the programmed period. Individual panels or make-up pieces shall not be left in position.

FOR.W560.9 FORMWORK FOR REUSE

After removal, formwork which is intended for re-use shall be cleaned and stored as FOR.W010 and FOR.W020.

MAINTENANCE OF FORMWORK

FOR.W570.9 DAMAGED AND DETERIORATED FORMWORK

Do not re-use formwork where strength and composition have so far deteriorated due to repeated use that, in the opinion of the CM, it will no longer adequately perform its function in accordance with the Specification but remove it from Site.

FOR.W580.9 RE-USE OF TIMBER FORMWORK

Do not subject plywood sheathing to formwork to more than nine uses, irrespective of the use of one or both faces of such sheathing.

FOR.W590.9 RUBBER SEALS

Properly maintain the rubber hose seals and replace when required or as Instructed but in no case subject seals to more than nine uses.

CLASSIFICATION OF FINISHES

FOR.W610.9 FORMED FINISHES

1. The characteristics of each class of formed finish shall be as stated in the following table:

Classification of Formed Finishes

Class of finish	Type of formwork normally used	Characteristics of finish			
		Formwork pattern	Abrupt irregularities permitted	Gradual irregularities permitted	Specific requirements
F1	Sawn timber	Not required	< 10 mm	< 15 mm in 2 m	No specific requirements
F2	Plywood	Pattern of formwork joints and tie holes as stated in Clauses. FOR.D150 and FOR.D160	< 5 mm	< 10 mm in 2 m	Even surface; no grout runs
F3			< 3 mm	< 5 mm in 2 m	Even surface; no grout runs
F4	Sealed plywood				Uniform, dense and smooth surface; no grout runs; no grain; pattern; no crazing; no major; blemishes
F5			< 2 mm	< 3 mm in 2 m	Uniform, dense and smooth surface; no grout runs; no grain pattern; no crazing; no blemishes; no staining or discolouration

2. Formwork of the type stated in the table in sub-clause (1), will normally produce a concrete surface which complies with the characteristics of finish stated but other types of formwork may be used to produce the specified finish.

FOR.W620.9 UNFORMED FINISHES

The characteristics of each class of unformed finish shall be as stated in the following table:

Classification of Unformed Finishes				
Class of finish	Method of producing finish	Characteristics of finish		
		Abrupt irregularities permitted	Gradual irregularities permitted	Specific requirements
U1	Levelling the surface of the compacted concrete with a screed board	Screed marks < 5 mm	< 10 mm in 2 m	No specific requirements
U2	Forming a Class U1 finish and tamping the surface	Tamp marks < 3 mm	Not applicable	Ridged surface
U3	Forming a Class U1 finish and wood floating or power floating the surface	Float marks < 3 mm	< 10 mm in 2 m	Uniform, dense and smooth surface
U4	Forming a Class U3 finish and brushing the surface with a stiff brush	Brush marks < 3 mm	< 10 mm in 2 m	Rough texture
U5	Forming a Class U3 finish and steel trowelling the surface under firm pressure or power floating the surface	Nil	< 5 mm in 2 m	Uniform, dense and smooth surface, free from trowel marks No staining or discolouration

FOR.W630.9 TREATED FINISHES

The characteristics of each class of treated finish shall be as stated in the following table:

Classification of Treated Finishes			
Class of finish	Type of finish	Method of producing finish	Characteristics of finish
T1	Exposed aggregate	Washing and brushing the concrete surface	Cement matrix removed and coarse aggregate exposed to a depth not exceeding one-third of the nominal maximum coarse aggregate size
T2	Point tooled	Point tooling the concrete surface	Cement matrix and aggregate surface removed sufficiently to expose the aggregate with a minimum penetration
T3	Bush hammered	Bush hammering the concrete surface	into the matrix between aggregates
T4	Broken rib	Hammering or chiselling the edges and faces of the concrete surface	Fragments of concrete ribs removed
T5	Light blasting	Blasting the concrete surface by abrasives	Cement matrix removed and coarse aggregate exposed to a minimum depth
T6	Heavy blasting	and compressed air or by water jetting	Cement matrix removed and coarse aggregate exposed to a depth not exceeding one-third of the nominal maximum coarse aggregate size

FOR.W640.9 APPLICATION OF FINISHES

The Class of formed and unformed finish required for different concrete surfaces shall be as stated in the following table unless otherwise stated in the Drawings. The high Class of finish shall start at least 150 mm below the finish ground level for concrete surfaces which are partly buried:

Description of surface			Class of finish	
			Formed	Unformed
Surfaces to be covered	-	screeded	-	U2
	-	rendered, plastered	F2	-
	-	tiles	F2	U3
	-	painted	F4	U5
Surface for treated finishes			F3	U3
Surfaces for pedestrian traffic			-	U4
Construction joints (for Class T1 finish)			F2	U3
Movement joints			F3	U3
Benching, screeds			F3	U5
Blinding, foundations, pile caps			F1	U1
Piers, blocks, pipe surrounds	-	below FGL	F1	U1
	-	above FGL	F2	U3
Manholes, chambers	-	external below FGL	F1	U1
	-	external above FGL	F2	U3
	-	internal	F2	U3
Culverts, channels	-	external below FGL	F1	U1
	-	external above FGL	F2	U3
	-	internal	F4	U5
Water retaining structures	-	external below FGL	F2	U3
	-	external above FGL	F4	U5
	-	internal	F4	U5
Buildings	-	external below FGL	F1	U1
	-	external above FGL	F2	U3
	-	internal	F4	U5
Bridges, retaining walls, walls	-	below FGL	F1	U1
	-	above FGL, not exposed to direct public view	F4	U5
	-	above FGL, exposed to direct public view	F5	U5
	-	internal, not exposed to direct public view	F2	U1

UNFORMED FINISHES

FOR.W710.9 GENERAL

Unformed finishes shall be produced by the methods stated in the table in FOR.W620.

FOR.W720.9 CLASS U4 FINISH

Brushing to produce a Class U4 finish shall be carried out in straight lines in a direction agreed by the CM; brushing shall be carried out when the concrete has hardened sufficiently for the float marks to be removed and for the ridges to be formed without displacing the aggregate.

FOR.W730.9 FLOATING AND TROWELLING

Floating and trowelling shall not be carried out until the concrete has hardened sufficiently to allow the specified finish to be produced with the minimum amount of floating and trowelling such that excess laitance is not produced.

FOR.W740.9 CONCRETE CARRIAGEWAYS

Surface finish to concrete carriageways shall comply with Worksection EXT2.

TREATED FINISHES

FOR.W810.9 GENERAL

1. Treated finishes shall be produced by constructing a concrete surface with a Class F3 or U3 finish as appropriate and applying the treatment to the surface by the methods stated in the table in FOR.W630;
2. The treatment shall be applied in a continuous operation in accordance with a consistent programme agreed by the CM.

FOR.W820.9 CLASS T1 FINISH

1. Washing and brushing to produce a Class T1 finish shall not be carried out until the concrete has hardened sufficiently for the cement matrix to be removed without disturbing the coarse aggregate. After washing and brushing have been completed and the concrete surface has hardened, the surface shall be cleaned;
2. The cement matrix shall not be removed or the aggregate exposed by mechanical methods unless permitted by the CM;
3. Class T1 finishes may be produced by using a surface retarder applied to the formwork or to the concrete surface. The surface retarder applied to the formwork or to the concrete surface. The surface retarder shall be applied by the method and at the rate of application recommended by the manufacturer, or as demonstrated to be satisfactory by use on the trial panel;
4. Plywood to which a surface retarder is to be applied shall be sealed with barrier paint, polyurethane varnish or other impermeable material agreed by the CM. The formwork shall be removed in small sections and the coarse aggregate exposed by washing and brushing the concrete surface;
5. Unless permitted by the CM, formwork to which a surface retarder has been applied shall not be re-used unless a surface retarder is to be used again on the formwork. Formwork to which a surface retarder has been applied and which is to be re-used shall be cleaned before the retarder is applied.

FOR.W830.9 CLASS T2 AND T3 FINISHES

Point tooling to produce Class T2 finishes and bush hammering to produce Class T3 finishes shall be carried out evenly in small areas and not in distinct lines. Tooling and hammering shall not start until at least 7 days after concreting.

FOR.W840.9 CLASS T4 FINISH

Hammering or chiselling to produce a Class T4 finish shall be applied from only one direction, and only either hammering or chiselling shall be applied on any one face. Hammering and chiselling shall not start until at least 14 days after concreting.

FOR.W850.9 CLASS T5 AND T6 FINISHES

Blasting to produce Class T5 and T6 finishes shall not be carried out until the concrete has hardened sufficiently for the cement matrix to be removed without disturbing the coarse aggregate. Adjacent surfaces shall be protected from blasting and dust shall be controlled by screens and by water-spraying.

INSPECTION AND COMPLIANCE OF FINISHES

FOR.W910.9 INSPECTION

1. Before any subsequent work is carried out on a concrete surface, the surface shall be inspected by the CM to determine if the specified finish has been produced. Formed finishes shall be inspected as soon as the formwork has been removed;
2. Blowholes or holes left by formwork ties and components shall not be filled and spatterdash or other coverings shall not be applied before the inspection; any such filling or covering carried out before the inspection may be rejected.

FOR.W920.9 COMPLIANCE STANDARD

1. Concrete surfaces shall have the characteristics stated in tables in FOR.W610 and FOR.W620 for the different Classes of formed and unformed finish before any subsequent work is carried out on the concrete surface and shall have the characteristics stated in the table in FOR.W630 for the different Classes of treated finish;
2. The CM shall determine if the specified finish has been produced and may use the trial panels as a means of comparison;
3. Abrupt irregularities shall be measured by direct measurement. Gradual irregularities shall be measured using a 2 m long straight edge on surfaces intended to be flat and by a method agreed by the CM on other surfaces.

REMEDIAL AND REPAIR WORK

FOR.W1010.9 GENERAL

1. Remedial or repair work shall not be carried out on concrete surfaces unless permitted by the CM; any such work carried out without permission may be rejected;
2. Filling of blowholes and holes left by formwork ties and components shall be carried out as soon as practicable after the CM has inspected the finish and with the minimum interruption to curing.

FOR.W1020.9 BLOWHOLES

Blowholes exceeding 3 mm in size in water retaining structures and watertight structures, and blowholes exceeding 10 mm in size in other structures shall be filled with cement mortar. The size of blowholes shall be the maximum dimension measured across the hole on the concrete surface. If the number and size of blowholes in concrete surfaces with Class F3, F4 and F5 finishes is in the opinion of the CM greater than in the trial panel the blowholes shall be filled, unless in the opinion of the CM filling is not required.

FOR.W1030.9 FORMWORK TIE HOLES

Holes left by formwork ties and components shall be cleaned and filled by ramming cement mortar into the holes in layers. Holes in concrete surfaces with a Class F5 finish shall be filled to a level slightly below the concrete surface; the holes shall not be overfilled and rubbed down.

FOR.W1040.9 APPLYING SPATTERDASH

1. Spatterdash shall be thrown with a hand trowel onto the surface to a thickness not exceeding 6 mm and shall cover at least 60% of the area which is to be plastered or rendered. Spatterdash shall be wetted one hour after application and shall be allowed to cure and harden before under coats are applied;
2. Spatterdash shall be applied as soon as practicable after the CM has inspected the finish and after the concrete surface has been cleaned and wetted.

FOR.W1050.9 CRACK REPAIR

See Worksection CON1.

PROTECTION OF FINISHES

FOR.W1110.9 GENERAL

Materials, constructional plant or other vehicles shall not use or be placed on or against concrete surfaces unless permitted by the CM.

FOR.W1120.9 CLASS F4, F5, U5 AND T FINISHES

Concrete surfaces with Class F4, F5, U5 and T finishes shall be:

1. Protected from running water, spillages, rust-marks and stains by covering the surface with polyethylene sheeting or timber or by other methods agreed by the CM. Protection from rust-marks caused by reinforcement bars shall be by polyethylene sleeves tied to the bars or by coating the bars with cement slurry; the bars shall not be coated with oil or grease;
2. Protected from damage by securing timber battens to the surface, by erecting barriers or fences or by other methods agreed by the CM.

FOR.W1130.9 CLASS F5 FINISH

Concrete surfaces with a Class 5 finish shall be protected from exposure to extreme variations in weather conditions for at least 14 days after the formwork has been removed.

TRIAL PANELS

FOR.W1210.9 GENERAL

1. A trial panel shall be constructed for each Class F4, F5, U5 and T finish to demonstrate that the proposed materials, mix design, methods of production and methods of construction, including curing and removal of formwork, will produce the specified finish;
2. Trial panels for Class F4 and F5 finishes shall be constructed before the relevant formwork for the permanent work is erected, and trial panels for Class U5 and T finishes shall be constructed before the relevant permanent work is concreted. The trial panels shall be constructed at least 4 weeks before the relevant permanent work is carried out;
3. The Contractor shall inform the CM at least 24 hours, or such shorter period agreed by the CM, before constructing trial panels;
4. Trial panels shall be constructed using the materials, mix design, methods of production and methods of construction, including curing and removal of formwork, submitted to the CM;
5. Trial panels shall be horizontal, vertical or inclined as appropriate and shall be constructed at locations agreed by the CM. Unless otherwise stated in the Contract, each trial panel shall be not less than 2 m by 2 m by 300 mm thick, and shall contain reinforcement representative of the most congested reinforcement which will be used in the permanent work. Trial panels shall incorporate formwork ties and components, horizontal joints, vertical joints, chamfers, splays, rebates and other features representative of those which will be used in the permanent work;
6. Trial panels shall be protected from damage and shall be left in position until the CM instructs their removal.

FOR.W1220.9 NON-COMPLIANCE OF TRIAL PANELS

If in the opinion of the CM the specified finish has not been produced in the trial panel, particulars of proposed changes to the materials, mix design, methods of production or methods of construction shall be submitted to the CM, further trial panels shall be constructed until the specified finish is produced in the trial panel. Further trial mixes shall be made unless in the opinion of the CM non-compliance of the trial panel was not due to the concrete mix.

FOR.W1230.9 COMMENCEMENT OF FORMWORK AND CONCRETING

Formwork for Class F4 and F5 finishes shall not be erected and elements with Class U5 and T finishes shall not be concreted until in the opinion of the CM the specified finish has been produced in the trial panel.

FOR.W1240.9 CHANGES IN MATERIALS AND METHODS

Unless permitted by the CM, the materials, mix design, methods of production or methods of construction, including curing and removal of formwork, used to produce the specified finish in trial panels shall not be changed.

MAR MARINE WORKS

MATERIALS

GENERAL

MAR.M010.9 APPLICATION OF OTHER WORKSECTIONS

The works and materials specified below shall comply with the Worksections stated, unless otherwise stated in this Worksection:

1. Pipes and fittings, including gaskets, internal linings, external coatings and anticorrosion tape, for submarine outfalls shall comply with Worksection DRA2;
2. Fill material for marine works shall comply with Worksection EAR;
3. Formwork and finishes to concrete shall comply with Worksection FOR;
4. Steel reinforcement shall comply with Worksection CON3;
5. Concrete shall comply with Appendix B entitled "Recommended Specification for Concrete in Marine Environment" of the Port Works Design Manual to address the corrosion of reinforced concrete for marine structures and also shall comply with Worksection CON1 in general.

MAR.M020.9 DEFINITIONS

1. Reclamation: the formation of land over an area of foreshore, sea bed, tidal inlet or river, including the adjoining areas, by the deposition of fill material to the limits shown in the Drawings;
2. Marine structures: seawalls, revetments, breakwaters, jetties, quay walls, dolphins, docks, slipways, beacons, lighthouses, landing steps for berthing of vessels and other similar structures;
3. Final surface of any work: the surface to which the work is to be finished.

FILL MATERIAL

MAR.M110.9 PARTICLE SIZE DISTRIBUTION

The different types of fill material for marine works shall either be Type 1, Type 2, rock or public fill as specified in the Contract and shall have the particle size distributions within the ranges stated in the table in clause EAR1.M220 and in the following table unless otherwise stated in the Contract:

Particle size distributions of fill material					
Type of fill material	Percentage by mass passing				
	Size		BS test sieve size		
	700 mm	200 mm	75 mm	20 mm	63 microns
Underwater fill material (Type 1)	-	-	100	-	0-30
Underwater fill material (Type 2)	-	-	100	-	0-25

Rock fill material (Grade 75)	-	-	100	0	-
Rock fill material (Grade 700)	100	0-10	0-5	0	-

MAR.M120.9 UNDERWATER FILL MATERIAL (TYPE 1)

Underwater fill material (Type 1) shall consist of natural material extracted from the sea bed or a river bed.

MAR.M130.9 UNDERWATER FILL MATERIAL (TYPE 2)

Underwater fill material (Type 2) shall consist of material which has a coefficient of uniformity exceeding 5 and a plasticity index not exceeding 12.

MAR.M140.9 ROCK FILL MATERIAL (GRADE 75)

Rock fill material (Grade 75) shall consist of pieces of hard, durable rock which are free from cracks, veins, discolouration and other evidence of decomposition.

MAR.M150.9 ROCK FILL MATERIAL (GRADE 700)

Rock fill material (Grade 700) shall consist of pieces of rock which are free from cracks, veins and similar defects and of which in the opinion of the CM not more than 30% by mass shall be discoloured or show other evidence of decomposition.

MAR.M160.9 SUBMISSIONS

Submit details of the sources and properties of fill material specified in this sub-section to the CM, at least 14 days before deposition of the fill material starts.

MAR.M170.9 IMPORTATION OF SAND

1. Where the Contractor intends to import sand as defined in the Contract from the People's Republic of China (PRC) by barges, he shall submit to the CM for Approval a proposal containing the information as referred to in sub-clause (2) below for the delivery of sand from any source in PRC waters to the Site at least 28 days prior to its delivery. Within a reasonable time of being required to do so, provide to the CM such further particulars as may be required by the CM to enable the CM to make a proper decision on the proposal. Approval by the CM shall not relieve the Contractor of any obligation or liability under the Contract;
2. The proposal shall contain the following information:
    a. The source of the sand, grading curves and test results for contamination of heavy metals or any other test required by the CM or as are necessary to confirm compliance with the Specification;
    b. The name and licence number of each barge to be engaged in transporting the sand, and the company name, address, telephone and fax number and contact person of their appointed Hong Kong shipping agent;
    c. Details of all permits and authorizations, original versions of which the relevant PRC and Hong Kong authorities require to be carried on each barge. The original versions of the documents normally required shall include but not be limited to the following:

        PRC Authorities

        Certificate of ship Nationality

        Certificate of Survey

Certificate of Navigation (Government of the Hong Kong Special Administrative Region, Government of the Macau Special Administrative Region and PRC)

Route Approval

Clearance Certificate

Pass for entering HK and Macau

Custom Supervision Book of Small Craft (Government of the Hong Kong Special Administrative Region, Government of the Macau Special Administrative Region and PRC)

Master and Chief Engineer Certificates

Seamans' ID Cards/Record Books

Permit for Sand Exportation

Hong Kong Authorities

Arrival Report (Marine Department)

Arrival Clearance, Vessel and Crew (Immigration Department)

Cargo Manifest (Customs & Excise Department)

Sand Permit (Civil Engineering Development Department)

Departure Clearance (Marine Department)

Departure Clearance (Immigration Department)

3. All sand imported from PRC for incorporation into the Works shall be obtained from the source approved under the above sub-clause (1);

4. On each occasion sand is delivered by barge to the Site, produce to the satisfaction of the CM documentary evidence that the sand is from the source approved under the above sub-clause (1);

5. Requirement for proof of third party insurance cover:

   Vessels transporting sand from China will be required to have third party risk insurance valid for Hong Kong waters and to carry a certified true copy of the third party insurance certificate on board the vessel.

6. Requirement for route approval:

   To minimise the adverse effects on marine traffic, the Contractor intending to import sand material from China in barges will be required before the sand importation starts, to apply to the Director of Marine to obtain Approval for the transportation routes to be used. Guidance on the approval procedures is given below:

   a. Sand imported from China should be transported to the Hong Kong destination site by the shortest and most direct route possible;

   b. Routes which are under heavy marine traffic usage include Ma Wan and Kap Shui Mun Channels, the Central Harbour, the East Lamma Channel, the Adamasta Channel and Lei Yue Mun. It is intended that these routes will not generally be available to an unlimited number of barges transporting sand. However, if sand barges must traverse these busy waters the number of such vessels allowed to do so will be strictly limited;

   c. To minimise the volume of individual vessels used, the Contractor is encouraged to use large rather than small vessels;

d. The Contractor intending to import sand from China in barges must apply to the Director of Marine for Approval of the transportation routes as soon as possible and certainly before any sand importation starts;

e. When making an application the following information will be required:

i. The site of the reclamation and Contract name and number;

ii. The total quantity of sand to be transported and the planned daily/monthly tonnage amounts to be transported;

iii. The proposed route;

iv. The number of vessels to be used plus their tonnage capacities and identities;

v. The frequency of vessel trips;

vi. The name and address of the Hong Kong agent;

vii. Details of third party risk insurance coverage for the vessels.

f. The Director of Marine will establish a working committee to advise him on individual applications for route approval. The committee membership will include concerned government departments, the Hong Kong Pilot's Association and selected port user groups. In considering applications for route approval, the Director of Marine will take into account the location of the reclamation and existing traffic levels;

g. Once route approval has been given, the marine traffic effects of the sand transportation will be monitored. The information gained from monitoring marine traffic, including marine traffic unrelated to a particular project, will be used by the Director of Marine to verify that the traffic level generated by that particular project is acceptable, needs adjusting downwards or could be set at higher levels;

h. Approved applications will stipulate a requirement for the applicant to forward to the Director of Marine on a monthly basis the following information:

i. The site of the reclamation and Contract name and number;

ii. The monthly amount in tonnage of sand transported;

iii. The number of vessels used plus their tonnage capacities and identities;

iv. The frequency of vessel trips;

v. The route used.

ROCK ARMOUR

MAR.M210.9 MAXIMUM AND MINIMUM MASSES

1. The different types of rock armour shall have the maximum and minimum masses as stated in the following table:

Mass of rock armour		
Type of fill material	Mass of individual piece of rock (kg)	
	Maximum	Minimum
Rock armour (Type 1)	1500	750
Rock armour (Type 2)	2000	1000

Rock armour (Type 3)	2500	1500
Rock armour (Type 4)	3000	2000
Rock armour (Type 5)	4000	2500
Rock armour (Type 6)	5000	3000
Rock armour (Type 7)	6500	4000

2. At least 50% in number of the individual pieces shall have a mass exceeding the mean of the specified maximum and minimum masses.

MAR.M220.9 PROPERTIES

Rock armour shall consist of rock having the properties stated in the following table:

Properties of rock for rock armour	
Property	Value
Specific gravity	≥2.6
Water absorption	≤3%
Aggregate impact value (in dry condition)	≤30%
Ten percent fines value (in dry condition)	≥100 kN
Soundness	loss in mass after five cycles not exceeding 12% for sodium sulphate and 18%for magnesium sulphate
Aggregate abrasion value	≤15%

and shall comply with the following requirements:

1. The maximum size of rock shall not be greater than twice the minimum dimension;
2. Each piece of rock shall be free from cracks, veins and similar defects;
3. In the opinion of the CM not more than 20% in number of the individual pieces shall be discoloured or show other evidence of decomposition.

MAR.M230.9 SUBMISSIONS

Submit details of the sources and properties of rock armour specified in this sub-section to the CM, at least 14 days before placing of the rock armour starts.

STONES

MAR.M310.9 FACING STONES

1. Facing stones to seawalls and pitched slopes shall consist of pieces of hard, durable fresh granite, free from cracks, veins, and similar defects. Facing stones shall be uniform in size, shape and colour, roughly squared and hammer dressed such that they will fit together without the use of quarry spalls or surface pinning;
2. Facing stones for vertical concrete seawalls shall be at least 300 mm wide on the face, at least 300 mm from back to front and shall be of a height which will allow the stones to be laid in 300 mm to 400 mm courses.

MAR.M320.9 BERMSTONES

1. Bermstones for seawalls and revetments shall consist of pieces of sound fresh rock, free from cracks, veins and similar defects;

2. Bermstones for vertical seawalls shall be at least 1000 kg in mass and when placed in position shall be roughly rectangular on plan and between 450 mm and 750 mm thick.

MAR.M330.9 LEVELLING STONES

Stones for levelling founding layers for marine structures shall be rock fill material (Grade 75) as stated in MAR.M140.

FENDERING SYSTEMS

MAR.M410.9 TIMBER SPECIES AND PROPERTIES

Timber for fendering systems shall be Selangan Batu species, also known as Yacal and Balau, or a similar species of hardwood visually stress graded to the HS (Hardwood Structural) grade of BS 5756:1980. The species shall comply with the strength requirements for strength class SC8 or SC9 as stated in BS 5628:Part 2:1985, shall be resistant to mechanical wearing and marine borer attack, and shall comply with the requirements stated in the following table:

Properties of timber for fendering systems	
Property	Minimum value
Oven dry density	655 kg/m³
Static bending at rupture	56 MPa
Modulus of elasticity under bending	8700 MPa
Hardness (Janka indentation test)	3200 N
Compressive stress parallel to grain at maximum load	29 MPa
Shear stress parallel to grain at maximum load	6.5 MPa

MAR.M420.9 TREATMENT OF TIMBER

Kempas, Kapur and other hardwoods which are less resistant in a marine environment shall be pressure treated with creosote in accordance with BS 144 and BS 5589:1989 or with copper, chrome and arsenic (CCA) salts in accordance with BS 4072:1987. The minimum net retention for pressure creosoting shall be 130 kg/m³ and the minimum net dry salt retention for treatment with CCA shall be 30 kg/m³.

MAR.M430.9 RUBBER FOR FENDERS

Rubber for fenders shall be natural or synthetic rubber, resistant to ageing, weathering and wearing, homogeneous and free from defective impurities, pores or cracks, and shall have the properties stated in the following table:

Properties of rubber for fenders		
Property	Value	Test method and condition Part No. of BS 903
Density	1100 kg/m³ to 1300 kg/m³	Part A1:1980
Hardness (International rubber hardness degrees)	≤72	Part A26:1969 Method N
Tensile strength	≥16 N/mm²	Part A2:1989
Elongation change	≥350%	Part A2:1989

After accelerated air ageing test: Hardness (increase in IRHD) Reduction in tensile strength Reduction in elongation	 ≤8° ≤20% ≤20%	Part A19:1986 Method A at 70℃ × 96 hours
Oil resistance (measured by volume change percentage): Industrial gasoline Heavy oil	 ± 60% ± 20%	Part A16:1987 at 23℃ × 22 hours
Compression set	≤30%	Part A6:1969 Method A at 70℃ × 22hours using Type 2 test pieces
Ozone resistance	No crack visible	Part A43:1990 at 40℃ × 100 hours
Tear resistance	≥60 kN/m	Part A3:1982 Method C at 23℃
Abrasion resistance (volume loss at 3000 revolutions)	≤1500 mm^3	Part A9:1988 Method C

MAR.M440.9 SUBMISSIONS FOR FENDERING MATERIALS

1. For timber:
    a. The following particulars shall be submitted to the CM at least 30 days before the first delivery of the timber to the Site:
        i. Species and grade of timber;
        ii. Name and address of timber supplier;
        iii. Method of pressure treatment and amount of net retention;
    b. Each batch of the timber delivered to the Site shall be accompanied by a certificate issued by a forestry authority approved by the CM or a bill of lading certifying the country of origin, method of pressure treatment, and grade and species of timber;
2. For rubber:
    a. The following particulars shall be submitted to the CM for approval of the source and type of rubber fenders at least 30 days before the first delivery of the rubber fenders to the Site:
        i. Manufacturer's literature, including a list of physical properties of the rubber for the fenders;
        ii. A report on compression load tests and characteristic load-deflection and energy deflection curves;
    b. A certificate showing the manufacturer's name, the date and place of manufacture and showing that the rubber fenders, including the rubber used in manufacturing the fenders, comply with the requirements stated in the Contract, shall be submitted for each batch of rubber fenders delivered to the Site.

IRON AND STEEL FITTINGS

MAR.M510.9 CAST IRON

Cast iron for bollards, pumphouse screens and screen guides shall be Grade 150 or 180 complying with BS 1452:1990.

MAR.M520.9 BOLTS AND NUTS

1. Mild steel bolts and nuts shall comply with BS 3692:1967;
2. Stainless steel bolts and nuts shall comply with Grade A4 and property class 80 of BS 6105:1981.

MAR.M530.9 WASHERS

1. Mild steel washers shall comply with BS 4320:1968;
2. Stainless steel washers shall be grade 316 austenitic steel complying with BS 1449:Part 2:1983. The dimensions and tolerances of stainless steel washers shall comply with BS 4320:1968.

MAR.M540.9 MILD STEEL CHAIN

Mild steel chain shall be grade 30 steel complying with BS 6405:1984.

MAR.M550.9 STAINLESS STEEL FITTINGS

Stainless steel for chains, railings, cat ladders, pumphouse screens and screen guides, mooring eyes and other marine fittings shall be grade 316 austenitic steel complying with the following:

1. General inspection and testing procedures and specific requirements for carbon, carbon manganese, alloy and stainless steels: BS 970:Part 1:1983;
2. Specification for stainless and heat-resisting steel plate, sheet and strip: BS 1449:Part 2:1983.

SUBMARINE OUTFALLS

MAR.M610.9 PRECAST CONCRETE PIPES

Precast concrete pipes for submarine outfalls shall comply with BS 5911:Part 100:1988 and shall have gasket type flexible rebated joints with clamps and bolts.

MAR.M620.9 CLAMPS AND BOLTS

The clamps and bolts shall be cast steel complying with BS 3100:1976 and shall be painted with two coats of coal tar epoxy of a type approved by the CM to a dry film thickness of 300 microns.

MAR.M630.9 GASKETS

Gaskets for joints in precast concrete pipes shall be type D (drainage) rubber gaskets complying with BS 2494:1990. The rubber gaskets shall be moulded jointless in ring moulds and shall not contain any reclaimed rubber.

MAR.M640.9 EPOXY RESIN

Epoxy resin for joints between precast concrete pipes shall be a type approved by the CM.

MAR.M650.9 MARKER BUOYS

Marker buoys shall be a hard plastic type approved by the CM.

MAR.M660.9 SUBMISSIONS

1. The following particulars of the proposed materials and methods of construction for submarine outfalls shall be submitted to the CM:
    a. Methods of lifting, laying, jointing and testing pipes;
    b. Manufacturer's literature;
    c. A certificate for pipes and pipe joints showing the manufacturer's name, the date and place of manufacture and showing that the pipes comply with the requirements stated in this Specification and including the results of load tests.
2. The particulars shall be submitted to the CM at least 14 days before the first delivery of the material to the Site. Certificates shall be submitted for each batch of the material delivered to the Site.

ANCILLARY MATERIALS

MAR.M710.9 JOINT FILLER FOR SLIP JOINTS

1. Joint filler for slip joints in seawalls shall consist of three plies of Type 1B fine granule surfaced bitumen felt of 1.4kg/m² nominal mass in accordance with BS 747:1994;
2. Adhesive for use with joint filler shall be a proprietary type recommended by the joint filler manufacturer and approved by the CM;
3. The following particulars shall be submitted to the CM at least 14 days before the first delivery of the material to the Site:
    a. Details of joint filler, including manufacturer's literature;
    b. Method of fixing and application of the materials.

MAR.M720.9 PRIMING PAINT

1. Priming coat for temporary tide gauges shall be lead based priming paint complying with BS 2523:1966. Undercoat and finishing coat for temporary tide gauges shall be micaceous iron oxide paint complying with BS 3981:1976;
2. Primer for steel fittings for fendering systems shall be lead based primer complying with BS 2523:1966.

MAR.M730.9 BITUMINOUS PAINT

Bituminous paint for fendering systems shall comply with BS 3416:1991.

MAR.M740.9 CREOSOTE

Creosote for pressure treatment of timber shall be Type 2 coal tar creosote as stated in BS 144:Part 1:1990.

WORKMANSHIP

SUBMISSIONS PRIOR TO COMMENCEMENT OF WORK

MAR.W010.9 MARINE WORKS GENERALLY

The following particulars shall be submitted to the CM at least 14 days before marine works start:

1. Any conditions or restrictions imposed by the Director of Marine and other authorities, including copies of applications, licences, permits, and correspondence;
2. Details of methods for controlling marine traffic.

MAR.W020.9 DREDGING

The following particulars shall be submitted to the CM at least 14 days before dredging starts:

1. Type and capacity of dredgers;
2. Methods of anchorage and positioning of dredgers;
3. Sequence and rate of working;
4. Arrangements for the transportation and disposal of dredged material.

MAR.W030.9 DEPOSITION OF FILL MATERIAL

1. The following particulars of the proposed materials and methods of deposition of fill material shall be submitted to the CM:
    a. Details of Constructional Plant and transport;
    b. Methods of deposition and compaction of fill material;
    c. Methods of controlling the moisture content of fill material;
    d. Sequence and rate of working;
2. The following particulars shall also be submitted if the proposed method involves deposition of fill material by hydraulic method:
    a. Layout plan showing the pumpline alignments and positions of the discharge points;
    b. Calculations of the rate and duration of discharge;
    c. Details of containment bunds and tailwater drainage systems;
3. The particulars shall be submitted to the CM at least 14 days before deposition of fill material starts.

MAR.W040.9 LIFTING SEAWALL BLOCKS, COPING AND WAVE DEFLECTORS

Particulars of the proposed methods and devices to be used for lifting precast concrete seawall blocks, seawall copings and wave deflectors shall be submitted to the CM at least 14 days before lifting starts.

HANDLING AND STORAGE OF MATERIALS

MAR.W110.9 STORAGE OF FILL AND DREDGED MATERIAL

Fill material and dredged material shall not be stockpiled on the foreshore, seabed or river bed within the Site unless permitted by the CM.

MAR.W120.9 FILL MATERIAL

1. Fill material shall not be handled or stored in a manner which will result in segregation, deterioration, erosion or instability of the material;
2. Different types of fill material shall be kept separate from each other.

MAR.W130.9 PRECAST CONCRETE COMPONENTS

1. Precast concrete seawall blocks, copings and wave deflectors shall be stored in such a manner that identification markings can be easily seen;
2. Precast concrete seawall blocks, copings and wave deflectors shall be stored on level supports and in a manner which will not result in damage or deformation to the units or in contamination of the units. The units shall be protected from damage and damaged units shall not be used in the permanent work unless permitted by the CM.

MAR.W140.9 TIMBER FOR FENDERING

1. Timber for fendering systems shall be stored off the ground on level supports and shall be protected from exposure to conditions which cause reduction in the moisture content in the material;
2. Timber which is treated with preservatives shall not be stored on or adjacent to concrete surfaces which form part of the permanent work;
3. Safety precautions as recommended by the timber treatment company shall be observed in the handling of treated timber. Treated wood offcuts shall be buried in a suitable location, or burnt in an open area and the ashes buried;
4. Safety precautions as recommended by the supplier of wood preservatives shall be observed in the handling of the wood preservatives.

MAR.W150.9 RUBBER FOR FENDERING

1. Rubber fenders and fittings shall be left in their original packing until required for placing. All rubber surfaces shall be protected against damage;
2. Rubber fenders shall be handled with nylon slings of a size agreed by the CM or by other methods agreed by the CM.

EXECUTION OF MARINE WORKS GENERALLY

MAR.W210.9 NOTIFICATION

Before commencing marine works, provide the CM with evidence that the Director of Marine has been notified of the proposed works in accordance with Section 70 of the Shipping and Port Control Regulations, Chapter 313.

MAR.W220.9 MARKING

Marine works and any part of the Site in which marine works are carried out shall be marked with flags, marker buoys and lights in accordance with the International Association of Lighthouse Authorities Maritime Buoyage System (current edition as adopted by Marine Department) for Region A and in a manner agreed by the CM. Red flags shall be at least 0.7 m square and marker buoys shall be a type, size and colour Approved by the CM. Lights shall be either fixed red lights or quick flashing yellow lights visible all round the horizon at a distance of 2 km.

MAR.W230.9 MARINE TRAFFIC AND WATERFRONT OPERATIONS

1. Marine traffic and the operation of public and private concerns in areas adjacent to the Site shall not be obstructed by the activities of the Contractor;
2. Make all arrangements with and obtain the necessary approvals from the Director of Marine and any other relevant authority for temporary marine traffic arrangements and control.

MAR.W240.9 TEMPORARY TIDE GAUGES

1. Temporary tide gauges shall be mounted vertically and firmly on rigid supports at locations agreed by the CM and shall be calibrated, levelled and fixed to give tidal readings within an accuracy of 20 mm;
2. Temporary tide gauges shall be made of 50 mm thick hardwood and shall be at least 250 mm by 3200 mm in size. The gauges shall be painted on the marked faces with alternate 100 mm stripes in red and white and shall be marked and numbered in black at 0.5 m intervals over the tidal range from 0.0 m to +3.0 m C.D. The painting applied shall consist of one primary coat, one undercoat and one finishing coat.

MAR.W250.9 WORK BOATS

1. Work boats shall be motorised boats equipped with a rain shelter and capable of carrying at least six passengers;
2. Work boats shall be licensed under the Merchant Shipping (Launches and Ferry Vessels) Regulations, Chapter 281 and shall be manned and maintained in good seaworthy condition;
3. Work boats shall be kept available for use by the CM for supervision, inspection and measurement during normal working hours and at other times when the Contractor is working.

MAR.W260.9 REMOVAL OF FLOATING DEBRIS

Floating debris within the Site arising from any source shall be collected and disposed of by the Contractor at regular intervals agreed by the CM. Floating debris shall be prevented from dispersing outside the Site.

MAR.W270.9 SURVEYS

1. Surveys for dredging and deposition of fill material shall be carried out using echo sounders of 200 kHz to 220 kHz frequency or by other methods agreed by the CM;
2. The initial survey for dredging shall be carried out within 30 days before dredging starts;
3. The final survey for dredging shall be carried out within 30 days after dredging has been completed;

4. The initial survey for deposition of fill material shall be taken as being the same as the final survey for dredging, or the final survey for the underlying layer of fill material as appropriate, except as stated in sub-clause (5) below;
5. If the final survey for dredging or the final survey for the underlying layer of fill material was carried out more than 30 days before deposition of the next layer of fill material starts, the initial survey for deposition of fill material shall be carried out within 30 days before deposition of the layer of fill material starts;
6. The final survey for deposition of fill material for the first layers, intermediate layers, and final layers of underwater foundations shall be carried out within 30 days after deposition of fill material has been completed. The final survey for final layers other than those of underwater foundations shall be carried out at least 30 days and not more than 90 days after deposition of fill material has been completed.

MAR.W280.9 UNSUITABLE OR DETERIORATED FILL MATERIAL

1. Fill material which has been used or is required for use in the permanent work and which is allowed to become unsuitable such that in the opinion of the CM it no longer complies with the specified requirements for that type of material shall be replaced or dealt with by methods agreed by the CM;
2. The material which is to be replaced shall be disposed of by the Contractor.

MAR.W290.9 CONCRETING IN TIDAL LOCATIONS

Concreting in locations affected by tides shall be carried out in dry conditions unless otherwise permitted by the CM. After concreting is complete, the top of the concrete shall be covered with polyethylene sheets fixed to the formwork.

DREDGING

MAR.W310.9 MARINE PLANT AND EQUIPMENT

1. Two weeks before commencement of any marine works, submit to the CM for approval the proposed methods of working and the marine plant and equipment to be used;
2. The marine plant and equipment to be used on the Works shall meet the requirement in MAR.W320 and shall be operated to achieve the water quality requirements. Provide all necessary facilities to the CM for inspecting or checking such plant and equipment and shall not use such plant and equipment for the execution of the Works without the agreement of the CM. When instructed by CM, carry out trials of any plant and equipment to prove their suitability;
3. After commencement of the Works, if the plant and equipment or work methods are in the opinion of the CM causing unacceptable adverse impacts which can be checked against the Technical Memorandum on Effluent Standards issued under the Water Pollution Control Ordinance, initiate immediately remedial measures so as to halt such deterioration when notified by the CM in writing. If the Contractor fails to initiate remedial measures, the CM may stop the Works. Where such remedial measures include the use of additional or alternative plant and equipment, do not use such plant and equipment on the Works until agreed by the CM. Where remedial measures include maintenance or modification of previously approved plant and equipment, do not use such plant and equipment on the Works until such maintenance or modification is completed and the adequacy of the maintenance or modification is demonstrated to the satisfaction of the CM;

4. Comply with the conditions of dumping permits obtained from the Director of Environmental Protection. Display the permits prominently displayed in the Chinese and English language on site and also on the dredgers and barges.

MAR.W320.9 AVOIDANCE OF POLLUTION DURING DREDGING, TRANSPORTING AND DUMPING OF MARINE MUD

1. Include pollution avoidance measures but not be limited to the following:-
   a. Design and maintain all equipment to minimise the risk of silt and other contaminants being released into the water column or deposited in locations other than designated location;
   b. Design and maintain mechanical grabs to avoid spillage and seal tightly grabs while being lifted;
   c. Where trailing suction hopper dredgers for dredging of marine mud are in use, do not permit overflow from the dredger and the operation of lean mixture overboard systems permitted unless expressly approved by the CM in consultation with the Director of Environmental Protection;
   d. Use cutterheads of suction dredgers suitable for the material being excavated and design cutterheads to minimise overbreak and sedimentation around the cutter;
   e. All vessels shall be sized such that adequate clearance is maintained between vessels and the sea bed at all states of the tide to ensure that undue turbidity is not generated by turbulence from vessel movement or propeller wash;
   f. Repair all pipe leakages promptly and do not operate plant with leaking pipes;
   g. Before moving the vessels which are used for transporting dredged materials, clean excess material from the decks and exposed fittings of vessels and never dump the excess materials into the sea except at the approved locations;
   h. Maintain adequate freeboard on barges to ensure that decks are not washed by wave action;
   i. Monitor all vessels transporting material to ensure that no dumping outside the Approved location takes place. Keep and produce logs and other records to demonstrate compliance and that journey times are consistent with designated locations and submit copies of such records to the CM;
   j. Fit all bottom dumping vessels with tight fitting seals to their bottom openings to prevent leakage of material;
   k. Control loading of barges and hoppers to prevent splashing of dredged material to the surrounding water, and do not fill vessels to a level which will cause overflowing of material or polluted water during loading or transportation; and
   l. The CM may monitor any or all vessels transporting material to check that no dumping outside the Approved location nor loss of material during transportation takes place. Provide all reasonable assistance to the CM for this purpose.
2. Obtain all necessary dumping permits and dispose the dredged marine mud at a disposal site as designated in the dumping permit.
3. When dredging, transporting and disposing of contaminated marine mud, implement adequate measures for the avoidance of pollution which shall include but not be limited to the following:
   a. Engage a suitable grab dredger with closed watertight grab to undertake dredging of contaminated marine mud;

b. Use split barge of not less than 750 m^3 capacity, well maintained and capable of rapid opening and discharge at the disposal site to transport contaminated marine mud;

c. Place the material into the disposal pit by bottom dumping;

d. Ensure discharge from split barges only within a radius of 100 metres of centre of the area allocated for the disposal of contaminated marine mud;

e. Discharge rapidly and then close immediately the hoppers, do not wash out material adhering to the sides of the hopper and keep the hopper closed until the barge next returns to the disposal site; and

f. Anchor the dumping vessel throughout the dumping operation.

4. Ensure that all marine mud is disposed of at the Approved locations. Ensure accurate positioning of vessels before discharge and submit proposals for accurate position control at disposal sites to the CM for approval before commencing dredging and dumping;

5. Ensure that all unsuitable material is disposed of at the Approved landfill or other designated location;

6. Employ vessels equipped with automatic self-monitoring devices as specified by the Director of Environmental Protection for disposal operation, co-operate with and facilitate the Director of Environmental Protection to inspect the device and retrieve the record stored in the device on a regular basis;

7. Provide experienced full time personnel on board all dumping vessels to ensure that appropriate methods to minimise pollution are implemented.

MAR.W330.9 PROTECTION OF WATER QUALITY AT WATER INTAKES

When dredging mud or placing fill in the vicinity of water intakes, protect the water intake by surrounding it with a suitable silt screen to prevent excessive suspended solids from entering the intake. Design the silt screen to ensure that the concentration of suspended solids entering the intake meets intake user requirements.

MAR.W340.9 SILT CURTAINS

1. If silt curtains shall be used to contain sediment losses during dredging and placing fill, design, install and maintain the silt curtains to minimise the impacts on the water quality and the protection of water quality at water intakes as described in MAR.W330. Submit the design and specification of silt curtains to the CM for approval.

2. Form silt curtains from tough, abrasion resistant, permeable membranes, suitable for the purpose, supported on floating booms in such a way as to ensure that the sediment plume shall be restricted to within the limit of the works area;

3. Form and install the silt curtain in such a way that tidal rise and fall are accommodated, with the silt curtains always extend from the surface to the bottom of the water column. The removal and reinstallation of such curtains during typhoon conditions shall be as agreed with the Director of Marine.

4. Regularly inspect the silt curtains and check that they are moored and marked to avoid danger to marine traffic. Repair any damage to the silt curtain promptly and stop the works until the repair is effected to the satisfaction of the CM.

MAR.W350.9 REFUSE CONTAINMENT BOOMS AND FLOATING REFUSE

1. Provide and install refuse containment booms before commencing public dumping to confine the floating debris arising within the site as a result of public dumping. Submit details of the refuse containment booms to the CM for approval before their use on site;
2. Remove refuses, timber debris, or oil contamination contained in public dump materials. Segregate all inert construction waste material suitable for reclamations. Dispose of all non-inert construction waste material at a public landfill;
3. Plastic buoys for the refuse booms will be provided by the Employer. Collect the plastic buoys from the Civil Engineering Development Department Technical Services Division's Store at North Point, clean and return after use;
4. Provide adequate sinker blocks and lit marker buoys to ensure that the booms are visible above the water line and securely anchored. The lights on the marker buoys shall be quick flashing yellow light visible all round the horizon at a distance of at least 2 km. Submit details to the CM for approval. The maximum spacing between the flashing yellow light shall be 30 metres. Properly maintain and operate the booms to the satisfaction of the CM throughout the progress of public dumping of the Site and replace the same if necessary when they are under repair or beyond repair;
5. Deploy sufficient sampans and labour for collecting floating refuse and preventing floating refuse within the Site from drifting into public waters. The frequency of collecting floating refuse shall be as agreed by the CM. Dispose of floating refuse collected off Site.
6. Make due allowance in programming the public dumping for the provision, installation, operation and maintenance of the refuse booms and the regular collection of the floating refuse throughout the progress of the reclamation work.

MAR.W360.9 CM'S PERMISSION

The permission of the CM shall be obtained before dredging starts in any area.

MAR.W370.9 PROCEDURE AND SEQUENCE

Dredging shall be carried out in such a manner and sequence that semi-fluid or disturbed seabed or foundation material will not accumulate in dredged areas.

MAR.W380.9 SAMPLING OF DREDGED MATERIAL

During dredging, samples shall be taken from the dredged materials for inspection and determination of the sand content. Notify the CM if there is any sudden or significant change in the properties of dredged material.

MAR.W390.9 DISPOSAL

Dredged material shall be disposed of by the Contractor in the dumping ground stated in the Contract.

DEPOSITION OF FILL MATERIAL BELOW +2.5mPD

MAR.W410.9 CM'S PERMISSION

The permission of the CM shall be obtained before deposition of the fill material starts in any area.

MAR.W420.9 DEPOSITING FILL MATERIAL

1. Fill material shall be deposited in a manner and sequence such that minimum lateral displacement of the underlying material will be induced and such that slopes are stable at all times;
2. The methods and Constructional Plant used for deposition of fill material shall be such that segregation of the material does not result. Fill material shall not be deposited by end-tipping unless permitted by the CM;
3. Fill material for blanketing layers and drainage layers shall be deposited uniformly by a method agreed by the CM.

MAR.W430.9 DEPOSITING FILL MATERIAL IN DREDGED TRENCHES

1. The first layer of fill material in dredged trenches for seawalls, revetments and breakwaters shall be deposited as soon as practicable after the dredged profile has been agreed by the CM. The dredged trench shall be substantially free from silt and debris before deposition of fill material starts;
2. Subsequent layers of fill material shall be deposited as soon as practicable after the profile of the underlying layer of fill material has been agreed by the CM.

MAR.W440.9 DEPOSITING ROCK FILL MATERIAL ADJACENT TO STRUCTURES AND UTILITIES

1. Rock fill material deposited adjacent to or above structures, piles or pedestals shall be hand packed or placed by a method approved by the CM;
2. Rock fill material deposited around utilities, including pipes for submarine outfalls, shall be hand packed or placed by a method Approved by the CM and shall be brought up to the specified level equally on both sides;
3. Rock fill material deposited directly on geotextile shall be deposited in such a manner that the geotextile is not ruptured.

DEPOSITION OF ROCK ARMOUR

MAR.W510.9 GENERAL

Each piece of rock armour shall be placed individually and shall not be deposited by tipping, dumping or dropping.

MAR.W520.9 BREAKWATERS, REVETMENTS ETC

Rock armour for breakwaters, revetments and similar structures shall be deposited by working from the bottom to the top of a section in such a manner and sequence that the individual rock pieces interlock and do not segregate. The interstices shall be kept free from small fragments of rock.

MAR.W530.9 DEPOSITING ROCK ARMOUR ON GEOTEXTILE

Rock armour deposited directly on geotextile shall be deposited in such a manner that the geotextile is not ruptured.

LEVELLING AND COMPACTION OF FILL MATERIAL

MAR.W610.9 UNDERWATER FOUNDATIONS

The top surface of rock fill material in foundations for structures or pipes shall be thoroughly tamped with a concrete block weighing at least 10 t dropped through a height of at least 300 mm or by other methods agreed by the CM. The voids at the top of the foundation shall be filled with rock fill material (Grade 75).

CONSTRUCTION OF MARINE STRUCTURES GENERALLY

MAR.W710.9 CONSTRUCTING SEAWALL BLOCKS, COPINGS AND WAVE DEFLECTORS

1. Formwork or moulds for precast concrete seawall blocks, copings and wave deflectors shall not be loosened or removed in less than 12 hours after completion of concreting;
2. Precast concrete seawall blocks, copings and wave deflectors shall be marked with the date of casting, identification reference and orientation in the structure. The letters and figures used for marking shall be at least 75 mm high and shall be sufficiently durable to be legible until the unit is placed in the final position;
3. Key holes in precast concrete seawall blocks, copings and wave deflectors shall be kept free from soil, aggregates, concrete and other materials before and after the blocks are set in position.

MAR.W720.9 SETTING SEAWALL BLOCKS

1. Seawalls constructed with precast concrete seawall blocks shall be constructed in layers between slip joints. The blocks shall be set in close contact with each other. Packing pieces shall not be used unless permitted by the CM;
2. The permission of the CM shall be obtained before the next layer is placed on each completed layer of blocks.

MAR.W730.9 FACING STONES

1. Facing stones to seawalls and revetments shall be built up one course at a time. The stones shall be thoroughly washed and cleaned with fresh water before placing and shall be set in 1:3 cement mortar. In vertical concrete seawalls there shall be at least one header stone to each square metre of facework. Header stones shall be staggered in alternate courses;
2. Concrete backing behind facing stones shall be placed as soon as each course of facing stones has been completed.

MAR.W740.9 SLIP JOINTS IN SEAWALLS

1. Slip joints in seawalls shall be straight and vertical and shall be perpendicular to the face of the seawall. The joints shall extend through the seawall from the coping down to the foundation;
2. Joint filler shall be cut to size before fixing and shall be securely fixed in position to the existing surface with adhesive. Concrete to the adjacent section of seawall shall be placed directly against the joint filler.

MAR.W750.9 FILLING CHANNELS IN SEAWALL BLOCKS

The channels in precast concrete seawall blocks and backing to seawalls shall be filled with rock pieces of sizes between 20 mm to 40 mm.

MAR.W760.9 CONCRETE COPINGS TO SEAWALLS

Concrete copings to seawalls shall be constructed in lengths of at least 5 m and not more than 10 m.

MAR.W770.9 BERMSTONES

1. Bermstones shall be placed as soon as practicable after toe blocks have been set in position or fill material has been deposited at the toe of marine structures;
2. Bermstones shall be set in close contact with each other and with the structure. The longitudinal axis of bermstones shall be perpendicular to the alignment of the structure on plan.

MAR.W780.9 BAGGED CONCRETE

1. Bagged concrete shall consist of hessian or canvas bags filled to approximately 70% full with Grade 30/10 concrete;
2. The bags shall be filled and the open ends tied or sewn up immediately before placing;
3. The bags shall be placed in brick bond fashion and flattened into position. The open ends of the bags shall be directed away from the outside surface and the spaces between bags and between layers of bags shall be kept as small as practicable. Bags shall not be disturbed after placing.

MAR.W790.9 TIMBERWORK FOR FENDERING

1. The finished surfaces of timber for fendering systems shall be free from irregularities. The timber shall not be cut by force splitting;
2. Timber which is to be pressure treated with preservatives shall be machined to the specified dimensions, sizes and shapes before treatment;
3. Drilling of holes and cutting of notches and recesses in timber shall be completed before painting and installation starts;
4. Pieces of timber shall not be jointed to form a member for the fendering system unless otherwise shown on the Drawings;
5. Unless otherwise permitted by the CM, pressure treated timber shall not be cut or drilled for holes after the treatment process. If cutting or drilling is permitted, surfaces exposed by cutting or drilling shall be field-treated as stated in sub-clauses (6) and (7);
6. Exposed surfaces of timber treated with creosote shall be field-treated by brushing, spraying or dipping with hot creosote;
7. Exposed surfaces of timber treated with CCA salts shall be field-treated by brushing or dipping with either a 100 g/L solution of the wood preservative or a solution suitable for after-fabrication treatment as recommended in BS 4072:1987.

MAR.W800.9 PAINTING TIMBER FENDERING

1. Timber members in fendering systems shall be painted with two coats of bituminous paint before installation;

2. Steel fittings for fendering systems, other than the threaded portions of bolts, nuts and other fittings, shall be painted with one coat of primer and two coats of bituminous paint before installation. The minimum thickness of each coat shall be 300 microns;
3. Bolt heads, shanks and nuts on the outer face of timber fendering systems shall be recessed into notches at a distance of 25 mm below the surface of the fenders. The notches shall be filled flush with the surface with a sealant composed of one part bitumen and two parts cement.

MAR.W810.9 INSTALLING RUBBER FENDERS

Timber or steel base templates shall be used to position anchor bolts for rubber fenders.

CONSTRUCTION OF SUBMARINE OUTFALLS

MAR.W910.9 LAYING OUTFALL PIPES

1. Pipes for submarine outfalls shall be marked with fluorescent paint such that the sequence of laying will be seen on underwater photographs. The letters and numbers used for marking shall be at least 100 mm high and shall be painted in orange on a white background;
2. Before submarine outfall pipes are laid, a guide rail of mild steel channel or other material agreed by the CM, painted with fluorescent paint, shall be laid on the levelling stones to provide a visible aid for laying pipes;
3. During construction of submarine outfalls, the open ends of the outfall pipes and riser pipes shall be temporarily capped by a method agreed by the CM to prevent the entry of silt or fill material.

MAR.W920.9 MARKER BLOCKS

1. Concrete marker blocks for submarine outfalls shall be placed on top of the fill material along the alignment of the pipeline as soon as deposition of fill material has been completed;
2. Concrete marker blocks shall be marked with fluorescent paint. The letters and numbers used for marking shall be at least 100 mm high and shall be painted in orange on a white background;
3. Concrete marker blocks shall be linked by coloured nylon ropes of at least 25 mm diameter.

MAR.W930.9 DIFFUSER PIPES

Epoxy resin joints between riser pipes and diffuser pipes shall be made in dry conditions.

MAR.W940.9 DIFFUSER CAPS

1. Diffuser caps shall be placed on top of the open ends of riser pipes and precast end plates shall be placed on the open end of the outfall within 7 days after the pipeline has been tested;
2. Marker buoys shall be tied to the diffuser caps with 1 m long nylon ropes of 6 mm diameter.

TOLERANCES

MAR.W1010.9 GENERAL

Refer to Appendix H 'Schedule of Tolerances' to this Specification.

TESTING

TRIALS FOR SUBMARINE OUTFALLS

MAR.T010.9 GENERAL

1. A trial shall be carried out to demonstrate that the proposed methods of lifting, laying and jointing pipes for submarine outfalls, including jointing of riser pipes to the diffuser pipes, comply with the specified requirements. The trial shall include a demonstration by a method agreed by the CM that the joints between the riser pipes and the diffuser pipes are sufficiently strong to withstand the forces which will be applied during construction of the submarine outfall;
2. The trial shall be carried out at least 14 days before pipelaying starts.

MAR.T020.9 TRIAL RESULTS

If in the opinion of the CM the proposed methods of lifting, laying and jointing the pipes as demonstrated by the outfall trial do not comply with the specified requirements, particulars of proposed changes shall be submitted to the CM. Further trials shall be carried out until in the opinion of the CM the methods are satisfactory.

MAR.T030.9 COMMENCEMENT OF PIPELAYING

Pipelaying for submarine outfalls shall not start until in the opinion of the CM the methods of lifting, laying and jointing pipes as demonstrated by the submarine outfall trial are satisfactory.

DREDGED MATERIAL

MAR.T110.9 SAMPLING

1. Areas being dredged shall be divided into a grid at 15 m intervals. One sample of dredged material shall be provided from each point on the grid at 2 m depth intervals. Additional samples shall be provided from positions instructed by the CM if there appears to be any change in the quality of the dredged material;
2. The mass of each sample shall be at least 1 kg. The method of sampling shall be as agreed by the CM.

MAR.T120.9 TEST METHOD

Each sample of dredged material shall be tested for sand content to the satisfaction of the CM. The test shall be carried out by an independent laboratory appointed by the Contractor and approved by the CM. The method of testing for sand content shall be as agreed by the CM.

FILL MATERIAL

MAR.T210.9 DEFINITION OF "BATCH"

A batch of fill material for marine works is any quantity of fill material for marine works of the same type and which in the opinion of the CM has similar properties throughout.

MAR.T220.9 SAMPLING

1. One sample of each type of fill material for marine works shall be provided at the same time as particulars of the material are submitted to the CM. Unless otherwise agreed by the CM, one sample of each type of fill material for marine works shall be provided from each batch;
2. The size of samples and the method of sampling shall be in accordance with the Testing section of Worksection EAR.

MAR.T230.9 TEST METHODS

1. Each sample of fill material shall be tested to determine the particle size distribution, plasticity index and coefficient of uniformity;
2. The method of testing shall be in accordance with the following:
   a. Particle size distribution: as Worksection EAR;
   b. Plasticity index: as Test Method 6.1 of Geospec 3;
   c. Coefficient of uniformity: as Worksection EAR.

MAR.T240.9 NON-COMPLIANCE

1. If the result of any test for particle size distribution, plasticity index or coefficient of uniformity of fill material for marine works does not comply with the specified requirements for the property, two additional samples shall be provided from the same batch and additional tests for the property shall be carried out;
2. The batch shall be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with such requirements.

ROCK ARMOUR

MAR.T310.9 DEFINITION OF "BATCH"

A batch of rock armour is any quantity of rock armour of the same type and which in the opinion of the CM has similar properties throughout.

MAR.T320.9 SAMPLING ROCK FOR ROCK ARMOUR

1. One sample of each proposed type of rock for rock armour shall be provided at the same time as particulars of the material are submitted to the CM;
2. If instructed by the CM, a representative example of each type of rock for rock armour, broken down into appropriate sizes, shall be provided for testing.

MAR.T330.9 TEST METHODS FOR ROCK FOR ROCK ARMOUR

1. Each sample of rock for rock armour shall be tested to determine the specific gravity, water absorption, aggregate impact value, ten percent fines value, aggregate abrasion value and soundness;
2. The method of testing shall be in accordance with the following:
   a. Relative density: BS 812:Part 2:1975;
   b. Water absorption: BS 812:Part 2:1975;
   c. Aggregate impact value: BS 812:Part 1121990;
   d. Ten percent fines value: BS 812:Part 111:1990;

e. Aggregate abrasion value: BS 812:Part 113:1990;

f. Soundness: BS 6349:Part 1:1984, Appendix B.

MAR.T340.9 SAMPLING ROCK ARMOUR

1. One sample piece of each type of rock armour shall be provided for the dropping test from each 100 pieces or part thereof of that type delivered to the Site;
2. One sample piece of each type of rock armour of the specified minimum size and one piece of the specified maximum size shall be provided for checking the sizes of material;
3. The sample pieces of the specified minimum and maximum sizes shall be mounted on individual plinths at locations agreed by the CM. The design and detail of the plinths shall be prepared by the Contractor and agreed by the CM.

MAR.T350.9 TESTING ROCK ARMOUR

1. Each sample piece of rock armour shall be tested by the dropping test to determine the resistance to fracture;
2. The dropping test shall be carried out with the largest cross-section of the specimen horizontal. The specimen shall be dropped from a vertical height, to the underside of the specimen, of 1.5 m onto a steel plate. The steel plate shall be at least 20 mm thick and shall be firmly bedded on a level concrete base.

MAR.T360.9 NON-COMPLIANCE OF ROCK FOR ROCK ARMOUR

1. If the result of any test for specific gravity, water absorption, aggregate impact value, ten percent fines value, aggregate abrasion value or soundness of rock for rock armour does not comply with the specified requirements for the property, two additional samples shall be provided from the same batch and additional tests for the property shall be carried out;
2. The batch shall be considered as not complying with specified requirements for the property if the result of any additional test does not comply with such requirements.

MAR.T370.9 NON-COMPLIANCE OF ROCK ARMOUR

1. If a sample piece of rock armour fractures as a result of the dropping test, nine additional sample pieces of rock armour from the same group of 100 pieces or part thereof shall be tested. If any of these sample pieces fracture as a result of the dropping test, every piece of rock armour in the same group shall be tested. Only those pieces of rock armour passing the dropping test shall be used;
2. A specimen is deemed to fracture if:
   a. Cracking occurs after dropping;
   b. The difference in masses of the original specimen and the largest single piece after dropping exceeds 1% of the mass of the original specimen.

TIMBER FOR FENDERING SYSTEMS

MAR.T410.9 DEFINITION OF "BATCH"

A batch of timber for fendering systems is any quantity of timber for fendering systems of the same grade and species and from the same source, covered by the same test certificates and bills of lading.

MAR.T420.9 SAMPLING

One sample of timber for fendering systems shall be provided at the same time as particulars of the material are submitted to the CM. Unless otherwise permitted by the CM, six samples shall be provided from each batch of timber for fendering systems delivered to the Site.

MAR.T430.9 TEST METHODS

1. For fendering systems delivered to the Site, the samples shall be provided in pairs taken from three separate balks of timber. Each sample shall be 1000 mm × 50 mm × 50 mm and shall be cut with the longest dimension parallel to the grain and the two shorter dimensions tangential and radial to the growth rings;
2. Each sample of timber for fendering systems shall be tested to determine the oven dry density, static bending at rupture, modulus of elasticity under bending, hardness, compressive stress parallel to grain at maximum load and shear stress parallel to grain at maximum load;
3. The method of testing, including the Janka indentation test for hardness, shall be in accordance with BS 373:1957 except that the specimens shall be tested at a moisture content of at least 25%.

MAR.T440.9 COMPLIANCE CRITERIA

The results of Janka indentation tests and tests for maximum shear parallel to grain of timber for fendering systems shall comply with the following requirements:

1. Each of the results of Janka indentation tests on the end face, radial face and tangential face shall comply with the requirements stated in the table in MAR.M410;
2. Each of the results of tests for shear parallel to grain on the radial face and tangential face shall comply with the requirements stated in the table in MAR.M410.

MAR.T450.9 NON-COMPLIANCE

1. If the result of any test for oven dry density, static bending at rupture, modulus of elasticity under bending, hardness, compressive stress parallel to grain at maximum load or shear stress parallel to grain at maximum load, of timber for fendering systems does not comply with the specified requirements for the property, three additional pairs of samples shall be provided from the same batch and additional tests for the property shall be carried out;
2. The batch shall be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with the specified requirements for the property.

RUBBER FENDERS

MAR.T510.9 DEFINITION OF "BATCH"

A batch of rubber fenders is any quantity of rubber fenders of the same type and from the same source, covered by the same test certificates.

MAR.T520.9 SAMPLING

Unless otherwise permitted by the CM, one sample shall be provided from each 50 rubber fenders or part thereof delivered to the Site.

MAR.T530.9 TEST METHOD

1. Each sample of rubber fenders shall be compression load tested either at a laboratory approved by the CM or at the manufacturer's workshop in the presence of the representative of a Government body or other organization approved by the CM;
2. Each sample of rubber fenders shall be subjected to three complete load cycles at a rate of 200 mm ± 20 mm per minute to 50% deflection. The results of the test shall be shown on a load-deflection curve and on an energy-deflection curve.

MAR.T540.9 COMPLIANCE CRITERIA

The result of compression load tests on rubber fenders shall comply with the following requirements:

1. The sample shall not show any visible sign of cracks or permanent deformation in shape;
2. The height of each sample one minute after releasing the third compression load shall be at least 95% of the original height;
3. The recovery in height shall be as stated in sub-clause (2) for the repeated compression test;
4. For each loading cycle, the deflection as measured from the load-deflection curve and the energy-deflection curve shall not deviate by more than 10% from the deflection at the same load on the characteristic curves provided by the manufacturer.

MAR.T550.9 NON-COMPLIANCE

1. If the result of any compression load test on rubber fenders does not comply with the specified requirements stated in MAR.T540, two additional samples shall be provided from the same batch and additional tests for the property shall be carried out;
2. The batch shall be considered as not complying with specified requirements for the property if the result of any additional test does not comply with such requirements.

SUBMARINE OUTFALLS

MAR.T610.9 TEST METHODS

1. Submarine outfalls shall be tested to determine if there is any blockage or leakage;
2. Precast end plates and diffuser caps shall be removed before the outfall is tested;
3. The outfall shall be cleaned by high velocity water jets or by other electromechanical methods agreed by the CM. Riser pipes and diffuser pipes shall be cleaned by high capacity grit suction pumps or by other methods agreed by the CM;
4. The outfall shall be tested for blockages by pulling a mandrel approved by the CM through the outfall between manholes and between manholes and the end of the outfall. The mandrel shall be 750 mm long and 12 mm less in diameter than the nominal diameter of the pipe;
5. Riser pipes and diffuser pipes shall be tested for blockages and leakage by pumping dyed water through the outfall and inspecting the discharge plume at each riser pipe. Precast end plates shall be replaced before the test is carried out.

MAR.T620.9 COMPLIANCE CRITERIA

There shall be no blockage or leakage in submarine outfalls, including riser pipes and diffuser pipes.

MAR.T630.9 NON-COMPLIANCE

If the result of any test for blockage or leakage does not comply with the specified requirements for the test, the blockage shall be removed, or the leakage shall be repaired, by methods approved by the CM, or the outfall or diffuser pipes shall be repaired or replaced by methods approved by the CM. The submarine outfall shall be retested for blockage or leakage.

MEW METALWORK

MATERIALS

GENERAL REQUIREMENTS FOR GUARD RAILING

MEW.M010.9 ALTERNATIVE DESIGN FOR PEDESTRIAN GUARD RAILING

The Contractor may offer an alternative design for the pedestrian guard railing or that which is to be erected as temporary works and shown on the drawings or detailed in this Specification. Such design must be in accordance with BS 3049:1976, Table 1, Class C.

MEW.M020.9 SUBMISSION OF GUARD RAILING DETAILS

Submit the following details to the CM at least 28 days prior to fabrication:

1. A certificate from the manufacturer stating their name, date and place of manufacture and a statement confirming that the materials comply with the requirements of this Specification; and
2. Details of alternative design proposals as MEW.M010 where applicable.

MEW.M030.9 SAMPLES OF GUARD RAILING

Submit with the other details required at MEW.M020 samples of the following for Approval of source and type:

1. Each type of pedestrian guard railing to be used;
2. Mesh infill;
3. Each type of bolt, nut and washer to be used in the fabrication.

GENERAL REQUIREMENTS FOR METAL HANDRAILING, STAIRS, LADDERS AND FLOORING

MEW.M110.9 CONTRACTOR'S DESIGN

Handrailing, ladders, stairs and flooring which are to be designed by the Contractor shall comply with the following requirements:

1. Handrailing shall be capable of withstanding a horizontal loading of 740 N/m. The deflection of handrailing shall not exceed 1 in 200 at mid-span;
2. Stairs shall be designed for a live loading of 5 kPa;
3. Flooring shall be designed for a live loading of 5 kPa. The deflection of flooring shall not exceed 1/200 of the span.

MEW.M120.9 SUBMISSION OF PARTICULARS

The following particulars of the proposed handrailing, ladders, stairs and flooring shall be submitted to the CM at least 14 days before fabrication starts:

1. Details of manufacturer's name and place of manufacture;
2. A certificate showing that the materials comply with the requirements stated in the Contract;

3. Drawings showing layout and details of handrailing, including positions of the different types of standards;
4. Drawings showing details of ladders, stairs, toe plates and safety chains;
5. Drawing showing layout and details of flooring, including positions and size of panels and supports;
6. Details of methods of fixing and of rag, indented, expansion and resin bonded bolts, including manufacturer's literature; and
7. Design details as MEW.M110.

MEW.M130.9 SAMPLES

The following samples of the proposed handrailing, ladders, stairs and flooring shall be submitted to the CM at least 14 days before the relevant work starts as Instructed:

1. Handrails;
2. Standards;
3. Ladders, including rungs;
4. Toe plates;
5. Flooring and curbs
6. Safety chains; and
7. Rag, indented, expansion and resin bonded bolts.

STEEL AND ALUMINIUM FOR PEDESTRIAN GUARD RAILING

MEW.M210.9 HOT FINISHED SEAMLESS STEEL TUBES

Complying with BS 6323:Part 3:1982.

MEW.M220.9 STEEL TUBES AND TUBULARS SUITABLE FOR SCREWING TO BS 21 PIPE THREADS

Complying with BS 1387:1985.

MEW.M230.9 HOT ROLLED STEEL SECTIONS

Complying with BS 4:Part 1:1980.

MEW.M240.9 HOT ROLLED STRUCTURAL STEEL SECTIONS (EQUAL AND UNEQUAL ANGLES)

Complying with BS 4848:Part 4:1972.

MEW.M250.9 WELDABLE STRUCTURAL STEELS

Complying with BS 4360:1986.

MEW.M260.9 STAINLESS STEEL

Complying with BS EN 10088-2:2005, Grade 1.4401.

MEW.M270.9 STAINLESS STEEL TUBES

To BS 6362:1990 Grade 316 S 31, and a type suitable for threading in accordance with BS 21:1985.

MEW.M280.9 ALUMINIUM ALLOY

1. Grade: EN AW-6082 in the T6, T651 or T62 tempers;
2. Anodized to grade AA25 in accordance with BS EN 12373:Part 1:2001.

MEW.M290.9 WROUGHT ALUMINIUM AND ALUMINIUM ALLOYS SUITABLE FOR GENERAL ENGINEERING PURPOSES

1. Plate, sheet and strip: complying with BS EN 485:Part 1:1994, BS EN 485:Part 2:2004, BS EN 485:Part 3:2003 and BS EN 485:Part 4:1994;
2. Drawn tube: complying with BS EN 754:Part 1:1997, BS EN 754:Part 2:1997, BS EN 754:Part 3:1996, BS EN 754:Part 4:1996, BS EN 754:Part 5:1996, BS EN 754:Part 6:1996, BS EN 754:Part 7:1998 and BS EN 754:Part 8:1998;
3. Bars, extruded round tubes and sections: complying with BS EN 755:Part 1:1997, BS EN 755:Part 2:1997, BS EN 755:Part 3:1996, BS EN 755:Part 4:1996, BS EN 755:Part 5:1996, BS EN 755:Part 6:1996, BS EN 755:Part 7:1998, BS EN 755:Part 8:1998 and BS EN 755:Part 9:2001.

STEEL AND ALUMINIUM FOR HANDRAILING, LADDERS, STAIRS AND FLOORING

MEW.M310.9 STEEL

Steel for handrailing, ladders, stairs and flooring shall comply with the following:

1. Steel tubes and tubulars suitable for screwing: BS 21:1985 pipe with threads: complying with BS 1387:1985;
2. Hot rolled sections: BS 4:Part 1:1980;
3. Hot rolled structural steel sections:
    a. Equal and unequal angles: BS 4848:Part 4:1972;
    b. Hollow sections: BS 4848: Part 2:1991;
    c. Weldable structural steels: BS 4360:1986.

MEW.M320.9 STAINLESS STEEL

Stainless steel for handrailing, ladders, stairs and flooring shall be Grade 1.4301 complying with BS EN 10029:1991, BS EN 10048:1997, BS EN 10051:1991 + A1:1997, BS EN 10095:1999 and BS EN ISO 9445:2006. Stainless steel tubes shall be longitudinally welded tubes complying with BS EN 10296-2:2005. Tubes for handrails shall be polished.

MEW.M330.9 ALUMINIUM

1. Aluminium for handrailing, ladders, stairs and flooring shall be type H 30 TF and shall comply with the following:

    Wrought aluminium and aluminium alloys for general engineering purposes:

    a. Plate, sheet and strip: to BS 1470:1987;
    b. Drawn tube: to BS 1471:1972;

c. Bars, extruded round tubes and sections: to BS 1474:1987.

2. Aluminium shall be anodised to Grade AA 25 in accordance with BS 1615:1987.

FIXINGS AND MESH INFILL FOR PEDESTRIAN GUARD RAILING

MEW.M410.9 TYPE

1. Use only galvanized bolts, nuts, screws and rivets with galvanized pedestrian guard railing;
2. Insulate aluminium fixings from ferrous materials with an Approved type non-conductive insulator at least 2 mm thick.

MEW.M420.9 ISO METRIC BLACK HEXAGON BOLTS, SCREWS AND NUTS

Complying with BS 4190:2001.

MEW.M430.9 ISO METRIC BLACK CUP AND COUNTERSUNK HEAD BOLTS AND SCREWS WITH HEXAGONAL NUTS

Complying with BS 4933:1973.

MEW.M440.9 METAL WASHERS

Complying with BS 4320:1968.

MEW.M450.9 RIVETS

Complying with BS 4620:1970 (1988).

MEW.M460.9 RIVET, BOLT AND SCREW STOCK

Wrought aluminium and aluminium alloys complying with BS 1473:1972.

MEW.M470.9 BOLT LENGTH

The threaded portion of bolt to project through the nut by a minimum of one thread and maximum of four threads.

MEW.M480.9 RAG, INDENTED, EXPANSION AND RESIN BONDED BOLTS

An Approved proprietary type capable of withstanding the design loading.

MEW.M490.9 MESH INFILL PANELS

To BS 4483:1998 and free from surface defects, surface irregularities and mesh misalignment.

FIXINGS AND BEDDING MORTAR FOR HANDRAILING, LADDERS, STAIRS AND FLOORING

MEW.M510.9 FIXINGS

1. Bolts, nuts, screws, washers and rivets shall comply with the following:
   a. ISO metric black hexagon bolts, screws and nuts to BS 4190:2001;

b. ISO metric black cup and countersunk headbolts and screws with hexagon nuts to BS 4933:1973;

c. Metal washers for general engineering purposes to BS 4320:1968;

d. Rivets for general engineering purposes to BS 4620:1970 (1988);

e. Wrought aluminium and aluminium alloys for general engineering purposes: rivet, bolt and screw stock to BS 1473:1972;

f. Stainless steel fasteners to BS EN ISO 3506-1&2:2009.

2. The length of bolts shall be such that the threaded portion of each bolt projects through the nut by at least one thread and by not more than four threads;

3. Rag, indented bolts, expansion bolts and resin bonded bolts shall be a proprietary type approved by the CM and shall be capable of withstanding the design working load;

4. Galvanized bolts, nuts, screws, washers and rivets shall be used with galvanized handrailing, ladders, stairs and flooring and aluminium bolts, nuts, screws, washers and rivets shall be used with aluminium handrailing, ladders, stairs and flooring; stainless steel bolts, nuts, screws, washers and rivets shall be used with other types of handrailing, ladders stairs and flooring. Bolts, nuts screws and washers shall be insulated from aluminium by non-metallic washers and sleeves.

MEW.M520.9 CEMENT MORTAR

1. Mortar for grouting fixing bolts shall consist of 1 part of cement to 3 parts of sand together with the minimum amount of water necessary to achieve a consistency suitable for completely filling the bolt holes. The mix shall contain a non-shrink admixture;

2. Resin grout shall be an Approved proprietary type and shall contain a non-shrink admixture;

3. Mortar for building in curbs for metal flooring shall consist of 1 part of cement to 3 parts of sand together with the minimum amount of water necessary to achieve a consistency suitable for the work. The mix shall contain a non-shrink admixture.

WORKMANSHIP

FABRICATION, PROTECTION AND INSTALLATION OF PEDESTRIAN GUARD RAILING

MEW.W010.9 STORAGE AND PROTECTION

1. Store and protect guard railing off the ground on level supports in a manner that will not result in damage, deformation or contamination;
2. Do not use any damaged guard railing in the permanent works unless permitted by CM.

MEW.W020.9 WELDING

1. Unless otherwise permitted by the CM, do not make welded joints after galvanizing. Where permitted, ensure welded areas are free from scale and slag and treated with an alternative zinc-coating system;
2. Type of weld: fillet;
3. Ensure welded surfaces are clean and flush, prior to application of the protective coating.

MEW.W030.9 GALVANIZING

1. Hot dip galvanize all steel components forming pedestrian guard railing in accordance with BS EN ISO 1461:1999 with a minimum coating thickness of 70 µm;
2. Unless Approved, all components are to be galvanized after welding, drilling and cutting operations are complete;
3. All hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
    a. Project title/number;
    b. Name of galvanizer;
    c. Types and dimensions of articles;
    d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

MEW.W040.9 INSTALLATION

1. Install guard railing to a smooth alignment within 10 mm of the line, position and height shown on the drawings;
2. Use guard railing curved in the workshop for radii of less than 45 m. Do not use straight lengths in this application;
3. Fix guard railing to concrete using rag, indented, expansion or resin bonded bolts. Fix bolts into pockets and fill with cement mortar or resin grout;
4. Bolt fix guard railing to metalwork.

FABRICATION OF HANDRAILING, LADDERS, STAIRS AND FLOORING

MEW.W110.9 FABRICATION OF STEELWORK

Steelwork for handrailing, ladders, stairs and flooring shall be fabricated in accordance with BS 5950:Part 2:1992.

MEW.W120.9 GALVANIZING STEEL

1. Steel which is to be galvanized shall be hot-dip galvanized in accordance with BS EN ISO 1461:1999 with a minimum coating thickness of 70 µm;
2. Unless Approved, all components are to be galvanized after welding, drilling and cutting operations are complete;
3. All hot dip galvanizing is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:
    a. Project title/number;
    b. Name of galvanizer;
    c. Types and dimensions of articles;
    d. Quantities.
5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

MEW.W130.9 WELDING STEEL

1. Welds to steel for handrailing, ladders, stairs and flooring shall be full depth fillet welds. The welded surface shall be clean and flush before application of the protective coating;
2. Steel shall not be welded after galvanizing unless permitted by the CM, if permitted, the welded areas shall be free from scale and slag and shall be treated with an appropriate coating system approved by the CM which is compatible with the protective system of the parent material.

MEW.W140.9 FABRICATION OF HANDRAILING

Handrailing shall be discontinued at movement joints in structures. The spaces between standards shall be regular and shall not exceed 1.6 m. Curved handrailing shall not be made up of a series of straights.

MEW.W150.9 FABRICATION OF LADDERS

1. Ladders shall comply with BS 4211:1987;
2. Steel ladders shall be hot-dip galvanized;
3. Aluminium ladders shall be Grade 6082 aluminium;
4. Rungs, extended stringers, safety cages and brackets shall be welded to the stringers of ladders;
5. Rungs on aluminium ladders shall have longitudinal grooves and pressed aluminium alloy caps shall be fixed to open ends.

MEW.W160.9 FABRICATION OF STAIRS

Stairs shall comply with BS 5395:Part 1:1977 (1984).

MEW.W170.9 FABRICATION OF FLOORING

1. The shape of each panel of flooring shall be such that the panel can be easily moved. The mass of each panel shall not exceed 40 kg. Where intermediate supports are provided to support flooring they shall be capable of being removed to provide the specified clear opening;
2. Curbs shall be provided in concrete surfaces for flooring;
3. Cut-outs in flooring shall be neatly shaped and shall be provided with toe-plates. Cut-outs in open mesh flooring shall be trimmed with edge bars welded to the bearing bars. The clearance between the edge of cut-outs and the components passing through the cut-out shall not exceed 30 mm;
4. The bearing bars in open mesh flooring shall be welded to the nosing bars. The transverse bars shall be riveted or welded to the bearing bars. Panels of open mesh flooring shall be secured with adjustable fixing clips;
5. Chequer plate flooring shall have a non-slip pattern of a type approved by the CM and shall be provided with lifting holes. The flooring shall be secured to curbs by countersunk screws.

MEW.W180.9 FABRICATION OF TOE PLATES

Toe-plates shall be fixed to handrail standards by brackets and shall be bolted or welded to stairs and flooring.

MEW.W190.9 FABRICATION OF SAFETY CHAINS

1. Safety chains shall comply with BS 4942:1981 and shall be capable of withstanding a breaking force of 30 kN and a proof force of 15 kN;
2. Steel safety chains shall be 8 mm nominal size, Grade M4 non-calibrated chain Type 1 and shall be hot dip galvanized;
3. The links of stainless steel safety chains shall be welded and shall have an internal length exceeding 45 mm and an internal width of between 12 mm and 18 mm. Fins caused by welding shall be removed;
4. Hooks on chains shall be fitted with a sprung securing device.

STORAGE, PROTECTION AND INSTALLATION OF HANDRAILING, LADDERS, STAIRS AND FLOORING

MEW.W210.9 STORAGE AND PROTECTION

Handrailing and flooring shall be stored on level supports in a dry weatherproof store and in a manner which will not result in damage or deformation to the materials or in contamination of the materials. Handrailing, ladders, stairs and flooring shall be protected from damage and damaged handrailing, ladders, stairs and flooring shall not be used in the permanent work unless permitted by the CM.

MEW.W220.9 INSTALLATION OF HANDRAILING, LADDERS AND STAIRS

1. Handrailing shall be installed to a smooth alignment;

2. Handrail standards, flanges, ladders and stairs shall be bolted to metalwork and shall be fixed to concrete using rag, indented, expansion or resin bonded bolts. The bolts shall be fitted into pockets left in the concrete and the pockets shall be filled with cement mortar or resin grout.

MEW.W230.9 INSTALLATION OF FLOORING

1. Flooring and curbs shall be flush with the adjoining surfaces;
2. Curbs shall be fitted into rebates left in the concrete and the rebates shall be filled with cement mortar;
3. Flooring shall be closely butted and the gap between panels and curbs, adjacent panels and other surfaces shall not exceed 10 mm.

MEW.W240.9 TOLERANCES

Refer to Appendix H 'Schedule of Tolerances' to this Specification.

GENERAL

MRY.M010.9 STONE FOR MASONRY

Local granite free from defects which will adversely affect the strength or appearance of the masonry.

MRY.M020.9 CEMENT MORTAR

Consisting of:

1. 1 part PC (complying with CON1);
2. 3 parts of fine aggregate (clean, hard, durable crushed rock having the particle size distribution given below:

BS test sieve size	Percentage by mass passing
5.00 mm	100
2.36 mm	90-100
1.18 mm	70-100
600 μm	40-80
300 μm	5-40
150 μm	0-10

3. The minimum of water to achieve a consistency suited to the required work.

SUBMISSIONS

MRY.M110.9 SAMPLES OF MATERIALS

Submit to the CM samples of each type of stone for masonry for approval of source and type at least 14 days before the masonry work starts.

WORKMANSHIP

GENERAL

MRY.W010.9 TRIAL PANNELS

Construct a trial panel for each type of masonry:

1. To demonstrate that the proposed materials will produce brickwork or blockwork which complies with the specified requirements;
2. At least 14 days before the relevant work starts;
3. Using the materials submitted to the Engineer;
4. Inform the Engineer 24 hours, or such shorter period agreed by the CM, before constructing trial panels;
5. Each trial panel shall be 1 m x 1 m and shall be constructed at a location agreed by the CM;
6. Trial panels shall be used as a means of comparison against which the CM shall determine the compliance or otherwise of the masonry in the permanent work. Trial panels shall be protected from damage and shall be left in position until the CM instructs their removal.

MRY.W020.9 NON-COMPLIANCE OF MASONRY

If in the opinion of the CM the brickwork or blockwork in the trial panel does not comply with the specified requirements for masonry, particulars of proposed changes to the materials and methods of construction shall be submitted to the CM; further trial panels shall be constructed until the trial panel complies with the specified requirements.

MRY.W030.9 COMMENCEMENT OF MASONRY

Masonry shall not commence until in the opinion of the CM trial panel complies with the specified requirements.

MRY.W040.9 CHANGES IN MATERIALS

Unless permitted by the CM, the materials used to produce a trial panel which complies with the specified requirements shall not be changed.

HANDLING AND STORAGE OF MATERIALS

MRY.W110.9 HANDLING AND STORAGE OF STONE

Transport stone for ashlar stone walling with the minimum amount of handling and stack in the vehicle using packing pieces to prevent damage. Store the stone in stacks on battens and protected from exposure to rain.

RUBBLE STONE WALLING

MRY.W210.9 PREPARATION OF STONE

1. Roughly cut stones for random rubble walling in irregular shapes between 75 mm and 300 mm high, at least 75 mm deep and between 75 mm and 600 mm long on bed. The length or depth on bed of each stone shall be greater than the height;
2. Trim stones for squared rubble walling roughly square to between 75 mm and 300 mm high, varying in 75 mm stages. Each stone shall be between 100 mm and 150 mm deep and between 100 mm and 600 mm long on bed. The length or depth on bed of each stone shall be greater than the height;
3. Trim the stones roughly square for square coursed rubble walling as stated in Clause MRY.W210 (2) to suit courses of regular height varying from 150 mm to 250 mm.

MRY.W220.9 LAYING AND JOINTING

1. Lay dry the stones in rubble stone walling in a full even bed of cement mortar; all joints shall be filled and shall be between 5 mm and 15 mm wide;
2. Bond together the stones of random shapes and sizes in random rubble walling over each face of the wall. Select the stones and rough dress them to keep joint widths to a minimum. Provided at least one bonding stone of minimum size 450 mm x 150 mm, carried through the full thickness of the wall per square metre. Provide not more than 3 stones adjacent to a vertical joint;
3. Bond roughly squared stones of random sizes together in square rubble walling with continuous straight horizontal joints. Keep the number of vertical joints to a minimum;
4. Lay roughly squared stones in square coursed walling as stated in clause MRY.W220 (3) but bring up courses at centres not exceeding 750 mm to line up with quoin and jamb stones;
5. Construct squared rubble walling exceeding 300 mm thick and faced one side in accordance with the following requirements:
    a. Provide roughly squared stone at least 300 mm thick with a backing of random rubble;
    b. Regularly space at least two bonding stones per square metre and carry them through the full thickness of the wall or at least 450 mm into the backing, whichever is less.
6. Construct squared rubble walling exceeding 300 mm thick and faced both sides in accordance with the following requirements:
    a. Provide roughly squared stone at least 150 mm thick with a core of random rubble;
    b. Provided bonding stones as stated in clause MRY.W220 (5) but carry them through the full thickness of the wall or 450 mm into the core.

MRY.W230.9 POINTING

Raked out joints in rubble stone walling to a depth of 15 mm as the work proceeds. Pointed the joints in cement mortar on completion with a flush, weathered or recessed joint as required.

ASHLAR STONE WALLING

MRY.W310.9 PREPARATION OF STONE

Dress the exposed faces and joint faces of each stone for ashlar stone walling square and true, free from hollows or rough areas. Finish exposed faces to a finely squared dressed surface. Stones shall be at least 300 mm high. Clearly mark each stone to indicate its position in the finished work.

MRY.W320.9 LAYING AND JOINTING

Lay stones in ashlar stone walling on a full, even bed of mortar. Form all joints 5 mm wide and fill all joints and shall be 5 mm wide. Lay stones to bond together throughout the wall, and to the backing, using projecting bonding stones.

MRY.W330.9 POINTING

Rake joints in ashlar stone walling to a depth of 15 mm as the work proceeds and point the joints with a flush joint on completion using cement mortar.

PROTECTION OF MASONRY

MRY.W410.9 GENERAL

Protect newly erected masonry from exposure to conditions which may adversely affect the masonry. Cover arrises, projections and similar features with protective sheeting lapped and securely held in position. Keep facework clean at all times.

WALL TIES FOR MASONRY

MRY.W510.9 GENERAL

1. Fix wall ties in masonry which is to face an existing or newly constructed wall at a rate of 5 per m^2. Fix the ties 100 mm into the wall and 75 mm into the masonry.
2. Fix wall ties between the ends of walls and concrete or brickwork at centres of at least 450 mm vertically. Project the ties 250 mm into the masonry.

TOLERANCES

PSC PRESTRESSING CONCRETE

MATERIALS

GENERAL

PSC.M010.9 APPLICATION OF OTHER WORKSECTIONS

Materials for grout for prestressing systems shall comply with Worksection CON1 except as stated in this Worksection.

PSC.M020.9 DEFINITIONS

1. Duct: a void formed in the concrete to accommodate a prestressing tendon;
2. Prestressing components: the components used in a prestressing system, including anchorages, grips, tendon deflectors, couplers, wedges, swages, nuts and other devices used to grip the prestressing tendon;
3. Prestressing tendon:
    a. An individual steel wire, wire strand or alloy steel bar in a duct; or
    b. An individual steel wire, wire strand or alloy steel bar not in a duct; or
    c. A group of steel wires or wire strands in a duct; used in a prestressing system.
4. Sheath: a tube or lining which is used to form a duct and which is left in place.

PRESTRESSING TENDONS

PSC.M110.9 WIRE

1. High tensile steel wire and strand shall comply with BS 5896:1980, supplied in coils sufficiently large in diameter to ensure that the steel wire and wire strand will pay off straight;
2. Grease for unbonded strand shall contain a corrosive inhibitor.

PSC.M120.9 BARS

Hot rolled and processed high tensile alloy steel bars shall comply with BS 4486:1980. All alloy steel bars must be straight.

COMPONENTS

PSC.M210.9 GENERAL

Prestressing components shall be proprietary type approved by the CM.

PSC.M220.9 ANCHORAGES

Prestressing anchorages shall comply with BS 4447:1973 and shall allow a minimum of 25 mm cover to cropped ends of prestressing tendons.

PSC.M230.9 SHEATHS AND DEVIATOR PIPES

1. Sheaths shall be an Approved proprietary type and shall be steel or other material approved by the CM. Sheaths shall be rigid and strong enough to retain their shape during fixing and concreting and to withstand forces from the prestressing tendons without damage;
2. For the sheath made of steel, the sheath shall be hot-dip galvanized to BS EN ISO 1461:1999;
3. For the sheath made of material other than steel, the sheath shall be non-metallic type;
4. Sheaths for external prestressing shall be continuous between anchorages and shall be airtight and watertight under the working conditions;
5. Results of tests on duct friction during tendon stressing shall be provided to the CM. It shall be demonstrated that at least 2 mm thickness of sheath will remain on completion of the stressing operation;
6. If the deviator pipes for external prestressing sheaths are made of steel, the deviator pipes shall be hot-dip galvanized to BS EN ISO 1461:1999. Additional protection in the form of Paint System "E" to STW.W650 shall be applied to all surfaces of the deviator pipes.

PSC.M240.9 DUCTS

The design of ducts shall allow for the grout to be injected from either end. There shall be no sudden change in the diameter of the duct.

PSC.M250.9 TAPS AND VENTS FOR GROUT

1. Taps for grout vents in ducts shall be a proprietary type, approved by the CM, and shall allow closure of the vents without loss of pressure in the duct. Vents to be used as grout entry points shall be threaded or fitted with screw connectors or other similar devices for connection to grout pumps;
2. All vents and vent connections shall have an internal diameter no less than 25 mm and shall be clearly identified by labelling.

PSC.M260.9 GROUT

1. Grout for prestressing systems shall consist of Portland cement and water. Sand, PFA and admixtures shall not be used unless permitted by the CM;
2. Grout shall have a minimum crushing strength of 25 MPa at 7 days;
3. The amount of bleeding of grout shall not exceed 2% in the first 3 hours and shall not exceed 4% in total. The water shall be reabsorbed by the grout during the 24 hours after mixing;
4. Free expansion of grout shall not exceed 10% at the ambient temperature;
5. The maximum total chloride content of grout, expressed as a percentage relationship between the chloride ion and the cementitious content by mass in the grout, shall not exceed 0.1%;
6. The maximum water/cement ratio of the grout shall be 0.40;
7. Where admixture is permitted by the CM, grout shall be non-shrink mix and comply with the following requirements:
    a. The free expansion of the grout shall be within a range from 0% to +5%;

b. The admixtures shall not contain chlorides, thiocyanides, nitrates, formats, sulphates or other ingredients which may cause the grout to promote corrosion of the prestressing steel by rusting, pitting or stress corrosion;

c. The admixture shall not segregate and shall be uniform in colour;

d. The admixture shall comply with BS EN 934:2009 Part 2 or Part 4 but full account shall be taken of their effects on the finished product;

e. The dosage shall be within the range recommended by the supplier and shall not exceed 5% of the weight of the cement.

SUBMISSIONS

PSC.M310.9 PRESTRESSING SYSTEMS

The following particulars shall be submitted to the CM for approval at least 8 weeks before the Approval is required:

1. Details of the prestressing system, including prestressing tendons, prestressing components, sheaths and tensioning apparatus;
2. Sequence of prestressing and ends of prestressing tendons from which prestress will be applied if not stated in the Contract;
3. Calculated values of:
   a. Each type of loss of prestress. Calculations for loss of prestress due to creep shall be based on the information stated in the Specification and Drawings;
   b. Prestressing tendon forces;
   c. Extensions of prestressing tendons and details of the method of measuring the extensions.
4. A certificate showing that the tensioning apparatus has been tested and calibrated by an agent approved by the CM within a period of two years before the apparatus is to be used;
5. Any alterations to the reinforcement or additional reinforcement required to allow for primary bursting effects;
6. Details of corrosion protection required for the prestressing system, including the type of grease for unbonded strand and type of corrosion inhibitor to be adopted;
7. Details of the format of tensioning schedules and of reports of tensioning operations, grouting operations and testing of duct friction.

PSC.M320.9 TENDONS

A certificate shall be submitted to the CM for each batch of prestressing tendons delivered to the Site and at least 28 days before installation of the prestressing tendons starts, showing the manufacturer's name, the date and place of manufacture and showing that the prestressing tendons comply with the requirements stated in the Contract and including details of:

1. Cast analysis;
2. Diameter, cross-sectional area and unit mass;
3. Results of tests for mechanical properties, including the characteristic breaking load, characteristic 0.1% load, elongation at maximum load, relaxation and modulus of elasticity;
4. Results of tests for ductility of prestressing wires.

PSC.M330.9 GROUT MIX AND GROUTING PROCEDURE

The following particulars of proposed grout mix and grouting procedure shall be submitted to the CM at least 7 days before trial mixes for grout are made:

1. Water:cement ratio by mass;
2. Details of mixing and grouting equipment;
3. Method of quality control during grout injection;
4. Details of grouting trials.

PSC.M340.9 SAMPLES

Samples of the following proposed items shall be submitted to the CM at the same time as particulars of the prestressing systems are submitted:

1. Prestressing tendons;
2. Prestressing components;
3. Sheaths;
4. Grout vents and taps.

WORKMANSHIP

HANDLING AND STORAGE OF MATERIALS

PSC.W010.9 HANDLING TENDONS

Prestressing tendons shall not be subjected to rough handling, shock loading or dropping from a height.

PSC.W020.9 HANDLING COMPONENTS

Prestressing components shall be handled in accordance with the manufacturer's recommendations.

PSC.W030.9 STORAGE

1. Each prestressing tendon shall be tagged with a number to identify the coil or bundle number of the prestressing tendon used;
2. Prestressing tendons and sheaths shall be stored off the ground on level supports and in a manner which will not result in damage or deformation to the materials or in contamination of the materials;
3. Different types and sizes of prestressing tendons, prestressing components and sheaths shall be stored separately;
4. Prestressing tendons, prestressing components and sheaths shall not be stored on or adjacent to concrete surfaces which form part of the permanent work;
5. Prestressing tendons, prestressing components and sheaths shall be protected from exposure to conditions which may affect the material.

INSTALLING PRESTRESSING SYSTEMS GENERALLY

PSC.W110.9 SURFACE CONDITION OF TENDONS AND COMPONENTS

1. Prestressing tendons, prestressing components and sheaths shall be clean at the time of installation and shall be free from loose mill scale, loose rust, pitting, grease or any substance which in the opinion of the CM is likely to reduce the bond or affect the prestressing tendons, prestressing components, sheaths, concrete or grout chemically. The prestressing tendons, prestressing components and sheaths shall be maintained in this condition until concrete or grout is placed around them;
2. If the surface condition of the prestressing tendons, prestressing components or sheaths deteriorates such that it does not comply with the requirements stated in sub-clause (1), the prestressing tendons, prestressing components, or sheaths shall be cleaned or dealt with by other methods agreed by the CM.

PSC.W120.9 SAFETY

Prestressing operations shall be carried out in such a manner that persons and property are not endangered by any sudden release of the energy stored in a stressed prestressing tendon.

PSC.W130.9 LOCATION OF TENDONS AND COMPONENTS

Prestressing tendons, prestressing components and sheaths shall be accurately located and maintained in the correct position during all operations. Supports shall be placed at a maximum spacing of 600 mm.

PSC.W140.9 TOLERANCES

Refer to Appendix H 'Schedule of Tolerances' to this Specification.

PSC.W150.9 INSPECTION

The Contractor shall allow the CM to inspect the completed prestressing system before carrying out any work, including concreting and grouting, which will make access to the prestressing system difficult. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out such work.

INSTALLATION OF PRESTRESSING TENDONS

PSC.W210.9 GENERAL

Prestressing tendons from each batch shall not be installed until testing of the batch has been completed.

PSC.W220.9 WIRES

1. Steel wires, wire strands and alloy steel bars which will be tensioned in one operation shall be taken from the same batch;
2. Individual steel wires and wire strands in the same duct shall not be twisted together. Strands which have become unravelled shall not be used.

PSC.W230.9 ALLOY BARS

Unless permitted by the CM, alloy steel bars which have become bent shall not be straightened. Small adjustments for straightness may be made provided that the straightening is carried out at the ambient temperature by non-mechanical methods and provided that no force is applied on the threaded portion. Bars which have become bent in the threaded portion shall not be used.

PSC.W240.9 DAMAGED TENDONS

Prestressing tendons which have been damaged mechanically or by work-hardening or heating shall not be used. After manufacture, prestressing tendons shall not be welded and heat treatment, work-hardening, galvanizing and other metallic coatings shall not be applied.

PSC.W250.9 CUTTING

Prestressing tendons shall be cut using either a high speed abrasive cutting wheel or a friction saw or by other methods agreed by the CM. Flame cutting shall not be used.

PSC.W260.9 JOINTS

Joints in prestressing tendons shall be made using couplers fixed in accordance with the manufacturer's recommendations.

COMPONENTS

PSC.W310.9 USE OF COMPONENTS GENERALLY

Prestressing components shall be used in accordance with the manufacturer's recommendations.

PSC.W320.9 INSTALLING SHEATHS

1. At the time of tensioning, sheaths shall be free from dents or other irregularities which may affect tensioning;
2. Joints in sheaths shall be formed using sleeve connectors and adequately sealed by tape against ingress of concrete, grout and any other materials into the ducts. Joints in adjacent sheaths shall be staggered by at least 300 mm. Use of joints shall be kept to a minimum where practicable.

PSC.W330.9 GROUT VENTS AND TAPS

1. Grout vents and taps shall be provided at the following positions:
    a. All crests of the prestressing tendon profile and 400 mm on each side of each crest;
    b. All low points of the prestressing profile;
    c. All anchorages;
    d. Intervals not exceeding 15 m;
    e. Beyond each intermediate crest in the direction of grout flow at the point where the duct is one half diameter lower than the crest (but not further than 1 m), and elsewhere as required by the CM.
2. Vents shall not be placed at positions where they will be blocked by the prestressing tendons after tensioning;
3. Vents at high points shall be extended to a minimum of 500 mm above the highest point of the duct profile.

TENSIONING TENDONS

PSC.W410.9 GENERAL

1. Apparatus for tensioning of prestressing tendons shall be a type such that a controlled total force is imposed gradually and such that excessive secondary stresses are not induced in the prestressing tendons and prestressing components or in the structure or element to which prestress is being applied;
2. Prestressing tendons shall be securely attached to jacks and tensioning apparatus;
3. Steel wires or wire strands which are tensioned simultaneously shall be approximately the same length between anchorage points;
4. The force in the prestressing tendons during tensioning shall be measured by direct reading load cells or obtained indirectly from pressure gauges fitted in the hydraulic system. Load measuring devices shall be accurate to within 2%;
5. The extension of prestressing tendons and any movement of prestressing tendons in the gripping devices shall be measured during tensioning. The elongation of prestressing tendons shall be measured to an accuracy of 2% or 2 mm, whichever is the more accurate;

6. Tensioning apparatus and load measuring devices shall be calibrated before tensioning starts and at regular intervals agreed by the CM. The calibration certificate shall be obtained from an approved testing laboratory once every 6 months;
7. The force in the prestressing tendons shall not be transferred to the concrete until the concrete has reached the specified transfer strength;
8. The capacity of pressure gauges, when used together with the load cell as a load indicator, shall be sufficient in capacity such that the working pressure lies within the central half of the range of the gauges;
9. The time of transfer will be determined by successful testing of a batch of minimum 3 test cubes. If the test result of any individual cube in the initial batch indicates that the concrete has not attained the required strength, a further batch of cubes shall be tested at a later stage. This process shall be repeated until a batch of cubes successfully passes the strength test.

PSC.W420.9 PRETENSIONING

1. The stress in prestressing tendons shall be fully maintained during the period between pretensioning and transfer of stress. Transfer of stress shall take place gradually to minimise shock or damage to the transmission length and shall be carried out in conjunction with the release of any hold-down and hold-up forces in tendon deflectors;
2. In the long-line method of pretensioning, locator plates shall be distributed throughout the length of the bed to ensure that the steel wires or wire strands are maintained in the correct positions during concreting. Units which are made in line shall be free to slide in the direction of their length to permit transfer of the prestressing force to the concrete along the whole line;
3. Moulds used in the individual mould system of pretensioning shall be sufficiently rigid to provide the reaction to the prestressing force without excessive distortion;
4. Tendon deflectors in contact with pretensioned prestressing tendons of single steel wire or wire strand shall have a radius of at least five times the prestressing tendon diameter for steel wire and at least ten times the prestressing tendon diameter for wire strand. The total angle of deflection shall not exceed 15°. If a system is used such that friction develops between prestressing tendons and tendon deflectors, the friction force shall be determined by a test procedure agreed by the CM and any necessary allowance shall be made;
5. The tendon shall be covered with sleeves of PVC or other approved material where these materials are specified as debonded from the concrete. Tape ends of the sleeves to the tendon shall prevent the ingress of grout;
6. When the temperature of the pretensioning steel is below 10o C at the time of tensioning, steel elongation computations shall allow for the increase in temperature of the steel between the time of tensioning and the time when the concrete takes its initial set;
7. The tendons shall be trimmed to flush with the face of the concrete with the specified protection applied to their ends;
8. The precast prestressed members shall be indelibly marked to show the specific information related to its manufacturer.

PSC.W430.9 POST-TENSIONING

1. A tensioning schedule shall be submitted to the CM for Approval at least 48 hours before each post-tensioning operation starts. The schedule shall include the proposed sequence of tensioning the prestressing tendons, the required prestressing loads and the calculated extensions of the prestressing tendons;
2. Spacers used with post-tensioned steel wire or wire strand which are not tensioned simultaneously shall be sufficiently rigid to ensure that they will not be displaced during successive tensioning operations;
3. If both ends of the prestressing tendon are free to move, a demonstration shall be carried out before post-tensioning starts to show that all prestressing tendons are free to move in the ducts;
4. Post-tensioning shall be carried out in such a manner that the stress in the prestressing tendons increases at a gradual and steady rate. The sequence of tensioning prestressing tendons and the ends of prestressing tendons from which prestress will be applied shall be as stated in the Contract or as approved by the CM;
5. For each element of a structure being stressed, post-tensioning of the prestressing tendons shall be carried out until the required prestress to that element has been reached. Tensioning of each prestressing tendon shall be carried out continuously until the required tendon loads or extensions have been reached. If tensioning is stopped for more than 2 days, particulars of any proposals for remedial or other work shall be submitted to the CM for Approval and tensioning shall not recommence until the Approved work has been carried out;
6. Measurements of extensions shall not commence until any slack in the prestressing tendon has been taken up. If the design permits, the draw-in of prestressing tendons at the non-jacking end shall also be measured. The tensioning shall be applied in increments of load and the extensions shall be measured at each increment. The average measured extension of the prestressing tendons shall be within 5% of the calculated extension and the measured extension of individual prestressing tendons shall be within 10% of the calculated extension;
7. If the tendon deflector in contact with a post-tensioned prestressing tendon has a radius of less than 50 times the diameter of the prestressing tendon or if the total angle of deflection exceeds 15°, the loss of strength of the prestressing tendon shall be determined by a test procedure agreed by the CM and any necessary allowance shall be made;
8. Post-tensioned prestressing tendons shall be cut at a distance from the anchorage of at least one diameter or 10 mm, whichever is greater. Unless otherwise permitted by the CM the tendons shall not be cut until at least 1 day after stressing, if the tendon is to be cut before grouting, or alternatively, at least 3 days after grouting.

PSC.W440.9 PROTECTION OF EXTERNAL TENDONS AND COMPONENTS

External prestressing tendons and anchorages shall be protected in their permanent positions from mechanical damage or corrosion until the permanent protection is applied.

PSC.W450.9 RECORDS

Records of tensioning operations shall be kept by the Contractor on the Site and a report shall be submitted to the CM within 24 hours of each tensioning operation. The report shall contain the following details:

1. Location of tensioning operations;
2. Coil, heat and bundle numbers of strand used;

3. Date and time of starting and completing tensioning operations;
4. Weather conditions;
5. Technical personnel supervising or carrying out tensioning operations;
6. Prestressing tendon reference numbers;
7. Tensioning apparatus identification;
8. Measured extensions;
9. Pressure gauge or load cell readings;
10. Amount of draw-in.

GROUTING

PSC.W510.9 GENERAL

Grouting of prestressing tendons shall be effective such that the duct is completely filled, and the prestressing tendon is completely surrounded, with grout.

PSC.W520.9 EQUIPMENT

1. Grout for prestressing tendons shall be mixed by a machine capable of producing a homogeneous colloidal grout and of keeping the grout in slow continuous agitation after mixing and until the grouting operation starts;
2. Grouting equipment shall be capable of continuous operation with little variation of pressure and shall include a system of recirculating the grout when grouting is not in progress;
3. Grout pumps shall be fitted with a safety valve to prevent pressure from rising above 2 MPa at any point within the grouting system including the sheaths. The connection of the pump to the duct shall be by a screw connector or other positive method. Baffles to the pump shall be fitted with 1.18 mm sieve strainers. Suction circuits shall be airtight;
4. Grouting equipment shall be thoroughly washed through with clean water after every series of grouting operations and at the end of use each day.

PSC.W530.9 INJECTION GENERALLY

The permission of the CM shall be obtained before prestressing tendons are grouted. If grouting is not started within 24 hours of permission having been given, the permission shall again be obtained from the CM.

PSC.W540.9 TIMING

Grouting of prestressing tendons shall be carried out as soon as practicable, and not more than 5 days, after tensioning of the prestressing tendons.

PSC.W550.9 PREPARATION

1. A check shall be made to ensure that the ducts, vents, inlets and outlets are capable of accepting injection of grout. This shall be done by blowing through the system with dry, oil-free air and testing each vent in turn;
2. All ducts shall be kept free of standing water at all times and shall be thoroughly clean and dry before grouting;

3. All anchorages shall be sealed by caps and fitted with grouting connections and vents. Sealing of anchorages shall be protected against damage at all times.

PSC.W560.9 PROCEDURE

1. Grout shall be used within 30 minutes of mixing unless a retarder is incorporated in the grout. If a retarder is used, the time shall be determined by a test procedure agreed by the CM;
2. The grout pressure applied shall be as low as practicable and shall not exceed 1 MPa. Grout shall be injected from the lower ends of ducts. Grout injection shall be continuous and steady and shall be at a rate which will avoid grout segregation and trapping air in the duct. Grout shall be allowed to flow from each of the grout vents until its consistency is equivalent to that of the grout injected. After the last grout vent has been closed, the pressure shall be maintained at 0.5 MPa for 5 minutes. The injection vent shall then be closed under pressure.

PSC.W570.9 BLOCKAGE OR BREAKDOWN

If there is any blockage or breakdown or if the grout injection is interrupted, the duct shall immediately be thoroughly washed with clean water and blown dry with oil-free compressed air. Regrouting shall start as soon as practicable.

PSC.W580.9 PROTECTION

Grouted ducts shall not be subject to shock or vibration within 24 hours of grouting.

PSC.W590.9 INSPECTION

The level of grout in grout vents shall be inspected and made good as agreed by the CM. Making good shall not be carried out until at least 2 days after grouting.

PSC.W600.9 RECORDS

Records of grouting operations for prestressing systems shall be kept by the Contractor on Site and a report shall be submitted to the CM within 3 days of each grouting operation. The report shall contain the following details:

1. Location of grouting operations;
2. Date and time of starting and completing grouting operations;
3. Weather conditions;
4. Technical personnel supervising or carrying out grouting operations;
5. Prestressing tendon reference numbers;
6. Grout mix, including any admixtures;
7. Grout injection pressure;
8. Volume of grout used;
9. Details of any interruptions and topping up.

TESTING

TRIAL MIXES FOR GROUT

PSC.T010.9 GENERAL

1. A trial mix for grout for prestressing systems shall be made to demonstrate that the proposed materials, grout mix and methods of production will produce grout which complies with the specified requirements;
2. The trial mixes shall be completed at least 35 days before the grout mix is used in the permanent work;
3. The Contractor shall inform the CM at least 24 hours, or such shorter period as may be agreed by the CM, before making trial mixes;
4. Trial mixes shall be made using the materials, grout mix and methods of production submitted to the CM.

PSC.T020.9 SAMPLING

1. One sample of grout shall be provided from the trial mix to determine the amount of bleeding and free expansion of the grout. The method of sampling shall be as stated in PSC.T710 (2);
2. One sample of grout shall be provided from the trial mix to determine the crushing strength of the grout. The method of sampling shall be as stated in PSC.T810 (2).

PSC.T030.9 TESTING PROCEDURE

1. Each sample of grout taken as stated in PSC.T020 (1) shall be tested to determine the amount of bleeding and free expansion. The method of testing shall be as stated in PSC.T720;
2. Each sample of grout taken as stated in PSC.T020 (2) shall be tested to determine the crushing strength. The method of testing shall be as stated in PSC.T820.

PSC.T040.9 NON-COMPLIANCE

If the result of any test for amount of bleeding, free expansion or crushing strength of trial mixes does not comply with the specified requirements for the property, particulars of proposed changes to the materials, grout mix or methods of production shall be submitted to the CM. Further trial mixes shall be made until the result of every test complies with the specified requirements for the property.

PSC.T050.9 USE OF NON-COMPLYING MIXES IN OTHER TRIALS

If grouting trials are carried out using the non-complying trial mix, further grouting trials shall be carried out unless in the opinion of the CM the changes to the materials, grout mix or methods of production will not affect the results of the previous grouting trials.

GROUTING TRIALS

PSC.T110.9 GENERAL

1. Grouting trials for grout for prestressing systems shall be carried out to demonstrate that the proposed materials, grout mix, methods of production and methods of construction will produce a grouted duct which complies with the specified requirements. The number and details of grouting trials shall be as stated in the Contract;
2. Grouting trials shall be completed at least 21 days before installation of the prestressing components in the permanent works;
3. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out grouting trials;
4. Grouting trials shall be carried out using the materials, grout mix, methods of production and methods of construction submitted to the CM;
5. The profile of ducts and the method of support for grouting trials shall be as agreed by the CM. Vents shall be provided in ducts and tendons shall be pulled tight;
6. Grouting trials which do not form part of the permanent work shall be removed;
7. The grouting trial shall incorporate all relevant parts and components as if these relevant parts and components will be used in the actual prestressing system.

PSC.T120.9 PROCEDURE

Three sections selected by the CM shall be cut from the grouted duct and inspected not less than 2 hours after the grout used in the grouting trial has achieved its final set. Each cut section shall be 300 mm long. The external sheath of the cut sections shall be removed for inspection of the cut sections.

PSC.T130.9 COMPLIANCE CRITERIA

The sections of grouted duct cut in grouting trials shall be completely filled, and the prestressing tendon shall be completely surrounded with grout.

PSC.T140.9 NON-COMPLIANCE

If the result of any test on sections of grouted duct in grouting trials does not comply with the specified requirements for the test, or if in the opinion of the CM any aspect of the grouting procedure as demonstrated by the grouting trial is unsatisfactory, particulars of proposed changes to the materials, grout mix, methods of production or methods of construction shall be submitted to the CM. Further grouting trials shall be carried out until the result of every test on sections of grouted duct complies with the specified requirements for the test and until in the opinion of the CM every aspect of the grouting procedure is satisfactory. Further trial mixes for grout shall be made unless, in the opinion of the CM, non-compliance of the grouting trial was not due to the grout mix.

APPROVED GROUT MIXES

PSC.T210.9 DEFINITION

A grout mix which complies with the specified requirements for trial mixes for grout and for grouting trials shall become an Approved grout mix.

PSC.T220.9 COMMENCEMENT OF GROUTING

Grouting shall not proceed until the grout mix has been approved by the CM.

PSC.T230.9 DEVIATION FROM APPROVED MIX

The materials, grout mix, methods of production or methods of construction used to produce an Approved grout mix shall not be changed, unless permitted by the CM.

TESTING PRESTRESSED UNITS

PSC.T310.9 GENERAL

Comply with Worksection CON1.

TESTING PRESTRESSING TENDONS

PSC.T410.9 DEFINITION OF "BATCH"

A batch of prestressing tendons is any quantity of prestressing tendons of the same type, size and grade, manufactured by the same manufacturer, covered by the same certificates and delivered to the Site at any one time.

PSC.T420.9 SAMPLING

Samples of prestressing tendons shall be provided from each batch of prestressing tendons delivered to the Site and at least 28 days before installation of the prestressing tendons starts. The number of samples to be provided from each batch shall be as stated in the following table:

Rate of sampling prestressing tendons		
Description	Size of batch	No. of samples per batch
Steel wire	0 - 50 tonnes	1
	Exceeding 50 tonnes	1 for each of 50 tonnes or part thereof
Wire strand and alloy Steel bar	0 - 100 tonnes	1
	Exceeding 100 tonnes	1 for each 100 tonnes or part thereof

PSC.T430.9 SPECIMENS

1. The number of specimens in each sample shall be 15;
2. Each specimen shall be 1.5 metres long and straight;
3. Each specimen shall be taken from different coils or bars in the batch. The ends of specimens shall be cut square without unravelling of wires before delivery to the laboratory.

PSC.T440.9 PROCEDURES

1. Each specimen of prestressing tendon shall be tested to determine the characteristic breaking load, characteristic 0.1% proof load, elongation at maximum load, diameter, cross-sectional area, unit mass and modulus of elasticity. Each specimen of prestressing wire shall also be tested to determine the ductility;

2. Except that tests shall be carried out on specimens having a temperature of between 5℃ and 30℃, the method of testing shall be in accordance with the following:

    a. High tensile steel wire and strand for the prestressing of concrete to BS 5896:1980;

    b. Hot rolled and hot rolled and processed high tensile alloy steel bars for the prestressing of concrete to BS 4486:1980.

PSC.T450.9 COMPLIANCE CRITERIA

1. The standard deviations of the results of tests for characteristic breaking load and characteristic 0.1% proof load, expressed as equivalent stress values, of prestressing tendons shall not exceed the following:

    a. Tensile strength: 55 MPa;

    b. 0.1% proof stress: 60 MPa.

2. The statistical interpretation of the test results shall be in accordance with BS 2846:Part 3:1975, Table 3 and BS 2846:Part 4:1976, Table E, both for a one-sided tolerance interval of 0.95 and for a confidence level of 0.95.

PSC.T460.9 NON-COMPLIANCE CRITERIA

1. If the result of any test for elongation at maximum load, diameter, cross-sectional area, unit mass, modulus of elasticity or ductility of prestressing tendons does not comply with the specified requirements for the property, one additional sample shall be provided from the same batch and additional tests for the property shall be carried out;

2. The number of specimens in the additional sample shall be 15;

3. The batch shall be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with the specified requirements for the property.

DUCT FRICTION

PSC.T510.9 GENERAL

The number and details of tests to determine the duct friction in prestressing systems shall be as follows:

PSC.T520.9 PROCEDURE

1. Prestressing tendons shall be tensioned from one end and the tendon forces shall be measured at both the jacking and non-jacking ends;

2. The tendon force at the non-jacking end shall be measured by a load-measuring device of a type approved by the CM. A direct reading load cell or a dummy jack is considered to be suitable as a load-measuring device. The load-measuring device shall be sufficiently rigid to ensure that the movement of the prestressing tendon at the non-jacking end under the specified tendon force is not excessive. The deflection of the load-measuring device shall be measured to an accuracy of 0.5 mm. A load-measuring device with a deflection exceeding 10 mm under the maximum load shall not be used;

3. The prestressing tendon shall be tensioned to the specified tendon force in equal increments and the tendon extensions at the jacking end and the tendon force and tendon movement at the non-jacking end shall be measured to within 5 mm. The number of load increments shall be suited to the tensioning operation but shall be at least five.

PSC.T530.9 COMPLIANCE CRITERIA

The force at the non-jacking end of the prestressing tendon determined in the duct friction test shall be within +10% and -5% of the calculated value.

PSC.T540.9 REPORTING OF TEST RESULTS

Reports of duct friction tests shall be submitted to the CM within 3 days of each test. The report shall contain the following details:

1. Details stated in the Preliminaries;
2. Prestressing tendon reference numbers;
3. Graph showing tendon forces at jacking end against tendon forces at non-jacking end;
4. Comparison between the calculated tendon forces at the non-jacking end and the measured values.

TESTING GROUT GENERALLY

PSC.T610.9 DEFINITION OF "BATCH"

A batch of grout for prestressing systems is any quantity of grout produced in one cycle of operations of a mixer.

TESTING GROUT FOR BLEEDING AND FREE EXPANSION

PSC.T710.9 SAMPLING

1. For each grout mix one sample of grout shall be provided from each 25 batches of grout, or from the amount of grout produced in a day, whichever is the lesser, to determine the amount of bleeding and free expansion of the grout;
2. Samples shall be provided and testing commenced within 1 hour after the grout has been mixed. Samples shall be protected from rain before the tests for amount of bleeding and free expansion are carried out.

PSC.T720.9 PROCEDURE

1. Each sample of grout taken as stated in PSC.T710 shall be divided into three specimens. Each specimen shall be tested to determine the amount of bleeding and free expansion;
2. A portion of each specimen shall be placed in a covered cylinder with a diameter of 100 ± 10 mm, to a depth of 100 ±5 mm and the amount of bleeding and free expansion measured by a scale fixed to the outside of the cylinder.

PSC.T730.9 NON-COMPLIANCE

If the result of any test for amount of bleeding or free expansion of grout for prestressing systems does not comply with the specified requirements for the property, particulars of proposed changes to the materials, grout mix or methods of production shall be submitted to the CM. Further trial mixes shall be made and further grouting trials shall be carried out unless otherwise permitted by the CM.

TESTING GROUT FOR CRUSHING STRENGTH

PSC.T810.9 SAMPLING

1. For each grout mix one sample of grout shall be provided from each 25 batches of grout, or from the amount of grout produced in a day, whichever is the lesser, to determine the crushing strength of the grout;
2. Samples shall be provided not more than 1 hour after the grout has been mixed and shall be protected from rain before test cubes are made.

PSC.T820.9 PROCEDURE

1. Two 100 mm test cubes shall be made from each sample of grout. Each pair of test cubes shall be tested to determine the crushing strength at 7 days;
2. The method of making, curing and testing the test cubes, and the calculations of the test results, shall be as stated in Worksection CON1, except that compaction of the grout is not required.

PSC.T830.9 NON-COMPLIANCE

If the result of any test for crushing strength of grout for prestressing systems does not comply with the specified requirements for crushing strength, particulars of proposed changes to the materials, grout mix or methods of production shall be submitted to the CM. Further trial mixes shall be made and further grouting trials shall be carried out unless otherwise permitted by the CM.

STW STEELWORK

MATERIALS

STANDARDS

STW.M010.9 GENERAL STEELWORK

Steelwork shall comply with BS 5950:Part 2:1992.

STW.M020.9 STEELWORK FOR BRIDGEWORKS

Comply with BS 5400:Part 6:1980, except in respect of the following amendments:

1. Content pages: delete '6.3.1 General';
2. Page 2, Clause 3.1.4.1, lines 5, 8 and 14: delete 'C of DD21' and insert 'L1 of BS 5996:1980';
3. Page 2, Clause 3.1.4.1, line 10 and Clause 3.1.4.2, line 3: delete 'DD21' and insert BS 5996:1980';
4. Page 3, Clause 4.2.1, line 1: delete '4.4.2' and insert '4.2.2';
5. Page 3, Clause 4.3.3(e), line 1: delete line 1 of text and insert 'the hardness of the edge is reduced to less than 350 HV 30 of BS 427:1990 by a suitable heat treatment';
6. Page 4, Clause 4.7.1, paragraph 2, line 4: delete '23 of BS 5135:1984' and insert '20 of BS 5135:1984';
7. Page 5, Clause 4.14: delete and insert: 'The Contractor shall determine the dead load camber of beams required to comply with the requirements of STW.W120. The camber of plate girders shall be formed by either of the two following alternatives, whichever is stated in the Contract:

   Type A cambering

   - Camber introduced by welding the flanges pressed against a web plate cut to a smooth cambered profile;

     or

   Type B cambering

   - Camber introduced by connecting straight sections of girder with the change of slope at their junctions;

   Type A

   - Camber shall be used if the alternative to be used is not stated in the Contract;

     with

   Type B

   - cambering the junction shall not be positioned at bolted connections'.
8. Page 6, Clause 5.2.2, line 2: delete 'DD21' and insert 'BS 5996:1980;
9. Page 7, Clause 5.5.2, paragraph 3, line 3: delete 'grider; and insert 'girder';
10. Page 9, Clause 6.3.1: delete Clause 6.3.1;
11. Page 15, Table 5, column 3, Member component 4: delete 'G=0' and insert 'G=D'.

STW.M030.9 PROTECTION OF STEELWORK

Protection of steelwork against corrosion shall comply with BS 5493:1977.

STEEL

STW.M110.9 STRUCTURAL STEEL GENERALLY

Structural steel shall comply with BS 4360:1986, including Clause B7 at Appendix B, and with BS 5950:Part 2:1992, Section 2.1 or BS 5400:Part 6:1980, Section 3.1 as appropriate.

STW.M120.9 HOT ROLLED SECTIONS

Hot rolled sections complying with BS 4:Part 1:1980, BS 4848:Part 2:1991, BS 4848:Part 4:1972 (1986) or BS 4848:Part 5:1980 shall not be replaced with sections complying with other standards unless approved by the CM. If approved, the sections shall have equivalent properties, and the dimensional tolerances shall comply with the relevant British Standard.

STW.M130.9 RIVETS

Steel rivet bars for the manufacture of steel rivets shall comply with BS 5400:Part 6:1980, Appendix A.

STW.M140.9 SHEAR CONNECTORS

Steel for headed stud type shear connectors shall have a yield stress of at least 385 N/mm² and a tensile strength of at least 495 N/mm². Steel for other types of shear connectors shall comply with BS 4360:1986.

STW.M150.9 CASTINGS AND CAST STEEL PINS

Carbon manganese steel castings shall comply with BS EN 10293:2005.

STW.M160.9 FORGINGS AND FORGED STEEL PINS

Steel forgings and forged steel pins shall comply with BS 29:1976.

STW.M170.9 STAINLESS STEEL

1. Wrought stainless steel shall comply with BS EN 10084:2008, BS EN 10085: 2001, BS EN 10087:1999, BS EN 10095:1999, BS EN 10250-1:2000 and PD 970:2005, grade 1.4401;
2. Flat rolled stainless steel shall comply with BS EN 10029:1991, BS EN 10048:1997, BS EN 10051:1991 + A1:1997, BS EN 10095:1999 and BS EN ISO 9445:2006, grade 1.4401 in the softened condition;
3. Stainless steel tubes shall comply with BS EN 10296-1:2003 and BS EN 10296-2:2005.

STW.M180.9 ROLLED STEEL PINS

Rolled steel pins, including those made from slabs, shall comply with BS 970:Part 1:1996 or BS 4360:1986, grades 43, 50 or 55.

CAST IRON

STW.M210.9 GREY IRON

Grey cast iron shall comply with BS 1452:1990, grade 10.

STW.M220.9 MALLEABLE CAST IRON

Malleable cast iron shall comply with BS 6681:1986.

STW.M230.9 SPHEROIDAL OR NODULAR CAST IRON

Spheroidal or nodular cast iron shall comply with BS 2789:1985.

CONNECTIONS

STW.M310.9 BOLTS, SCREWS AND NUTS

Bolts, screws and nuts shall comply with the British Standards and strength grades stated in the following table unless other strength grades or British Standards are stated on the Drawings or elsewhere in this Worksection:

British Standards and strength grades for bolts, screws and nuts			
Type of bolts, screws and nuts	British Standard	Strength grade of bolt	Strength grade of nut
High strength friction grip bolts and nuts	BS 4395: Part 1 : 1969	General grade	As specified in BS 4395:Part 1:1969
Precision bolts, screws and nuts	BS 3692: 1967	4.6	4.0
Cup head and counter-sunk head bolts, screws and nuts	BS 4933: 1973	4.6	4.0
Black bolts, screws and nuts	BS 4190: 2001	4.6	4.0
Other types of bolts, screws and nuts	BS 4190: 2001	4.6	4.0
Hexagon socket screws	BS 4168: Part 1 : 1981	12.9	12.0

STW.M320.9 STAINLESS STEEL BOLTS AND NUTS

Stainless steel bolts and nuts shall comply with BS EN ISO 3506-1&2:2009, steel grade A4 and property class 80. Stainless steel washers shall comply with BS EN 10029:1991, BS EN 10048:1997, BS EN 10051:1991 + A1:1997, BS EN 10095:1999 and BS EN ISO 9445:2006, grade 1.4401 in the softened condition. The dimensions and tolerances of bolts and nuts shall comply with BS 3692:1967. The dimensions and tolerances of tapered washers shall comply with BS 3410:1961 and the dimensions and tolerances of flat washers shall comply with BS 4320:1968, Form C.

STW.M330.9 WASHERS

1. Washers for high strength friction grip bolts and nuts shall comply with the following:

a. High strength friction grip bolts and associated nuts and washers for structural engineering:

i. General grade: BS 4395:Part 1:1969;

ii. Higher grade bolts and nuts and general grade washers: BS 4395:Part 2:1969;

iii. Higher grade bolts (waisted shank), nuts and general grade washers: BS 4395:Part 3:1973.

2. Plain washers for other bolts, screws and nuts shall comply with BS 4320:1968; tapered washers for other bolts, screws and nuts shall comply with BS 3410:1961.

STW.M340.9 WELDING CONSUMABLES

1. Welding consumables used in metal-arc welding of grades of steel complying with BS 4360:1986 shall comply with BS 5135:1984. Welding consumables used in the fusion of steel castings shall comply with BS 4570:1985. Welding consumables used in metal-arc welding of austenitic stainless steels shall comply with BS 4677:1984;
2. Welding consumables and the procedures used shall be such that the mechanical properties of the deposited weld metal shall not be less than the respective minimum values of the parent metal being welded;
3. Welding consumables used with grades of steel other than those complying with BS 4360:1986 shall be such that the performance requirements stated in BS 5400:Part 6:1980, Table 1 or BS 5950:Part 2:1992, Table 1 as appropriate are achieved.

METAL COATINGS TO STEELWORK

STW.M410.9 GALVANIZING

1. Unless otherwise specified, galvanized coatings to be applied by hot-dip galvanizing to be in accordance with BS EN ISO 1461:1999. The coating thickness to comply with the following Table:-

Article Thickness	Minimum Mean Coating Thickness
≥ 6 mm	85 μm
3 mm to < 6 mm	70 μm
1.5 mm to < 3 mm	55 μm
< 1.5 mm	45 μm

2. Unless Approved, all components are to be galvanized after fabrication and welding;
3. All hot dip galvanizing, including the galvanizing work specified in other Worksections, is to be carried out by galvanizers with ISO 9001 certification. Submit the name of galvanizer for Approval;
4. Submit original invoice/delivery note and galvanizing certification for each delivery. These documents shall include the following information:

a. Project title/number;

b. Name of galvanizer;

c. Types and dimensions of articles;

d. Quantities.

5. Attach a durable identification tape to each batch of galvanized articles indicating the project title, galvanizing certification number and name of galvanizer.

STW.M420.9 SHERARDIZING

Sherardized zinc coatings shall comply with BS 4921:1988, Table 1, Class 1.

STW.M430.9 SPRAYED ZINC AND ALUMINIUM

Sprayed zinc and aluminium coatings shall comply with BS 2569:Part 1:1964. The nominal coating thickness shall be 100 microns. Sprayed metal shall be pre-treated with product CP1 and sealed product CP3C in accordance with BS 5493:1977.

STW.M440.9 ELECTROPLATED ZINC AND CADMIUM

Electroplated zinc and cadmium coatings on threaded components with a diameter not exceeding 36 mm shall comply with BS 3382:Parts 1 and 2:1961. The coating thickness shall be at least 5 microns.

STW.M450.9 THREADED COMPONENTS

Allowance for the thickness of the metal coating shall be made in the sizes of the threads of metal coated threaded components. Nuts shall not be tapped oversize by more than 0.4 mm. Metal coated HSFG bolts and nuts shall not be tapped oversize unless Approved.

PAINT

STW.M510.9 GENERAL

Paint shall be supplied in sealed containers of not more than 5 litres capacity. Each container shall be marked on the side to show the following:

1. The name of the manufacturer;
2. The paint manufacturer's reference number;
3. Intended purposes, type of pigment and binder;
4. Batch number, date of manufacture, expiry date and pot life; and
5. Colour, gloss, drying times and flash point.

STW.M520.9 STANDARD

1. Paint for steelwork shall comply with BS 5493:1977, Section 2, Table 4;
2. Organic zinc-rich paint shall comply with BS 4652:1971;
3. The Volatile Organic Compound (VOC) content of all paint applied on surfaces of steelwork shall comply with the VOC limits stipulated in the Air Pollution Control (Volatile Organic Compounds) Regulation.

STW.M530.9 LEAD BASED PAINTS

Shall not be used for finishing coats.

ANCILLARY MATERIALS

STW.M610.9 GROUT FOR COLUMN BASES

1. Grout for bedding steel bases and for filling bolt pockets and pocket bases shall be based on PC and shall have the same grade strength as the surrounding foundation concrete. The grout shall contain a non-metallic expanding admixture and shall have a total chloride content of not more than 0.1% by mass of cement;
2. Grout for bedding steel bases and for filling bolt pockets shall be a proprietary type approved by the CM and shall be suitable for filling the space by pouring under a suitable head. The proportions of the grout shall be in accordance with the manufacturer's recommendations;
3. A dry packed mortar may be used for bedding steel bases which exceed 75 mm thick. The mortar shall consist of 1 part by weight of cement of 2 parts by weight of fine aggregate together with the minimum amount of water necessary to achieve a consistency suitable for thorough ramming against supports such that the space is completely filled;
4. Grout for filling pocket bases shall be a mix Approved by the CM with a nominal maximum aggregate size of 10 mm.

STW.M620.9 LUBRICANT

Lubricant for lubricating nut threads of HSFG bolts shall be a wax based type Approved by the CM. Machine oil and other free flowing lubricants shall not be used.

SUBMISSIONS

STW.M710.9 STEEL

1. The manufacturer's certificates for steel shall be submitted to the CM in accordance with BS 4360:1986, Clause 12 and Appendix B6;
2. The certificates shall be submitted to the CM not more than 2 days after the steel has been delivered to the place of fabrication.

STW.M715.9 WELDING CONSUMABLES

The manufacturer's certificates for each batch of electrodes / rods / coils of wire shall be submitted to the CM.

STW.M720.9 DRAWINGS

1. Two sets of drawings of the steelwork shall be submitted to the CM. The drawings shall show details of the following:
    a. Steelwork and welds, including any stud welds, marked with the relevant welding procedures;
    b. Joints or non-standard welds proposed by the Contractor;
    c. Locations and methods of removal of any temporary welded attachments proposed by the Contractor;
    d. Edges of steelwork complying with BS 5400:Part 6:1980 to be formed by flame cutting or shearing procedures complying with BS 5400:Part 6:1980, Clause 4.3.3 (a), (d) and (e) with the edges marked with the procedures to be used;

e. Parts of steelwork complying with BS 5400:Part 6:1980 to be worked by hot processes complying with BS 5400:Part 6:1980, Clause 4.8, 4.9 or 4.10 with the parts marked with the processes to be used;

2. The drawings shall be submitted to the CM for Approval at least 6 weeks before fabrication of the steelwork starts. Drawings shall not be Approved until all procedures and details shown on the drawings have been approved by the CM;

3. A print and a diazo film of the Approved drawings shall be submitted to the CM at least 7 days before fabrication of the steelwork starts.

STW.M730.9 DELIVERY

1. The following particulars of steelwork fabricated off the Site shall be submitted to the CM:

   a. Expected and actual arrival dates;

   b. Name of carrier;

   c. Duplicate copies of bill of lading and packing list for steelwork transported by sea;

   d. Duplicate copies of delivery note and a list showing the marking and weight of each component for steelwork transported by land;

2. The particulars of expected arrival date and name of carrier shall be submitted to the CM at least 14 days before the due date; other particulars shall be submitted to the CM within 3 days after delivery of the steelwork to the Site.

STW.M740.9 ERECTION

1. The following particulars of the proposed method of erecting steelwork shall be submitted to the CM:

   a. Sequence and method of erection of steelwork;

   b. Method of lifting and handling the components;

   c. Method of preventing damage to protective coatings on steelwork during handling;

   d. Procedure for aligning, levelling and plumbing steelwork, including temporary supports and methods of making beddings for column bases;

   e. Sequence of casting concrete bonded to the steelwork;

2. The particulars shall be submitted to the CM at least 6 weeks before erection of the steelwork starts.

STW.M750.9 WELDER CERTIFICATES

1. Certificates endorsed by inspecting authority Approved by the CM shall be submitted to the CM to show that each welder has been Approved in accordance with BS 4570:1985, BS EN 287:Part 1:1992 or BS 4872:Part 1:1982 as appropriate. The extent of approval of the welder shall be appropriate to the categories of welds which he will carry out;

2. The welder certificates shall be submitted at least 4 weeks before fabrication of the steelwork starts.

STW.M760.9 WELDING PROCEDURES

The particulars of the proposed welding procedures as specified in Project Specific Specification shall be submitted to the CM at the same time as welder certificates are submitted.

STW.M770.9 STUD WELDING, FLAME CUTTING AND SHEARING

1. The following particulars of the proposed stud welding, flame cutting and shearing procedures for steelwork complying with BS 5400:Part 6:1980 shall be submitted to the CM:
    a. Procedures for stud welding, flame cutting and shearing processes complying BS 5400:Part 6:1980, Clause 4.3.3 (a), (d) or (c);
    b. Documentation endorsed by an inspecting authority Approved by the CM to show that the stud welding, flame cutting or shearing procedure has complied with the procedure trial requirements stated in STW.T020 (4) in previous tests; report of procedure trials as stated in STW.T060 (2) if procedure trials are required under STW.T010 (1).
2. The particulars shall be submitted to the CM at least 6 weeks before fabrication of the steelwork starts.

STW.M780.9 PREPARATION FOR GALVANIZING

Particulars of the method of plugging vent holes required for hot-dip galvanizing hollow or box sections shall be submitted to the CM at least 3 weeks before fabrication of the steelwork starts.

STW.M790.9 NON-DESTRUCTIVE TESTING

Particulars of the proposed method for carrying out non-destructive testing on welds shall be submitted to the CM at least 4 weeks before the tests start.

STW.M800.9 INSPECTING AUTHORITY

The name of the proposed inspecting authority endorsing welder certificates and records of approval tests for welding procedures shall be submitted to the CM. The name shall be submitted at least 3 weeks before approval tests start or, if approval tests are not required, at the same time as the welder certificates are submitted.

STW.M810.9 TESTING CONSULTANT

The name of the proposed testing consultant stated in STW.T210 shall be submitted to the CM at least 3 weeks before the testing consultant commences work.

STW.M820.9 PAINTS

The following particulars of the proposed paints and associated products shall be submitted to the CM at least 6 weeks before painting starts:

1. Name of manufacturer;
2. Duplicate copies of the manufacturer's data sheets including temperature, humidity and other conditions at the workshop or on the Site under which the paint is to be applied; and
3. Manufacturer's product specifications, product range and technical information.

SAMPLES

STW.M910.9 STEEL

A sample of blast cleaned steel plate shall be submitted to the CM for Approval at least 14 days before blast cleaning starts. The sample shall be 150 mm x 150 mm x 6 mm and shall be enclosed in a sealed, colourless, transparent wrapping. The grade of steel and the method of blasting shall be representative of those which will be used in the permanent work.

STW.M920.9 PAINTING SYSTEM

Two samples of painted tin plates for each painting system shall be submitted to the CM at least 14 days before painting starts. Each plate shall be 150 mm x 75 mm x 1 mm and shall have smooth edges and 10 mm corner radii. The plates shall be brush cleaned and painted on one face with the painting system in such a manner that each coat is stepped back from the underlying coat in equal strips. The degree of gloss of the finishing coat shall be as agreed by the CM.

STW.M930.9 FIXINGS

Samples of each type of nut, bolt, washer, stud and rivet shall be provided within 3 days after the material is delivered to the Site.

WORKMANSHIP

HANDLING, STORAGE AND TRANSPORT

STW.W010.9 HANDLING STEELWORK

1. Steelwork shall not be subject to rough handling, shock loading or dropping from a height;
2. During handling and transport of coated steelwork, the steelwork shall be separated from wires and lashings by rubber padding in such a manner that the coatings are not damaged or discoloured. Free ends shall be stiffened, measures shall be taken to prevent permanent distortion and machined surfaces and faying surfaces shall be protected;
3. Steelwork shall not be lifted from the painting bed until the last applied coating is sufficiently dry or cured for handling.

STW.W020.9 PACKING OF SMALL COMPONENTS

Rivets, bolts, nuts, washers, screws and small plates and articles shall be packed in containers marked to identify the contents.

STW.W030.9 STORAGE OF STEELWORK

1. Steelwork shall be stored off the ground on level supports in well drained areas in a manner which will not result in damage or deformation to the steelwork or coatings or in contamination of the steelwork or coatings. Packings shall be placed between steelwork which is stacked;
2. Covered places in which steelwork is stacked shall be ventilated;
3. Different types and sizes of steelwork shall be stored separately;
4. Steelwork shall not be stored on or adjacent to concrete surfaces which form part of the permanent work;
5. Steelwork shall be protected from exposure to conditions which may affect the steelwork or coatings;
6. Wet paint films, steelwork surfaces which are to be primed or overcoated and joint surfaces which are to be assembled shall be protected from exposure to conditions which may affect the film or surface. Undercoats which contain anatase titanium dioxide shall be protected from exposure to direct sunlight;
7. Except as stated in sub-clauses (8) and (9) steelwork shall be stored in an enclosed workshop and protected from conditions which may affect the steelwork after the steelwork has been cleaned as stated in STW.W510 until the following times:
    a. When the second undercoat to painted steelwork has hard dried;
    b. When the coating process to galvanized, electroplated or metal sprayed steelwork has been completed;
    c. When the sealer to metal sprayed and sealed steelwork has been completely absorbed;
    d. When the first undercoat to metal sprayed and painted steelwork has hard dried.
8. Primed steelwork surfaces may be exposed outside the enclosed workshop for a period not exceeding two weeks;

9. Micaceous iron oxide undercoats to steelwork may be exposed outside the enclosed workshop for a minimum period necessary to move the steelwork from one part of the workshop to the other; the undercoated surfaces shall be covered when the steelwork is being moved.

STW.W035.9 STORAGE OF ELECTRODES

Keep electrodes in unbroken packets in accordance with BS EN 1011-1:2009. Any drying or baking of consumables before issue shall be carried out in accordance with the manufacturer's recommendations.

STW.W040.9 STORAGE OF PAINT

Paint and associated materials shall be stored in sealed containers marked as stated in STW.M510 and protected from exposure to conditions which may affect the materials. The materials shall be stored in accordance with the manufacturers' recommendations and shall not be used after the recommended expiry date has been exceeded. The materials shall be stored in a locked store.

FABRICATION GENERALLY

STW.W110.9 STANDARDS

1. Comply with BS 5950:Part 2:1992, Sections 3 and 4 for general steelwork except where stated in this Worksection;
2. Comply with BS 5400:Part 6:1980, Clauses 4.1 to 4.16 for bridgeworks.

STW.W120.9 ALLOWANCES FOR DEFORMATION

Allowances shall be made for the deformation due to permanent loads and the process and sequence of fabrication, erection and construction such that steelwork is completed to within the specified tolerances.

STW.W130.9 COMPATIBILITY OF DIMENSIONS

The compatibility of the dimensions and setting-out data of steelwork shall be verified by the Contractor before the materials for steelwork are ordered.

FABRICATION - WELDING, HEATING AND CUTTING

STW.W210.9 GENERAL

1. Welding, heating or thermal cutting processes which give off toxic or irritant gases shall not be used unless permitted by the CM; if permitted, precautions, including the provision of exhaust ventilation, breathing apparatus and display of warning signs, shall be taken to enable the work to be carried out in safe conditions. Welding, heating or thermal cutting shall not be carried out within 2 m of lead-based, cadmium or carbonaceous coatings;
2. Pre-setting, pre-bending, skip welding, back-step techniques and other measures shall be taken as necessary to counteract shrinkage or distortion due to welding, gouging, thermal cutting or heat treatment.

STW.W220.9 WELDERS

Welding shall be carried out by welders who possess a valid welding certificate for the appropriate category of welding. A welder shall cease to carry out welding if any of the circumstances stated in BS 4570:1985, Clause 21.1 or BS 4872:Part 1:1982, Clause 6 as appropriate occurs, or the requirements stated in BS EN 287:Part 1:1992, Clause 10.1 are not satisfied.

STW.W230.9 BUTT WELDS

1. Butt welds shall be complete penetration butt welds made between fusion faces;
2. Butt welds in each component part shall be completed before the final assembly of built-up assemblies.

STW.W240.9 STAINLESS STEEL

Welding of austenitic stainless steel shall be carried out in accordance with BS 4677:1984.

STW.W250.9 TEMPORARY WELDS

1. Temporary welded attachments shall not be used unless permitted by the CM;
2. Temporary welded attachments, when permitted by the CM to be used, shall be removed by cutting with a flame torch 3 mm above the surface of the steel member when not required any longer. The excess metal protruding above the parent plate surface shall be removed by grinding and finished flush.

FABRICATION - BOLTED CONNECTIONS

STW.W310.9 LENGTH OF BOLTS

1. The length of HSFG bolts shall comply with BS 4604:Part 1:1970 or BS 4604:Part 2:1970 as appropriate;
2. The length of bolts complying with BS 3692:1967, BS 4190:2001 and BS 4933:1973 shall be such that the end of the bolt will project above the nut by at least one thread, but by not more than one nominal bolt diameter, after tightening.

STW.W320.9 LENGTH OF THREADS

The length of threads on bolts shall be determined in accordance with BS 3692:1967, BS 4190:2001, BS 4395:Part 1:1969, BS 4395 Part 2:1969, BS 4395 Part 3:1973 or BS 4933:1973 as appropriate. If additional locknuts or other nuts are specified, the thread length shall be increased by one nominal bolt diameter for each additional nut.

STW.W330.9 NUTS

Nuts shall not be used with bolts or screws which comply with a different Standard.

STW.W340.9 WASHERS

Washers for HSFG bolts shall be provided in accordance with BS 4604:Part 1:1970 or BS 4604:Part 2:1970 as appropriate. Washers shall be provided for bolts complying with BS 3692:1967, BS 4190:2001 and BS 4933:1973 under the nut or bolt head, whichever is rotated during tightening, if the parts to be connected are to be coated with protective coatings before assembly. Washers shall be provided under the nuts and heads of bolts in oversized and slotted holes.

STW.W350.9 TIGHTENING BOLTS

Bolts shall be tightened in such a manner that the contact surfaces of permanent bolted joints are drawn into close contact.

STW.W360.9 TIGHTENING HSFG BOLTS

1. The degree of preliminary tightening of bolts and nuts complying with BS 4395:Part 1:1969 which are tightened by the part turn method shall be torque controlled. The tightening equipment for preliminary tightening shall be calibrated with a bolt load meter. The value of bedding torque for the preliminary tightening shall be within 10% of the values stated in the following table:

Bedding Torque for HSFG Bolts	
Nominal diameter of bolt (mm)	Bedding torque (N.m)
16	80
20	160
22	210
24	270
27	340
30	460

2. Bolts and nuts at each joint with bolts and washers with load indicating devices shall be initially tightened to bring the faying surfaces into close contact over the full area. The range of the average gap after initial tightening shall be as agreed by the CM. The bolts and nuts shall be re-tightened to close the average gap back to the agreed range. After all bolts and nuts at the joint have been initially tightened, the bolts and nuts shall be finally tightened to attain the shank tension stated in BS 4604:Part 1:1970 or BS 4604:Part 2:1970 as appropriate. The range of average gap corresponding to the required shank tension shall be established for each batch as defined in BS 4395:Part 1:1969, BS 4395:Part 2:1969 or BS 4395:Part 3:1973 as appropriate by testing at least three bolt, nut and washer assemblies in a bolt load meter and shall be as agreed by the CM. The average gap after final tightening shall be within the established range;

3. The threads of nuts for HSFG bolts which are to be tightened by the part turn method or the load indicating method shall not be lubricated unless Approved by the CM. If the use of lubricant is Approved in the part turn method, the bedding torque shall be established by a bolt load meter and shall be as agreed by the CM. The lubricant shall be applied at the place of manufacture and shall only be applied to the nut threads. The bearing surfaces of the nuts and the faying surfaces shall not be contaminated with the lubricant;

4. The bolt load meter for measuring bolt shank tension in the part turn, torque control or load indicating methods of tightening shall be calibrated by a laboratory approved by the CM before tightening of bolts and nuts starts and at regular intervals agreed by the CM. During re-calibration, a replacement calibrated bolt load meter shall be provided on the Site. Calibration results shall be submitted to the CM at least one week before the bolt load meter is used.

FABRICATION - APPROVAL AND DEFECTS

STW.W410.9 DEFECTIVE STEELWORK

Defective components for steelwork shall not be used in the permanent work unless repair of the defects is permitted by the CM. If permitted, defective components shall be repaired by methods agreed by the CM.

STW.W420.9 APPROVAL

Until the steelwork, including any repaired areas, complies with the specified test and inspection requirements and has been approved by the CM, fabricated steelwork shall not be:

1. Covered with protective coatings, concrete or other materials;
2. Erected; or
3. Despatched from the place of fabrication if fabricated off the Site.

PREPARATION OF STEELWORK TO RECEIVE COATINGS

STW.W510.9 CLEANING STEELWORK AND COATED SURFACES

1. Soil, concrete and other adherent matter shall be removed immediately from steelwork or coated surfaces and the surfaces shall be made good by methods agreed by the CM;
2. Dust, soot, grit, detritus, metallic or other loose particles shall be removed by vacuuming after steelwork surfaces have been blast cleaned or before coated surfaces are washed or steam cleaned;
3. Oil and grease shall be removed by emulsion cleaners, by steam cleaning or by high pressure water jets before removing rust and mill scale or overcoating. Oil and grease shall not be removed by turpentine or other solvents. If steam cleaning is used, steam cleaning shall be carried out after the greasy deposits have been removed by scraping and a detergent shall be added to the feed water of the steam generator;
4. Salts, chemicals, corrosion or paint degradation products, including rust-spotting on blast cleaned surfaces and zinc salts on zinc coatings or zinc-rich paints, shall be removed by washing with detergent solution before coating steelwork surfaces or overcoating;
5. The final shop coats on external surfaces shall be thoroughly washed with a detergent solution at the Site before being overcoated;
6. Unless otherwise permitted by the CM finished coated surfaces shall be cleaned as stated in sub-clauses (2), (3), and (4) not more than 14 days before handover of the steelwork;
7. Cleaning agents to be used shall be as agreed by the CM. Surfaces which have been cleaned using cleaning agents shall be rinsed with fresh water to remove all traces of the cleaning agent;
8. Cleaning tools shall be a type which will not result in damage to the surfaces being cleaned. Wire brushes and brooms shall not be used for cleaning coated surfaces.

STW.W520.9 PREPARATION OF STEEL SURFACES

1. Bare metal surfaces of steelwork which are to be painted or metal coated shall be treated before rust and mill scale are removed in accordance with the following requirements:
   a. Burrs, arrises and serrations shall be smoothed by grinding or filing;
   b. Weld spatter, weld slag and raised metal laminations shall be removed by grinding or chipping and the surface shall be made good.
2. Rust and mill scale shall be removed from steelwork which is to be metal coated in factories by a pickling process which is compatible with the metal coating process;
3. Rust and mill scale shall be removed from steelwork which is to be metal sprayed by blast cleaning carried out in accordance with BS 2569:Part 1:1964, Clause 3;
4. Rust and mill scale shall be removed from steelwork which is to be painted by blast cleaning as stated in STW.W540 unless the use of acid-pickling, mechanical cleaning or flame cleaning as stated in STW.W550 to STW.W570 has been approved by the CM;
5. Excess acid or other chemicals used in the pickling process shall be removed from steelwork which has been prepared by pickling before the application of the metal coating. Pickling shall not be carried out for longer than is necessary to remove the rust and mill scale.

STW.W530.9 METAL COATINGS

1. Metal coatings which will be overcoated with paint shall not be passivated;
2. Damaged areas of metal coatings shall be rubbed down to remove excessive roughness, cleaned and made good with a compatible coating of a type approved by the CM;
3. Metal coatings required on part of a component shall be completed before the rest of the component is painted.

STW.W540.9 BLAST CLEANING

1. Carry out blast cleaning of steelwork to second quality of surface finish in accordance with Sa 2½ in Swedish Standard SIS 05 59 00:1988 using chilled iron abrasive;
2. Grade chilled iron grit in accordance with BS 2451:1963. The maximum size of grit shall be G17 for use in automatic impeller type equipment and shall be G12 for manual or compressed air equipment. The difference in level between a peak and the adjacent trough of the blasted surface profile shall not exceed 0.1 mm;
3. Do not use non-metallic abrasives with a maximum particle size not exceeding 1 mm other than with portable equipment;
4. Abrasives shall not contain materials which may contaminate the steel surfaces. Do not use sand containing salt or excessive amounts of silts. Remove contaminants from recovered abrasives before re-use;
5. Carry out blast cleaning in a fully enclosed space separated from the place of painting. The enclosed space shall be fitted with dust extractors and filters to prevent the dispersal of dust outside the enclosed space.

STW.W550.9 ACID PICKLING

Acid-pickling of steelwork shall be carried out by the Footner process in accordance with BS 5493:1977, Clause 14.3.2. The first priming coat of paint shall be applied as soon as the steel has dried and is still warm.

STW.W560.9 MECHANICAL CLEANING

Mechanical cleaning of steelwork shall be carried out using carborundum grinding discs or other power-driven tools followed by steel wire brushing and dusting to remove all loosened material which is not firmly bonded to the metal surface. Excessive burnishing of the metal through prolonged application of rotary wire brushes shall not be carried out. Visible peaks and ridges shall be removed. Pneumatic chipping hammers shall not be used.

STW.W570.9 FLAME CLEANING

1. Flame cleaning shall be carried out without distorting the steelwork and without adversely affecting the properties of the steel. The temperature of the steel surface being flame cleaned shall not exceed 200°C;
2. Loose materials shall be removed from the flame-cleaned surface by wire brushing followed by blowing dry air or vacuuming. The priming coat shall be applied when the surface temperature of the steel is between 35°C and 40°C. Surfaces with temperatures of less than 35°C shall be reheated;
3. Flame cleaning of steelwork shall not be carried out at the following locations:
    a. Within 2 m of HSFG bolts, cold worked high tensile steel and surfaces already coated with paint or cadmium, lead-based or carbonaceous materials;
    b. On sections thinner than 0.5 mm.

STW.W580.9 BOLTS, NUTS AND WASHERS

Bolts, nuts and washers for steelwork shall be kept free from dirt and deleterious material. Oil and grease on bolts, nuts and washers other than Approved lubricants for nuts of HSFG bolts, shall be removed before assembling and coating the exposed parts of assembled bolts, nuts and washers.

STW.W590.9 APPROVAL

Surfaces shall not be coated until the cleaning and preparation of the surfaces have been approved by the CM.

PAINTING SYSTEMS

STW.W610.9 SYSTEM A

Here shown or scheduled on the Drawings, apply the following paint system:

1. Primer: 1 coat of high build zinc phosphate paint;
2. Undercoat: 2 coats of oil based with micaceous iron oxide phenolic paint;
3. Finish: 1 coat of alkyd resin paint;
4. Minimum total DFT: 250 microns.

STW.W620.9 SYSTEM B

Where shown or scheduled on the Drawings, apply the following paint system:

1. Primer: 1 coat of epoxy resin with aluminium mastic paint;
2. Undercoat: 1 coat of epoxy resin paint;
3. Finish: 1 coat of epoxy resin paint;
4. Minimum total DFT: 280 microns.

STW.W630.9 SYSTEM C

Where shown or scheduled on the Drawings, apply the following paint system:

1. Primer: 1 coat of inorganic zinc silicate paint DFT 75 microns;
2. Undercoat: 2 coats of high build micaceous iron oxide epoxy paint;
3. Finish: 1 coat of high build amine adduct cure epoxy paint;
4. Minimum total DFT: 320 microns.

STW.W640.9 SYSTEM D

Where shown or scheduled on the Drawings, apply the following paint system:

1. Primer: 1 coat of two pack wash primer DFT 5 microns;
2. Undercoat: 1 coat of epoxy resin paint;
3. Finish: 1 coat of epoxy resin paint or 2 coats of polyurethane paint;
4. Minimum total DFT: 180 microns.

STW.W650.9 SYSTEM E

Where shown or scheduled on the Drawings, apply the following paint system:

1. Inhibitor: rustoleum or other rust inhibitor paint Approved by the CM;
2. Primer: zinc phosphate, for hot-dip galvanized or GI surface, 'T' wash as specified in BS 5493:1977, Section 2, Clause 11.3.2;
3. Undercoat: 2 coats of micaceous iron oxide paint;
4. Finish: 1 coat of oil based paint or 1 coat of micaceous iron oxide paint;
5. DFT of each coat: as recommended by the manufacturer.

APPLYING PAINT TO STEELWORK

STW.W710.9 GENERAL

1. The different types of paints within each painting system shall be compatible with each other and shall be manufactured by the same manufacturer. Successive coats in a painting system including stripe coats, shall be in contrasting colours to aid identification;
2. Surfaces which are to be painted shall be dry immediately before paint is applied;
3. Paint shall be taken from the paint store ready for application. Thinning, if necessary, shall be carried out in the paint store in the presence of the CM and using the type of thinner in the ratio stated in the manufacturer's data sheets;
4. Paint shall be applied by brush, by air pressure spray or by airless spray. Sealer and primers shall be applied by continuous spraying;

5. Each coat in the paintwork system shall be sufficiently dry or cured before the next coat is applied. The time between the application of successive coats shall be within the limits recommended by the manufacturer and the limits stated in STW.W730;
6. Paints having a pot life specified by the manufacturer, including two pack paints and moisture cured paints, shall be discarded on expiry of the pot life or at the end of each working day, whichever comes first. Other paints in opened containers shall be kept in sealed containers with not more than 10% ullage in store after each day's work and shall not be thinned or mixed with fresh paint when re-issued for another day's work.

STW.W720.9 AMBIENT CONDITIONS

1. Paint shall not be applied to steelwork under the following conditions:
   a. When the ambient temperature falls below 4°C or the relative humidity rises above 90%;
   b. For outdoor work, during periods of inclement weather including fog, frost, mist and rain or when condensation has occurred or is likely to occur on the metal;
   c. When the surface temperature of the metal to be painted in less than 3°C above the dew point of the ambient air;
   d. When the amount of dust in the air or on the surface to be painted is in the opinion of the CM excessive;
2. Two pack paints of the epoxide resin type shall not be applied and cured when the temperature is below that recommended by the paint manufacturer.

STW.W730.9 TIME LIMITS ON PAINTING

1. Blast cleaned steel shall be primed or metal coated within 4 hours after blast cleaning;
2. Primed steel surfaces shall be overcoated within 8 weeks after priming;
3. Second undercoats shall be applied within 72 hours after application of the first undercoat;
4. Sealer or etch primer to sprayed metal shall be applied within 4 hours after spraying. The etch primed surfaces shall be overcoated within 72 hours after priming;
5. Etch primer to galvanized steelwork shall be applied within 14 days after delivery of the steelwork to the Site. The etch primed surfaces shall be overcoated within 48 hours after priming;
6. Overcoats to two pack paints of the epoxide of polyurethane type shall be applied within 48 hours after application of the two pack paint. If it is not possible to overcoat within 48 hours, the two pack paint shall be abraded to produce a roughened surface and shall be given a flash coat of primer of a type approved by the CM. The primer shall be allowed to dry for at least 4 hours before application of the next coat of the system.

STW.W740.9 STRIPE COATS

Immediately after the first undercoat of the painting system to steelwork has dried, a stripe coat of undercoat paint shall be applied by brush to edges, corners, crevices, exposed parts of bolts, nuts, rivets and welds. Another stripe coat of finishing paint shall be applied in the same manner after the last undercoat has dried.

STW.W750.9 FINISH THICKNESS

1. The dry film thickness of the paint coats to steelwork shall be measured using a magnetic dry film thickness gauge or other apparatus Approved by the CM. The total dry film thickness shall be measured at spacings of approximately 1.0 m. If the measured dry film thickness is less than 75% of the specified nominal dry film thicknesses or if more than 10% of the measured dry film thickness are less than 95% of the specified nominal dry film thickness, repair work shall be carried out as stated in STW.W780;
2. Wet film thickness gauges shall not be used as a means of determining whether the dry film thickness of the painting system complies with this Specification.

STW.W760.9 FINISH QUALITY

1. Each coat of paint shall be free from embedded foreign matter, mechanical damage and surface defects, including bittiness, blistering, brush marks, bubbling, cissing, cracking, cratering, dry spray, floating, pinholing, rivelling, runs, sagging, spotting and spray mottle as stated in BS 2015:1992. The finished paintwork system shall have an even and uniform appearance;
2. Each coat of paint shall adhere firmly to the substrate without blistering, chipping, flaking or peeling.

STW.W770.9 ETCH AND BLAST PRIMERS

Etch primers and blast primers shall not be applied on phosphated steel and shall not be overcoated with zinc-rich primers.

STW.W780.9 REPAIRS TO DAMAGED PAINT

1. Areas of paint to steelwork which have been damaged shall be cleaned to bare metal or to the metal coating; the edges of the undamaged paint shall be bevelled;
2. The full specified painting system shall be restored in such a manner that each new paint coat overlaps the existing paint by at least 50 mm all round the affected part.

PROTECTION OF JOINTS AND SURFACES

STW.W810.9 SHOP BOLTED JOINTS

Blast primer for painted steelwork or sprayed metal plus sealer for metal sprayed steelwork shall be applied to the joint and parent material of shop-bolted joints other than HSFG bolted joints. Joints for painted steelwork shall be assembled after the first undercoat of the painting system has been applied to the contact surfaces and while the undercoat is still wet.

STW.W820.9 SITE BOLTED JOINTS

Surfaces of the parent and joint material of site-bolted joints other than HSFG bolted joints shall be coated with the same protective system as the parent material.

STW.W830.9 HSFG BOLTED JOINTS

1. The faying surfaces of HSFG bolted joints in steelwork which is metal sprayed overall and sealed or metal sprayed and painted overall shall be coated with the sprayed metal. The sealer on the parent material shall extend for a distance of between 10 mm and 20 mm inside the perimeter of the faying surfaces. Free surfaces and edges of the joint material shall be coated with the same sealer;

2. The joint material and the faying surfaces on the parent material of steelwork which is metal sprayed only at joints and painted overall shall be metal sprayed. The sprayed metal on the parent material shall extend for a distance of between 10 mm and 20 mm outside the perimeter of the faying surfaces. The primer on the parent material shall extend for a distance of between 10 mm and 20 mm inside the perimeter of the faying surfaces. Sprayed metal on the free surfaces and edges of the joint material shall be coated with a sealer which is compatible with the painting system;
3. The primer on the parent material of steelwork which is painted overall and undercoat at faying surfaces of HSFG bolted joints shall extend for a distance of between 10 mm and 20 mm inside the perimeter of the faying surfaces.

STW.W840.9 WELDED JOINTS

Welds and steelwork surfaces which have been affected by welding shall be coated with the same protective system as the parent material.

STW.W850.9 JOINTS MADE AFTER COMPLETION OF COATING

1. Hot-dip galvanizing and electroplating to steelwork shall not be carried out until all welds for the steelwork which is to be galvanized or electroplated have been completed;
2. Except as stated in sub-clause (4), sprayed metal on the parent material shall be kept at least 15 mm, but not more than 300 mm, clear of areas which are to be welded. The restricted area shall be masked during metal spraying;
3. Except as stated in sub-clause (4), successive coats of paint on the parent material shall be stepped back at 30 mm intervals commencing at 100 mm from welded joints and at 10 mm from the perimeter of HSFG bolted joints;
4. If the parent metal in the Approved welding procedure is coated with the pre-fabrication primer or sprayed metal such coatings are permitted to cover the area to be welded. After welding the pre-fabrication primer or sprayed metal adjacent to the weld shall be made good;
5. The parent material, joint material, exposed part of bolts, nuts and washers, welds and weld affected areas shall be cleaned, prepared and brought up to the same protective system as the adjoining surfaces not more than 14 days after the joints have been made.

STW.W855.9 REINSTATEMENT OF ZINC COATING WITH POST-GALVANIZING WELDING

1. Where post-galvanizing welding is necessary and permitted by the CM, the zinc coating shall be ground off the mating surfaces directly before welding. Immediately after welding, the surface of the weld area shall be prepared by removal of slag with the chipping hammer followed by vigorous wire brushing. The zinc coating shall then be reinstated within 4 hours of welding by either:
    a. Application of the two coats of an organic zinc rich paint (zinc content at least 95%) to an overall dry film thickness greater than 100 μm in accordance with BS EN ISO 12944 (1998); or
    b. Pre-heating the surface of the weld area to 315℃ and application of proprietary metallic repair stick or powder to a thickness greater than 100 μm.
2. If reinstatement of the zinc coating takes place after 4 hours of welding, the weld areas shall be vacuum-grit blasted in accordance with BS EN ISO 8501 "first quality" and hot-zinc spray coated in accordance with BS EN ISO 2063 (2005) to a minimum coating thickness of 100 μm;

3. After reinstatement of the zinc coating, the specified paint system shall be applied to the repaired area in accordance with STW.W610 to STW.W780 in such a manner that each new paint coat overlaps the existing paint by at least 50 mm all round the affected part.

STW.W860.9 SEALING JOINTS

1. The different parts of joints in steelwork shall be dry immediately before the joints are assembled;
2. Gaps around the perimeter of bolted joints and load indicator gaps of HSFG bolts in steelwork painted overall shall be sealed by brush application of the same painting system as the parent material; gaps shall be plugged if necessary with soft solder wire without flux core as a backing before sealing with paint.

STW.W870.9 HOLLOW SECTIONS

The ends of hollow steel section shall be sealed by welding mild steel plates over the open ends; the plates shall be at least 5 mm thick. Immediately before hollow steel sections are sealed, bags of anhydrous silica gel shall be inserted in each void at the rate of 0.25 kg/m^3 of void.

STW.W880.9 BRIDGE BEARING SURFACES

Dirt, oil, grease, rust and mill scale shall be removed from the metal bearing surfaces for bridge bearings. The surfaces shall be masked with tape or other methods agreed by the CM and shall not be primed or painted until the bonding agent has been applied.

STW.W890.9 UNCOATED SURFACES

The coated surfaces of steelwork coated over part of the surface shall be protected from rust which may form on the uncoated surfaces. Temporary coatings which may affect the bond between concrete and uncoated surfaces against which the concrete is to be placed shall be removed and the uncoated surfaces shall be cleaned before the concrete is placed. The full coating system shall extend 25 mm, or 75 mm for steel piles, into areas against which concrete is to be placed.

ERECTION OF STEELWORK

STW.W910.9 FOUNDATION BOLTS

1. Foundation bolts for steelwork shall be held firmly in the set position during fixing. Measures shall be taken to ensure that the full movement tolerances are achieved and the bolts are not displaced during concreting. Bolts and nuts, including the threads, shall be protected against damage, corrosion and contamination;
2. Bolt pockets shall be kept dry and clean. Tubes which are cast in concrete for grouting bolt pockets shall be securely fixed and sealed to prevent ingress of grout during concreting;
3. Bolts in bolt pockets shall be installed in such a manner that the bolt can be moved inside the pocket as designed without hindrance.

STW.W920.9 SUPPORTING DEVICES

The material, size, position and cover of packs, shims and other supporting devices for steelwork which are to be embedded shall be as approved by the CM.

STW.W930.9 TEMPORARY SUPPORTS AND FASTENINGS

1. Steelwork shall be secured in position by temporary supports and fastenings until sufficient permanent connections are complete to withstand the loadings liable to be encountered during erection. The temporary supports and fastenings shall be capable of withstanding loadings which may be encountered during erection and shall not damage the steelwork or the protective coatings;
2. Riveted and bolted connections shall be aligned using drifts complying with BS 5400:Part 6:1980, Clause 4.12 and shall be temporarily fastened using service bolts.

STW.W940.9 ALIGNMENT

1. Steelwork shall be erected in such a manner that the alignment and levels of the steelwork comply with the tolerances stated in TOL.STW.040. Allowance shall be made for the effects of temperature on the steelwork;
2. Measures shall be taken to ensure that the steelwork will remain stable before temporary supports and fastenings are slackened or removed for lining, levelling, plumbing or other purposes. The temporary supports and fastenings shall be re-tightened or replaced as soon as the adjustments are complete and at the end of each continuous period of working;
3. Permanent connections shall be made as soon as a sufficient portion of the steelwork has been lined, levelled and plumbed. Temporary supports and fastenings shall be replaced by permanent connections progressively and in such a manner that the part connected are securely restrained in the aligned position at all times;
4. Permanent connections for each portion of steelwork shall be completed not more than 14 days after the portion has been erected.

STW.W950.9 COLUMN BASES

1. Column bases for each portion of steelwork shall not be bedded or grouted until the portion has been lined, levelled, plumbed and permanently connected. Spaces below the steel shall be dry, clean and free from rust immediately before bedding or grouting;
2. Proprietary types of grout shall be used in accordance with the manufacturer's recommendations;
3. Temporary timber wedges holding steel columns in position shall not project into pockets bases by more than one-third of the embedded length of the steel column. The pocket shall be initially concreted up to the underside of the wedges and the steel column shall be left undisturbed until 48 hours after concreting; the wedges shall then be removed and the remainder of the pocket shall be concreted.

TOLERANCES

STW.W1010.9 GENERAL

Refer to Appendix H 'Schedule of Tolerances' to this Specification.

OFF-SITE FABRICATION

STW.W1110.9 SUBMISSIONS

Where structural steelwork is to be fabricated off-site, submit the following items for Approval within a period from the notified date for commencement of the Works as specified in the Project Specific Specification:

1. The name, fabrication yard address with street maps and job reference of the fabricator and the following:
    a. A quality assurance (QA) scheme and testing regime on fabrication of the structural steelwork with the items as stipulated in STW.W1120; and
    b. A fabrication and delivery schedule.
2. A RSE appointed by the Contractor who shall carry out the duties as stipulated in STW.W1130;
3. A laboratory for carrying out the tests and issuing test certificates in the QA scheme, which shall be accredited either by Hong Kong Accreditation Scheme (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS), or an equivalent organization which has signed a mutual recognition agreement with HOKLAS.

STW.W1120.9 QUALITY ASSURANCE (QA) SCHEME

Ensure that the steelwork is fabricated under a quality assurance scheme which covers the following items and is certified under ISO 9001:

1. Organisation chart of the fabrication yard with the qualification and experience of key technical personnel clearly stated;
2. Responsibility of the management in respect of the fabrication process;
3. Material purchasing and delivery procedures;
4. Material / product identification, traceability process and control;
5. Fabrication and inspection process;
6. Designated welders who shall be tested to and comply with the requirements of this Specification;
7. Quality control testing regime including welding procedural test and chemical analysis for welding consumables used for temporary or permanent structural steelworks on Site of steel grade as stated in STW.M110 and shown in the working drawings;
8. Control on non-compliant materials and works;
9. Transportation and storage process.

STW.W1130.9 REGISTERED STRUCTURAL ENGINEER

1. Appoint a Registered Structural Engineer (RSE) registered under Buildings Department for ensuring and certifying that the fabrication works are in compliance with the drawings and Specification;
2. The duties and roles of the RSE include but not limited to:
    a. Pay regular site visits to off-site fabrication yard for proper control of the works and submit reports after each visit;
    b. Carry out inspection on all activities which, in his professional judgement, are critical and require close supervision.
3. The frequency of RSE's visits shall be a minimum of two visits per month.

TESTING

PROCEDURE TRIALS FOR WELDING, FLAME CUTTING AND SHEARING

STW.T010.9 GENERAL

1. If in the opinion of the CM the proposed welding procedure submitted as stated in STW.M760 or the proposed stud welding, flame cutting or shearing procedure for steelwork complying with BS 5400:Part 6:1980 submitted as stated in STW.M770 has not complied with the procedure trial requirements for the procedure stated in the Contract in previous tests, a procedure trial shall be carried out as stated in STW.T020;
2. Procedure trials for welding, flame cutting and shearing shall be carried out in the presence of an inspecting authority approved by the CM.

STW.T020.9 PROCEDURE TRIALS

1. Procedure trials for welding for structural steel shall comply with BS 5400:Part 6:1980, Clauses 4.7.3, 5.4.1.1 and 5.4.1.2;
2. Procedure trials for welding for steel castings shall comply with BS 5400:Part 6:1980, Clauses 4.7.3 and 5.4.2;
3. Procedure trials for welding of studs shall comply with BS 5400:Part 6:1980, Clauses 4.7.4 and 5.4.4;
4. Procedure trials for flame cutting and shearing shall comply with BS 5400:Part 6:1980, Clauses 4.7.3 and 5.4.3;
5. Welds for grade A steels complying with BS 4360:1986 are not required to comply with the requirements for Charpy V-notch impact tests. The temperature of -20°C stated in BS 5400:Part 6:1980, Clause 5.4.1.2(a)(3) shall be amended to 0°C;
6. If in a welding procedure one or more of the parts to be welded is coated with a prefabrication primer or metal coating before welding, the same primer or coating shall be applied to the same before the procedure trial for the welding procedure is carried out;
7. The thickness of the sample of material to be used in procedure trials for flame cutting shall be:
    a. 20 mm for material not exceeding 20 mm thick;
    b. 40 mm for material exceeding 20 mm and not exceeding 40 mm thick;
    c. T mm for material exceeding (T-10) mm and not exceeding T mm thick, where T is any multiple of 10 from 50 up.

STW.T030.9 TRIAL RESULTS

If a procedure trial for welding, flame cutting or shearing does not comply with the specified requirements for the procedure trial, the cause of failure shall be established by the Contractor and particulars of proposed changes shall be submitted to the CM. Further procedure trials shall be carried out to establish the amended procedure unless otherwise permitted by the CM.

STW.T040.9 APPROVED PROCEDURES

1. A welding flame cutting or shearing procedure which complies with the specified requirements for the procedure trial shall become an Approved procedure;
2. If a procedure trial is not required, the procedure for welding, flame cutting or shearing submitted as stated in STW.M760 and STW.M770 shall become an Approved procedure;
3. Welding, flame cutting or shearing shall not commence until the procedure has been approved by the CM.

STW.T050.9 CHANGES TO APPROVED PROCEDURES

Unless permitted by the CM, Approved procedures for welding, flame cutting or shearing shall not be changed. Further procedure trials shall be carried out to demonstrate proposed changes to the procedure unless otherwise permitted by the CM.

STW.T060.9 RECORDS

1. A record of the Approval test for welding procedures shall be submitted to the CM for approval at least 3 weeks before fabrication of the steelwork starts. The record shall be in the form stated in BS 4870:Part 1:1981, Appendix B or BS 4570:1985, Appendix A as appropriate and shall be endorsed by the inspecting authority approved by the CM;
2. Reports of procedure trials for stud welding, flaming cutting and shearing shall be submitted to the CM at least 3 weeks before fabrication of the steelwork starts.

PAINTING TRIALS

STW.T110.9 GENERAL

1. A painting trial shall be carried out for each painting system which will be applied to areas exceeding 100 m^2 to demonstrate that the proposed materials and methods of application will produce a painted surface which complies with the specified requirements;
2. Painting trials shall be carried out at the place where painting to the permanent work will be carried out and using the employees and equipment which will be used to carry out painting to the permanent work;
3. Painting trials shall be carried out on blast cleaned steel.

STW.T120.9 TRIAL RESULTS

If the painted surface produced in a painting trial does not comply with the specified requirements for the paintwork, the cause of failure shall be established by the Contractor and particulars of proposed changes shall be submitted to the CM. Proposed changes to the paint formulation, other than an adjustment in the amount of thinners, shall be carried out at the paint manufacturer's work before the final painting trial and before the first batch of paint is delivered.

STW.T130.9 COMMENCEMENT OF PAINTING

Painting shall not commence until the painted surface produced in painting trial complies with the specified requirement for paintwork.

STW.T140.9 CHANGES TO MATERIALS AND METHODS OF APPLICATION

Unless permitted by the CM, the materials and methods of application used in a painting trial which complies with the specified requirements shall not be changed.

TESTING GENERALLY

STW.T210.9 TESTING CONSULTANT

Tests which are stated in this Specification to be carried out by an Approved testing consultant shall be carried out by a testing consultant employed by the Contractor and approved by the CM.

OFF-SITE TESTING

STW.T310.9 GENERAL

The test shall be carried out by the manufacturer at the manufacturer's works on samples selected by the manufacturer.

STW.T320.9 STRUCTURAL STEEL

Tests shall be carried out on structural steel in accordance with BS 5400:Part, 6:1980, Clauses 5.2.1, 5.2.2 and 5.3.

STW.T330.9 BOLTS, NUTS AND WASHERS

Carry out tests on bolts, nuts and washers in accordance with BS 3692:1967, BS 4190:2001, BS 4395:Part 1:1969, BS 4395:Part 2:1969, BS 4395:Part 3:1973 or BS 4933:1973 as appropriate. Carry out the tests on full size bolts. The rates of sampling and testing shall be in accordance with BS 4395:Part 1:1969.

TESTING STEELWORK GENERALLY

STW.T410.9 STEELWORK BATCHES

1. A batch of steelwork is the amount of steelwork stated in the Contract and which is completed or delivered to the Site at any one time;
2. Submit to the CM a list of the parts included in each batch at least 7 days before testing starts.

STW.T420.9 SAMPLING

1. Samples to be tested shall be selected by the CM if testing is to be carried out in Hong Kong and shall be selected by the Approved testing consultant if testing is not to be carried out in Hong Kong;
2. Samples shall be selected from positions which in the opinion of the CM or Approved testing consultant are representative of the batch as a whole;
3. The CM shall inform the Contractor of the samples selected for testing at least 3 days before testing starts.

STW.T430.9 TEST PROCEDURES

1. The relevant tests stated in STW.T520 to STW.T910 shall be carried out on each batch of steelwork;

2. Inform the CM at least 7 days before tests in Hong Kong are carried out.

STW.T440.9 TEST REPORTS

1. Records of tests on steelwork carried out by the Contractor or the Approved testing consultant shall be kept by the Contractor and a report shall be submitted to the CM at least 7 days before Approval of the batch of steelwork tested is required. The report shall contain the following details:
   a. Procedure tested and exact test location in the steelwork;
   b. Results of tests compared to the required values, with any non-complying results highlighted;
   c. Any tearing, cracking or other defects;
   d. Conclusion as to the overall acceptability of the parts of steelwork examined by the Approved testing consultant.
2. Report shall be certified by the Contractor's authorised representative or by the Approved testing consultant who carried out the test.

STW.T450.9 NON-COMPLIANCE OF STEELWORK

1. If the result of any test on steelwork stated in STW.T520 to STW.T910 does not comply with the specified requirements for the test, the test shall be carried out on additional samples from the batch. The number of additional tests shall be twice the number of original tests;
2. The batch shall be considered as not complying with the specified requirements for the test if the result of any additional test does not comply with the specified requirements for the test;
3. If the result of every additional test complies with the specified requirements for the test, only those parts the samples from which have failed in the original test shall be considered as not complying with the specified requirements of the test.

TESTING STEEL

STW.T510.9 SAMPLING

Provide samples of steel from each batch of steel within 3 days after delivery of the batch to the fabricator's work or to the Site. The rate of sampling and the position and direction of the samples shall be in accordance with BS 4360:1986.

STW.T520.9 TENSILE AND IMPACT TESTING

The tensile test and the impact test shall be carried out by Employer’s Specialist Contractor on each sample of steel. The method of testing shall be in accordance with BS 4360:1986.

STW.T530.9 QUALITY GRADING

Quality grading of structural steel shall be carried out by Employer’s Specialist Contractor on steel which has not been tested for quality grades by the manufacturer. Quality grading shall be carried out in accordance with BS 5400:Part 6:1980, Clause 3.1.4 or BS 5950:Part 2:1992, Clause 2.1.6 as appropriate.

TESTING WELDING CONSUMABLES

STW.T550.9 BATCH OF WELDING CONSUMABLES

In this Specification, a batch of welding consumables is the quantity of welding consumables of the same type and size, which may include one or multiple standard lot(s) as defined in the manufacturer's quality assurance programme, delivered to the Site, or the off-site fabrication yard as one consignment that is covered by the manufacturer's certificate(s) and under one delivery order, and shall not exceed five tonnes and twenty tonnes respectively.

STW.T560.9 TESTING OF WELDING CONSUMABLES

For each batch of welding consumables used for temporary or permanent structural steelworks on Site of steel grade as stated in STW.M110 and shown in the working drawings, prepare 2 test specimens for each standard lot and carry out the chemical analysis in accordance with BS EN ISO 2560:2009 or BS EN ISO 14341:2011 or BS EN ISO 14171:2010 or BS EN ISO 17632:2015 as appropriate, except for the standard lot(s) where complying chemical analysis results have been attained from the first chemical analysis under which circumstance no further chemical analysis is required for the same standard lot(s) in subsequent batches of welding consumables. The chemical analysis shall be carried out by an Approved laboratory, accredited either by the Hong Kong Accreditation Service (HKAS) under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) or an equivalent organization which has signed a mutual recognition agreement with HKAS and is employed and paid for directly by the Contractor. Allow sufficient time for testing of welding consumables in the programme.

STW.T570.9 ACCEPTANCE CRITERIA - WELDING CONSUMABLES

A standard lot in a batch of welding consumables is deemed to comply with the requirements of the Specification if the test results meet the requirements of BS EN ISO 2560:2009 or BS EN ISO 14341:2011 or BS EN ISO 14171:2010 or BS EN ISO 17632:2015 as appropriate. If the test results of the first chemical analysis of a standard lot complied with the requirements of the Specification, further chemical analysis on the same standard lot in all subsequent batches of welding consumables delivered to the same Site or the same off-site fabrication yard is not required.

STW.T580.9 FAILURE OF TESTS

Non-compliance:

If any test specimen of the welding consumables does not comply with BS EN ISO 2560:2009 or BS EN ISO 14341:2011 or BS EN ISO 14171:2010 or BS EN ISO 17632:2015, the Contractor may choose to carry out further test(s) and take further test samples from the same lot of welding consumables at the Contractor's expense or remove the whole lot of the particular batch from Site and / or the fabrication yard for off-site fabrication if appropriate. If further test(s) is chosen, the number of further test(s) is to be calculated by the application of the formula given below and no extension of time will be allowed for the said further test(s). Bear the cost of such further test(s).

$$\text{number of further test(s)} = \left(n^2 - 2n + 3\right)$$

where n = total number of unsuccessful inspection(s) / test(s) progressively until all inspection(s) / test(s) is / are successful.

Typical example of calculating the number of further inspections / tests is given in Appendix I to this Worksection, for illustration purposes only.

Acceptance criteria and further actions arising from the further test(s) shall be in accordance with STW.T570.

For a standard lot with any non-compliant chemical analysis results, chemical analysis shall be carried out for the standard lot of welding consumables, as defined in the manufacturer's quality assurance programme, subsequently delivered to the same Site or the same off-site fabrication yard regardless of the results of the further test(s).

STW.T590.9 STANDARD FOR REJECTION

If the result of any test or any further test does not comply with the specified requirements in the Specification for any particular property, the standard lot in a batch of welding consumables is deemed failing to comply with the specified requirements for that property. Then:

1. The non-compliant standard lot in a batch of welding consumables shall be removed from the Site;
2. The non-compliant standard lot in a batch of welding consumables shall be removed from the off-site fabrication yard if appropriate.

TESTING WELDS

STW.T610.9 GENERAL

1. Examination and testing of welds shall be carried out after post-weld heat treatment and before the application of corrosion protective coatings. De-burring, dressing, grinding, machining and peening shall be carried out after the visual inspection for cracks, surface pores and joints fit-up and before other inspections and tests are carried out;
2. Testing shall be carried out by the Approved testing consultant except as stated in STW.T640.

STW.T620.9 DESTRUCTIVE TESTING

Destructive testing of welds for steelwork complying with BS 5400:Part 6:1980 shall be carried out in accordance with BS 5400:Part 6:1980, Clauses 5.5.1.1., 5.5.1.2 and 5.5.1.3.

STW.T630.9 NON-DESTRUCTIVE TESTING

Inspect welds for structural steel and steel castings visually in accordance with BS 5289:1976. Carry out non-destructive testing on a proportion of welds after visual inspection. The compliance criteria and the proportion of welds to be tested are denoted by quality categories as stated in BS 5135:1984, Table 18 for butt welds and in BS 5135:1984, Table 19 for fillet welds. The quality categories of welds shall be as stated in the following table:

Quality categories of welds				
	Steelwork complying with BS 5400:Part 6:1980		Steelwork complying with BS 5950:Part 2:1992	
	Butt welds	Fillet welds	Butt welds	Fillet welds
Welds stated in the Contract for 100% non-destructive testing	A	A	A	A

Welds stated in Table 18.2	D	D	D	D
Other welds	B	B	C	C

1. Carry out non-destructive testing of butt welds by ultrasonic examination in accordance with BS 3923:Part 1:1986 or BS 3923:Part 2:1972 or by radiographic examination in accordance with BS 2600:Part 1:1983, BS 2600:Part 2:1973 or BS 2910:1986. Carry out non-destructive testing of fillet welds by either the liquid penetrant method in accordance with BS 6443:1984 or the magnetic particle flaw detection method in accordance BS 6072:1981. The particular standard or part of standard to be used shall be appropriate for the joint geometry, material and production requirements and shall be as agreed by the CM. Dress welds to facilitate ultrasonic examinations;
2. If the parent metal adjacent to the length of weld subject to non-destructive testing has been tested for laminations in accordance with BS 5996:1980, the same areas on the parent metal shall be tested by ultrasonic examination in accordance with BS 3923:Part 1:1986 or BS 3923:Part 2:1972 as appropriate when non-destructive testing is carried out on that length of weld;
3. Inspect welds for steelwork which has been fabricated and tested by non-destructive testing at the fabricator's works visually for cracks when the steelwork is delivered to the Site. Examine 5% of the welds, other than welds stated in the Table in STW.M760, for cracks by the magnetic particle flaw detection method in accordance with BS 6072:1981.

STW.T640.9 INSPECTION OF WELDS

Inspection of welds will be carried out by the CM for welds stated in the table in STW.M760.

TESTING STUD SHEAR CONNECTORS AND RIVETS

STW.T710.9 GENERAL

Testing shall be carried out by the Contractor in the presence of the CM.

STW.T720.9 WELDED STUD SHEAR CONNECTORS

Tests shall be carried out on 5% of welded stud shear connectors in accordance with BS 5400:Part 6:1980, Clause 5.5.4.

STW.T730.9 RIVETS

Tests shall be carried out on 5% of driven rivets in accordance with BS 5400:Part 6:1980, Clause 5.8.

TESTING FABRICATION TOLERANCES

STW.T810.9 GENERAL

Testing shall be carried out by the Contractor in the presence of the CM.

STW.T820.9 PROCEDURE

Rolled and built-up sections of steelwork complying with BS 5400:Part 6:1980 shall be tested to determine compliance with fabrication tolerances in accordance with BS 5400:Part 6:1980, Clauses 5.6.1 to 5.6.6.

TESTING REPAIRS

STW.T910.9 GENERAL

Defects which have been repaired and adjoining areas which in the opinion of the CM may have been affected by the repair shall be retested as Instructed by the CM.

APPENDIX STW/I

STW.APPEND1.9 CALCULATION OF NUMBER OF FURTHER INSPECTIONS / TESTS

Typical Examples for Illustrative Purposes Only

1. Chemical analysis shows 2 samples failing to meet the requirements in the Specification.

2. The Contractor can either remove the standard lot of the particular batch of welding consumables from the Site and / or the fabrication yard for off-site fabrication or at his own expense, carry out further test(s) in accordance with the formula of:

   $\left(n^2 - 2n + 3\right)$ = 2^2 - 2 x 2 + 3

   = 3 further tests

3. If one of the above 3 further tests fails, the Contractor may order further tests to be carried out at the Contractor's own expense by re-applying the formula and taking into account the total number of failed samples. Altogether and based on the formula, the number of total retesting required:

   = 3^2 - 2 x 3 + 3

   = 6

   As 3 tests have already been carried out by the Contractor, the Contractor shall carry out:

   6 - 3 = 3 further tests

4. If the next 3 further tests show further failed samples, the formula will be re-applied as before until all the tests results are satisfactory.

WRS WATER RETAINING STRUCTURES

MATERIALS

GENERAL

WRS.M010.9 APPLICATION OF OTHER WORK SECTIONS

The following works and materials shall comply with the Worksections stated, unless otherwise stated in this Worksection:

1. Earthworks shall comply with Worksection EAR;
2. Formwork and finishes to concrete shall comply with Worksection FOR;
3. Steel reinforcement shall comply with Worksection CON3;
4. Concrete shall comply with Worksection CON1;
5. Joints in concrete shall comply with Worksection CON1;
6. Drainage systems shall comply with Worksection DRA2.

WRS.M020.9 DEFINITION OF WATER RETAINING STRUCTURE

Water retaining structure is a structure, or part of a structure, including walls, floors, roofs, columns and footings, which is stated in the Contract to be constructed for storing, conveying or excluding water, sewage or other aqueous liquids.

SLIDING LAYER

WRS.M110.9 GENERAL

Sliding layers below floor slabs of water retaining structures shall be a proprietary type of polythene sheeting approved by the CM. Polythene sheeting shall be impermeable and shall have a nominal thickness of 1.1 mm.

WRS.M120.9 SUBMISSIONS

Particulars of the source and type of proposed sliding layers for water retaining structures shall be submitted to the CM for approval at least 14 days before the first delivery of the sliding layer to the Site.

WRS.M130.9 SAMPLES

Samples of the proposed sliding layers for water retaining structures shall be submitted to the CM at the same time as the particulars of the sliding layer are submitted.

MATERIALS PROVIDED BY THE WATER SUPPLIES DEPARTMENT

WRS.M210.9 WATER AND STERILIZING CHEMICALS

Water and sterilizing chemicals for cleaning, sterilizing and testing water retaining structures as stated in WRS.W320 and WRS.T240 will be provided by the Water Supplies Department for one set of tests only for those parts of the Works as stated in the Project Specific Specification. The water and sterilizing chemicals, if to be so provided, shall be obtained from the locations stated in the Contract or from other locations agreed by the CM and shall be mixed by the Contractor.

WORKMANSHIP

GENERAL

WRS.W010.9 SUBMISSIONS

The following particulars shall be submitted to the CM at least 28 days before the relevant work starts:

1. Sequence and method of concreting bays in floor slabs, walls and roof slabs and in columns and footings;
2. Details of alternative locations of construction joints if required;
3. Details of type and size of waterstops at construction joints and box-outs;
4. Sequence and method of testing roofs for watertightness;
5. Details of method of testing water retaining structures for watertightness including:
    a. Arrangement of pumps and equipment;
    b. Source of water;
    c. Equipment for measuring fall in water level;
    d. Device for dampening the oscillatory motion of the water surface;
    e. Filling rate;
    f. Method of correction for evaporation and rainfall.

WRS.W020.9 STORING SLIDING LAYERS

Sliding layers for water retaining structures shall be stored in accordance with the manufacturer's recommendations in a dry weatherproof store.

WRS.W030.9 PROTECTION OF DRAINAGE SYSTEM

Measures shall be taken to prevent concrete and deleterious material from being deposited in drainage systems under floors and on roofs of water retaining structures. After construction and before testing, the drainage system shall be thoroughly cleaned by rodding and flushing to remove any deleterious material which may impede the flow of water into or through the drainage system. The lines and levels of drainage systems shall be within 20 mm of the specified horizontal alignment and within 10 mm of the specified vertical alignment.

CONSTRUCTION

WRS.W110.9 LAYING SLIDING LAYERS

Polyethylene sheeting in sliding layers below floor slabs of water retaining structures shall be laid flat without creases. Laps shall be at least 225 mm and there shall be no gaps at the edges of the bays.

WRS.W120.9 FLOOR SLABS

If reinforcement is continuous across the joint between bays in the floor slab of water retaining structures, the bays shall be concreted contiguously, in sequence, with a minimum period of 48 hours between completion of concreting one bay and commencement of concreting the adjacent bay.

WRS.W130.9 WALLS

1. If reinforcement is continuous across the joint between bays in the wall of water retaining structures, the bays shall be concreted contiguously, in sequence, with a minimum period of 72 hours between the completion of concreting the lift in one bay and commencement of concreting the adjacent lift in the adjacent bay;
2. Unless otherwise permitted by the CM, the first lift in each bay in the walls of water retaining structures shall be concreted within seven days after completion of concreting the adjacent base of the wall. Individual lifts shall be concreted in one continuous operation without cold joints, whether or not the full height of the wall is concreted in one lift. If the full height of the wall is not placed in one lift, succeeding lifts shall be concreted within seven days from concreting of the adjacent lift unless otherwise permitted by the CM.

WRS.W140.9 ROOF SLABS

If reinforcement is continuous across the joint between bays in the roof slab of water retaining structures, the bays shall be concreted contiguously, in sequence, with a minimum period of 48 hours between completion of concreting one bay and commencement of concreting the adjacent bay.

WRS.W150.9 BUILT-IN PIPES

Puddle flanges on built-in pipes in water retaining structures shall be located centrally within the formwork. Waterstops shall be fixed around the perimeter of box-outs to the built-in pipes.

WRS.W160.9 PROTECTION PRIOR TO THE DEPOSITION OF FILL

1. Immediately after the roof slab of water retaining structures has been tested, the slab shall be protected with damp sacks or by other methods agreed by the CM from exposure to conditions which may affect the slab. The protection shall be continued until the roof drainage system has been constructed or the fill material has been deposited and compacted;
2. Materials shall not be stockpiled on roof slabs of water retaining structures. Constructional Plant or other vehicles shall not stand or run on floor slabs or roof slabs of water retaining structures unless permitted by the CM.

DEPOSITION OF FILL MATERIAL

WRS.W210.9 GENERAL

Fill material shall be spread out evenly and shall not be stockpiled on roofs to water retaining structures. Weed killer or other chemicals shall not be applied to fill material on the roofs of water retaining structures for potable or fresh water.

WRS.W220.9 TIMING

1. Fill material shall not be deposited behind sections of walls of water retaining structures until at least seven days after completion of concreting to the section of wall;
2. Deposition of fill material on or adjacent to water retaining structures shall be carried out after the watertightness test on the structure has been completed, unless otherwise permitted by the CM.

CLEANING AND STERILIZATION

WRS.W310.9 CLEANING

Immediately before water retaining structures are tested for watertightness, all dust, debris, unused materials and equipment shall be removed from the structure and the interior of the structure shall be washed and brushed down with water.

WRS.W320.9 STERILIZATION

Water for washing water retaining structures for potable or fresh water shall be fresh, potable water incorporating a mixture of sterilizing chemicals added before the structure is washed at a concentration instructed by the CM. The structure shall be maintained in a clean condition after cleaning.

TESTING

DRAINAGE SYSTEMS

WRS.T010.9 TEST METHODS

Drainage systems under floors and on roofs of water retaining structures shall be tested in accordance with the following requirements:

1. Water shall be poured at different locations agreed by the CM along the drainage system and the flow of water observed at junction pits, outfalls and other discharge points;
2. A mandrel shall be pulled through each completed section of pipeline of 300 mm diameter or less. The mandrel shall be 750 mm long and 12 mm less in diameter than the nominal diameter of the pipe.

WRS.T020.9 COMPLIANCE CRITERIA

The results of tests on drainage systems for water retaining structures shall comply with the following requirements:

1. The water shall in the opinion of the CM be freely discharged by the drainage system;
2. The bore, linearity and jointing of pipes shall comply with the specified requirements.

WRS.T030.9 NON-COMPLIANCE

If the result of any test on the drainage system for water retaining structures does not comply with the specified requirements for the test, the Contractor shall investigate the reason. Remedial or replacement work approved by the CM shall be carried out and the drainage system shall be retested.

WATERTIGHTNESS OF ROOFS

WRS.T110.9 TEST METHODS

1. The roofs of water retaining structures shall be tested for watertightness over the complete area of the roof, including perimeter joints. Roofs shall not be tested in sections unless permitted by the CM;
2. Water shall be ponded on the roof for a period of three days and topped up to maintain a depth of at least 75 mm. The test shall be carried out before fill material is deposited or drainage systems are constructed on the roof.

WRS.T120.9 COMPLIANCE CRITERIA

There shall be no leaks or damp patches visible on the soffits of roofs of water retaining structures during or at the end of the test for watertightness.

WRS.T130.9 NON-COMPLIANCE

If the result of any test for watertightness of the roof of a water retaining structure does not comply with the specified requirements for the test, the Contractor shall investigate the reason. Remedial or replacement work approved by the CM shall be carried out and the roof shall be retested.

WATERTIGHTNESS OF STRUCTURES

WRS.T210.9 GENERAL

Each compartment of structures which incorporate division walls shall be tested separately with adjoining compartments empty. The complete structure shall also be tested.

WRS.T220.9 LOAN OF EQUIPMENT

The equipment for recording water levels in tests on water retaining structures as stated in WRS.T230 will be loaned by the Water Supplies Department only for those parts of the Works as stated in the Project Specific Specification.

WRS.T230.9 TEST METHOD

1. The structure shall be filled with water at an approximately uniform rate not exceeding 2 m depth in 24 hours to the levels stated in the following table:

Tests on water retaining structures		
Type of structure	Part of structure tested	Test water level
Water retaining structures other than for sewage	Structure with division wall - each compartment of structure	100 mm below top of division wall
	Structure with division wall - complete structure	Top water level of structure
	Structure without division wall	
Water retaining structures for sewage	Structure with division wall - each compartment of structure	Top water level of structure
	Structure with division wall - complete structure	
	Structure without division wall	

2. The water used for testing water retaining structures for potable or fresh water shall be fresh potable water. The permission of the CM shall be obtained before filling starts. The structure or each compartment of the structure being tested shall be kept full for 7 days before testing to allow for absorption;

3. After the period for absorption, the water shall be topped up to the specified level and the test shall begin. During testing, the oscillatory motion of the water surface shall be dampened. The test period shall be 7 days;

4. The equipment for recording water levels shall be installed in a temporary enclosure of minimum dimensions 2 m x 2 m x 2.5 m high with a lockable door. The enclosure shall be located over stilling wells, manhole openings or other points of recording water levels. The temporary enclosure shall be removed on completion of the test. The equipment shall be calibrated before testing starts and at regular intervals agreed by the CM and shall be readable and accurate to 0.5 mm;

5. The fall in water level of water retaining structures shall be measured at hourly intervals between 8 am and 5 pm each day. The total fall shall be measured at the end of the test period.

WRS.T240.9 DRAINING AFTER TEST

1. Except as stated in sub-clause (2), structures shall be emptied after completion of testing and maintained in a clean dry condition. The water shall be removed at an approximately uniform rate not exceeding 2 m depth in 24 hours. The permission of the CM shall be obtained before emptying starts;
2. Unless otherwise instructed by the CM, the water used for the final tests on water retaining structures for potable or fresh water shall be retained in the structure and shall not be wasted or contaminated.

WRS.T250.9 COMPLIANCE CRITERIA

The results of tests for watertightness of water retaining structures shall comply with the following requirements:

1. The total fall in water level at the end of the test period, after adjustment for evaporation and rainfall, shall not exceed 1/500 times the maximum specified depth of water in the test or 10 mm, whichever is less;
2. There shall be no leaks or damp patches visible on the surface of the structure, including any division walls, during or at the end of the test.

WRS.T260.9 NON-COMPLIANCE

If the result of any test for watertightness of a water retaining structure does not comply with the specified requirements for the test, the Contractor shall investigate the reason. Remedial or replacement work approved by the CM shall be carried out and the structure shall be retested.

WATER STERILITY

WRS.T310.9 SAMPLING

After the test for watertightness of a water retaining structure for potable or fresh water has been completed, samples of the water in the structure shall be taken by the CM. The number of samples and location of sampling shall be as instructed by the CM.

WRS.T320.9 TEST

Each sample of water shall be tested to determine the bacteriological content.

WRS.T330.9 COMPLIANCE CRITERIA

The results of tests for bacteriological content of the water shall demonstrate that in the opinion of the CM the structure has been adequately sterilized.

WSP WATER SUPPLY PIPEWORK

MATERIALS

GENERAL

WSP.M010.9 APPLICATION OF OTHER WORKSECTIONS

The works and materials specified in this Worksection shall comply with the following Worksections, unless otherwise stated:

1. Drainage works shall comply with Worksection DRA2;
2. Earthworks shall comply with Worksection EAR1;
3. Formwork and finishes to concrete shall comply with Worksection FOR;
4. Concrete shall comply with Worksection CON1.

WSP.M020.9 DEFINITIONS

1. Fitting: a component fitted to a pipe for jointing or connecting or for changing the direction or bore of a pipe;
2. Flexible joint: a connection between pipes and fittings which provides angular deflection or axial movement or a combination of both in service without impairing the efficiency of the connection;
3. Mechanical joint: a flexible joint in which an elastomeric joint ring is located in the socket and the joint sealed by applying pressure to the joint ring by means of a gland bolted to the socket;
4. Nominal size: a numerical designation of size which is common to all components in a pipework system. The nominal size is stated as a convenient round number in millimetres and is related to, but not normally the same as, the actual internal diameter of the pipework; dn designates the nominal size of tees and tapers which are less than DN;
5. Push-in joint: a flexible joint in which an elastomeric ring is located in the socket and the joint is effected by entering the spigot through the joint ring in the socket;
6. Special fitting: a fitting which is made from a manipulated or fabricated pipe;
7. Thin walled pipe: a pipe, including pipes of DN 1200 or greater, which has a ratio of nominal size to wall thickness, excluding linings and coatings, exceeding 125.

WSP.M030.9 MATERIALS GENERALLY

Materials for water supply pipeworks for potable water shall be non-toxic, shall not promote microbial growth and shall not impart a taste, odour, cloudiness or discolouration to the water after disinfection and washing out of the pipelines as WSP.W1110 and WSP.W1120.

PIPES AND FITTINGS

WSP.M110.9 STEEL PIPES AND FITTINGS

1. Steel pipes and fittings shall comply with the following:

a. Steel pipes, joints and specials for water and sewage: BS 534:1990;

b. Dimensions and masses per unit length of welded and seamless steel pipes and tubes for pressure purposes: BS 3600:1976;

c. Steel pipes and tubes for pressure purposes: carbon steel with specified room temperature properties: BS 3601:1987.

2. Steel pipes and fittings shall be manufactured by the electric-resistance welded and induction-welded process or by the submerged-arc welded process. The tensile strength of the steel used shall be at least 410 N/mm^2;

3. Steel pipes, fittings and specials (including all flanges and blank flanges) shall be coated or lined internally and externally as stated in the following table:

Protection to steel pipes and fittings	
Protection	Description
External	A Fusion Bonded Epoxy system, complying with latest revision of ANSI/AWWA C213, manufactured under a quality system certified to ISO 9001, and factory applied by an applicator approved by the manufacturer, to a minimum dry film thickness of 400 microns. OR A chemically-cured Liquid Epoxy system, complying with the latest revision of ANSI/AWWA C210 manufactured under a quality system certified to ISO 9001, and factory applied by an applicator approved by the manufacturer, to a minimum dry film thickness of 400 microns.
	AND For pipes to be installed outdoor under direct sunlight, a topcoat of aliphatic polyurethane at 50 microns shall be applied for extra protection.
Internal	A Fusion Bonded Epoxy system, complying with latest revision of ANSI/AWWA C213, manufactured under a quality system certified to ISO 9001, and factory applied by an applicator approved by the manufacturer, to a minimum dry film thickness of 400 microns. OR A chemically-cured Liquid Epoxy system, complying with the latest revision of ANSI/AWWA C210 manufactured under a quality system certified to ISO 9001, and factory applied by an applicator approved by the manufacturer, to a minimum dry film thickness of 750 microns.

Other requirements of using epoxy system shall be in accordance with Appendix WSP/I.

4. Gusseted steel bends and tees shall be fabricated in accordance with BS 534: 1990, BS 2633:1987 and BS 4515:1984.

WSP.M120.9 DUCTILE IRON (DI) PIPES AND FITTINGS

1. DI pipes and fittings shall comply with BS 4772:1988. Pipes and fittings other than collars, caps and blank flanges shall be lined internally with cement mortar in accordance with BS 4772:1988, Clause 3.2. Linings shall be made with sulphate-resisting Portland cement complying with BS 4027:1980;

2. Pipes shall be externally coated with metallic zinc in accordance with BS 4772:1988, Clause 3.1. Fittings shall be externally coated with zinc rich paint in accordance with BS 4772:1988, Clause 3.1.5(b). After zinc coating pipes and fittings shall be externally coated with a finishing coat of one of the following materials as stated in BS 4772:1988, Clause 3.3:

   a. Bitumen based hot applied coating material complying with Clause WSP.M240 and BS 4147:1980: Type I, Grade C; or

   b. Bitumen based cold applied coating material complying with Clause WSP.M240 and BS 3416:1991: Type II.

WSP.M130.9 UPVC PIPES AND FITTINGS

UPVC pipes and fittings shall be class D and shall comply with the following:

1. UPVC pipe for cold water services: BS 3505:1986;
2. Joints and fittings for use with UPVC pressure pipes:
   a. Injection moulded UPVC fittings for solvent welding for use with pressure pipes, including potable water supply: BS 4346:Part 1:1969;
   b. Mechanical joints and fittings principally of UPVC: BS 4346:Part 2:1970;
   c. Solvent cement: BS 4346:Part 3:1982.

WSP.M140.9 GREY IRON PIPES AND FITTINGS

GI pipes and fittings shall comply with the following:

1. Steel tubes and tubulars suitable for screwing to BS 21:1985 pipe threads: BS 1387:1985, medium grade;
2. Pipe threads for tubes and fittings where pressure tight joints are made on the threads: BS 21:1985;
3. Wrought iron steel pipe fittings (screwed BSP thread): BS 1740:Part 1:1971.

WSP.M150.9 FLANGES

1. Steel flanges shall comply with BS 4504:Section 3.1:1989, and shall be either steel plate for welding type or steel plate blank flange type. The dimensions and drilling of flanges shall comply with BS 4504:Section 3.1:1989, Table 11, as appropriate regardless of the nominal pressure rating;
2. Steel ring flanges shall be machined in the bore to a diameter of 4 mm ±1 mm larger than the outside diameter of the pipe to which the flange is to be welded;
3. Steel puddle flanges shall be separated into 180° segments;
4. DI flanges shall be cast-on or welded on standard flanges complying with BS 4772:1988.

ANCILLARY MATERIALS

WSP.M210.9 BOLTS AND NUTS

1. Bolts and nuts for flanged joints shall comply with BS 4504:1989: Section 3.1, Section 6;
2. Bolts and nuts shall be compatible with the type of joint and, unless otherwise approved by the CM, shall be obtained from the same manufacturer as the joint;

3. Bolts shall be sufficiently long and shall be suitably threaded for jointing the relevant flanges.

WSP.M220.9 ELASTOMERIC JOINT RINGS

Elastomeric joint rings shall comply with BS EN 681-1:1996, Type WA. Elastomeric joint rings for DI pipes and fittings shall comply with BS 4772:1988, Clause 2.3.4. The dimensions of rings for use with flanged joints shall comply with BS 4865:Part 1:1989. The rings shall be compatible with the type of joint and, unless otherwise approved by the CM, shall be obtained from the same manufacturer as the joint.

WSP.M230.A ANTICORROSION TAPE

1. Anticorrosion tape shall be a proprietary type approved by the CM. The tape shall either be a petrolatum tape with fabric reinforcement or a bituminous tape with PVC backing. Petrolatum tape shall be used for valves, flanged joints, slip-on type couplings and flange adapters of all sizes. Bituminous tape shall be used in buried or non-exposed condition for welded joints of steel pipe, repair of steel pipe sheathing and other applications as specified on the Drawings;

2. Anticorrosion tapes shall have a high resistance to catholic disbondment, acids and alkalis. Colour of bituminous tape shall be black. Anticorrosion tapes shall have the minimum properties stated in the following table:

Properties of anticorrosion tape			
Properties		Petrolatum Tape	Bituminous Tape
Thickness of PVC backing (mm)		-	0.75
Total thickness (mm)		1.1	1.65
Mass (kg/m²)		1.4	2.0
Tensile strength (N/mm)		4	10
Adhesion strength (180° peel) (N/mm)	Self	N/A	2.5
	Steel	N/A	2.5
Tacky adhesion strength to JIS Z 1902 (N/mm)	Self	0.5	N/A
	Steel	0.5	N/A
Dielectric strength (2 layers) (kV)		15	30
Elongation (at break) (%)		-	260
Temporary range (°C)	Wrapping	-5 to +55	+5 to +50
	In service	-20 to +70	-20 to +75

3. Primer and mastic filler for use with anticorrosion tape shall be compatible with the tape and shall be a type recommended by the manufacturer of the tape and approved by the CM. Notwithstanding clause WSP.M410 (6), primer and mastic filler for use with anticorrosion tape shall be supplied by the Contractor;

4. Bituminous tapes shall be stored in a cool dry place away from the sun's rays. No dirt or grits shall be allowed to stick on the edge of the tape before applying the tape for pipe protection.

WSP.M240.9 BITUMINOUS COATINGS

1. Bituminous coatings shall comply with the following:

   a. Bitumen based hot applied coating material for protecting iron and steel including suitable primers where required: BS 4147:1980, Type I, Grade C;

b. Black bitumen coating solutions for cold application: BS 3416:1991, Type II.

2. Bituminous coatings used for repairing joints and coatings shall be compatible with the adjacent coating;

3. Bituminous coatings shall be made from petroleum or asphaltic bitumen.

WSP.M250.9 WHITEWASH

Whitewash shall comply with AWWA C 203:1986.

WSP.M260.9 ZINC-BASED PAINT

1. Zinc-based paint shall be a proprietary type approved by the CM;

2. Primers for zinc-based paint shall comply with BS 4652:1971;

3. Rust inhibitor shall be a chemical agent which is capable of converting rust into iron phosphate.

WSP.M270.9 JOINT FILLER

Joint filler for joints in concrete bed, haunch and surround shall be a proprietary type approved by the CM and shall be a firm, compressible, single thickness, non-rotting filler. The thickness of the filler shall be as stated in the following table:

Joint filler for concrete bed, haunch and surround	
Nominal diameter of pipe	Thickness of joint filler (mm)
Less than 450 mm	18
450 mm – 1200 mm	36
Exceeding 1200 mm	54

WSP.M280.9 COMPRESSIBLE PADDING

Compressible padding between pipes and supports shall be bitumen damp-proof sheeting complying with BS 743:1970.

WSP.M290.9 POLYETHYLENE SHEETING

Polyethylene sheeting shall be impermeable and shall have a nominal thickness of 0.125 mm.

WSP.M300.9 EXTENSION KEYS

Extension keys, clamps and its associated bolts, nuts and washers for valves shall be Grade 1.4401 stainless steel complying with BS EN 10084:2008, BS EN 10085:2001, BS EN 10087:1999, BS EN 10095:1999, BS EN 10250-4:2000 and PD 970:2005.

MATERIALS PROVIDED BY THE AUTHORITY OR WATER SUPPLIES DEPARTMENT

WSP.M410.9 PIPES, FITTINGS AND VALVES ETC

The following materials for water supply pipeworks will be provided by the Water Supplies Department or the Authority only for those parts of the Works stated in the Contract and shall be used in the permanent works:

1. Full, half and quarter length pipes with plain, flanged and spigot and socket ends;

2. Ring flanges, puddle flanges, slip-on type couplings, flange adaptors, collars, expansion joints, detachable joints, elastomeric joint rings, nuts and bolts;
3. Blank flanges and caps other than those required for pressure tests;
4. Bends, tees and tapers;
5. Steel pipes for the fabrication of gusseted steel bends and tees;
6. Primer, bitumen based composition and woven glass cloth for repairs to joints in steel pipes with bitumen coating provided by the Water Supplies Department or the Authority other than materials for protection of steel flanged joints, slip-on type couplings and flange adaptors;
7. Gate valves, air relief valves, butterfly valves and non-return valves, including all winding gear, operating motors and control equipment.

WSP.M420.9 WATER AND CHEMICALS

Water and sterilizing chemicals for cleaning, sterilizing and testing pipelines as stated in WSP.W1110, WSP.W1120 and WSP.T220 to WSP.T250 will be provided by the Water Supplies Department for one set of tests only for those parts of the Works stated in the Contract. The water and sterilizing chemicals shall be obtained from the locations agreed by the CM and shall be mixed by the Contractor.

WSP.M430.9 PROCUREMENT

The materials shall be obtained from the locations and at the times stated in the Project Specific Specification.

INSPECTION AND SUBMISSIONS

WSP.M510.9 INSPECTION OF MANUFACTURE AND TESTING

1. The manufacture and testing of pipes, joints, fittings and valves for water supply pipeworks other than materials provided by the Water Supplies Department or the Authority shall be inspected by an independent inspection authority approved by the CM;
2. The inspections shall be carried out at the manufacturer's works or at other locations stated in the Project Specific Specification or Instructed by the CM;
3. Particulars of the proposed independent inspection authority for pipes, joints, fittings and valves for water supply pipeworks, including name and address, previous experience, and names of inspectors, shall be submitted to the CM at least 28 days before manufacture of the materials starts.

WSP.M520.9 PIPES JOINTS AND FITTINGS

1. The following particulars of the proposed pipes, joints and fittings for water supply pipeworks shall be submitted to the CM;
    a. Manufacturer's literature, including details of:
        i. Manufacturing process;
        ii. Pressure and temperature ratings;
        iii. Permissible values of straight draws and angular deflection of flexible joints;
        iv. Recommendations for handling, storage, laying, jointing and repair;
        v. Drilling and tapping equipment for connections to pipes.

b. A certificate for each material showing the manufacturer's name, the date and place of manufacture and showing that the material complies with the requirements stated in the Contract and including results of tests required in accordance with the relevant British Standard;

c. Three copies of drawings showing details of the pipes, joints and fittings, including the materials used and the mass of each item;

d. A certificate of inspection of the manufacture and testing signed by the Approved independent inspection authority.

2. The particulars, including certificates other than certificates of inspection, shall be submitted to the CM at least 14 days before the first delivery of the material to the Site.

WORKMANSHIP

GENERAL

WSP.W010.9 ACCESS TO PIPELINES

1. Rubber wheeled trolleys shall be provided to obtain access inside pipelines exceeding DN 500 for water supply pipeworks in order to joint pipes, repair joints, coatings and linings and inspect the pipeline. Persons entering pipelines shall wear clean soft-soled footwear;
2. Mechanical fans shall be provided to ensure that an adequate air supply is available to those entering pipelines for inspection. Engine driven fans shall be fitted with a flexible exhaust or other methods of keeping exhaust fumes clear of the fresh air intake.

WSP.W020.9 SETTING OUT OF PIPELINES

1. The alignments of pipelines shown on the Drawings are indicative only and shall be set out in lengths in accordance with the following sub-clauses for determination of the exact alignment on Site by the CM;
2. At least three weeks before commencing trench excavation of a section of pipeline, set out on Site such section of pipeline and proceed to conduct underground utilities survey in accordance with PRE.C9.1630 to PRE.C9.1650. Upon completion of the said survey and at least two weeks before commencing trench excavation, prepare and submit proposal of inspection pits excavation in relation to such pipeline to the CM for agreement. Complete excavation of the inspection pits as agreed by the CM and allow at least one week for CM's inspection before commencing trench excavation;
3. The CM may order excavation of inspection pits after the initial setting out of the alignment of pipeline or after completion of the excavation of inspection pits proposed by the Contractor at locations that may deviate from the proposed indicative alignment for determination of the final alignment. If found necessary, adjust the indicative alignment of the pipeline to suit the topography and obstructions encountered;
4. The method of setting out shall be a centre line peg with suitable offset at every change of horizontal alignment and a sight rail mounted on two posts at 30 m maximum or at every change in vertical alignment or such other appropriate methods as proposed by the Contractor and agreed by the CM;
5. Following the setting out and adjustments, if any, the existing ground levels shall be recorded and agreed with CM;
6. Submit as-built drawings within 14 days after the trench excavated for a section of the pipeline is backfilled.

WSP.W030.9 CONNECTION TO EXISTING WATER MAINS

1. Where connections to existing water mains are specified in the Contract, whether to be done by others or by the Contractor, the Contractor shall excavate inspection pits to determine the locations and levels of the existing water mains as directed by the CM. The CM may adjust the lines and levels of the proposed water mains to suit the lines and levels of the existing water mains;

2. Where connections to the existing water mains are specified in the Contract to be done by others, the Contractor shall lay the proposed water mains up to approximately 2 m from the existing water mains or as directed by the CM on Site.

TRANSPORT HANDLING AND STORAGE

WSP.W110.9 PIPES, JOINTS AND FITTINGS GENERALLY

1. Pipes, joints and fittings for water supply pipeworks shall be transported, handled and stored in accordance with the manufacturer's recommendations and in a manner which will not result in damage or deformation to the pipes, joints and fittings or in contamination of the pipes, joints and fittings;
2. Pipes, joints and fittings shall be protected from damage and damaged pipes, joints and fittings shall not be used in the permanent work unless approved by the CM. Pipes, joints and fittings shall be securely packed and supported to prevent movement when being transported;
3. UPVC pipes, joints and fittings shall be protected from exposure to conditions which may affect the material;
4. Bolts and nuts shall be packed in sealed metal containers;
5. Elastomeric joint rings shall be packed in bags and lubricant for joints shall be stored in sealed containers marked to identify the contents. The rings and lubricants shall be protected from exposure to conditions which may affect the material;
6. Boxed or crated materials or those in sealed containers shall remain in their original boxes, crates or containers.

WSP.W120.9 HANDLING PIPES AND FITTINGS

1. Pipes and fittings other than thin walled pipes shall be handled by manual methods or by using lifting appliances or chains, wire rope or canvas slings of a type recommended by the pipe manufacturer and agreed by the CM. Hooks shall not be used;
2. Slings shall be placed around the pipes and fittings and padding shall be provided at points of contact between pipes and fittings and metal lifting appliances or slings. Pipes and fittings shall not be handled by means of metal slings passed through the pipes;
3. Pipes and fittings shall not be subjected to rough handling, shock loading or dropping and shall not be rolled down ramps unless permitted by the CM; if permitted, the ramps shall be padded.

WSP.W130.9 STORING PIPES

1. Pipes other than thin walled pipes shall be stored horizontally at least 75 mm above the ground on wedged timber bearers. The bottom layers and the outer pipes in each layer shall be securely wedged to prevent sideways movement;
2. Socket and spigot pipes shall be stored with the sockets alternating and in such a manner that loads are not applied to the sockets;
3. The height of stacks of pipes other than thin walled pipes shall not exceed 2 metres unless recommended by the manufacturer and permitted by the CM;
4. Pipes shall not be strung out along the route of the pipeline unless permitted by the CM.

WSP.W140.9 TRANSPORTING THIN WALLED PIPES

When being transported, thin walled pipes shall be supported on three rubber covered saddles shaped such that the pipes are supported over at least one-quarter of the circumference. The pipes shall be securely fixed in position at each saddle by straps tightened by turnbuckles. One saddle shall be placed at the mid-point length of the pipe and the other two saddles shall be placed at distances of one-fifth of the length of the pipe from each end of the pipe.

WSP.W150.9 HANDLING AND STORING THIN WALLED PIPES

1. When being handled and stored, thin walled pipes shall be protected from deformation by means of at least two screw jack cruciform struts with rubber padded ends shaped to fit the circumference of the pipes. The struts shall be fitted inside the pipes; any temporary struts fixed by the manufacturer shall be left in position until the cruciform struts have been fixed;
2. Thin walled pipes shall be handled by using two reinforced canvas slings at least 300 mm wide. The slings shall be suspended from a lifting beam and shall be placed at a distance of one-fifth of the length of the pipe from each end of the pipe;
3. Thin walled pipes shall not be rolled;
4. Thin walled pipes shall be stored on timber bearers padded with hessian or straw to provide continuous support over at least one-third of the circumference of the pipe. The pipes shall be securely fixed in position with wedges placed at a distance of one-fifth of the length of the pipe from each end of the pipe;
5. Thin walled pipes shall not be stacked on top of each other.

WSP.W160.9 STORING VALVES

Valves, including power operated valves and associated electrical and control equipment, shall be stored in accordance with the manufacturer's recommendations in a weatherproof store.

LAYING AND BEDDING PIPES

WSP.W210.9 LAYING PIPES GENERALLY

1. The CM shall be allowed to inspect trenches, bedding, pipes, joints, fittings and valves before pipelaying for water supply pipeworks starts. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before pipelaying starts in any part of the permanent work;
2. The permission of the CM shall be obtained before pipelaying starts in any of the permanent work;
3. The Contractor shall inspect pipes, joints, fittings and valves, including internal and external coatings, immediately before and after pipelaying; valves shall be inspected to ensure that they are in working order and are capable of being fully opened and closed. Deleterious material shall be removed and damage shall be repaired immediately before and after pipelaying; potable water shall be used for washing;
4. The inside of pipelines shall be kept clean and free from water, dirt, stones, debris and deleterious material. Except when pipes are being jointed, the open ends of pipelines shall be sealed with a wooden plug or stopper or by other methods agreed by the CM;
5. Measures shall be taken to prevent flotation of pipes;

6. Pipelaying shall follow closely on excavation of the trench. Lengths of trench which in the opinion of the CM are excessive shall not be left open;
7. Unless otherwise permitted by the CM, pipelines with a gradient steeper than 1 in 20 shall be laid in an uphill direction with sockets facing uphill;
8. Pipes shall be laid in such a manner that water will not pond in locations with zero and shallow gradients and such that the line and level of pipes will comply with the specified tolerances.

WSP.W220.9 LAYING STEEL PIPES

Steel pipes with welded joints for water supply pipeworks shall be spot welded to the adjacent pipe to which they will be jointed immediately after laying. Steel pipes manufactured with longitudinal or spiral welds shall be aligned in such a manner that the welds are staggered from pipe to pipe by at least 15° of arc.

WSP.W230.9 LAYING FLEXIBLY JOINTED PIPES

The degree of the curve of pipes for water supply pipeworks with flexible joints which are to be laid to a curve shall be equally distributed over all joints within the curved section. The deflection at a completed joint shall not exceed 3° or three-quarters of the maximum deflection recommended by the manufacturer whichever is less.

WSP.W240.9 INSTALLING VALVES

1. Operating gear and associated fittings shall be installed and fixed at the same time as valves for water supply pipeworks are installed. After installation, valves shall be cleaned inside and outside and left in a closed position;
2. Extension keys and clamps shall be fixed to valves in valve chambers if the vertical distance between the top of the valve spindle and the finished ground level exceeds 600 mm. The length of extension keys shall be such that the top of the extension key is not more than 300 mm below the finished ground level.

WSP.W250.9 BEDDING PIPES

1. Surfaces on which pipes for water supply pipeworks will be laid shall be cleaned and objects which may damage the pipes shall be removed before pipes are laid;
2. The bottom of trenches on which pipes will be laid directly shall be shaped to support the pipes uniformly along the length of the barrel. Holes shall be dug to prevent pipes resting on the sockets and to allow the pipes to be jointed.

CUTTING AND DRILLING PIPES

WSP.W310.9 CUTTING

1. Pipes for water supply pipeworks shall be cut and the ends shall be prepared in accordance with the manufacturer's recommendations. Purpose made equipment recommended by the manufacturer and agreed by the CM shall be used for cutting the pipes;
2. Cut ends of pipes shall be square and even, without damage to the pipe or coating. Cut ends, including cut ends of the piece not immediately required, shall be trimmed and chamfered to suit the type of joint and in such a manner that elastomeric joint rings will not be damaged by the cut end;
3. Pipes requiring to be cut to form closing lengths shall not be cut until adjacent pipes have been laid and jointed and the length to be cut can be accurately measured;

4. The permission of the CM shall be obtained before pipes provided by the Water Supplies Department or the Authority are cut. Only those pipes which in the opinion of the CM are suitable for cutting on Site shall be cut. All off-cuts shall be used for the permanent work unless in the opinion of the CM this is not practicable.

WSP.W320.9 DRILLING

1. Pipes for water supply pipeworks shall be drilled for small diameter connections using purpose made drilling and tapping equipment;
2. The threads of screw joints shall be painted before assembly with two coats of bituminous paint and shall be wrapped with three turns of spun yarn or other material approved by the CM.

JOINTING PIPES

WSP.W410.9 GENERAL

1. Pipes for water supply pipeworks shall be jointed in accordance with the manufacturer's recommendations and using jointing equipment and jointing materials recommended by the manufacturer and agreed by the CM;
2. The Contractor shall inspect pipes, joints, fittings and valves, including internal and external coatings, immediately before and after jointing. Deleterious material shall be removed and damage shall be repaired immediately before and after jointing. Potable water shall be used for washing. Surfaces which are to be jointed and jointing materials shall be cleaned immediately before jointing;
3. All joints in pipelines shall be watertight;
4. The widths of gaps at joints shall be in accordance with manufacturer's recommendations and shall be achieved by marking the outside of the pipe, by using metal feelers or by other methods agreed by the CM. The position of elastomeric joint rings shall be checked by using metal feelers after jointing;
5. Gaps at joints in pipes shall be protected after jointing by methods agreed by the CM to prevent dirt, stones or other material entering the joint;
6. Bolt holes in flanged joints and joints incorporating bolted components shall be correctly orientated before the bolts are tightened. The correct size of bolts and nuts shall be used. Bolt threads shall be lubricated and bolts shall be tightened using the correct size of spanner. Bolts shall be tightened in diametrically opposite pairs working around the bolt circle until all bolts are tightened to the torque recommended by the manufacturer;
7. Bolt holes in flanged joints shall be orientated symmetrically about the vertical diameter with no bolt holes on the vertical diameter. Elastomeric joint rings shall be the correct size and shall not protrude into the bore of the pipe. The rings may be temporarily fixed to the face of the flange using a minimum amount of adhesive of a type recommended by the manufacturer. Jointing compound or paste shall not be used.

WSP.W420.9 PIPES WITH PUSH-IN JOINTS

Pipes with push-in joints for water supply pipeworks shall be jointed by smearing the spigot end of the pipe with lubricant and placing the elastomeric ring joint in position inside the groove of the socket end of the laid pipe. The spigot end of the pipe shall be placed in the socket end of the laid pipe and pushed home.

WSP.W430.9 DI PIPES WITH MECHANICAL JOINTS

1. The elastomeric joint ring and the ends of the pipe shall be smeared with lubricant over a distance recommended by the manufacturer;
2. The gland and the elastomeric joint ring shall be placed in position on the spigot end of the pipe;
3. The spigot end of the pipe shall be placed in the socket end of the laid pipe before the bolts are tightened.

WSP.W440.9 WELDING JOINTS IN STEEL PIPES

1. Welding of joints in steel pipes for water supply pipeworks shall be carried out by the metal-arc process in accordance with BS 2633:1987 and BS 4515:1984;
2. Butt welding shall not be used for jointing plain ended pipes other than for gusseted bends unless approved by the CM. If Approved, the ends of the pipes shall be prepared in accordance with BS 534:1990 and BS 2633:1987 and welding shall be carried out in accordance with BS 4515:1984;
3. Records of welding operations shall be kept by the Contractor on the Site and shall be available for inspection by the CM at all times. Records should contain the following details:
    a. Date;
    b. Names of welders;
    c. Location of welding operation;
    d. Electrodes used in making each weld.

WSP.W450.9 SUBMISSIONS FOR WELDING

The following particulars shall be submitted to the CM at least 14 days before welding starts:

1. Details of welders, including names, copies of Hong Kong Identity Cards and details of previous experience;
2. Details of format of records;
3. Details of welding procedures, including welding plant, method of welding, materials, manufacturer and size of electrodes, number of runs and current strength;
4. Procedures for nitrogen gas tests on joints;
5. Valid certificate of competency in accordance with BS 2633:1987, Clause 11 for each welder, issued by an Authority approved by the CM.

WSP.W460.9 STEEL PIPES WITH SPIGOT AND SOCKET JOINTS

1. Pipes not exceeding DN 700 shall be welded externally. Pipes exceeding DN 700 shall be welded internally and shall then be welded externally with a sealing weld;
2. Loose scale, slag, rust, paint and other deleterious material shall be removed from parts of pipes to be welded by wire brushing or by other methods agreed by the CM. The parts shall be kept clean and dry before welding;
3. A double-run convex fillet weld shall be used for pipes not exceeding DN 900 and a triple-run convex fillet weld shall be used for pipes exceeding DN 900. The leg length of the fillet as deposited shall be at least the same as the full thickness of the pipe wall. The actual throat depth shall not be less than seven-tenths, and shall not exceed nine-tenths, of the minimum leg length as deposited;

4. Deposition of the weld metal shall be carried out in such a manner that all welds have adequate root fusion and are of good, clean metal, free from cracks, gas holes, slag intrusion and other impurities. The surface of the weld shall have an even contour with a regular finish and shall indicate proper fusion with the parent metal. Slag shall be removed from each weld by light hammering with a chipping hammer and by wire brushing;
5. Welds which contain cracks or other cavities or defects or in which the weld metal overlaps on to the parent metal without proper fusion shall be cut out and the joints shall be rewelded.

WSP.W470.9 STEEL PIPES WITH WELDED STEEL COLLAR JOINTS

Steel pipes with welded steel collar joints for water supply pipeworks shall be jointed by leaving a gap not exceeding 75 mm between the ends of the pipes to be jointed. A split steel collar shall be placed centrally around the ends of the pipes; the collar shall be at least the same thickness as the pipe wall and shall be approximately 300 mm long. The end of each pipe shall be fillet welded to the collar as stated in WSP.W460.

WSP.W480.9 STEEL PIPES WITH COUPLINGS AND FLANGE ADAPTERS

Steel pipes with slip-on type couplings and flange adapters for water supply pipeworks shall be jointed as follows:

1. Protective wrappings shall be removed from the ends of plain ended pipes to be jointed and shall be replaced by:
   a. Bitumen coating as WSP.M240 and BS 534:1990:Clause 25.1; or
   b. Epoxy or plastics based coating of a proprietary type approved by the CM.
2. The pipe shall be finished to an even, smooth surface free from distortion to allow the components of the coupling or flange adapter to be correctly positioned and jointed;
3. The coupling or flange adapter shall be placed in position on the plain end before the bolts are tightened.

WSP.W490.9 UPVC PIPES WITH SOLVENT WELDED JOINTS UPVC

Pipes with solvent welded joints for water supply pipeworks shall be jointed by applying solvent cement to the pipes to be jointed and pushing the pipes home. Excess solvent shall not be applied and surplus solvent shall be removed after jointing. Solvent welded pipes jointed outside the trench shall not be placed in the trench until the solvent setting period recommended by the manufacturer has elapsed.

WSP.W500.9 GREY IRON PIPE JOINTS

GI pipes for water supply pipeworks shall be screw jointed using a threaded coupler. The surface of the pipe and coupler shall be cleaned and the threads shall be painted with two coats of bituminous paint. The pipe thread shall be wrapped with three turns of spun yarn or other material approved by the CM and the joint tightened using purpose made tools. Coal tar compounds or lead-based paint shall not be used. Locking nuts to branch connections shall be tightened. Branch connections shall not protrude inside the pipe.

WSP.W510.9 MAKING FLANGED JOINTS

1. Further to WSP.W410, pipes and/or fittings to be jointed together shall be independently supported and properly aligned. After placing the gasket in position, the bolts shall be tightened in a sequence in accordance with the manufacturer's recommendations to avoid overstressing of the flange. If it is necessary to dismantle the flanged joint, the bolts shall be loosened in the reverse sequence to that used for tightening. The bolt tightening sequence shall be approved by the CM before making flanged joints;
2. When flanges other than polyethylene flanges are tightened, the bolts shall be tightened with a torque not exceeding the corresponding value specified in Table A or B below as appropriate. If the joint is not sealed after applying the specified torque, then the bolts shall be tightened with the torque increased by 10%. This procedure will be repeated until the joint is sealed. A final tightening shall then be applied with a further 10% increase in torque;
3. When polyethylene flanges are tightened, the bolt torque shall be in accordance with the manufacturer's recommendations or in the absence of such manufacturer's recommendations to the limits as shown in Table C below.

Table A

PN 10 Flanged Joints

APPROXIMATE BOLT TORQUES

Using rubber, cork, or

paper millboard gaskets (3 mm thick only)

Nominal Size DN (mm)	Approximate Bolt Torque (Nm)		
	To seal at 5 bar	To seal at 10 bar	To seal at 16 bar

250	250	12	100

JOINT PROTECTION

WSP.W610.9 PROTECTION TO STEEL FLANGED JOINTS, SLIP-ON COUPLINGS AND FLANGE ADAPTERS

1. Steel flanged joints, slip-on type couplings and flange adapters in steel pipes for water supply pipeworks shall be protected after jointing is complete;
2. The joint, including bolts and nuts, shall be cleaned to remove all moisture, dirt, oil, grease and deleterious material. Bolts and nuts shall be painted with two coats of bituminous paint and the joint shall be coated with primer. Mastic filler shall be applied in such a manner that all depressions, corners and voids between the bolts and nuts are filled and a smooth surface is available on which to apply the anticorrosion tape;
3. At least two layers of anticorrosion tape shall be applied to all parts of the joint and to the adjacent pipe for at least 200 mm beyond each end of the joint. The tape shall be applied in accordance with the manufacturer's recommendations and shall be wrapped spirally around the joint and pipe with at least 55% overlap per spiral;
4. The tape shall be moulded manually after application to take up the contours of the parts being protected.

REPAIRS TO JOINTS, COATINGS AND LININGS

WSP.W710.9 GENERAL

1. Unless otherwise approved by the CM, repairs to joints, coatings and linings shall be carried out using materials of the same type and grade as in the pipe, joint or fitting;
2. External repairs shall be completed before internal repairs are carried out;
3. Internal repairs and adjacent areas shall be washed with potable water after the repair is complete.

WSP.W720.9 INTERNAL REPAIRS TO BITUMEN COATED STEEL PIPES

1. Dirt, mill scale, rust and other deleterious material shall be removed from the areas to be repaired by wire brushing to leave dry, clean, bright material. All damaged material shall be removed and the area shall be cleaned and dried;
2. Primer shall be applied to the metal surface by brushing, avoiding bare spots, floods and sags;
3. The area surrounding the area to be repaired shall be gently heated with a blow lamp or hot iron until the adjacent coating is molten;
4. Bitumen shall be heated to 200℃ and shall be stirred from time to time to prevent overheating. The bitumen shall be worked into the area to be repaired with a heated trowel to the same thickness as the adjacent coating. The bitumen shall be finished to a smooth uniform surface.

WSP.W730.9 EXTERNAL REPAIRS TO BITUMEN COATED STEEL PIPES

External repairs to joints other than flanged joints, slip-on type couplings and flange adapters of steel pipes with bitumen coatings shall be carried out as stated in WSP.W720, except:

1. External repairs shall not start until any specified electrical continuity has been provided and any individual test to each joint has been carried out;
2. A purpose made moulding box shall be cleaned and coated internally with whitewash. After the whitewash has dried, the box shall be fitted centrally around the joint and bolted together. Gaps between the pipe and the box shall be sealed with yarn or other material agreed by the CM to prevent leakage;
3. The heated bitumen shall be poured into the box in one operation. After the bitumen has solidified, the box shall be removed, cleaned and stored for re-use;
4. The affected area of bitumen coating shall be painted with whitewash after cooling;
5. External repairs of coatings to steel pipes with bitumen coatings shall be carried out as WSP.W720 except that the heated bitumen together with woven glass cloth shall be worked into the area to be repaired. The affected area of bitumen coating shall be painted with whitewash after cooling.

WSP.W740.9 INTERNAL REPAIRS TO STEEL PIPES WITH CONCRETE OR CEMENT MORTAR LINING

1. The area to be repaired shall be cut back to leave clean, bright metal. The area surrounding the area to be repaired shall be wetted;

2. The concrete or cement mortar shall be worked into the area to be repaired and compacted to the same thickness as the adjacent lining; the concrete or cement mortar shall be finished to a smooth uniform surface. The compressive strength and density of the compacted concrete or cement mortar shall be in accordance with BS 534:1990, Clause 29.5. The repaired area shall be cured by using curing compound as Worksection CON1;
3. Samples of the concrete or cement mortar shall be provided and test cubes shall be made and tested as Worksection CON1.

WSP.W750.9 REPAIRS TO DUCTILE IRON PIPES WITH BITUMEN COATINGS

Internal and external repairs to joints and coatings of DI pipes with bitumen coatings shall be carried out using bituminous paint. The area to be repaired shall be cleaned to bare metal and dried. The area to be repaired shall be painted with bituminous paint to the same thickness as the adjacent coating. The paint shall be finished to a smooth uniform surface.

WSP.W760.9 INTERNAL REPAIRS TO DUCTILE IRON PIPES WITH CEMENT MORTAR LINING

1. The area to be repaired shall be cut back to leave clean, bright metal. The area surrounding the area to be repaired shall be wetted;
2. The cement mortar shall be worked into the area to be repaired and compacted to the same thickness as the adjacent lining; the cement mortar shall be finished to a smooth uniform surface. The repaired area shall be cured with curing compound as stated in Worksection CON1;
3. The inside of pipe sockets and the faces of flanges shall be kept free from cement mortar.

WSP.W770.9 REPAIRS TO GREY IRON PIPES

Internal and external repairs to joints and coatings of GI pipes shall be carried out using zinc-based paint. The area to be repaired shall be cleaned to bare metal and dried. The area to be repaired shall be painted with a rust inhibitor, primer and two coats of zinc-based paint.

THRUST AND ANCHOR BLOCKS

WSP.W810.9 CASTING

The bearing face, and other faces stated in the Contract, of concrete thrust and anchor blocks for water supply pipeworks shall be cast directly against undisturbed ground. The faces of excavations shall be trimmed to remove loose material before concreting. Excess excavation and working space shall be filled with concrete of the same Grade as the block.

WSP.W820.9 APPLICATION OF INTERNAL PRESSURE

Internal pressure shall not be applied to the pipeline until thrust and anchor blocks have developed the specified grade strength.

BEDDING, HAUNCHING AND SURROUNDING OF PIPELINES

WSP.W910.9 SUPPORT

Pipes shall be supported at the required level by Grade 20 precast concrete wedges, blocks or cradles or by other methods agreed by the CM. One support shall be placed adjacent to each end of the pipe and the spacing between supports shall not exceed 3 m. Compressible sheeting shall be placed between the pipes and supports.

WSP.W920.9 FLEXIBLE JOINTS

Flexible joints shall be formed in concrete bed, haunch and surround at flexible joints in pipelines. Joint filler shall be placed next to the flexible joint in the pipeline and shall extend for the complete thickness of the bed, haunch and surround.

WSP.W930.9 CONCRETING

1. Polyethylene sheeting shall be placed on the trench bottom before concreting;
2. Concrete shall be placed evenly over the complete width of the bed and over the complete length of the pipe being concreted up to a level of 25 mm below the underside of the pipe. Concrete shall then be placed on one side of the pipe only and worked under the pipe until the concrete spreads under the pipe. Concrete shall then be placed equally on both sides of the pipe to the specified level.

TOLERANCES

WSP.W1010.9 GENERAL

Refer to Appendix H 'Schedule of Tolerance' to this Specification.

CLEANING AND STERILIZATION

WSP.W1110.9 TIMING

1. Unless otherwise permitted by the CM, pipelines shall be cleaned and sterilized not more than 7 days before the pipeline is handed over;
2. Cleaning and flushing shall be carried out after:
    a. The complete pipeline, or parts of the pipeline permitted by the CM, have been tested;
    b. Temporary Works required for testing have been removed;
    c. Parts of the pipeline removed for testing have been reconnected.

WSP.W1120.9 PROCEDURE

1. Fresh water and potable water pipelines for water supply pipeworks shall be cleaned and flushed through with potable water;
2. The pipeline shall be completely filled with water that has been dosed with a homogeneous solution of sterilizing chemicals such that the final concentration of free chlorine in the water is at least 30 ppm. The water shall be left in the pipeline for at least 24 hours;

3. After the 24 hour period, the pipeline shall be drained down and the sterilizing water shall be flushed out using potable water until the concentration of the remaining chlorine is less than 1 ppm.

CONNECTION OF UNDERGROUND WATER SUPPLY MAINS

WSP.W1210.9 PROCEDURE

Connect to supply mains as follows:

1. Submit proposed re-arrangement or tee-off (if any) to CM for approval at least 24 hours prior to execution;
2. Identify existing live fresh, flush, and fire service supply mains by:
   a. Inspect as-built record drawings;
   b. Verify by valve operation. Close all the valves of the pipes and turn on valve of each pipe one by one to identify the type of each water pipes;
   c. Paint underground pipeworks of fresh, flushing and fire service supply mains at both sides of isolating gate valves in colours as stated in WSP.W1240.
3. Test turbidity to confirm salt water mains in accordance with WSP.T530;
4. Provide temporary cover and lockable device for isolating valve pits;
5. Submit findings of the identification for inspection and confirmation by Management Division;
6. Submit to Management Division Form DCMP-F741 together with Form H for making connections to existing in service supply mains within Housing Department estates;
7. Upon receipt of Part B of Form DCMP-F741, proceed with connection works;
8. Upon connection to supply mains, complete Part C of Form DCMP-F741 and submit to Management Division together with a copy of Certificate regarding Water Supply Connection issued by Water Authority for record;
9. Remove temporary cover of the isolating valve pits after completion of the connection of supply mains;
10. Submit record drawings to Management Division within 14 days of connection irrespective of whether or not changes have been made to the Contract Drawings.

WSP.W1220.9 INSPECTION OF CONNECTION

Check all connected pipeworks to supply mains by valve operation. Close all the valves of the pipes and turn on valves of each pipe one by one to identify the type of each water pipe.

WSP.W1230.9 RECORD DRAWINGS

Submit record drawings to CM within 14 days of underground water supply connection irrespective of whether or not changes have been made to the Contract Drawings.

WSP.W1240.9 UNDERGROUND SUPPLY PIPELINE IDENTIFICATION SCHEDULE

Paint underground pipeworks of fresh, flushing, and fire service supply mains at both sides of isolating gate valves in the colours shown in the following table, complete with the identification colour code indication:

Underground Supply Pipe Identification - Colour Reference to BS 4800:1989			
Service Type	Colour Code Indication Approx. 50 mm each ring		No. of Colour Rings Around Pipe
Fresh Water Main	Blue	18 E 53	3
Flushing Water Main	Green	12 D 45	2
Fire Service Water Main	Safety Red	04 E 53	1

WORKS OUTSIDE SITE BOUNDARY

WSP.W1310.9 APPROVED CONTRACTOR FOR PUBLIC WORKS

Carry out all work in laying and extending the fresh, flushing and fire services water mains from an location at the site boundary to the street mains by a contractor, sub-contractor or licensed plumber approved by Water Supplies Department or other duly constituted authority.

WSP.W1320.9 CONNECTION BY WATER SUPPLIES DEPARTMENT

Cap end of mains to prepare for connection to street mains by Water Supplies Department.

WSP.W1330.9 NOTIFY WATER SUPPLIES DEPARTMENT TO INSPECT

Notify Water Supplies Department to inspect completed pipework and valve pit before backfilling.

TESTING

TRIALS

WSP.T010.9 WELDING TRIALS

1. Unless otherwise permitted by the CM, trials shall be carried out to demonstrate the competency of each proposed welder who will be employed to weld joints in steel pipes for water supply pipeworks;
2. Trials shall be carried out at least 7 days before welding starts;
3. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out welding trials;
4. The trials shall be carried out using the welding procedures submitted to the CM;
5. Trials shall be carried out under similar conditions as those which will be encountered on the Site. Each trial shall consist of fillet welding two steel plates using at least two electrodes to complete one run of weld. The thickness of the steel plates shall be the same as the thickness of the steel pipe which will be welded;
6. A 150 mm length of the plate which contains what in the opinion of the CM is the worst welding shall be cut from the steel plates and broken in a vice;
7. The CM shall determine the competency or otherwise of each welder on the basis of the results of the welding trials.

WSP.T020.9 PIPE JOINTING TRIALS

1. Trials shall be carried out to demonstrate that the pipes, joints and fittings for water supply pipeworks fit correctly;
2. The trials shall be carried out at least 6 weeks, or such shorter period agreed by the CM, before the materials are to be incorporated in the permanent work;
3. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out the trials;
4. The Contractor shall immediately inform the CM of any pipes, joints or fittings which do not fit correctly. Modifications shall be made to pipes, joints or fittings which do not fit correctly or replacements shall be provided as instructed by the CM.

WSP.T030.9 TRIALS FOR DRILLING AND TAPPING

1. Trials shall be carried out to demonstrate that the proposed equipment and methods of drilling and tapping pipes for water supply pipeworks will produce connections which comply with the specified requirements;
2. The trials shall be carried out at least 14 days before drilling and tapping starts;
3. The Contractor shall inform the CM 24 hours, or such shorter period agreed by the CM, before carrying out trials.

TESTING JOINTS IN STEEL PIPES

WSP.T110.9 METHOD OF TEST

1. Spigot and socket joints in steel pipes exceeding DN 700 for water supply pipeworks shall be tested after welding by the nitrogen gas test;

2. A tapped hole of approximately 6 mm diameter shall be made in the socket end of each pipe to be tested and a non-return valve shall be fixed in the hole. The nitrogen gas test shall be carried out by pumping nitrogen to a pressure of 400 kPa into the annular space between the spigot and socket. The pump shall be disconnected and the pressure shall be recorded for 30 minutes.

WSP.T120.9 COMPLIANCE CRITERIA

There shall be no drop in pressure in the joint during the 30 minute period of the nitrogen gas test.

WSP.T130.9 NON-COMPLIANCE

If the result of any nitrogen gas test does not comply with the specified requirement for the test, the weld at the joint shall be cut out and the joint shall be rewelded and tested.

PRESSURE TESTING PIPELINES

WSP.T210.9 SUBMISSIONS BEFORE TESTING

The following particulars shall be submitted to the CM at least 14 days before the test starts:

1. Test equipment and method of setting up the equipment;
2. Calibration certificates for pressure gauges;
3. Procedure for carrying out the test;
4. Programme for testing.

WSP.T220.9 TESTING IN SECTIONS

1. The pipelines shall be tested in sections as stated in the Contract unless otherwise permitted by the CM;
2. If testing in sections other than those stated is permitted, the section to be tested shall be as long as practicable provided that the specified test pressure will not be exceeded;
3. Final tests on complete pipelines which have been tested in sections shall not be carried out.

WSP.T230.9 TEST PRESSURES

The test pressure shall be:

1. 1.5 times the maximum working pressure if the maximum working pressure does not exceed 1.5 MPa;
2. 1.3 times the maximum working pressure if the maximum working pressure exceeds 1.5 MPa.

WSP.T240.9 TESTING BEFORE BACKFILLING

1. Unless otherwise permitted by the CM, pressure tests shall not be carried out until the fill material has been deposited and compacted over the complete length of the pipeline to be tested;
2. If permitted, sufficient fill material shall be deposited to restrain the pipeline in position during the test.

WSP.T250.9 SIMULTANEOUS TESTING

Tests shall not be carried out simultaneously on pipelines in the same trench.

WSP.T260.9 TEST EQUIPMENT

The following equipment is required:

1. Blank flanges or caps;
2. Struts and wedges;
3. Temporary concrete blocks or other anchors;
4. Force pump and pump feed tank;
5. Pressure gauge, readable and accurate to 0.01 m head;
6. Continuous pressure recorder and purpose made charts, which will be loaned by the Authority or the Water Supplies Department only for those parts of the Works stated in the Contract.

WSP.T270.9 PROCEDURE

The procedure shall be as follows:

1. Pipes and valves shall be checked for cleanliness and the operation of valves shall be checked;
2. Blank flanges or caps shall be fixed to the ends of the pipeline, or section of the pipeline, to be tested. Tests shall not be made against valve gates;
3. The blank flanges and caps shall be secured with struts and wedges against temporary concrete blocks or other anchors. The blocks and anchors shall be completed and shall have hardened sufficiently before testing starts;
4. Thrust and anchor blocks, pipe straps and other devices required to prevent movement of pipes and fittings shall be completed before testing starts;
5. The pipelines shall be filled with water and all air shall be removed;
6. Unless otherwise permitted by the CM, the pipeline shall remain filled for 3 days before testing starts to allow absorption to take place and to achieve conditions which are as stable as practicable;
7. The pressure in the pipeline shall be increased slowly to the specified test pressure by pumping water into the pipeline using a force pump;
8. The pressure in the pipeline shall be maintained within +0% and -5% of the specified test pressure for a test period of at least 2 hours;
9. At the beginning and end of the test period and at 30 minute intervals during the test period, readings shall be taken from the pressure gauge and the pressures (p) shall be recorded. The pressure shall be adjusted to the specified test pressure each time a reading is taken;
10. The pressure shall be adjusted to within the specified tolerances for the test pressure at any time during the test period when the pressure falls outside the specified tolerances;
11. The pressure shall be monitored during the test by means of a continuous pressure recorder with purpose made charts;
12. The leakage of water from the pipeline shall be measured as the amount of water required to maintain the specified test pressure in the pipeline. The amount of water shall be determined from the fall in level of water in the pump feed tank.

WSP.T280.9 CALCULATION

1. The average test pressure (P) shall be calculated as the average of the pressures (p) recorded during the test;
2. The permitted leakage of water from the pipeline during the pressure test shall be calculated from the equation:

$$permitted\ leakage = 0.02 \times d \times l \times \frac{t}{24} \times \frac{P}{10} litres$$

where:

d is the nominal diameter of the pipe (mm);

l is the length of pipeline tested (km);

t is the test period (hr);

P is the average test pressure (m).

WSP.T290.9 REPORTING RESULTS

The following shall be reported:

1. The internal diameter of pipe to the nearest 1 mm;
2. The length of pipeline tested to the nearest 1 m;
3. The test period to the nearest 0.01 hr;
4. The pressures recorded during the test to the nearest 0.01 m;
5. The average test pressure to the nearest 0.01 m;
6. The leakage and permitted leakage of water to the nearest 0.1 litre;
7. Details of any discernible leakage of water from the pipeline during the test;
8. Charts obtained from the continuous pressure recorder;
9. That the test method used was in accordance with this Specification.

WSP.T300.9 MAINTENANCE OF HEAD

Unless otherwise permitted by the CM, the pipeline shall be left charged with water at a head of at least 15 m after testing and until the pipeline has been sterilized or handed over to the Authority.

WSP.T310.9 COMPLIANCE CRITERIA

The results of tests on pressure pipelines for water supply pipeworks shall comply with the following requirements:

1. The leakage of water from the pipeline determined by the pressure test shall not exceed the permitted leakage calculated in accordance with WSP.T280;
2. There shall be no discernible leakage of water from the pipeline or from any joint during the pressure test.

WSP.T320.9 NON-COMPLIANCE

If the result of any test on pressure pipelines for water supply pipeworks does not comply with the specified requirements for the test, the Contractor shall investigate the reason. Remedial or replacement work approved by the CM shall be carried out and the pipeline shall be retested.

TESTING WATER STERILIZATION

WSP.T410.9 GENERAL

1. After the pressure test on fresh water and potable water pipelines for water supply pipelines has been completed, samples of the water in the pipeline will be taken by the CM. The number of samples and locations of sampling shall be as instructed by the CM. Testing shall be carried out as stated in WRS.T320 and WRS.T330 for water sterilization of water retaining structures;
2. The colour, odour, appearance, turbidity, conductivity and pH value of the water samples shall be of a quality comparable with that drawn from the supply point and acceptable for potable water.

TESTING TURBIDITY

WSP.T510.9 FACILITIES FOR TESTING

Provide clean water and apparatus for testing. Ensure reagents or other chemicals where used, are of current stock.

WSP.T520.9 TESTING PRIOR TO CONNECTION OF SUPPLY MAINS

Test fresh, flush, and fire service supply mains prior to connection works as required by WSP.W1210.

WSP.T530.9 PROCEDURE

Test for development of white turbidity to identify salt water mains to satisfaction of CM, as follows:

1. Collect two 10 ml samples in clean McCartney bottles from the supply mains under investigation;
2. Add two drops of barium chloride solution to one sample;
3. Shake to mix contents and wait for approximately 3 minutes for turbidity to develop;
4. Compare with the other sample for increase in white turbidity (which would indicate the presence of salt water);
5. In doubtful cases, seek record drawings as well as laboratory services for confirmation.

APPENDIX WSP/I PROTECTION TO STEEL PIPES, FITTINGS AND SPECIALS USING EPOXY SYSTEM – OTHER REQUIREMENTS

GENERAL

WSP.A1.010.9 GENERAL REQUIREMENTS

1. Pipes, fittings and specials shall be protected both internally and externally and shall be suitable for use in and transport through the tropics;
2. The Contractor shall provide full documentation from the pipe manufacturer and/or protection supplier detailing the guaranteed service life of the proposed materials;
3. The Contractor shall provide certification pursuant to Clause 4.2.2 of AWWA C210-1997 where epoxy system is applied;
4. For pipes with outside diameter less than 1016 mm, internal protection with sulphate resistant cement mortar lining in accordance with the requirement of BS EN 10298:2005 will also be considered by the CM;
5. Slip-on type couplings and flanges adaptors (including nuts and bolts) shall be protected with Rilsan Nylon 11 or a fusion bonded epoxy coating (as described in the table in WSP.M110) and shall not require bituminous paint;
6. Expansion joints shall be protected in accordance with sub-clauses (1) and (2) above, except stainless steel slides surfaces that require no coating;
7. All bolts and nuts shall be hot dip galvanized or be coated with an epoxy-based or plastic-based corrosion-protection coating;
8. For pipes, fittings and specials to be jointed together by welding, internal and external protections shall be stopped at distance from the ends as follows:
   a. Butt welded joints – 75 mm from the ends of pipes to be welded;
   b. Sleeve welded joints – for sleeve and spigot sleeve, length plus 75 mm.

   In all cases, priming shall be up to the ends of the pipes.
9. For pipes, fittings and specials not to be jointed by welding, the external protection shall be stopped at a distance sufficient to permit assembly of the joint and internal protection shall be up to the pipe end;
10. On-site completion or repair of protection lining shall be carried out in strict compliance with the manufacturer's recommendation. Except for epoxy or plastic based protection coatings, materials for completing and repairing the external and internal protections on Site shall be approved by the CM. One set of the maintenance guideline/manual on repair of epoxy coatings shall be submitted to the CM.

GENERAL PROTECTION COATING REQUIREMENTS

WSP.A1.110.9 GENERAL

Selection of coating systems and application procedures shall be made with due consideration to environmental conditions during fabrication, installation and service of the installation. All coating application procedures shall be carried out in accordance with ANSI/AWWA C210-97.

WSP.A1.120.9 PLANNING AND DOCUMENTATION

1. All painting activities shall be fully incorporated into and regarded as an integral part of the fabrication plan;
2. Procedures pertaining to overall management, painting facilities, painting equipment, painting application, quality assurance, quality checks, repair and maintenance etc. shall be established and documented in detail and submitted for the approval of the CM before commencement of the actual painting work.

WSP.A1.130.9 AMBIENT CONDITIONS

1. No final blast cleaning or coating application shall be done if the relative humidity is more than 85%, and if the steel temperature is less than 3℃ above dew point in the ambient. No coating shall be applied or cured at ambient temperatures below 10℃;
2. The coating specification and/or product data sheets shall specify the maximum and minimum application and curing temperatures and other relevant requisites regarding application and curing conditions for each product in any coating system.

WSP.A1.140.9 COATING MATERIALS

The coating materials shall be suitable for the intended use and shall meet the following requirements:

1. In compliance with health, safety and environment protection requirements;
2. Suitable for raw water, salt water, fresh water and treated effluent;
3. For fresh water main coating, the material shall be suitable for drinking water uses.

WSP.A1.150.9 STEEL MATERIALS

Before abrasive blast cleaning, the steel used for fabrication shall as a minimum requirement conform to Rust Grade B as described in BS EN ISO 8501-1:2001. Any primer applied by the steel manufacturer shall be regarded as temporary corrosion protection and shall be removed in appropriate manner before application of the coating systems herein.

WSP.A1.160.9 REQUIREMENTS OF COATING, PERSONNEL AND PROCEDURES

Requirements as described in WSP.A1.510 to WSP.A1.540 of this Appendix shall be complied with and documented. Any equivalent product or alternative to the coating system specified in WSP.A1.610 proposed by the Contractor shall be approved by the CM before commencement of any coating work.

HEALTH, SAFETY AND ENVIRONMENTAL CONCERNS

WSP.A1.210.9 REQUIREMENTS

The following information/documentation shall be properly filed and made available for inspection upon demand:

1. Product Data Sheet of the coating material;
2. Material Safety Data Sheet of the coating material;
3. Volatile Organic Compound content (g/l) of the coating material;
4. Special handling precautions, personal protection and disposal instructions.

SURFACE PREPARATION OF THE SUBSTRATE

WSP.A1.310.9 PRE-BLASTING PREPARATION

1. Sharp edges, blurs, welding seams shall be rounded or smoothened by mechanical grinding before blast cleaning;
2. Hard surface lavers resulting from flame cutting shall be removed by mechanical grinding before blast cleaning;
3. Welding slag shall be removed by mechanical chipping and/or grinding. Blow-holes and welding imperfections shall be repaired by spot welding or removed by mechanical grinding. All welds shall be inspected and if necessary repaired before final blast cleaning of the area;
4. Any major surface defects, particularly surface laminations or scabs detrimental to the protective coating system shall be removed by suitable dressing. Where such defects have been revealed during blast cleaning, and dressing has been performed, the dressed area shall be re-blasted to the specified standard;
5. The surface of the substrate shall be free from any foreign matter such as weld flux, residue, dirt, oil, grease, salt, etc. before blast cleaning;
6. Any oil and grease contamination shall be cleaned by use of a new rag soaked with a suitable solvent.

WSP.A1.320.9 BLAST CLEANING

1. Blasting abrasives shall be dry, clean and free from contaminants that will be detrimental to the performance of the coating. It shall be in compliance with requirements as specified in BS EN ISO 11124;
2. Size and shape of abrasive particles for blast cleaning shall be such that the prepared surface profile (anchor pattern profile) is in accordance with the requirements for the applicable coating system. The surface profile will be graded in accordance with BS EN ISO 8503;
3. The cleanliness of the blast-cleaned surface shall be as referred to for each coating system i.e. Sa 2.5 or Sa 3 in accordance with BS EN ISO 8501-1:2001.

WSP.A1.330.9 FINAL SURFACE CONDITION

1. The substrate surface, after abrasive blast cleaning and before coating, shall be clean, dry, free from oil/grease and have the specified roughness and cleanliness ready for the first coat to be applied;

2. Dust, residual blast abrasives etc. shall be removed from the surface after blasting such that the surface cleanliness complies with Rating 2 of BS EN ISO 8502-3:2000;
3. The maximum content of soluble impurities on the blasted surface as sampled in accordance with BS EN ISO 8502-6:2000 shall not exceed a conductivity corresponding to a NaCl content of 100 mg/M². Equivalent methods may be used.

PAINT APPLICATION

WSP.A1.410.9 GENERAL

1. Product data sheet for each and every product used in a coating system shall be filed and made available for reference;
2. The following information for each product used in the coating system shall be clearly specified:
   a. Surface treatment requirements;
   b. Wet film thickness/dry firm thickness (max, min. and specified);
   c. Maximum and minimum recoating intervals at 10℃ gradient from 40℃ down to -5℃;
   d. Information on type of thinner to be used, thinning ratios;
   e. Mixing, handling and application requirements/recommendations.

WSP.A1.420.9 APPLICATION EQUIPMENT

1. Roller shall not be used for paint application;
2. When paints are applied by brush, the brush used shall be of a style and quality acceptable to the coating manufacturer. Brush application shall be done so that a smooth coat in accordance with the specified thickness is obtained;
3. Airless spray equipment is recommended to achieve uniform coating with good penetration. Coating supplier's recommendation for pressure settings, nozzle sizes and fan angles shall be followed.

WSP.A1.430.9 APPLICATION

1. Before application of each coat, a stripe coat shall be applied by brush to all welds, corners, behind angles, sharp edges of beams and areas not fully reachable by spray, etc. in order to obtain the specified film thickness in these areas;
2. Edges of existing coating shall be feathered before over-coating and overlapping;
3. Each coat shall be applied uniformly over the entire surface. Skips, runs, sags and drips shall be avoided. Each coat shall be free from pinholes, blisters and holidays;
4. Contamination of painted surface between coats shall be avoided. Any contamination shall be removed as per ANSI/AWWA C210 requirements.

WSP.A1.440.9 REPAIR

All repairs of coating shall be conducted in accordance with the original surface preparation requirements for the substrate and coating application requirements. The Contractor shall submit a method statement for repair of any damage caused to the epoxy coating for the approval of the CM.

QUALIFICATION OF PERSONNEL, SUPPLIER AND PRODUCT

WSP.A1.510.9 OPERATORS

1. Operators for blast cleaning, paint application etc. shall be properly trained and approved by the CM with knowledge in areas concerning operational technique, equipment use, product handling, industrial safety, personal health and use of protection equipment, etc.;
2. The personnel involved in carrying out quality inspection or verification such as QC/QA staff shall be qualified in accordance with industrial standard. A relevant qualification in this regard is acceptable if the person has attained the status of Certified Painting Inspector by FROSIO or NACE Painting Inspector - Level 3 or equivalent.

WSP.A1.520.9 SUPPLIER

1. The supplier of coating material shall be evaluated and approved by the CM;
2. The supplier shall demonstrate that it has the resources technically and financially to fulfill its commitments with supply to the Contract. In this regard, Manufacturer's research and development ability to support product advancement, production capacity, quality assurance system, supply logistics, and on-site technical after-sale support shall be evaluated.

WSP.A1.530.9 COATING MATERIAL

1. The coating material used for internal lining shall be tested and pass the requirements of BS 6920. A certification issued by Water Research Centre of the UK approving such coating for contact with potable water suitable for human consumption or its equivalent shall be provided;
2. Coatings used for both internal and external lining shall be demonstrated to have suitable mechanical properties and anti-corrosion properties for the long-term protection of the substrate. In this regard, the following properties may be used as selection criteria:
    a. Minimum adhesion strength in accordance with ASTM D4541 shall be equal to 19 MPa or in accordance with BS EN ISO 4624:2003 shall be equal to 12 MPa;
    b. Minimum impact test in accordance with ASTM D2794 shall be 0.136 kg-m;
    c. Minimum abrasion resistance in accordance with ASTM D4060 (Taber Abraser Wheel CS-17) shall be 200 mg/1000 rotations, load 1000 grams.

WSP.A1.540.9 PAINT WORKING SPECIFICATION

The supplier of coating material shall provide a working specification sheet giving a summary of the work procedures. This working specification shall be properly filed and made available for reference from time to time to ensure that correct procedures are followed.

COATING SYSTEM

WSP.A1.610.9 COATING SYSTEM REQUIREMENTS

Coating system for carbon steel pipe shall be in accordance with the coating system as in Table A, B or C as below appropriate:

Table A

System 1 for carbon steel pipe – internal lining

SYSTEM 1 For carbon steel pipe – internal lining	Coating Material and Surface Protection Requirements	Minimum Dry Film Thickness (DFT) (Microns)
Surface Preparation	Abrasive blast to Min. Sa2.5 (BS EN ISO 8501) Roughness to medium grade (BS EN ISO 8503) or 10Na according to Rugotest No.3	-
Primer Coat	Solvent free two-component, high build polyamine cured epoxy	250
Intermediate Coat	Solvent free two-component, high build polyamine cured epoxy	250
Final Coat	Solvent free two-component, high build polyamine cured epoxy	250
Total Dry Film Thickness		750

Table B

System 2 for carbon steel pipe – external lining pipe shielded from direct sunlight (buried underground)

SYSTEM 2 For carbon steel pipe – external lining pipe shielded from direct sunlight (buried underground)	Coating Material and Surface Protection Requirements	Minimum Dry Film Thickness (DFT) (Microns)
Surface Preparation	Abrasive blast to Min. Sa2.5 (BS EN ISO 8501) Roughness to medium grade (BS EN ISO 8503) or 10Na according to Rugotest No.3	-
Primer Coat	Solvent free two-component, high build polyamine cured epoxy	200
Final Coat	Solvent free two-component, high build polyamine cured epoxy	200
Total Dry Film Thickness		400
NOTES: For pipe to be installed outdoor under direct sunlight, a topcoat of aliphatic polyurethane at 50 microns is required for extra protection.		

Table C

System 3 for carbon steel pipe – temporary protection after blasting (approx. 15cm)

SYSTEM 3 For carbon steel pipe end – temporary protection after blasting (approx. 15 cm)	Coating Material and Surface Protection Requirements	Minimum Dry Film Thickness (DFT) (Microns)
Surface Preparation	Abrasive blast to Min. Sa2.5 (BS EN ISO 8501) Roughness to medium grade (BS EN ISO 8503) or 10Na according to Rugotest No.3	-
Blast Primer	2-component amine adduct cured epoxy primer	50
Total Dry Film Thickness		50

INSPECTION AND TESTING

WSP.A1.710.9 TESTING AND INSPECTION

1. Testing and inspection shall be carried out in accordance with the following table throughout the application process to ensure overall specification is met:

Testing and Inspection				
Test Type	Method	Frequency	Acceptance criteria	Action to take in case of failure
Environmental Conditions	Ambient and steel temperature. Relative humidity Dew point	Before start of each shift + twice per shift evenly timed	a. Relative Humidity below 85% b. Steel surface temp. 3℃ above dew point	No blasting or coating
Visual examination	Visual for sharp edges. Welding spatter slivers rust grades etc.	100% of all surface	No defect. Ref. Specified requirement	Defects to be repaired
Cleanliness	BS EN ISO 8501-1:2001	100% visual of all surface	Min Sa2.5	Re-blasting
De-dust condition	BS EN ISO 8502-3:2000	Spot check	Dust condition Max. quantity and size rating 2	Re-cleaning and retesting until acceptable
Water soluble salts on steel surface	BS EN ISO 8502-6:2000	Spot check	Max. conductivity corresponding to 100 mg/m² NaCl	Re-cleaning and retesting until acceptable
Surface profile of the blast cleaned surface	BS EN ISO 8503	Spot check	Profile grade "Medium"	Re-blasting

Visual Examination of Coating defects	Visual to determine: 1.Contamination 2. Solvent retention 3. Pinholes 4. Sagging 5. Surface defects	100% of surface for each coat	1. No contamination 2. No solvent trap 3. No pinholes 4. No sagging 5. Smooth and good cosmetic appearance	Repair of defect
Film thickness	SSPC-PA 2 Calibration on smooth surface	SSPC-PA2	SSPC-PA2 Apply DS/R 454-80:20 rule	Repair additional coats or re-coating as appropriate
Adhesion	ASTM D 3359	Spot check	Above level 3	Coating to be rejected
NOTES: All readings should refer to coating system specification.				

2. All epoxy and plastic bond coating shall be tested in accordance with BS 6920 and Water Industry Specification (WIS) No. 4-52-01 of UK.

GIN GROUND INVESTIGATION, INSTRUMENTATION AND SOIL TESTING

MATERIALS

GENERAL

GIN.M010.9 SUBMISSION OF DETAILS REGARDING GEOTECHNICAL INSTRUMENTATION

1. The following particulars of the proposed geotechnical instrumentation shall be submitted to the CM:
    a. Details of instruments and any alternative instruments proposed;
    b. Manufacturer's specifications;
    c. Test and calibration certificates;
    d. Method of installation;
    e. Method of acceptance testing;
    f. Details of ancillary measuring equipment;
    g. Schedule for installing instrumentation in relation to other work;
    h. Documents showing that the instruments are capable of measuring within the ranges and accuracies stated in this Worksection and as shown on the Drawings;
    i. Name and experience of persons responsible for installation, testing and monitoring of instruments;
    j. Details of standpipe piezometer tips, including manufacturer's specification; and
    k. Details of the form of records;
2. The particulars shall be submitted for Approval at least 28 days before installation of instrumentation starts.

GIN.M020.9 SUBMISSION OF DETAILS REGARDING GROUND INVESTIGATION

1. Submit the following particulars of the proposed materials and methods for ground investigation to CM:
    a. Details of drilling and in-situ testing equipment;
    b. Details of sampling equipment; and
    c. Details of filter materials and fill materials for drilling and testing.
2. Submit the particulars for Approval at least 7 days before the relevant work starts.

GIN.M050.9 FENCING

Comply with Worksection EXT9.

INSTRUMENTS AND EQUIPMENT

GIN.M110.9 GEOTECHNICAL INSTRUMENTATION - GENERAL REQUIREMENTS

1. Instruments for geotechnical instrumentation and their accessories shall be provided complete with all appropriate tubing, connections, monitoring equipment, read-out units and any other tools necessary for the installation calibration, setting to work and maintenance of the instruments;
2. Instruments shall be manufactured by companies with proven experience and only instruments which are well proven and have been in successful use shall be used, unless otherwise agreed by the CM;
3. Installed instruments shall become the property of the Employer. Detachable tubing, connections, monitoring equipment and read-out units shall become the property of the Contractor upon the expiry of the Maintenance Period.

GIN.M120.9 STANDPIPE PIEZOMETERS

1. Unless otherwise specified, standpipe piezometer is also referred to as piezometer in this Worksection;
2. Piezometer tips for geotechnical instrumentation shall be porous ceramic or plastic material at least 200 mm long and with a bore of at least 25 mm. The permeability shall be at least 10-4 m/sec;
3. The piezometer tip shall be connected to rigid uPVC standpipes with a bore of at least 25 mm and with a wall thickness of at least 3 mm. The standpipes shall be joined together and to the piezometer tips in such a manner that the joints remain leak-proof under the anticipated head of water;
4. Submit sample of the proposed standpipe piezometers to the CM for approval at least 14 days prior to installation.

WORKMANSHIP

GENERAL

GIN.W010.9 METHODOLOGY

1. Except otherwise specified or Instructed, carry out all ground investigation works in accordance with 'Geoguide 2: Guide to Site Investigation', GEO, 'Geotechnical Manual for Slopes', GEO, British Standard BS 1377:1990 - 'Methods of Test for Soils for Civil Engineering Purposes', 'Geospec 3: Model Specification for Soil Testing', GEO, together with any of its Corrigenda. Description of all samples and exposures shall generally be in accordance with 'Geoguide 3: Guide to Rock and Soil Description', GEO;
2. The various methods of sub-surface exploration to be used during the ground investigation are defined in this Worksection;
3. Carry out each exploration method in such a way that even slight changes in the character of the strata can be detected and the soil or rock removed from any hole shall be truly representative of the subsurface;
4. The exploration techniques shall accurately reveal the location of all changes of strata and shall facilitate the taking of disturbed and undisturbed samples at any depth;
5. Chose the exploration techniques, methods and equipment in such a way that all drill casings and other ground investigation tools such as drill rods and drill bits etc. shall be retrieved from all drillholes upon completion of drilling so that they would not become underground obstructions to future developments. If any drill casings and other ground investigation tools cannot be retrieved from drillholes, inform the CM immediately and record in accordance with GIN.W040.

GIN.W020.9 DEFINITIONS

Definitions of words and terms used in this Worksection include the following:

1. On completion of the investigation, the holes may be required to give further information on site conditions by the installation of perforated standpipes, Casagrande, Cambridge type or pneumatic piezometers. With the exception of pneumatic piezometers, these installations shall be called "observation wells";
2. The word "holes" shall mean all boreholes, auger holes, drillholes, Delft sample holes, probe holes, Penetration Vane Shear Test holes and trial pits, trial trenches, slope surface strippings where the context refers to them collectively. An "uncompleted hole" means any hole in which work is being carried out, and includes any hole which has not yet been backfilled;
3. "Hole Reference Number" shall mean the unit number allocated by the CM to a hole;
4. "Final Report" shall be a report submitted to the CM after satisfactory completion of the Works specified and after CM's acceptance of the draft reports of fieldworks, field tests and / or laboratory tests;
5. "Boring" shall mean advancing a hole into the sub-surface by the cable tool method using a suitable shell, chisel or clay cutter. Boring will be used principally in conjunction with disturbed and open drive undisturbed sampling. The rig used shall be called a "boring rig" and the hole formed shall be called a "borehole";

6. "Hand augering" shall mean advancing a hole using a portable soil auger rotated by hand and will be used principally for shallow exploration in fine-grained materials. The hole formed shall be called an "auger hole";
7. "Drilling" shall mean the use of a machine-driven rig for advancing a hole in rock or soil and recovering a core with a rotary cutting tool tipped with diamonds or other hard materials. If Instructed that a core is not required the Contractor may use a rock roller or similar bit. The rig shall be called a "drilling rig", and the hole formed shall be called a "drillhole";
8. "Probing" shall mean advancing a tool of specified dimensions into the ground without the use of boring, drilling, hand augering or excavation equipment, using either static or dynamic forces and recording the resistance to penetration offered by the ground. The hole formed shall be called a "probe hole";
9. "Sample" is any quantity of material obtained from the ground for the purposes of inspection, logging or testing;
10. A "sample tube" shall mean the container into which undisturbed soil is forced during sampling and in which the soil is extracted from the ground and stored. A "sampler" shall mean the sample tube and all the accessories that are required to obtain the undisturbed sample of soil;
11. Definitions used for laboratory testing staff are given in the testing section to this Worksection;
12. "Datum station" is a mark for which horizontal or vertical values, or both, have been fixed, and which is used as a datum for monitoring or control surveys;
13. "Geotechnical instrumentation" is the installation and monitoring of instruments in the ground or structures to provide information on soil and rock parameters, and to monitor specific variations in the condition of the ground or structures for the purposes of geotechnical design, construction control and performance monitoring;
14. "Monitoring mark" is a mark, fixed or installed, on a structure to be monitored;
15. "Reference point" is a mark placed close to another important survey mark to aid recovery or replacement;
16. "Survey station" is a mark on a stone, concrete, metal or wooden block, pipe, peg or other item defining a surveyed position;
17. "Investigation station" is the area within 1 metre from the specified point or area;
18. "Common ground" is material of clay, silt, sand, gravel, cobbles and all other types of material other than rock or boulders;
19. "Boulders" are rock fragments greater than 200 mm in size;
20. "Cobbles" are rock fragments 60 mm to 200 mm in size;
21. "Gravel" is soil particles 2 mm to 60 mm in size;
22. “Sand” is soil particles 0.06mm to 2mm in size. Sand shall be natural sand or crushed natural stone;
23. "Rock" is naturally occurring material of Grades I to III as classified in Table 4 of Geoguide 3 'Guide to Rock and Soil Descriptions';
24. "Structural concrete" shall mean concrete materials of over 200 mm unbroken length measured along the centre line of the hole, either reinforced or unreinforced that are part of structural elements, such as retaining walls, foundation caps, etc.;
25. "Unformed area" shall mean an area where slopes of inclination equal to or greater than 1 vertical to 2 horizontal, over 5 m high imposed between the nearest road access to Site and the first Investigation Station or between adjacent Investigation Stations;

For the purpose of this definition the nearest road access to Site shall be that point which, in the opinion of the CM, can be reached by a vehicle carrying a drilling rig.

26. "Formed area" shall mean all areas other than those defined as "unformed areas";
27. "Notation":

Length:	mm, m, km
Mass:	g, kg, Mg
Area:	mm^2, m^2
Volume:	mm^3, m^3
Time:	s, min, year
Liquid Volume:	l
Force:	N, kN, MN
Pressure:	kN/m^2, MPa
Unit Mass:	Mg/m^3, kg/m^3
Permeability:	m/s
Consolidation:	mm^2/s, $m^2/year$

28. "Dimensions of Cores" are given in BS 5930:1981;
29. "Hard strata" are natural or man-made materials, which cannot be penetrated, except by the use of rotary drilling or powered breaking tools;
30. "Block sample" is an undisturbed sample recovered by in-situ hand trimming of a block of material from the surrounding soil;
31. "Bulk sample" is a sample of at least 10 kg mass, which is representative of the grading of the material at the point of sampling;
32. "Inspection pit" is a pit for locating and identifying underground utilities and structures;
33. "Jar sample" is a disturbed sample of at least 0.7 kg mass contained in a transparent airtight jar, which has a screw cap with an airtight sealing ring;
34. "Slope surface stripping" is the removal of surface protection and vegetation from existing slopes to expose underlying soil or rock for inspection;
35. "Trial pit" is a pit for inspecting and logging the ground and in which to carry out in-situ testing and sampling;
36. "Trial trench" is any excavation with dimensions larger than a trial pit on plan;
37. "U76 sample" is an undisturbed sample recovered by advancing a thin-walled tube of approximately 76 mm diameter with a cutting edge into the soil;
38. "U100 sample" is an undisturbed sample recovered by advancing a thin-walled tube of approximately 100 mm diameter with a cutting edge into the soil;
39. "Undisturbed soil sample" is a sample complying with Class 1 or Class 2 of BS 5930:1981;
40. "AGS digital format" is a data format that complies with the Association of Geotechnical and Geoenvironmental Specialists (AGS) publication "Electronic Transfer of Geotechnical and Geoenvironmental Data";
41. "Inclined hole" is any drillhole or corehole Instructed to be drilled at an angel between the horizontal and 89.5° from the horizontal;

42. "CP (Logging)" is a person who shall comply with the minimum requirements on the qualifications and experiences required for the Competent Person (Logging) set out in the CoPSS, to carry out logging of samples and preparation of borehole logs; and

43. "AS" is the Authorized Signatory of RSC(GIFW) who is responsible for the carrying out the ground investigation field works under the Contract.

GIN.W030.9 PROCEDURE

1. Information will generally be obtained by boring and drilling with continuous boring in rock, decomposed rock and other materials;

2. Where rock and decomposed rock is overlain by soft natural deposits, then information on these soft deposits shall be obtained by boring through the deposits, taking frequent undisturbed samples and making frequent insitu tests when directed by the CM;

3. When rock or decomposed rock is reached, or as directed by the CM, drilling and coring shall be used to extend any hole started by boring;

4. Fresh or slightly decomposed rock will in general be proved to a depth of 5 m by N size drilling, unless otherwise Instructed.

GIN.W035.9 FENCING

1. Erect safety fencing or temporary barriers to comply with the requirements of GCC Clause 5.12. Where Instructed, the fencing shall be erected and left in place after completion of the investigation;

2. Comply with Worksection EXT9.

GIN.W040.9 SUBMISSION OF RECORDS AND REPORTS - GENERAL REQUIREMENTS

1. Unless otherwise specified, submit the following records and reports as detailed in this Worksection to the CM within the required periods as follows:

   a. 2 copies of daily records of holes, field installations and field tests within 4 working days;

   b. 2 copies of records of the coordinates and levels of holes within 2 working days of completion of the last hole excluding backfilling and reinstatement;

   c. 2 copies of preliminary records (logs) of holes, 2 sets of discs containing gINT files capable of generating the preliminary logs and associated data files of AGS within 5 working days of sinking the hole;

   d. 2 copies of draft fieldwork report including 2 sets of all photographs, 2 sets of discs containing gINT files capable of generating the preliminary logs and associated data files of AGS within 10 working days of the actual date of completion of fieldwork;

   e. 2 copies of laboratory test results within 3 working days of completion of each test;

   f. 2 copies of draft laboratory test report within 5 working days of the actual date of completion of test programme. The draft laboratory test report should contain full details of each test together with a summary sheet(s) tabulating the results of the tests undertaken on each sample;

   g. 2 copies of the draft pumping test report within 10 working days of completion of pumping test;

h. On receipt of CM's acceptance of the draft fieldwork and laboratory test reports, prepare and submit the following within 10 working days:

i. 5 fast-bound copies of the Final Report including all photographs required;

ii. 3 copies of digital image of the Final Report. Each digital image shall be stored in files on a CD-ROM and placed in a plastic protective pocket. Each CD-ROM shall be securely and clearly labelled with the date of production of the compact disc, the Contract No. and Works Order No., where applicable, the names of the Site, the name of the Employer, and the name and company chop of the Contractor. The digital image shall contain the complete contents of the report, including a scanned image of the cover page of the Report, all photos, drawings and the certificate signed by the AS as stated in sub-clause (5). The files shall be in Portable Document Format (PDF) that can be viewed and printed by the Adobe Acrobat reader. The size of each file shall be less than 10 MB and the file name shall be agreed with the CM. Separate files should be kept of borehole logs and photographs. The resolution of all colour images shall not be less than 150 dots per inch (dpi) with colour depth of 24-bit true colour. The resolution of black and white images shall not be less than 200 dpi;

iii. 2 sets of discs containing gINT files capable of generating the Final Report and associated data files of AGS format.

i. Additional copies of the Final Report including photographs ordered by the CM shall be supplied within 10 working days when Instructed.

2. The preliminary records shall give the Contractor's preliminary description and depths of all strata encountered and all the relevant information taken from the daily records including the setting out data. Obtain Approval to the form of his daily record sheets and his preliminary records before Works commence on Site;

3. The draft reports shall contain all the information required for the Final Report;

4. The Final Fieldwork Report shall be dated and certified on its cover page as being accurate, correct and complete by the AS;

5. The Final Fieldwork Reports shall contain all the information obtained from the investigation. Each Fieldwork Report shall contain the following:

a. A factual description, prepared by a CP (Logging), of the nature and methods of the ground investigation works carried out;

b. If holes have been sunk, a summary table of the depths and thicknesses of all strata (including decomposed rock and rock) encountered at each hole location and the reduced level of each stratum boundary;

c. A copy of the location plan amended as necessary to show the exact position of each completed hole;

d. A table of the as-drilled coordinates;

e. Final records of holes together with data in AGS digital format as specified in Appendix I to this Worksection or to the approval of the CM;

f. Colour photocopies of any photographs taken;

g. A certificate signed by the AS confirming the standards of ground investigation works carried out. The contents of the certificate shall be in accordance with the requirements stated in the CoPSS in respect of ground investigation report certification by the AS. The certificate shall be prepared on ICU forms provided by the CM.

6. The Final Laboratory Testing Reports shall contain the following:
   a. All the information gained from the testing programme and such introducing pages and summary sheets as are necessary together with data in AGS digital format as specified in Appendix II to this Worksection or to the approval of the CM. The summary sheets and all test certificates shall be fully typed for inclusion into each Report. Any record photographs of unsuitable samples shall immediately follow the summary sheets;
   b. A complete index of all the tests carried out and those which are HOKLAS accredited shall be clearly shown.
7. All records and reports shall be submitted on International A4 size paper unless otherwise agreed by the CM. All Final Reports shall be typed. The format and binding of the Final Reports shall be to the approval of the CM;
8. The photograph negatives or digital photograph images, together with the digital data disk in AGS digital format, shall be included in a single copy of the Final Report which shall be marked "Master Copy". For Final Laboratory Testing Reports, the original copies of all worksheets and supporting HOKLAS endorse test certificates shall be included in the Master Copy.

GIN.W050.9 GEOTECHNICAL INSTRUMENTATION - GENERAL REQUIREMENTS

1. Instruments shall be handled, stored, installed and used in accordance with the manufacturer's recommendations and in such a manner that the performance of the instruments will not be impaired;
2. Instruments shall be protected from damage and measures shall be taken to ensure that the instruments suffer the minimum practicable amount of disturbance;
3. Instruments shall be calibrated by an Approved laboratory. Instruments shall be calibrated at intervals recommended by the manufacturer and at other intervals as Instructed. Calibration certificates shall be provided to the CM within 24 hours after calibration. See also GIN.W120;
4. Installation, testing and monitoring of the instruments shall be carried out under the supervision of a suitably qualified technician. Particulars of the technician, including qualifications and experience, shall be submitted to the CM at least 7 days before commencement of work relating to geotechnical instrumentation.

GIN.W060.9 LOCATION AND ARRANGEMENT OF GEOTECHNICAL INSTRUMENTATION

Unless specified otherwise:

1. The locations and arrangement of instruments for geotechnical instrumentation shall be as stated on the Drawings or as agreed with the CM before installation;
2 The positions and alignments of instruments shall be recorded after installation and surveys shall be carried out at times and frequencies agreed by the CM to detect any displacement of the instruments;
3. At least two reference points shall be established for each survey station or monitoring mark;
4. The survey station which has the least chance of being disturbed shall be selected as datum station. The datum station shall be stainless steel and shall be protected from damage. At least three reference points shall be established for each datum station;
5. The survey network shall be related to the territorial control points provided by the CM.

GIN.W070.9 INSTALLATION OF INSTRUMENTS

1. Unless specified otherwise, inform the CM 24 hours, or such shorter period agreed by the CM, before the installation of each instrument for geotechnical instrumentation starts;
2. Instruments shall be installed, fixed and protected in a manner which will ensure that the instruments will function satisfactorily. Tests shall be carried out after installation to demonstrate that the instruments have been correctly installed and are functioning correctly. Instruments which are not correctly installed or are not functioning correctly shall be reinstalled or replaced as Instructed;
3. All installed instruments, tubes and wires shall be clearly marked with a unique and conspicuous identification number.

GIN.W080.9 ATTACHMENT OF TUBES AND CABLES TO INSTRUMENTS

Unless specified otherwise:

1. Tubes and cables attached to instruments for geotechnical instrumentation for remote reading shall be impervious to air and water, and shall have sufficient strength and stiffness to withstand the internal and external pressures. Tubes and cables shall be protected from mechanical damage and from the harmful effects of direct sunlight, heat and ultra violet radiation at all times;
2. Tubes and cables shall be free from defects and shall be marked with identification colours and numbers at 5 m intervals. The tubes and cables shall be wound onto reels in such a manner that kinks are not formed and strain is not induced. Open ends of tubes and cables shall be blocked with stop ends at all times;
3. Tubes and cables shall be buried at least 0.5 m below ground level;
4. Tubes and cables shall be laid with sufficient slack, loops and bends to allow for settlement and other ground movements. The routing of tubes and cables shall be as agreed by the CM and shall be in straight lines unless otherwise permitted by the CM. The radius of bends shall be at least 300 mm. Each tube or cable shall be laid from the measuring instrument to the terminal duct in one continuous length without joints.

GIN.W090.9 MAINTENANCE OF GEOTECHNICAL INSTRUMENTATION

1. Instruments for geotechnical instrumentation shall be maintained in good working order until the expiry of Maintenance Period. Instruments, survey marks and stations shall be protected by suitable barricades, notices, signs, marker-buoys or by other methods agreed by the CM. Construction shall be carried out in a manner which will avoid damage to the instruments;
2. Inform the CM immediately of any instruments found damaged or instruments found not to be in working order. Replacements shall be installed for read-out units which are faulty or under repair.

GIN.W100.9 RECORDS OF GEOTECHNICAL INSTRUMENTATION

Unless otherwise specified:

1. Keep on the Site records of activities relating to installation of geotechnical instrumentation and submit a copy to the CM within 24 hours after installation of the instrument is complete;
2. Prepare a drawing showing the locations and identification of installed instruments and submit to the CM within 24 hours after installation of the instrument is complete;

3. Prepare a drawing showing the locations and details of survey stations, monitoring marks and reference points and submit to the CM within 3 days after the survey network has been established.

GIN.W110.9 MONITORING AND RECORDING INSTRUMENT READINGS - GENERAL REQUIREMENTS

Notwithstanding specific requirements detailed in the following clauses to this Worksection:

1. Record the instrument readings and processed data for geotechnical instrumentation on agreed record sheets, and submit to the CM within 24 hours after recording. The form of record sheets shall be as agreed by the CM. Unless otherwise agreed by the CM, readings shall be taken in the presence of the CM;
2. Initial readings shall be taken immediately after the instruments have been installed and after the effects of installation have subsided. The initial readings shall be submitted to the CM and shall form the basis of comparison of subsequent readings. The instruments and the initial readings shall be replaced if the initial readings are not repeatable;
3. The frequencies for reading instruments shall be as agreed with the CM. Inform the CM immediately of sudden or significant changes in the readings;
4. All installed instruments shall be left in correctly functioning condition after final readings have been taken or at the end of the Maintenance Period. Keys for locks shall be tagged to identify the instrument number and shall be handed over to the CM.

GIN.W120.9 CALIBRATION OF MEASURING INSTRUMENTS

1. Where load, displacement, flowmeters, or other measuring instruments are used or where the nature of the instruments is such that calibration is required, then produce evidence of the calibration of all such instruments prior to commencing the works. Calibration of instruments should be carried out at the intervals shown in the table below:

Measuring Equipment	Calibration Interval
Flowmeters	6 months
Proving rings	2 years (or as agreed by the CM)
Pressure gauges	6 months
Torque Head (Vane)	Prior to each mobilisation
Load cells	1 year

2. Recalibration shall be conducted immediately if there is any suspicion of damage to measuring instruments or should the CM suspect the quality of the data produced. Copies of certified calibration charts shall be supplied to the CM within three days of a calibration test.

GIN.W130.9 DEPTHS OF EXPLORATION

1. Whilst investigation holes shall be continued to such depths as the CM may direct, provisional termination criteria will be as stated in this Worksection or the Works Order or as shown on the Drawings;
2. Excess drilling/excavation deeper than the depth specified/directed (including the tolerance given in the 'Schedule of Tolerance') will be at the Contractor's expense;

3. When required by the CM, holes shall be started at the bottom of trial pits, which have been excavated by the Contractor.

GIN.W140.9 USE OF CASING

1. Where sub-surface exploration is being carried out in any stratum, which is not sufficiently cohesive to stand firmly without a casing, or when directed by the CM, casing shall be used;
2. Ensure casings are advanced concurrently with the removal of material in such a manner that loss of ground is avoided;
3. Ensure that casings are of a suitable size and are inserted in such a manner as to render them recoverable. The CM reserves the right to direct the minimum diameter of casings where these are required to maintain the hole.

GIN.W150.9 REMOVAL OF CASING

The casing shall not be removed from any hole nor any filling introduced into a hole until permission is given by the CM. The casing shall be gradually withdrawn and, in non-cohesive material, the filling in the hole shall be kept above the bottom of the casing during withdrawal.

GIN.W160.9 SITE LOG BOOK

1. Maintain a Site Log Book in a format approved by the CM. All visitors to an investigation station, including the Contractor's staff, shall sign the Site Log Book on each visit. The Site Log Book shall also be used to record all verbal instructions at that particular investigation station and shall be countersigned by the authorized personnel making the instruction before the work is carried out;
2. Copy the Site Log Book to the CM within 3 working days of the date of completion of the fieldwork for each Works Order.

GIN.W170.9 DISPLAY OF REMOVED MATERIAL

When Instructed, display the removed material as follows:

1. All material removed from boreholes and auger holes, including small and large disturbed samples in their containers and undisturbed samples in their samplers shall be laid out in sequence on a clean corrugated metal sheet protected from the weather for examination by the CM;
2. The material shall be displayed in such a manner that, when required by the CM, further small disturbed samples can be taken unmixed with other material;
3. No material shall be removed from the display unless authorised by the CM.

GIN.W180.9 MARKING HOLES

When ordered by the CM, mark the position of holes permanently by the installation of Grade 20/20 concrete markers (300 mm x 300 mm x 300 mm) flush with ground level and the hole number indicated in red paint on the top face.

GIN.W190.9 ACCESS SCAFFOLDING

1. When Instructed, provide, maintain and subsequently remove on completion of the fieldwork access scaffolding of one of the types specified below:
    a. Scaffolding for the support and transportation of drilling rigs or other plant, equipment and personnel; and

b. Inspection scaffolding for examination of slope faces by the CM or other authorized person. The scaffolding shall be constructed of sound bamboo or other suitable materials approved by the CM.

2. The scaffolding referred to in sub-clause (1)(a) shall be of adequate size and constructed in a safe and secure manner including the provision of adequate working platforms, guardrails, barriers, toe-boards, fences, coverings on openings, gangways and runs in accordance with the Construction Sites (Safety) Regulations to ensure stability of the plant and equipment and the safety of persons working thereon and of third parties during boring, drilling, sounding and the movement of plant and equipment;

3. The inspection scaffolding referred to in sub-clause (1)(b) shall normally be a double-row scaffold having a maximum horizontal and vertical grid size of 600 mm and shall conform to the relevant safety requirements in the Code of Practice for Bamboo Scaffolding Safety and the Code of Practice for Metal Bamboo Scaffolding Safety or its latest revisions issued by Labour Department. The scaffolding structure at every grid shall be sufficiently strong for safety supporting at least a person and equipment weighting 120 kg. The scaffolding shall be constructed in such a way that makes it possible for person to climb on the outside face of the grid without having to climb across any over-hanging portion or member;

4. Provide a suitable fall-arresting system approved by the CM at every area where the slope inspection process may be involved. The fall-arresting system shall normally be vertical independent lifelines securely tied to stout steel pegs, tree trunks or other suitable anchorage (except the scaffolding members) at a horizontal interval of maximum 4 m;

5. Each lifeline shall be a fibre rope with a minimum diameter of 15.9 mm complying with the American National Standard, ANSI A10.32.2012, or other relevant international safety standards. Make available to the CM four sets of full body safety harness with suitable fall arresters for attaching to the lifelines. All the provided fall-arresting systems and equipment shall meet the relevant requirements in the Labour Department Guidance Notes on Classification and Use of Safety Belts and their Anchorage Systems published in 1998 or its latest revision. In addition, appoint a Competent Person according to the above Guidance Notes to check the provided safety equipment and anchorage system prior to their being used each time. Provide also necessary training to every concerned person to ensure the proper use of the safety equipment;

6. Where the inspection scaffolding in sub-clause (1)(b) as Instructed is a single-row scaffold, provide suitable working platform(s) for proper execution of slope inspection at area(s) considered to be necessary by the CM. The working platform(s) can be supported by double-row scaffolding, truss-out scaffolding or other suitable structural form(s) meeting the site environment. All working platforms and their supporting structures shall comply with the Code of Practice for Bamboo Scaffolding Safety and the Code of Practice for Metal Bamboo Scaffolding Safety or its latest revisions issued by Labour Department.

GIN.W200.9 WORKING OVER WATER

1. The Contractor may be required to carry out investigations over water. Over deep water a pontoon or jack up platform suited to the conditions may be required. Any pontoon shall have a minimum working area of 100 m^2 unless otherwise agreed by the CM;

2. The personnel for marine work shall include an experienced Marine Supervisor who will be responsible for the safe moving and movement of marine craft and equipment required for this work;

3. Where drilling over water, all depths shall be measured from the initial submerged ground level which shall be a fixed referenced datum to Principal Datum level;
4. Be responsible for making an application to the Marine Department regarding the Notice to Mariners within 2 working days following the receipt of an instruction for site investigation works over water. The processing of this application by Marine Department normally takes a minimum of 14 working days. Also be responsible for applying for any extension of the Notice to Mariners to complete the Ground Investigation ordered;
5. Be responsible for observing all applicable marine regulations and requirements of the Marine Department, especially those regarding safety;
6. Ensure that, during underwater boring and drilling operations, the craft or structure supporting the plant is adequately secured against movement from tidal, wind, current or other effects. Should the Contractor employ a tower or staging for making underwater boreholes or drillholes he shall ensure that the effects of settlement of the tower or staging are allowed for in any measurement.

GIN.W210.9 WATER LEVELS

1. Take daily readings of water levels in holes on land at the following times in all holes and observation wells and record them in the daily site records and report logs:
   a. Before work commences in the morning;
   b. Before the mid-day break;
   c. After the mid-day break;
   d. After work has finished in the evening but before water (if any) is added to stabilise the hole;
   e. When a hole has been completed;
   f. Immediately prior to backfilling a hole;

   The level of the bottom of the hole and the bottom of the casing, if any, shall be measured and recorded at the same time as each water level reading;
2. If at any time the level of the water in a hole fluctuates, keep a record for the fluctuation. If the hole "gains" or "loses" water, inform the CM immediately and record the details including the level of the bottom of the hole at that time and an estimate of the rate of gain or loss of water. Make provision for measuring artesian water levels when directed by the CM;
3. Record any addition of water to assist the advance of a borehole. In the case of drilling and wash boring, keep a careful record of the behaviour of the drill and wash water including an estimate of the percentage return. Report any extraordinary smell or colour of the water and other unusual circumstances in the daily site records.

GIN.W220.9 WATER LEVEL MEASUREMENT

Provide electrically operated dipmeters to measure all water levels. Each dipmeter shall be fitted with 60 metres of graduated tape at minimum 1 cm interval graduations.

SAMPLING

GIN.W310.9 GENERAL

1. Take both disturbed and undisturbed samples from all holes at the depths and intervals as specified or as otherwise directed by CM, provide all necessary sampling equipment, tubes and containers and carry out all handling and transportation of samples to a laboratory-testing contractor or to a storage area (both temporary and permanent) as directed by the CM;
2. Transport and deliver all samples in core boxes or in any other containers as specified.

GIN.W320.9 EQUIPMENT USED FOR SAMPLING

1. All the sampling equipment and containers shall conform to the requirements of Geoguide 2 and this Worksection;
2. Submit the specifications and examples of the equipment and containers proposed to be used to the CM for approval prior to the commencement of the Works.

GIN.W330.9 SAMPLE NUMBERING

1. Assign a reference number to each common ground sample (both disturbed and undisturbed) and groundwater samples taken, commencing with samples obtained from the inspection pit, if excavated;
2. The number shall be unique for that hole and shall be in order of depth below ground level;
3. The number shall also be shown on the records adjacent to the sample symbol.

GIN.W340.9 LABELLING OF SAMPLES

1. Mark all sample containers and tube samples clearly both on the side and the top of the sample with a permanent marker pen with the following information:
    a. Name of the Contract and Works Order number where applicable;
    b. Name or reference number of the site and area;
    c. Reference number, location and inclination of the hole;
    d. Reference number of the sample;
    e. Date of sampling;
    f. Brief description of the sample;
    g. Depth of the top and bottom of the samples below ground level.
2. Identify each core box by the following information, which shall be clearly marked on the top, both ends and beneath the core box lid using waterproof ink or paint:
    a. Name of the Contract and Works Order number where applicable;
    b. Name or reference number of the site and area;
    c. Reference number, location and inclination of the hole;
    d. Depths of material contained; and
    e. Core box number with indication on the total number of boxes for the hole.

3. Record the depths at which each core run started and finished at the ends of each core run by permanent marker pen on the edge of the box or on wooden blocks which fit between the dividing slats. If a core run is contained in two sequential core boxes, the abbreviation "cont'd" shall be used on the adjacent edges of the core boxes.

GIN.W350.9 SMALL DISTURBED SAMPLES FROM DRILLHOLES

1. For all drillholes,
   a. Take jar samples from the cutting shoes of each undisturbed sample, from any anomalous material, from each Standard Penetration Test and at other locations as Instructed;
   b. Take small disturbed samples of common ground on entering each new stratum (including decomposed rock) and every 1.0 m in between other small disturbed samples from cutting shoes or corebits. They shall be taken with a driven sample tube or other method approved by the CM. The disturbed sample shall be representative of the composition of the common ground.

GIN.W360.9 SMALL DISTURBED SAMPLES FROM TRIAL PITS, TRIAL TRENCHES OR SLOPE STRIPPINGS

1. Take small disturbed samples in all trial pits and trial trenches at the top of each common ground layer encountered and then at intervals of 0.5 m in any layer thicker than 0.5 m. Take small disturbed samples in common ground every 0.5 m along each slope surface stripping, commencing at the base;
2. The disturbed sample shall be representative of the composition of the common ground exposed;
3. Place samples of material predominantly coarser grained than sand, or when Instructed, place the samples in large polythene bags. Place other material in airtight plastic containers, of minimum 100 mm diameter, with a screw top. Take sufficient material to fill the bag or container, which shall be sealed immediately after recovery;
4. Label each sample as specified in accordance with GIN.W340 including the face number from which the sample was taken.

GIN.W370.9 BLOCK SAMPLES

1. Take block samples of common ground from the sides or bottom of trial pits or trial trenches or from slope strippings when directed by the CM. Samples shall be not less than 230 mm cube;
2. The top and four sides of the sample, but not the base, shall be excavated, trimmed, wrapped in aluminium foil and waxed. A wooden box, with two opposite sides removed, shall then be placed over the prepared sample such that a minimum annulus of 25 mm exists between the inside of the box and the sample. The top and side annuli shall then be filled using polyurethane by means of two reagents. After hardening of the polyurethane, the top of the box shall be attached and the sample carefully broken away at its base at a depth of no less than 50 mm below the base of the sample. The sample shall then be carefully inverted and the "base" trimmed, wrapped in aluminium foil and waxed before the basal annulus is filled with polyurethane. After hardening, the base of the wooden box shall be attached. The top and bottom of the sample shall be clearly marked on the box, as shall the direction of magnetic north relative to the in situ sample.

GIN.W380.9 LARGE DISTURBED SAMPLES FROM TRIAL PITS, TRIAL TRENCHES OR SLOPE STRIPPINGS

Take large disturbed samples of at least 25 kg in trial pits, trial trenches or from slope stripping, when Instructed. Place all large disturbed samples in heavy duty polythene bags immediately after they are taken, and securely fastened. Before taking sample in slope stripping, remove a minimum of 100 mm of material, or other thickness, as Instructed.

GIN.W390.9 UNDISTURBED SAMPLES FROM TRIAL PITS OR TRIAL TRENCHES

Take open drive undisturbed samples from the sides or bottom of trial pits or trial trenches, when directed by the CM as described in this "Sampling" sub-section.

GIN.W400.9 OPEN DRIVE UNDISTURBED SAMPLERS

1. Take open drive undisturbed samples in trial pits, trial trenches, drillholes and as directed by the CM;

2.

   a. Undisturbed samples shall be taken in an Approved 101 mm (±1 mm) (for U100), 77 mm (±1 mm) (for U76) and 41 mm (±1 mm) (for U40) internal diameter open drive sample tubes made from thin walled seamless stainless steel or galvanised mild steel not less than 450 mm (for U100), 350 mm (for U76) and 200 mm (for U40) in length fitted with a cutting shoe tapered at an angle not exceeding 20°;

   b. The end area ratio of the sample tube cutting shoes as defined in Figure 13 of Geoguide 2 shall not exceed 30% and inside clearance between the shoe and each tube shall not exceed 2% unless a core retainer is used, in which case the clearance shall not exceed 4%;

   c. The adaptor head at the top of the sample tubes shall be fitted with a ball valve to permit the exit of air or water during driving and to assist in retaining the sample during withdrawal and it shall have an allowance for over-driving;

   d. Each sample tube shall have the word "TOP" engraved on its exterior at one end;

   e. The internal and external diameter of the cutting shoe and of the sample tube shall be recorded.

3.

   a. The sample tube cutting shoe shall be free from rust, pitting, burring or any other defect;

   b. The use of oil inside the sampler shall not be permitted;

   c. The end of the sample tube marked "TOP" shall be driven uppermost;

   d. Care shall be taken to ensure that the sample is not compressed by over-driving;

   e. The minimum recovery shall be 80% of the sampled length;

   f. The method of driving, dimensions, construction and condition of each sample tube, cutting shoe, adaptor head and sample retainer shall be to the approval of the CM prior to sampling;

   g. All recovered samples shall be stored and transported vertically, in their correct orientation, in purpose-built racks which shall hold the tubes securely.

GIN.W402.9 GROUNDWATER SAMPLES FROM LAND CONTAMINATION INVESTIGATIONS

1. When Instructed, take one groundwater sample at each drillhole, inspection pit and trial pit where groundwater is encountered during drilling/excavation and only after required soil samples have been collected;
2. For groundwater taken from a drillhole, install a groundwater sampling well in accordance with Appendix XXII to this Worksection. The well shall be constructed using at least 50 mm, flush jointed, threaded class 18 uPVC with standard factory pre-slotted sections of 1 mm or less slot aperture (or a size equivalent to 90% retention for filter pack material) vertically separated by no more than 4 mm, with at least three cuts per perimeter:
    a. Submit a method statement to CM for approval for the installation of the groundwater sampling well prior to the commencement of the installation;
    b. After installation of the wells, measure the depth to water table at all wells at the same period of time with an interface probe in order to delineate the water table contours at the Site;
    c. Upon completion of installation of the wells, pump out approximately five well volumes to remove silt and drilling fluid residue from the wells;
    d. Allow the wells to stand for a day to permit groundwater conditions to equilibrate;
    e. Measure groundwater level and thickness of free product layer, if present, at each well before groundwater samples are taken;
    f. Purge the wells for at least three well volumes to remove fine-grained materials and to collect freshly refilled representative groundwater samples. Record the time for each groundwater purging or recharge as well as the estimated groundwater flow.
3. Where groundwater is encountered in inspection or trial pits, record groundwater level. Collect groundwater samples through pumping out all groundwater, letting groundwater to recharge and allowing the groundwater to stand for a day to permit conditions to equilibrate before sampling;
4. Where free product (discrete layer of contaminant which is not bound to soil or mixed in with groundwater) at or above groundwater is encountered, measure the thickness and depth of the free product layer using an approved interface probe and collect a sample when Instructed;
5. Collect groundwater samples using Teflon bailer and decant it into appropriate sample vials or bottles provided by other contractor in a manner that minimises agitation and volatilisation of the volatile organic compounds from the samples;
6. Comply with the requirement stated in sub-clauses (2) to (8) of GIN.W405 and GIN.W406.

GIN.W405.9 SOIL SAMPLES FROM LAND CONTAMINATION INVESTIGATIONS

1. When Instructed, take specified types of soil samples from inspection pits, trial pits or drillholes for land contamination investigations and comply with the "Guidance Notes for Investigation and Remediation of Contaminated Sites of Petrol Filling Stations, Boatyards, Car Repair/Dismantling Workshops" by Environmental Protection Department;
2. Take special precautions to prevent contamination of samples, which shall include but not be limited to the following:

a. For soil and groundwater samples taken from the inspection pits/trial pits/drillholes, decontaminate all plant and equipment used for excavation/drilling and sampling as follows:

i. Decontaminated by steam cleaning or high-pressure hot water jet;

ii. Washed by phosphate-free detergent; and

iii. Rinsed by distilled or de-ionized water.

b. Between samples, decontaminate all equipment used for sample extraction and handling in accordance with sub-clauses (a)(i), (a)(ii) and (a)(iii).

3. The sample containers shall be laboratory cleaned, sealable, watertight, made of glass or other suitable materials with aluminium or Teflon-lined lids, in order to prevent reaction between container surface and sample or adsorption of contaminants;

4. Do not allow headspace in the sample containers after collection of sample;

5. Store samples at between 0°C - 4°C but never frozen, and deliver to the laboratory as directed by the CM within 24 hours of the samples being collected. Operate a chain of custody system as part of the QA system;

6. Label the samples in accordance with GIN.W340 unless otherwise specified;

7. Water use for flushing medium shall be of potable quality and no lubricant, hydraulic fluid or other additive shall be introduced during drilling. No re-use of water shall be permitted;

8. Comply with GIN.W406 for safety measures for Land Contamination Investigations;

9. Prior to mobilization, submit for the CM's approval the proposed sampling procedures and safety measures to be taken for the Land Contamination Investigations.

GIN.W406.9 SAFETY MEASURES FOR LAND CONTAMINATION INVESTIGATIONS

1. Comply with safety measures as specified in the "Guidance Notes for Investigation and Remediation of Contaminated Sites of Petrol Filling Stations, Boatyards, Car Repair/Dismantling Workshops" by Environmental Protection Department for Land Contamination Investigations;

2. Exercise extreme care when toxic gases or other hazardous materials are encountered. Report any abnormal conditions found immediately to the safety officer on site and the CM;

3. Establish and maintain a Health and Safety Plan, before commencement of the Works, which shall include but not be limited to the following:

a. Instruction of works on work procedures, safe practices, emergency duties, and applicable regulations;

b. Regularly scheduled and impromptu meetings of the workers in which the possible hazards, problems of the job, and related safe practices are emphasized and discussed;

c. Good housekeeping practices; and

d. Availability of and instruction in the location, use and maintenance of personal protective equipment.

4. Maintain equipment and supplies reasonably required in an emergency, including lifesaving, evacuation, rescue and medical equipment in good working order and condition at all times. Use all reasonable means to control and prevent fires and explosions, injury to personnel and damage to equipment of property. Without limiting the foregoing:

    a. Maintain proper safety devices, barriers to minimise hazards during performance of the work;

    b. Prohibit smoking and open flames and the carrying of matches and lighters;

    c. Develop and maintain a written emergency plan applicable to the Works and Site;

    d. Maintain equipment in good operating condition and have emergency and first aid equipment ready for immediate use, where applicable;

    e. Conduct equipment tests to ensure that the equipment is properly placed and in good operating condition, and that workers are able to respond to emergency situations;

    f. Require all workers on Site at all time to wear clothing suitable for the work being carried out, weather and environmental conditions. For example, wear clean PVC/latex gloves whilst handling sampling equipment and carrying out sampling; and

    g. Require the personnel to wear respirator and gloves for vapour exposure protection, if necessary. Safety helmet and protective boots should be worn.

GIN.W410.9 CLEANING HOLE BEFORE SAMPLING

Before an attempt to take an undisturbed sample from a drillhole is made, remove all loose material and material disturbed by drilling or field testing from the holes. On recommencement of work at the start of each shift during the progress of a drillhole, remove a minimum of 300 mm of material before the next undisturbed sample is taken, unless otherwise Instructed.

GIN.W420.9 OPEN DRIVE SAMPLING IN BOREHOLES AND DRILLHOLES

1. The CM may order the use of an open drive undisturbed sampler in any drillhole in common ground;

2. Drive the sampler by means of either a jarring link (i.e. drilling rods delivering the impact at the adaptor head of the sampler), a sliding hammer arrangement to the Approval of the CM or a single ram stroke;

3. Do not apply vertical pull-up action to the sampling tube during the lift-up of any hammering operation;

4. Record the total depth driven or pushed and, where relevant, the number of blows used. If driven samples are Instructed in common ground of low cohesion, such as silts and silty fine sands, provide a core retainer of suitable design to improve sample recovery. In cohesive common ground, make an initial attempt to obtain a sample without the use of a core retainer;

5. If an attempt to take a U100 or U76 sample in a drillhole recovers a length of sample less than specified, clear the material disturbed by the sampling process in the hole immediately and make another attempt from the level of the base of the failed attempt, using core retainer. Should the second attempt also prove unsuccessful, perform a Standard Penetration Test with liner sampler, and continue the required sampling sequence. If two consecutive sequences of failed sampling occur in any one drillhole, inform the CM immediately.

GIN.W430.9 OPEN DRIVE UNDISTURBED SAMPLING IN AUGER HOLES

When directed by the CM open drive undisturbed samples shall be taken in auger holes. Open drive undisturbed samplers in auger holes shall be driven by mean of a jarring link and the total number of blows used shall be recorded. The sampler shall be of an Approved design.

GIN.W440.9 OPEN DRIVE SAMPLING IN TRIAL PITS AND TRIAL TRENCHES

1. Prior to sampling in trial pits or trial trenches, clear all disturbed material in order to expose common ground in its natural condition;
2. Take samples using a sliding hammer arrangement with care to ensure that no lateral movement takes place during driving, with the use of guide frame as necessary. The proposed method of driving shall be to the approval of the CM;
3. If a driven sample recovers less than that specified, make a second attempt at a clear distance at least one tube diameter from the first attempt. If the second attempt fails, make a third and final attempt at a clear distance at least one tube diameter from any previous attempts. If the third attempt fails, inform the CM immediately.

GIN.W450.9 WITHDRAWING THE SAMPLER

1. Before withdrawal in boreholes, auger holes and drillholes, rotat the sampler through two complete revolutions to shear the soil horizontally at the bottom of the sampler;
2. If necessary, delay this operation to allow the development of sufficient adhesion inside the tube;
3. Smoothly withdraw the sampler so that disturbance to the sample is kept to a minimum;
4. In trial pits or trial trenches, remove the sampler by excavating around it;
5. Measure and record the total length of the sample. Record any soil that has fallen out of the bottom of the tube.

GIN.W460.9 SEALING OF COMMON GROUND TUBE SAMPLES

1. Once a sample tube has been detached or removed from the sampling equipment, keep the visible ends of the sample clear of any disturbed material and trim the edges at 45°;
2. After cleaning the sides of the tube above the recovered sample, coat the ends with three successive thin films of just molten microcrystalline wax. Add a metal foil disc followed by more molten wax to give a total thickness of not less than 20 mm. Solidly fill any space remaining in the ends of the sample tube with damp sawdust or other material approved by the CM and cover the ends of the sample tube with tight fitting rubber caps;
3. Handle the tubes containing samples with care to avoid any possible disturbance, store them in a cool and dry location and protect them against the sun or inclement weather whilst on Site;
4. Place the material from the cutting shoe/core bit immediately in a plastic container of minimum diameter 100 mm, with a screw top. They shall be arranged securely in the corebox in their proper sequence;
5. If any undisturbed samples are found to have been incorrectly sealed, labelled or stored, they will be regarded as disturbed samples by the CM.

GIN.W470.9 GROUND WATER SAMPLES

1. When directed by the CM, take ground water samples from trial pits, trial trenches, boreholes or drillholes;
2. If water has been used for the purpose of drilling, bale out a volume of water at least equivalent to that of the drillhole volume before sampling;
3. Each sample taken shall not be less than 2 litres and shall be placed in a sterilized airtight bottle of sufficient capacity. Bottles shall be flushed out twice with the water to be sampled before use.

GIN.W480.9 LINER SAMPLES FROM STANDARD PENETRATION TESTS

1. When Instructed, provide a liner sample in conjunction with the Standard Penetration Test;
2. The split barrel sampler shall have an enlarged internal diameter to accommodate a thin stainless steel or aluminium liner of 35 mm internal diameter which shall fit tightly inside. The internal diameter of the liner may be up to 0.2 mm larger but in no case be smaller than that of the drive shoe. The liner shall have a smooth internal surface and may comprise two separate sections of equal length. The enlarged split barrel shall not be used without a liner in place;
3. After the sampler has been withdrawn from the drillhole, treat the liner and the retained soil in the same manner as an undisturbed sample.

GIN.W490.9 PISTON SAMPLING

Take undisturbed piston samples in boreholes or drillholes when Instructed and as follows:

1. Carry out piston sampling with an Approved thin-walled stationary piston sampler;
2. The sampling tube shall be 1000 mm long, formed from stainless steel with an internal cutting edge and shall have an internal diameter of 75 mm or 100 mm (± 1 mm) as specified by the CM;
3. The piston sampler shall be capable of operating to a depth of 20 metres below ground level;
4. The sampling operation shall ensure the sampling tube is pushed into the soil at a steady rate with no lateral deflection;
5. The design and performance of the sampler shall be such that a vacuum is formed over the retained sample in the tube;
6. The area ratio of the tube, as defined in Geoguide 2, shall not exceed 10% and the cutter edge taper angle shall not exceed 15°. No inside clearance is permitted;
7. The minimum recovery shall be 90% of the sampled length. Where the sample length is less than that specified, clear the material disturbed by the sampling process in the hole and make another attempt from the level of the base of the failed attempt at no extra cost. If this second sampling attempt also fails to recover the minimum specified, continue the Instructed sampling sequence and inform the CM immediately, or as soon as possible the next working day;
8. Fabricate purpose-built sample boxes for transporting and storing all piston samples in a vertical position in the correct orientation. Each vertical box shall be used to transport a maximum of two piston samples. These boxes shall be robust, water-tight, and shall be fitted with hinged top and attaching rope stands. The inside of the box shall be provided with styrofoam padding which holds samples tightly in place.

GIN.W500.9 RETRACTABLE TRIPLE TUBE CORE SAMPLER

1. Take undisturbed samples of common ground in drillholes using a triple tube retractable core barrel (Geoguide 2) fitted with either a detachable rigid clear ABS plastic or rigid opaque PVC or Polyethylene (PE) liner;

2. The dimensions of the core barrel and liner shall be as follows:

Item			Dimension (mm)
Core Barrel	Outer Tube	OD	98.5 ± 2.0
	Inner Tube	ID	78.0 ± 1.0
		OD	85.0 - 89.0
	Cutting Shoe (LeadingEdge)	ID	72.5 ± 1.0
		OD	77.2 ± 1.0
	Drill Bit	OD	101.1 ± 2.0
Liner	ID		74.0 ± 1.0
	OD		77.0 ± 1.0
	Ovality		± 0.5
	Bow		3 per metre
	Length		1000 ± 5
	Wall Thickness		1.5 minimum

3. Use face-discharged bit formed of steel and set with tungsten carbide inserts in a saw tooth profile. The drill bit shall have groove cuts on the external sidewall to facilitate return of flushing fluid;

4. The cutting shoe shall have an area ratio of 10 to 15%. The ID of the leading edge of the cutting shoe shall be smaller than the ID of the liner tube with an inside clearance within 1.5 to 3.5%. Three lengths of cutting shoes, referred to as "long", "medium" and "short" with decreasing lengths of protrusion beyond the drill bit when mounted, shall be available. The "long" shoe with a protrusion of not more than 50 mm shall be used generally for looser or softer soils, and the "medium" or "short" shoes for denser or stiffer soils;

5. The liner shall fit tightly inside the inner tube, in both radial and longitudinal directions. Obtain the type and make of the liners to be used from a manufacturer approved by the CM. In addition, within 3 weeks of award of the Contract, submit the name(s) of the suppliers, material specification and samples of the liners proposed for use in the Contract to the CM for approval. If approved, maintain the quality of the liners throughout the duration of the Contract;

6. The barrel, drill bit and cutting shoe shall be free from significant defects and in good working condition. A sediment tube may be attached to the top of the barrel to trap the cuttings falling out of suspension from the flushing medium. A core retainer of suitable design may be used only when it is necessary to reduce the risk of sample loss;

7. Prior to lowering the barrel down the drillhole, it shall be checked to ensure that the inner barrel rotates freely, the retractor spring works and that the check valve at the top of the inner barrel is functioning properly;

8. Clean out the bottom of the drillhole properly prior to sampling to the specified sampling commencement depth within a tolerance of ±25 mm, unless otherwise agreed by the CM;

9. In order to alleviate disturbance to the soil being sampled, keep the applied flushing pressure to a minimum. An optimum combination of the applied bit pressure and rotation speed shall be used to achieve a steady penetration which shall not be too slow to avoid unnecessary disturbance induced by the flushing medium;
10. Successful sampling shall mean a minimum recovery of 80% of the sampled length when water flush is being used, and 90% of the sampled length when air-foam flush is being used. If sampling is not successful, clear the material disturbed by the sampling process in the hole immediately and make another attempt from the level of the base of the failed attempt;
11. If continuous retractable triple tube core sampling has been Instructed and the second attempt also proves unsuccessful, inform the CM immediately, or as soon as possible the next working day, and submit a proposal to improve sample recovery for CM's agreement;
12. If interval sampling has been Instructed and the second attempt also proves unsuccessful, perform a Standard Penetration Test with a liner sample and continue with the sampling sequence Instructed. If two consecutive sequences of failed undisturbed sampling occur in any one drillhole, inform the CM immediately, or as soon as possible the next working day. Continue the sampling sequence unless otherwise Instructed;
13. If the CM accepts a sample less than the successful sampling length as described in sub-clause (10), the sample shall be paid for pro-rata based on the successful length.

GIN.W510.9 VIBROCORING

1. When Instructed, obtain samples by vibrocoring;
2. The vibrocore sample shall be 75 mm (±2 mm) in diameter and shall be 6 m long. The vibrocore shall be fitted with a detachable rigid PVC tube to assist in the recovery of samples;
3. A piston shall be placed inside the PVC liner. During sampling the piston shall be held rigidly so that no vertical movement of the piston shall occur such that a vacuum is formed over the retained sample. A basket core retainer shall be fitted at the bottom of the tube to assist in the recovery of samples;
4. The vibration effort shall be supplied pneumatically or hydraulically, and the vibration energy must be adjustable to suit the ground conditions. The minimum vibration energy necessary to obtain a core should be used, to avoid undue disturbance of the sample;
5. Core recovery shall be at least 80% in any vibrocore run. If the recovery falls below this level, and if in the opinion of the CM higher recoveries should have been achieved, the CM may require another sample to be taken at the same depth at another location to be agreed by the CM;
6. Storage of vibrocore samples for trace metal contamination analysis to comply with Environment, Transport and Works Bureau Technical Circular (Works) No. 34/2002, Management of Dredged/Excavated Sediment;
7. Responsible for labelling, splitting, photographing and logging of the vibrocores. After logging, the vibrocores should be wrapped and sealed in polythene sheeting. When required by the CM, cut the vibrocores into 1 m length, seal and cap both ends, label, and store in core boxes;
8. The equipment shall be so designed that 6 m long core samples can be taken continuously from the existing ground level to the required depth and surface samples can be taken from the 0-2 m run below the existing ground level;

9. Include the logging and photographs in the report in a format to be Approved and submit them in a manner as described in GIN.W040.

GIN.W520.9 FIELD MOISTURE CONTENT SAMPLES

Field moisture content samples shall be taken on the following occasions when directed by the CM:

1. When an undisturbed sample is taken (the material for the moisture content sample shall be taken from the cutting shoe);
2. When a large disturbed sample is taken in cohesive soils (the moisture content sample shall be separated from the large disturbed sample);
3. When a Standard Penetration Test is conducted (the moisture content sample shall be taken from cohesive soil in the split spoon);
4. When a Vane Shear Test is conducted (one moisture content sample shall be taken from the soil adhering to the vane, if any, when it is extracted and another moisture content sample from the sheared soil removed from the borehole, drillhole, auger hole or trial pit when it is advanced to the level of the test);
5. When an in-situ density test is conducted;
6. At the top of any cohesive stratum;
7. At 1500 mm depth below the last moisture content sample.

GIN.W530.9 LARGE DIAMETER PISTON SAMPLING

When Instructed, take large diameter undisturbed piston samples as follows:

1. Large diameter piston sampling shall be carried out with an Approved thin-walled fixed piston sampler;
2. The piston sampler shall be capable of operating to a depth of 20 metres below ground level with no lateral movements being allowed during the actual sampling operation;
3. Where marine site investigations require large diameter piston sampling, the craft supplied must be capable of being supported rigidly from the sea-bed or a fixed platform shall be provided;
4. Prior to sampling, 200 to 300 mm of borehole advance shall be undertaken to remove disturbed ground;
5. The load required to penetrate the sampler shall be applied smoothly and evenly;
6. The minimum sample length shall be 450 mm and have a diameter of 260 mm;
7. The piston sampler shall have an Approved method of cutting the base of the sample; such a method shall include a cutting wire located in the base of the sampler;
8. Samples shall be taken with the exploratory hole filled with water unless otherwise Instructed;
9. The design and maintenance of the sampler shall be such that a vacuum is formed over the retained sample in the tube;
10. Take all necessary steps to ensure full recovery of the specimen;
11. The sampler shall be withdrawn carefully and slowly, particularly for the first metre of its withdrawal, to avoid a vacuum being formed beneath the sampler and sucking the sample from the tube.

GIN.W540.9 STORAGE OF LARGE DIAMETER PISTON SAMPLES

1. Large diameter piston samples shall be stored at all times inside a steel storage container;
2. The ends of the sample tube shall be sealed with at least 3 layers of Approved wax/petroleum jelly mixture;
3. Timber blocks shall be fitted into the sample tube to fill any voids at the top of the tube;
4. The sample tube shall be clamped into the storage container by metal plates at both ends separated from the sample tube by rubber sheeting about 4 mm thick;
5. The space between the sample tube and the inside of the storage container shall be filled with water;
6. Transportation of samples shall conform to GIN.W620.

GIN.W560.9 CORE BOXES

1. Core boxes shall be 1.05 m in length, 0.45 m in width and of sound robust timber construction, able to withstand the weight of the cores and stacking of the boxes, and be sufficiently watertight to protect the cores from rain on Site and in transit. The lid shall be fitted with metal hinges, hasp and staple and a locking device. Rope strands shall be attached to the core box for lifting. Boxes shall be made with rigid separating wooden slats. For core boxes containing rock cores only, core boxes of smaller size to be approved by the CM may be used;
2. Take appropriate preventive and protective measures to minimise the risks of manual handling operations of core boxes, which include but not be limited to the following:
    a. Provide information to the workers on the risks of manual handling operations (ie. The weight and the heaviest side of the load);
    b. Provide mechanical aids and proper personal protective equipment to the works;
    c. Arrange a team of workers to carry out the manual operations.

GIN.W570.9 EXTRUSION AND HANDLING OF CORES

1. Remove all cores from double tube core barrels using a hydraulic extruder, unless otherwise Instructed. Under no circumstances shall air pressure be used for the extrusion of cores. The extruder shall apply a continuous pressure to one end of the core whilst the barrel is in a horizontal position. Only gentle hammering with a wooden mallet on the side of the core barrel to free wedged pieces shall be permitted;
2. Extrude carefully cores from single and double tube core barrels onto split plastic piping of similar diameter to the core such that the core fits tightly into the pipe and is not free to rotate. When Instructed, or the recovered core is heavily jointed or fragmented and is likely to be disturbed during transportation, it shall also be wrapped in self-clinging transparent film, or similar Approved;
3. Wrap cores from split inner tube triple tube core barrels in self-clinging transparent film and then aluminium foil and carefully transferred into split plastic piping of the same internal diameter as the split inner tubes;
4. As the core is extruded, arrange it in core boxes in a proper sequence starting with the shallowest core on the left side nearest the hinge and then working along the slat and subsequently outwards towards the hasp (i.e. from left to right with the box lid on the far side of the box as the core is placed). Position and secure slats to restrain the core from movement;

5. Pack fractured rock securely. At no time should any core be loose in the box. Show core losses in individual core runs by wooden blocks or polystyrene of a square cross section to fill the core box, and of a length equal to the core lost.

GIN.W610.9 CORE SAMPLES FOR LABORATORY TESTS

Cores recovered from drillholes will be taken for use as samples for laboratory testing when directed by the CM. The samples shall be cut from the core as it is extruded from the core barrel or when directed by the CM and a spacer bearing the sample number and depth of the top and bottom of the sample placed in the core box.

GIN.W620.9 DELIVERY AND STORAGE OF SAMPLES

1. Deliver all samples, including cores, obtained from the Site to the designated HKHA core stores, stores within the Site or any other core stores as directed by the CM within 3 working days after the completion of the field works, unless otherwise Instructed. The locations of the HKHA's core stores are shown in Appendix XXI to this Worksection;
2. Deliver all samples, including cores in their appropriate containers in such a manner as to prevent disturbance of the samples or cores by sudden movement, continuous or intermittent vibration, sudden temperature changes of any other reason. When necessary, provide purpose-built containers to protect sample tubes and jars when they are being delivered;
3. Whilst in the possession of the Contractor, store the samples in a cool and dry location protected against the sun, inclement weather, theft and vandalism to the satisfaction of the CM. Store block samples in their correct orientation. Store and transport in a vertical or horizontal direction for all samples recovered from vertical/sub-vertical or horizontal/sub-horizontal drillholes respectively in their correct orientation, and in purpose-built racks which shall hold the samples securely. Stack the core boxes by investigation station and box order;
4. Deliver samples to the laboratory specified by the CM within 3 working days of receipt of an instruction. Raise with the CM any discrepancies between the laboratory testing schedule attached to the instruction and the samples, such as incorrect sample depths or reference numbers, prior to delivery. Obtain a signed delivery docket to record the delivery and check off all the samples with a representative from the laboratory.

INSPECTION PITS, TRIAL PITS, TRIAL TRENCHES AND SLOPE SURFACE STRIPPING

GIN.W710.9 INSPECTION PITS

1. Start all land boreholes and drillholes by means of a hand excavated inspection pit, not less than 0.25 m^2 on plan and not less than 2 m deep, unless otherwise Instructed;
2. Assist excavation with hand operated power tools where hard strata cannot be broken out without the use of such tools;
3. Do not commence boring or drilling until the presence or otherwise of all services/utilities have been established;
4. Measure the positions, depths and dimensions of all services/utilities encountered and record them as part of the report;
5. Take small disturbed samples every 0.5 m in all common ground layer encountered in the inspection pits for logging purposes, commencing at ground level or below any concrete or road surfacing layers;

6. Where the holes are located near underground electricity cables, comply with the "Code of Practice on Working near Electricity Supply Lines" issued by Electrical and Mechanical Services Department.

GIN.W720.9 EXCAVATION OF TRIAL PITS AND TRIAL TRENCHES

1. Excavate trial pits and trial trenches by manual methods to the termination requirements or depths Instructed. Do not use powered tools unless otherwise agreed by the CM;
2. Remove the excavated material from the site and import the same or similar material for subsequent backfilling. For excavations on sloping ground, protect the material in such a manner that it does not fall or wash downhill or in any way enter surface water drainage system. Protect all excavated material from the weather. Also take all necessary measures to prevent the ingress of surface water into the excavations;
3. Before commencing any excavation, carry out three dynamic probing tests in a triangular pattern not more than 800 mm apart around the centre of each proposed trial pit unless otherwise Instructed. In trial trenches, carry out one dynamic probing test for each 1.0 m^2 of plan area of the excavation, equally spaced, unless otherwise Instructed. Terminate all probes at the initial Instructed depth of the trial pit or trial trench. On sloping ground, terminate each individual dynamic probing test at the Instructed base of the trial pit or trial trench. Make a second attempt for each test if refusal is met before the Instructed termination depth, at a distance of not less than 150 mm from the original position;
4. Submit to the CM the preliminary results of the dynamic probing tests carried out prior to excavation with the relevant daily site records for each trial pit or trial trench excavated. Include the dynamic probing test results in the Final Fieldwork Report and provide them in AGS digital format; and
5. Inform the CM immediately when each trial pit or trial trench has been completed, or if hard strata are encountered. Carry out logging or photography of each trial pit or trial trench after the termination of each excavation has been Approved.

GIN.W730.9 SIZE AND SUPPORT OF TRIAL PITS AND TRIAL TRENCHES

1. Trial pits shall have nominal plan dimensions of 1.5 m x 1.5 m to their full depth of excavation, unless otherwise Instructed or due to restricted space at the pit location or where prevented by the presence of hard strata. Where trial pits are excavated on sloping ground, the base of each pit shall be horizontal and any Instructed termination depth shall be taken as the depth of excavation at the mid-point of the base to original ground level;
2. Provide or carry out benching, shoring and access ladders such that personnel can safely inspect the sides and base of the pit or trench or carry out in-situ tests and take undisturbed samples;
3. Trial pit or trench sides shall be vertical and shored in such a manner that the natural ground shall be clearly visible throughout the height of each face;
4. Adequately support the sides of all excavation exceeding 1.2 m deep at all times to comply with the Construction Site (Safety) Regulations by using a method approved by the CM to ensure the safeguarding of life and property;
5. This clause shall in no way relieve the Contractor of his obligations or responsibilities under the Conditions of Contract.

GIN.W740.9 ACCESS TO TRIAL PITS AND TRIAL TRENCHES

1. Provide such ladders and platforms as may be necessary such that personnel can safely inspect the sides and base of the pit/trench, take photographs and carry out in-situ tests and take undisturbed samples as necessary in the trial pits or trial trenches;
2. Provide such pumps as may be necessary to maintain the excavation free from water and such ventilation and lighting as may be needed to ensure the safety of people working in the pit/trench. The base of each excavation shall be clearly visible during logging and taking of photographs.

GIN.W750.9 PUBLIC SAFETY

At all times when a trial pit or trial trench is left unattended, provide a strong wooden cover securely battened down and appropriate fencing to prevent persons and animals from falling into the excavation.

GIN.W760.9 PHOTOGRAPHS OF TRIAL PITS AND TRIAL TRENCHES

1. Within 2 working days of the date of Approval of any trial pit or trial trench, take photograph of trial pit or trial trench using a reference board with maximum dimensions of 300 mm (width) by 450 mm (length). Each face and the base shall be photographed;
2. Each photograph shall cover a length of the excavated face of between 1.5 m and 2.0 m in both vertical and horizontal directions. Where more than one photograph is required to cover the full excavated depth or length of a face, the overlap between adjacent photographs shall be between 10% and 20%;
3. Each photograph shall identify the face of the excavation and shall contain a natural scale. In the case of trial trenches, it shall also identify the location of the photograph by the metrage along the face of the excavation;
4. One colour print of minimum size 85 mm x 125 mm of each trial pit or trial trench photograph shall be supplied with the draft fieldwork report. Each copy of the Final Fieldwork Report shall contain colour photocopies of A4 mounted prints of minimum size 125 mm x 175 mm. Within 3 weeks of the award of the Contract, submit the name(s) of the suppliers and samples of the colour photocopies proposed for use in the Contract for the CM's approval. The quality of the approved colour photocopies shall be maintained throughout the duration of the Contract;
5. The method of photography shall be agreed with the CM prior to carrying out the work and shall be in accordance with GIN.W1240; and
6. Submit one copy of photographs of the trial pit or trial trench to the CM for approval before backfilling of the trial pit or trial trench.

GIN.W770.9 BACKFILLING OF INSPECTION PITS, TRIAL PITS AND TRIAL TRENCHES

1. Backfill inspection pits on completion of the drillhole. Plug at the bottom with concrete or similar material;
2. Backfill trial pits and trial trenches within 2 working days of the date of issue of an instruction from the CM. The backfilling material shall contain no material exceeding 200 mm in size, refuse, metal, rubber or synthetic material, peat, vegetation, perishable material, toxic material or material susceptible to combustion or to volume change;

3. Compact the material used to backfill inspection pits, trial pits and trial trenches until original ground level is restored. Compaction for trial pits and trial trenches shall be performed mechanically in successive layers of not more than 150 mm thick. Restore the ground surface to its condition prior to the excavation, i.e. any pitching, paving, chunam, concrete or turf shall be replaced;

4. As backfilling of each trial pit or trial trench proceeds, remove progressively timber, sheeting and other excavation supports, but the removal of such supports will not relieve the Contractor of his responsibilities for the safety and stability of the Works;

5. On completion of backfilling and prior to any reinstatement of the ground surface at the location of any trial pit or trial trench, carry out a further set of dynamic probing tests unless otherwise Instructed. Carry out three such tests in a triangular pattern not more than 0.8 m apart around the centre of each trial pit, whilst in trial trenches one such test shall be carried out for each 1 m^2 of plan area of the excavation, equally spaced. Terminate each test at the level of the excavated base of the respective trial pit or trial trench. Make a second and final attempt for each test if refusal is met before the required depth, at a distance of not less than 150 mm from the first test. Submit to the CM the results of the dynamic probing tests with the relevant daily site records for each trial pit or trial trench excavated, or to volume change. Compact the material used to backfill inspection pits, trial pits and trial trenches until original ground level is restored;

6. Compact the backfill material such that the average dynamic probing test value of the post-backfilled set of probes at any level within the excavation depth of the pit or trench excavation, shall be 80% of the average value of the pre-excavation set of probes at the same level, and no less than 10 blows/100 mm. Notwithstanding this requirement, fill and compact any subsequent depression of the ground surface occurring due to settlement;

7. For backfilling under an Excavation Permit, no broken concrete, bricks, clay, bituminous materials, materials susceptible to spontaneous combustion, perishable materials or debris shall be present in the backfill materials. The backfill materials shall not exceed 75 mm maximum particle size. The work shall comply with the requirements set out in the Conditions of Permit. The more stringent requirement shall prevail in case of any ambiguities or discrepancies between this clause and the Conditions of Permit. Satisfactory compaction of backfill shall be demonstrated by testing for relative compaction in accordance with the Worksection EAR. Relative compaction testing shall be carried out for every meter depth of backfill in each trial pit and trial trench, at locations instructed by the CM.

GIN.W777.9 RECORDS OF INSPECTION PITS

Include details of each inspection pit in the relevant daily site record and drillhole record. Submit a photograph taken vertically downwards into each inspection pit together with the daily site record for the relevant drillhole. A board showing the Contract number, Works Order number where applicable, and drillhole number, and the depth indicator used shall be clearly visible in the photograph.

GIN.W780.9 RECORDS OF TRIAL PITS AND TRIAL TRENCHES

1. Submit daily site records for trial pits or trial trenches in accordance with GIN.W040. The format of daily site records shall be to the approval of the CM. The information required on the daily site records is listed below:

   a. Site name, Contractor's name, Contract number and Works Order number where applicable, trial pit or trial trench number;

   b. Dates of excavation and weather conditions;

c. Depths and details of all sampling and field testing including total blow count for driven samples and sample recovery;

d. Any other relevant information e.g. comments on stability, maximum and average trial pit and trial trench depths and plan dimensions, water inflow, powered tools used.

2. Submit preliminary and final records for trial pits or trial trenches in accordance with GIN.W040. Present the records in the format as shown in Appendix III to this Worksection, unless otherwise agreed by the CM. The record for each trial pit or trial trench shall contain the following information:

a. Site name, Contractor's name, Contract number and Works Order number where applicable, trial pit or trial trench number;

b. The reduced level at the centre of the pit for trial pits located on level or sloping ground; the reduced levels of both ends of the longer axis for trial trenches;

c. Dates during which trial pit or trial trench was excavated;

d. Dimensions of trial pit or trial trench and its orientation;

e. The coordinates of the centre of the pit for trial pits; the coordinates of both ends of the longer axis for trial trenches;

f. Water levels with full details of fluctuation and locations of seepages. If no water is encountered, this shall be recorded;

g. A hand drawn (preliminary) and computer-generated (final) representation of the features and material types encountered in each face and the base of the trial pit or trial trench. Fill shall be shown as its constituent materials in the face sketch and its legend pattern in the legend column;

h. Details of photographs taken;

i. Stability conditions during excavation;

j. Locations and types of samples taken;

k. In-situ test types and locations;

l. The size and orientation of any services encountered;

m. A sketch showing the dimensions of any sub-surface structures, including foundations exposed in the excavations;

n. If pumping was required during excavation this shall be noted and an estimate of the rate of inflow of water made;

o. Sign of any settlement caused by excavation;

p. A "remarks" section which shall include groundwater and wall stability observations, average and maximum depths, use of shoring and details of any obstruction encountered. If the required number of dynamic probing tests was not carried out, the excavation was terminated earlier than specified, or the plan area of the excavation was reduced, these facts shall be noted with reasons.

GIN.W790.9 SLOPE SURFACE PROTECTION STRIPPING

1. Strip and dispose of surface protection, including that containing reinforcement, from slopes to expose underlying common ground or rock. The width of stripping shall be 500 mm, unless otherwise Instructed, with the axis of the strip parallel to the dip of the slope. The underlying common ground shall be excavated to a minimum depth of 100 mm and up to 300 mm as Instructed;

2. Terminate all excavation if boulders, rock or hard strata are encountered, unless otherwise Instructed. Start the stripping at the top of the slope and proceed downwards unless otherwise Instructed. Horizontal stripping may also be required;
3. When Instructed, limit stripping to specified intervals (windows) along the instructed length and provide a record for the full instructed length of the stripping to the CM;
4. Provide access for inspection by the CM;
5. Protect all exposed surfaces in such a way as to minimise the channelling of rainwater run-off. Cover up stripped areas at the end of each working day and during rainstorms to prevent the ingress of water into the slope;
6. Backfill the excavation in common ground with material approved by the CM. Reinstate stripped areas in form, colour, and conditions similar to the original conditions unless otherwise Instructed. Obtain the permission of the CM before reinstatement starts;
7. Submit preliminary and final slope stripping records in accordance with GIN.W040. Present the records in the format as shown in Appendix III to this Worksection, unless otherwise agreed by the CM. Records of the stripped areas shall contain the following:
    a. Descriptions of strata (including decomposed rock) encountered;
    b. Levels and coordinates of the top and bottom of strips, berms, benches and changes in type of slope surfacing. The survey results shall include all points on each strip where there is a change in gradient. Any other salient features shall be noted e.g. dip and dip direction of joints;
    c. The direction and bearing of the slope and the results of any in situ testing carried out;
    d. A dimensioned sketch of the strip cross-section;
    e. Photographic records as specified in GIN.W1240. The photograph of the exposed slope face shall be of such a size that it occupies the full height of an A4 size page.

DRILLING AND HAND AUGERING FOR GROUND INVESTIGATION

GIN.W810.9 METHOD AND PLANT TYPE

1. Inform the CM immediately prior to the commencement of any drilling. Unless otherwise Instructed, sink drillholes for ground investigation by rotary methods;
2. Undertake drillholes by using rigs that meet the following requirements:
    a. Drilling rigs shall be of the hydraulic feed type having the capacity to drill in the sizes and to the termination requirements or depths Instructed;

b. Drilling rigs shall be capable of providing stable drill-string rotation at speeds in the range 50-1250 rpm and have a minimum ram stroke length of 400 mm if applicable. The rigs shall be fitted with a tachometer, a hydraulic feed pressure gauge of an appropriate scale and a pressure gauge for reading water-flushing pressure. The hydraulic feed pressure readings shall be readily converted to loads transferred to the bit in pounds or kilograms according to the manufacturer's specification. In order to provide a means of measuring penetration and estimating the rate of advance, a rigid rod, clearly graduated in 10 mm increments, shall be permanently attached to, and parallel with, the hydraulic feed rams;

c. Drilling rigs shall have the company name and a unique rig number clearly and conspicuously marked; and

d. Drilling rigs shall be capable of drilling both vertical and inclined holes at any angle.

3. Undertake coreholes by using portable electric powered coring rigs that meet the following requirements. Other types of portable coring rig shall be subject to the approval of the CM:

   a. The rig can be attached securely to the structure being cored to minimise vibration;

   b. The rig shall be such that cores of H size or larger can be obtained to a depth of 6 m measured along the axis of the hole, and that either water or air-foam can be used as flushing medium;

   c. The rig shall be capable of drilling at any inclination and shall be of such type that samples of common ground can also be obtained from beyond the structure being investigated.

4. The core barrels, drill rods and drill bits of drilling equipment for ground investigation shall be of a type appropriate to the purpose of the drilling and sampling. Triple tube core barrels shall be provided with bits suitable for air-foam flush. The type and make of core barrels shall be approved by the CM;

5. The size of casings shall be appropriate to the drilling, coring, sampling, testing and other installation requirements;

6. Use only standard nominal lengths of casing and drill rods. The mixing of standard nominal imperial and metric lengths is not permitted;

7. Casings and drill rods shall be straight, in good condition, clean at the time of drilling and free from scale, dirt and other loose material;

8. All accessories and spare parts shall be as supplied or recommended by the same manufacturer unless otherwise approved by the CM. They shall be compatible with the equipment in use and with each other. Sufficient spares for core barrels, core bits, core lifters and other accessories shall be available for use on Site without causing any delay to drilling operations. The condition of the core bit in use shall be carefully monitored and if any damage occurs, such as breaking of teeth, it shall be replaced immediately;

9. Always maintain core barrels in proper working order and pay particular attention to the condition of the extrusion piston. Maintain the rubber O-rings in good condition so that no water escapes past the piston during extrusion of the cores;

10. Use sediment catcher tubes attached to the top of the core barrels if Instructed. The tube shall have the same external diameter as the core barrel, and be approximately 0.75 m long;

11. Store core barrels and drill rods on steel frame trestles;

12. Types of core barrel(s) to be used for individual drillholes will be as Instructed;
13. The methods and equipment used shall be such that:
    a. The soils encountered and the levels at which changes in ground conditions occur can be accurately identified;
    b. The specified sampling requirements can be achieved;
    c. All in-situ tests referred to in this Worksection can be undertaken and field installations incorporated at any depth in the hole;
    d. Consistency of measurement and minimal disturbance of the ground is achieved;
    e. Drilling of holes shall be executed in a sequence as indicated on the ground investigation Drawings unless otherwise Instructed.
14. Rotary drilling shall normally be carried out with diamond, tungsten carbide or combination tipped core bits which shall be suitable for the percentage core recovery and diameters required by the Contract. The type and state of the core bit, feed rates and management of the drill string shall be such that the specified minimum acceptable core recovery in any single core run can be obtained where the condition of the ground permits;
15. Common ground around the bottom of a drillhole shall not be unduly disturbed by water entering or leaving the hole, or by stress relief. The water level in a drillhole shall be kept at least 1 m to 2 m above the ambient groundwater level at all times, unless otherwise Instructed. Rapid withdrawal of rods and sampling equipment, causing rapid fluctuation in the water level inside the casing, shall be avoided;
16. Advance casings concurrently with the removal of material in such a manner that loss of ground is avoided. Set larger casings concentric with drillholes that are being reamed;
17. When Instructed, drill coreholes through retaining walls or other man-made structures by using single tube core barrels. Handle, photograph and report the core obtained as if it were rock with the exception that the submission of data in digital format is not required.

GIN.W820.9 SIZE OF DRILL HOLES

1. The size of bits, core barrels and casing shall conform to BS 4019-3:1993 or as otherwise agreed by the CM. Whenever required by the CM, drilling rigs shall be capable of drilling and recovering samples, vertically or inclined, with casing to a depth of 60 metres in S or P size, 160 metres in H size and 200 metres in N size. For purpose of pumping test, provide rigs of adequate capacity for drilling holes of minimum 250 mm diameter;
2. When Instructed, increase the size of a drillhole by reaming. The larger casing shall be set concentric with the existing hole and shall be sunk parallel with it.

GIN.W825.9 CATEGORIES OF CORE DRILLING

Three categories of core drilling shall be available:

1. Category 'A' – Water/Air-foam flush with triple tube core barrels using split inner tube (4C-MLC, HMLC or NMLC);
2. Category 'B' – Water/Air-foam flush with double tube core barrels (T2-101, TNW or products having equivalent functions or performance Approved);
3. Category 'C' – Water/Air-foam flush with single tube core barrels.

GIN.W828.9 RECOVERY OF CORES

1. Total core recovery is defined as the length of core recovered expressed as a percentage of the length of core run carried out;
2. The total core recoveries given below are the minimum which shall normally be accepted for the categories of drilling as defined in GIN.W825:

Minimum Acceptable Total Core Recovery for Category of Drilling (%)				
	Category			
	'A'	'A'	'B'	'C'
Ground Conditions	(Air-foam flush)	(Water flush)	Water/Air-foam flush)	Water/Air-foam flush)
Rock of Decomposition Grade of I to III or concrete or boulder	98	98	95	90
Common ground	80	N/A	N/A	N/A

GIN.W830.9 CORING RUN LENGTH

1. Limit coring runs to a maximum length of 1.5 m;
2. If the percentage core recovery in a core run is less than that specified, reduce the following core run by 50%, to a minimum length of 0.5 m;
3. Notwithstanding the above requirements, withdraw the core barrel and remove the core more frequently as necessary to secure the maximum possible core recovery when approved by the CM.

GIN.W840.9 BLOCKED DRILLHOLE

The core shall be removed from the drillhole immediately if blocking of the bit or grinding of the core is apparent regardless of the length of run which has been made.

GIN.W850.9 USE OF LUBRICANTS AND FLUSHING MEDIUMS

1. Do not use drilling lubricants other than clean water unless otherwise Instructed;
2. If the flushing medium is water, comply with the following:
   a. Provide a pump equipped with a gear box and capable of delivering up to 2 litres/sec;
   b. The pump shall incorporate a "surge" bottle to reduce fluctuations in water pressure and the suction hose shall be fitted with a suitable filter. It shall have a by-pass system allowing full control of water flow at all pump delivery rate;
   c. A flowmeter and a pressure gauge shall be directly fitted into the water supply line on the 'downstream' side of the by-pass valve. The flowmeter shall give an immediate visual indication of flow rate (e.g. a large rotating wheel) and be capable of measuring flow rates to the nearest 0.01 litres/sec.
3. If the flushing medium is air with foam additive, comply with the following:
   a. Provide an appropriate air-compressor and all necessary ancillary equipment to carry out drilling with air-foam flush to the CM's satisfaction;

b. The foam return shall be the consistency of thick shaving cream and the hole shall be kept full of foam at all times. The foam shall either be fully biodegradable or water soluble and arrangements shall be made for the collection and removal or dispersal of the foam returns, if required. The proposed foam additive and mixes shall be to the approval of the CM. A typical arrangement of air-foam mixing and flushing system is shown in Figure 12, Geoguide 2.

4. Flushing media shall be passed through a sedimentation basin and shall be either re-used or be discharged to surface drains or natural stream courses, except stream courses that are used as a supply of drinking water. Take measures to prevent the flushing medium from seeping through the ground. Provide excavated re-circulation pits or re-circulation tanks at the drillhole locations if the flush returns cannot be discharged safely or if Instructed. If necessary, provide temporary settling ponds or tanks to remove drilling cuttings / arisings prior to the disposal of flush returns.

GIN.W860.9 RAPID DRILLHOLES

1. The Contractor may be required to form holes up to 250 mm diameter and 60 m deep in soil or rock using rapid rotary-percussive methods with air or water as flushing medium and as follows:

   a. The OD method (Overburden Drilling): this will require the use of top-hammers to advance bit and casing tubes at the same time;

   b. If required by the CM the casing tubes, or Approved equivalent, shall be left in the drillhole to enable drilling to continue with conventional core barrels;

   c. Accurately measure and record the rate of penetration with this method of drilling. The method of measurement of penetration will be to Approval. The measurement of the rate of penetration can generally be achieved by timing, with a stop watch, the passage of a fixed point on the drillrods over a unit distance which can vary from 0.15 m to 1.0 m;

   d. The Final Report shall include a graphical record of rate of penetration against depth for each rotary percussive drillhole.

2. As far as possible consistent pressures and rotation speeds should be used with rotary percussive drilling. Changes in any drilling parameters such as bit pressure or gearing etc should all be recorded and presented with the penetration record for the drillhole;

3. This drilling technique may be required for proving bedrock, probing for boulders, forming holes rapidly for the installation of instruments or forming inclined holes for the installation of drains.

GIN.W865.9 ROTARY OPEN HOLE DRILLING

Advance a hole up to 170 mm in diameter and to a maximum depth of 40 m in common ground, rock or hard strata without the recovery of core or samples by means of a tricone roller bit, drag bit or other non-coring bit with water as the flushing medium.

GIN.W870.9 INCLINATION AND BEARING MEASUREMENT OF DRILLHOLES

1. When required by the CM, measure and report the inclination and bearing of a drillhole using a single-shot or multi-shot photographic survey tool or similar Approved instrument;

2. Report the results of each test on the daily site records and state the average inclination and bearing over the length of the drillhole on both the preliminary and final record. Submit the original film data with the daily site records.

GIN.W910.9 DRILLING RECORDS

1. The information required on the daily site record and records of a hole are listed below:
   a. Contractor's name, Contract number, Works Order number where applicable, Site name and hole number;
   b. Rig type, number, operator, hours worked and method of drilling;
   c. Dates of operation and weather conditions;
   d. Ground level of hole, the depth of each stratum from the surface and level of samples, in-situ tests and field installations;
   e. Details of all samples including blow counts of driven samples, in-situ tests and field installations and inclination / orientation of hole;
   f. Details of casing and length of casing;
   g. Water levels at start of shift, end of shift, and at times as GIN.W210;
   h. Full and continuous description of the material encountered in the hole, including the classification of each stratum by name and, when required by the CM, the characteristics of the discontinuities all according to Geoguide 3;
   i. Water return;
   j. Details of any delays, standing time;
   k. Rock Quality Designation (RQD), Fracture Index, Core Recovery and Rock Grade as defined in Figure 4 of Geoguide 3;
   l. Coordinates of hole position related to the Hong Kong Metric Grid;
   m. Legend (Drillhole Records);
   n. Any other relevant information.
2. Present the daily record sheets and record sheets of a hole in the format as shown in Appendix III to this Worksection, unless otherwise agreed by the CM.

GIN.W920.9 BACKFILLING OF DRILLHOLES AND ROTARY OPEN HOLES

1. Backfill all drillholes and rotary open holes in which no instrumentation will be installed with cement bentonite grout within one working day of the completion of the hole. The cement bentonite grout shall be a pumpable mix of cement and bentonite in the proportion of 4:1 by dry weight, or an alternative mix agreed by the CM. The water content of the grout shall be limited to that necessary for proper mixing and placement. In no case shall the water:cement ratio exceed 3. The resulting grout shall be free of lumps and foreign material;
2. When Instructed, backfill drillholes with cement grout with water/cement ratio not exceeding 0.45 from the bottom of the drillholes up to a depth specified by the CM. Backfill the remaining portion of the drillhole by cement bentonite grout as described in sub-clause (1) above after the cement grout has achieved initial set;
3. Submit a method statement to the CM for approval together with a trial showing the proposed equipment, material, mixing, handling and placement procedures including appropriate quality controls and checks to be adopted;
4. For each drillhole backfilled with grout, record the viscosity of the grout measured by Marsh Funnel and specific gravity of the grout measured by Mud Balance or any instrument of sufficient accuracy to permit measurement within ±0.01 g/cc. Keep a labelled jar sample of grout from each hole;

5. Unless otherwise Instructed, feed the grout into the bottom of the hole using a suitable pump and a tremie pipe, the end of which shall always be maintained below the grout/water interface. Remove casing in stages during grouting to ensure that the entire hole is backfilled. Check grout level at least 24 hours after initial grouting, and top up any significant drop in grout level with additional grout, or backfill with material agreed by the CM. Level and compact any subsequent depression;
6. Only if Instructed shall granular material, cement mortar or other materials be used to backfill the holes. Under no circumstances shall the Contractor use cement-bentonite balls (i.e. mixed paste) to backfill the hole;
7. Include in the daily site record a complete record of backfilling operations including the quantity of grout placed, the drop in grout level after 24 hours, the viscosity and specific gravity of the grout and any other relevant information and submit the record to the CM within 3 days of completion of backfilling;
8. For backfilling involving an Excavation Permit, the work shall comply with the requirements set out in the Conditions of the Excavation Permit. If there are any discrepancies between this clause and the Conditions of the Excavation Permit, the more stringent requirement shall prevail.

GIN.W930.9 BACKFILLING OF COREHOLES

Backfill each corehole with sand and cement mortar (1:1 ratio by weight) unless otherwise Instructed.

GIN.W940.9 METHOD OF AUGERING

1. Auger holes shall be advanced using hand-operated helical or post-hole type augers;
2. No material other than clean water shall be added to the auger holes and only when Approved;
3. Casing will not be required.

GIN.W950.9 DIAMETER OF AUGER HOLES

Post-hole auger holes shall be at least 100 mm diameter unless otherwise specified or Instructed.

FIELD INSTALLATIONS

GIN.W1110.9 INSTALLATION OF STANDPIPES

1. When Instructed, install standpipes in completed boreholes or drillholes (the holes) as indicated in Appendix V to this Worksection. Install the standpipes within 3 working days after the date of receiving the instruction;
2. The standpipes shall consist of rigid uPVC tubing to the dimensions as described in GIN.M120 for piezometer. The tube shall be capped at its lower end, and perforated/slotted in accordance with the Appendix V;
3. The upper imperforated end of the tube shall be set in concrete and fitted with an air vented uPVC cap and lockable surface box as shown in Appendix IV to this Worksection;
4. Fill the annular space between the perforated uPVC pipe and the wall of the hole with 6 mm to 10 mm size aggregates for its full length;
5. Take readings of water levels in standpipes as described in GIN.T010. Submit preliminary results within 3 working days after the date of completion of water level monitoring and tabulate and incorporate the results in the Final Fieldwork Report.

GIN.W1130.9 INSTALLATION OF PIEZOMETERS

1. When Instructed, install piezometers in completed boreholes or drillholes (the holes) as indicated in Appendix V to this Worksection. Install the piezometers within 3 working days after the date of receiving the instruction;
2. The upper end of the tube shall be set in concrete and fitted with an air vented uPVC cap and a lockable surface box as shown in Appendix IV to this Worksection;
3. Prior to installation, flush the completed hole with clean water to remove loose materials. Where the depth of the completed hole is greater than the depth at which the piezometer tip, sand filter and bottom bentonite seal are to be installed, the hole below the seal shall be grouted;
4. The grout shall consist of cement and bentonite in the proportion of 1:1 by weight or alternative mix as agreed by the CM. Bentonite shall be thoroughly mixed with water for at least 15 minutes before cement is added;
5. Place sufficient grout in the hole using a tremie pipe reaching to the bottom of the hole, such that the top of the grout shall finish 1.0 m below the base of the Instructed response zone. Bentonite pellets of between 10 mm and 15 mm in size, or other material to the approval of the CM, shall be placed in the hole and shall always be tamped with a suitable shaped tamper to form a homogeneous plug 1 m thick;
6. Extend the sand filter surround to the piezometer tip forming the response zone to at least 500 mm above and below the piezometer tip unless otherwise Instructed. The sand filter shall comprise clean sand, falling wholly between the grading limits of 200 and 1210 microns, and the volume of the sand filter placed shall be recorded on the daily site records. Alternative filter material shall be to the approval of the CM;
7. Where there is water in a hole, allow sufficient time for all the sand to settle, and measurements of the upper surface of the filter shall be taken from time to time to ensure this. Bentonite pellets, or other material to the approval of the CM, shall then be placed above the sand filter in the hole and shall always be tamped with a suitable shaped tamper to form a homogeneous impermeable plug 1 m thick. The depth of all boundaries in an installation shall always be recorded on the daily site records;
8. Backfill the hole above the compressed bentonite pellets with the cement/bentonite grout as described above to the details shown in Appendix V to this Worksection;
9. Take readings of water levels in piezometers as described in GIN.T010. Submit preliminary results within 3 working days after the date of completion of water level monitoring and tabulate and incorporate the results in the Final Fieldwork Report.

GIN.W1135.9 INSTALLATION OF BUCKETS IN STANDPIPES AND PIEZOMETERS

1. When Instructed, fabricate strings of buckets and install them in standpipes/piezometers. Install the buckets within 3 working days after the response test or within 3 working days of receiving an instruction, whichever is the later. The details of fabrication are as shown in Figure 23 of Geoguide 2;
2. Each installed bucket shall have the depth below existing ground level clearly marked at the mid point of the bucket. Include a record of all buckets including their depth and date of installation in the relevant daily site records.

GIN.W1140.9 MONITORING STANDPIPES AND PIEZOMETERS

1. When Instructed, monitor either previously installed existing standpipes/piezometers or those standpipes/piezometers installed by the Contractor in accordance with this Worksection;

2. Where standpipes/piezometers contain buckets, they shall also be monitored. Empty all buckets after monitoring. Lock surface boxes securely after monitoring;

3.

   a. Take standpipe/piezometer readings at intervals as Instructed;

   b. Reading intervals will vary depending on the time of year and the weather. Dates for readings and report submissions shall be given by the CM;

   c. Submit the reading results to the CM within 3 days of the reading date;

   d. The wet season shall be taken as being from 1st May to 31st October and intense rainfall shall be rainfall greater than 100 mm/day.

4. Submit reading results with an updated list of water level readings with record photos depicting the locations of all reading points and the readings displayed on the meter to the satisfaction of the CM and in graphical plots for each tube as per the typical layout at Appendix VII to this Worksection. The size and format of the photographs shall be agreed with the CM within 4 weeks from the notified date for commencement of the Works. Submit two copies of each to the CM within 3 days of taking the readings;

5. The graphical plots shall include rainfall information from Geotechnical Engineering Office, Civil Engineering Development Department (GEO, CEDD) rainfall station nearest to the standpipe/piezometer. Propose for Approval the rainfall station to be used. An information sheet on all GEO rain gauges is published monthly by the Geotechnical Information Unit, GEO, CEDD;

6. Holes may have more than one standpipe/piezometer tube but readings shall be taken in each tube. The measurement for standpipe/piezometer readings shall be for each tube reading.

GIN.W1145.9 AUTOMATIC GROUNDWATER MONITORING DEVICE IN STANDPIPES AND PIEZOMETERS

1. When Instructed, monitor groundwater levels in standpipes/piezometers by an automatic groundwater monitoring device. Submit details of the automatic groundwater monitoring device and report format to the CM for Approval;

2. Holes may have more than one standpipe/piezometer tubes. When Instructed, carry out automatic groundwater monitoring for the tube(s);

3. The automatic groundwater monitoring device shall comply with the following minimum requirements:

   a. Memory capacity: 24,000 measurements (non-volatile);

   b. Sampling rate: 0.5sec to 99 hours;

   c. Measurement range: 30 m H_2O with accuracy of 0.025 m H_2O and resolution of 0.01 m H_2O.

4. Download monitoring data as Instructed by the CM;

5. Submit monitoring data with an updated list of water level readings taken by dipmeter in graphical plot. Submit two copies of each and a floppy disk or CD-ROM containing the monitoring data in digital format to the CM within 3 working days of downloading the monitoring data;

6. Include graphical plots of rainfall information from Geotechnical Engineering Office, Civil Engineering Development Department (GEO, CEDD) rainfall station nearest to the standpipe/piezometer. Propose for Approval the rainfall station to be used. An information sheet on all GEO rain gauges is published monthly by the Geotechnical Information Unit, GEO, CEDD.

GIN.W1150.9 FLUSHING OUT STANDPIPES AND PIEZOMETERS

When Instructed, provide all necessary labour, plant and material to clean out blocked piezometers and standpipes by water flushing.

GIN.W1160.9 INSTALLING INCLINOMETER ACCESS TUBES

1. When Instructed, install inclinometer access tubes in existing or new drillholes for measuring ground movements in directions perpendicular to the drillhole axis;
2. All components of the inclinometer system shall be from the same manufacturer to the approval of the CM;
3.
    a. The access tube shall be of rigid PVC tubing with a bore of 50 to 70 mm. It shall be self aligning and contain 4 longitudinal keyways equally spaced around the perimeter precisely manufactured to fit the wheel dimensions of the torpedo as described in GIN.W1170 through the entire length of the tube;
    b. The access tube shall be supplied and installed in not less than 3 m lengths except for one shorter length as required to suit the total required depth;
    c. The tubes shall be joined together with Approved couplings and rivets with sealing mastic applied to each rivet head and also to the points where tubing enters a coupling;
    d. The whole joint assembly shall be wrapped in impregnated water-proofing tape and the end cap shall also be fixed and sealed in a similar manner.
4.
    a. Before the assembled access tube is lowered into a drillhole, the hole shall be pre-grouted in accordance with GIN.W930. The strength of the grout shall be comparable to that of the surrounding soil or rock;
    b. Clean water shall be added to the inside of the tubing to overcome buoyancy and the ingress of grout;
    c. When installation is finished the tubing shall be completely filled with clean water and keyways aligned to the required directions.
5. When Instructed, the upper end of the tube shall be set in concrete and fitted with lockable surface box in accordance with details as shown in Appendix IV to this Worksection.

GIN.W1170.9 TAKING INCLINOMETER READINGS

1.
    a. When Instructed, take inclinometer readings at the required frequency using an Approved biaxial torpedo. The torpedo shall be fitted with wheels and contain 2 servo-accelerometers located securely within a stainless steel water proof housing;
    b. The accelerometers shall have the sensing axes at 0° and 90°, allowing the angle of inclination of sensor and probe casing to be measured in two orthogonal directions;
    c. The sensitivity of the probe shall not be less than ±0.02 mm per 500 mm casing with a total System Accuracy of ±1.0 mm per 25 m of casing or better;
    d. The torpedo shall be able to negotiate access tube curvature of not less than 3 m radius.

2. The length of the wheel base shall be in the order of two thirds of the overall length of the probe body and the outside diameter of the torpedo (not including the wheels) shall be 25.4 mm or less. The operating range shall be 0° to 53° measured from the vertical. All electrical connections and the torpedo shall be fully waterproofed enabling the probe to operate and provide accurate and repeatable readings under water;
3. The wheels of the inclinometer probe shall be spring loaded enabling it to run precisely in the grooves of the inclinometer casing with a minimum of wobble in the 90° axis;
4. The inclinometer suspension/control cable shall be continuous with no splices or defects steel core with one piece waterproof neoprene jacket to prevent creep and slippage during use and of adequate length for all the holes on the project. It shall be limited to 10 mm diameter;
5. Reading shall be taken successively along the entire length of access tube at 500 mm intervals or shorter, and also at depths as directed by the CM. A set of readings is a down and up set for the first direction and 90° to the first direction. Another set of readings shall also be taken with the torpedo axis rotated through 180° to minimise face errors;
6.
    a. Results of all inclinometer readings shall be presented to the CM within 3 working days of completion of each monitoring and shall include a profile of all the horizontal deviations from the true vertical at each measuring point in units of mm;
    b. Four copies of monitoring reports shall be submitted to the CM within 14 days of the completion of the required monitoring. The report shall contain all the results obtained in each monitoring and where appropriate the final monitoring report may be included in the Final Report to be submitted in accordance with GIN.W040.

GIN.W1180.9 MONITORING MOVEMENTS OF RETAINING STRUCTURES AND CRACKS

1. When Instructed by the CM, provide and install tell-tales, tilt-plates, nail heads for Demag gauge measurement, or similar approved type for measuring retaining walls or crack movements in all directions;
2. Prior to the installation and monitoring, submit to the CM details of the proposed instruments to be installed, monitoring equipments to be used, installation methods and monitoring methods for Approval. The details of the proposed monitoring instruments and equipments to be used shall be submitted with manufacturer's standard specification;
3.
    a. When instructed by the CM, monitor and maintain either existing monitoring instruments or monitoring instruments installed by the Contractor and readings shall be taken at the required frequency;
    b. Results of all monitoring readings shall be presented to the CM within 3 working days of each monitoring.
4.
    a. Provide all equipment of every kind necessary for use in the execution of the monitoring works;

b. All equipment to be used shall be calibrated within the recommended calibration period and conform with the relevant manufacturer's standard specification prior to the start of each monitoring work;

c. Calibration certificates shall be supplied to the CM whenever an instrument is calibrated and the standard calibration procedure from the relevant manufacturer shall be followed and supplied together with required calibration interval and the most recent calibration carried out.

GIN.W1190.9 TILTMETER SYSTEM

1. The Tiltmeter System shall include three major components: tiltmeter sensor, mounting plate and read out unit;

2.

a. The portable tiltmeter sensor shall utilise a closed loop, force-balanced servo accelerometer specifically designed for vertical or horizontal tilt measurements;

b. The tiltmeter sensor shall have a measuring range of ±50° from vertical or horizontal, with a sensitivity of 8 arc. seconds reading + 5 arc seconds/℃ or better. The sensor unit shall have a stainless steel base and accelerometer housing. To operate, the sensor shall be oriented on the pegs of the mounting plate and an angle read on the four digit indicator display;

c. The mounting plates shall be cast from specially formulated porcelain with four equally spaced pegs on 102 mm diameter circumference. The plates shall be bonded to the rock, concrete, or metal surface by an Approved epoxy resin.

3. The readout unit shall be portable, powered by a rechargeable battery capable of operating for a minimum of 16 hours at 20℃. This readout unit shall have a 20 x 20 backlit LCD screen. The readout unit shall have a temperature rating of -20℃ to +50℃ and shall be housed in an aluminium case with a plastic jacket. The top of the box shall be splash proof with waterproof connectors.

GIN.W1200.9 TELLTALES

1. The standard telltale shall be capable of monitoring movement across cracks in both horizontal and vertical directions. The instrument shall be manufactured using durable acrylic plastic with a linear coefficient of thermal expansion of 7.3×10^{-5} mm/℃;

2. The corner telltale shall be capable of monitoring movement across cracks in the corners in both horizontal and vertical directions. The instrument shall be manufactured using PVC rigid sheet with a linear coefficient of thermal expansion of 6.5×10^{-5} mm/℃;

3. The floor telltale shall be capable of monitoring settlement of floors relative to a wall or a column. The instrument shall be manufactured using PVC rigid sheet with a linear coefficient of thermal expansion of 6.5×10^{-5} mm/℃;

4. The displacement telltale shall be capable of monitoring movement across cracks when one surface moves out of plane with the other. The instrument shall be manufactured using PVC rigid sheet with a linear coefficient of thermal expansion of 6.5×10^{-5} mm/℃.

GIN.W1210.9 DEMAG GAUGE

1. The Demag Gauge shall consist of an Invar main beam with two conical locating points, one in a fixed position at one end, and the other, pivoting on a special knife edge. The pivoting movement shall be transmitted to a dial gauge graduated in 2 x 10^{-3} mm mounted on a table. The dial gauge shall be able to measure a maximum movement of 5 mm. The main beam shall be fixed to the pivot block with the dial table;
2. The gauge points shall be made by stainless steel discs and cemented to the structure using the setting out bar. The Demag readings are operator dependent. Ensure that the same technician always performs the gauge readings.

GIN.W1220.9 SETTLEMENT MARKERS

1. When Instructed, provide, install and monitor settlement markers at surface of existing features or at vertical face of building such as wall for settlement monitoring. Survey the settlement markers for level and position and plot on the Instrument Location Plan immediately after installation;
2. Surface Settlement Marker:
    a. The settlement marker shall be securely founded on level ground free from obstructions. Surface settlement marker shall be installed as in Appendix XVIII of this Worksection.
3. Building Settlement Marker:
    a. The settlement marker shall be installed as in Appendix XVIII of this Worksection and securely fixed to building free from obstructions.

GIN.W1230.9 MAGNETIC EXTENSOMETER

1. The magnetic extensometer shall include two major components:
    a. Magnetic target (magnet);
    b. Read switch probe.
2. For each number of magnetic extensometer ordered, it shall be equipped with a maximum 7 nos. of magnetic targets and the installation details including their depths and intervals shall be specified by the CM;
3. The magnetic targets shall be Spider Magnets comprising a PVC body with 3 Spring steel legs. The legs shall be Zinc Plate Type II coated for corrosion resistance and be attached to the body with stainless steel screws 120 degrees from one another. The legs shall be 210 mm long and require a force of at least 40N to pull the leg flush with the access tubing during tying. The magnet body shall have 6 or 12 Alnico V magnets equally spaced around its centre line;
4. The magnet shall be tied to the casing by a single wrap of 20 kg test nylon line around the top and bottom legs. The line shall be held in place by a draw pin which passes through a loop at each end of the lines. The draw pin shall be attached to a nylon cord at least 5 m longer than the installation depth. The magnet shall be held in its correct location on the access tubing by catching the top line in a tight score mark on the access tubing that will be no deeper than 0.5 mm. The magnet shall be released by withdrawing the pin from the magnet by pulling the nylon cord when it is at the required location in the borehole;

5. The Reed Switch Probe shall consist of a reel housing, the electronics and a tape with a probe at the end. The probe shall be 15 mm diameter made of stainless steel and shall house a miniature reed switch. The tape shall consist of a survey tape graduated in millimetres, coated with polyethylene, having two conductors running its length, either side of the survey tape. The reel shall be powder coated and have an epoxy painted stand. The reel shall have a light and buzzer to provide visual and audio response to magnetic fields;

6.

   a. When instructed by the CM, monitor magnetic extensometer installed and readings shall be taken at the required frequency;

   b. Results of monitoring readings shall be presented to the CM within 3 working days of each test.

7.

   a. Provide all equipment of every kind necessary for use in execution of the monitoring works;

   b. All equipment to be used shall be calibrated within the recommended calibration period and conform with the relevant manufacturer's standard specification prior to the start of each monitoring work;

   c. Calibration certificates shall be supplied to the CM whenever an instrument is calibrated and the standard calibration procedure from the relevant manufacturer shall be followed and supplied together with the required calibration interval and the most recent calibration carried out.

GIN.W1240.9 PHOTOGRAPHS OF GROUND INVESTIGATION WORKS

1. Within 3 working days of the date of completion of the hole, take photograph of the samples and/or cores contained within each core box. The photograph shall contain a reference board giving details of:

   a. Contract number and Works Order number where applicable;

   b. Project title;

   c. Hole number;

   d. Core box number (where applicable);

   e. Depth below ground level of start and finish of all material in the core box;

   f. Contractor's name;

   g. Date of taking the photograph;

   h. Standard colour chart or similar;

   i. A reference scale for the entire board length marked in 100 mm units.

2. The following criteria shall also be fulfilled:

   a. The core is evenly lit with no shadows;

   b. The core box and reference board in each photograph fill the frame;

   c. The focal plane of the camera and the plane of the core box are parallel.

3. All cores, except those susceptible to deterioration on contact with water, shall be thoroughly moistened before being photographed. Where core boxes contain disturbed samples, the lids shall be removed from the containers so that the contents are visible in the photograph. The first disturbed sample in any photographed core box shall be identified by its unique sample number and depth so that subsequent disturbed samples in that box can also be identified;

4. All photographs taken during the Contract Period shall be either on good quality colour film or in digital format as instructed by the CM. It is essential to maintain a sharp image and good colour saturation of the photographs. Colour film shall be of the same manufacture, speed and type to maintain consistent colour balance. Soft copy of digital photographs (digital photograph images) shall be the original unaltered digital images taken with a digital camera that shall conform to the JPEG Exchangeable Image File (EXIF) Version 2.2 (or later version) standard;
5. All exposed film shall be processed at a professional laboratory to ensure even results throughout the Contract. Photographs of poor quality due to uneven colour balance, poor focus, missing information or other defects shall not be accepted and the Contractor shall re-photograph the subject at his own expense;
6. One full set of colour prints of minimum size 85 mm x 125 mm shall be supplied with the draft fieldwork report. Colour photocopies of A4 mounted prints of minimum size 200 mm x 250 mm shall be supplied in each copy of the Final Fieldwork Report. Within 3 weeks of award of the Contract, the name(s) of the suppliers and samples of the colour photocopies proposed to be use in the contract shall be submitted for CM's approval. If approved, the quality of the colour photocopies shall be maintained throughout the duration of the Contract;
7. The photograph negatives, digital photograph images and all prints shall become the property of the Employer and shall not be used by the Contractor for any purpose without written consent from the CM;
8.
    a. Photographs of soil samples may be required from selected boreholes as decided by the CM. These may include piston, undisturbed samples. The samples should be split longitudinally and photographed using the procedure as for the rock core except they should not be wetted. The top and bottom of each sample should be clearly labelled;
    b. Where photographs of soil samples are required, one copy of each soil sample photograph shall be included in each of the laboratory draft report, in each of the Final Reports;
    c. Split and take photograph all triaxial test samples (refer to GIN.T340).

GIN.W1260.9 DATA FOR SETTING OUT THE WORKS

1. It is the Contractor's responsibility to locate Lands Department Bench Marks and survey control points for his use in setting out of any Works. Carry out all survey and levelling work necessary for setting out of any Works in fulfilment of his obligations for setting out of the Works under the Conditions of Contract. In all cases, levelling shall be referred to the Principal Datum of Hong Kong;
2. Setting out and levelling shall be carried out to an accuracy of ±0.1 m and ±0.01 m respectively or as otherwise directed by the CM;
3.
    a. If it is impractical to locate the Investigation Station within the area defined in GIN.W020 (17), reposition the Station with the prior approval of the CM;
    b. No drilling will be allowed to commence unless the setting out of the Investigation Station has been agreed by the CM.
4. Following completion of work at each Investigation Station, determine the coordinates of the Investigation Station to the nearest 0.1 m, and the ground level at the Investigation Station to the nearest 0.01 m. Submit this information to the CM within 3 working days of the completion of work at each Investigation Station;

5. Protect and fence adequately all survey pegs and marks erected to enable the proper execution of the Works. Submit record photos showing completion of the aforesaid protection/fencing works to the satisfaction of the CM. The size and format of the photographs shall be agreed with the CM within 4 weeks from the notified date for commencement of the Works;
6. When ordered by the CM, carry out additional setting out and levelling of Investigation Stations;
7. When ordered by the CM, carry out surveying to determine the coordinates and levels of Survey Stations set up by others.

GIN.W1270.9 RESULTS AND SAMPLES TO BECOME THE EMPLOYER'S PROPERTY

All the results of the investigation and testings shall be deemed to be the property of the Employer and shall not be divulged without CM's consent. All cores, samples and other materials recovered from the holes shall also be deemed to be the property of the Employer and the Contractor shall not dispose of any such materials and samples except as directed by the CM.

GIN.W1280.9 TOLERANCES

Refer to Appendix H "Schedule of Tolerances" to this Specification.

TESTING

FIELD TESTS

GIN.T010.9 RESPONSE TEST AND WATER LEVEL READINGS IN STANDPIPES AND PIEZOMETERS

1. Within three working days of the completion of the installation of any standpipe/piezometer, carry out a Response Test in order to prove its successful operation. When Instructed, carry out Response Test on any existing standpipe/piezometer;
2. Carry out the test as for a falling head permeability test except that it shall be terminated after 60 minutes or when the water level has retuned to its initial level, which is sooner. Before any Response Test is carried out, give the CM at least 1 working day's prior notice;
3. Submit preliminary results on a record sheet, to the approval of the CM within 1 working day of completion of each test. Include the results of all Response Tests in the fieldwork report;
4. For newly installed standpipes/piezometers:
    a. After completion of the Response Tests, read all standpipe and piezometer water levels daily whilst working on the Site until 7 days after installation of the last standpipe or piezometer;
    b. Subsequent readings on a periodic basis may also be required by the CM;
    c. Submit to the CM records of each readings which shall include hole number, site name, contract number, Works Order number where applicable, date and time of reading, reduced level of ground water surface and method of taking reading. All water levels recorded shall be presented in record charts in a tabular and graphical form as Appendix VII to this Worksection.

GIN.T020.9 IMPRESSION PACKER TEST

1. When Instructed, carry out drillhole impression packer surveys in vertical or inclined drillholes in TNW or T2-101 size, in accordance with Geoguide 2 and using equipment and methods to the approval of the CM. The impression packer equipment shall be capable of surveying a minimum 1.5 m length of drillhole for each test;
2. Carry out the survey by inserting the impression packer device into the drillhole to the depths Instructed, expanding the packers and obtaining an impression of the drillhole wall on the thermoplastic film surrounding the packers. The survey shall be referenced to a known direction by means of a downhole compass and sufficient time shall be allowed for the compass to set following the expansion of the packer. Great care shall be taken when placing the thermoplastic film onto the packers and when transferring the north point from the compass to the film;
3. If an impression packer survey is instructed over a continuous length of drillhole longer than the length of the impression packer itself, successive impression packer test sections shall overlap by a minimum of 250 mm to ensure continuity of information and cross-checking of the north direction between successive test sections;

4. Carry out measurements of the dip and dip direction of the discontinuity traces on the impression packer film. This will involve the measurement of the dip and dip direction of the joints contained in the section of core taken from the drillhole at the level of the impression packer, related to discontinuity traces on the impression packer film;
5. Present the results of the survey on a discontinuity log, in the format to be approved by the CM. Submit each set of preliminary logs to the CM with the preliminary logs of the hole and shall be presented in the Final Fieldwork Report in the same format.

GIN.T040.9 N-SCHMIDT HAMMER TEST

1. Schmidt Hammer testing using the N type Schmidt Hammer shall be carried out at the specified intervals on chunam strips. The CM may also instruct testing to be carried out at other locations;
2. The test shall be carried out on a smooth vertical soil face by trimming a patch of at least 100 mm square on the surface exposed after stripping of chunam surfacing. The test shall be conducted, with the hammer held in the horizontal direction, by striking at the vertical face of the patch;
3. Prior to each testing sequence, the hammer shall be calibrated using a calibration test anvil supplied by the manufacturer for that purpose. At each specified location, several initial "seating" blows shall be taken to ensure good contact. Ten consecutive readings shall then be recorded by striking the same spot;
4. Preliminary results shall be submitted to the CM within 2 weeks of the completion of the tests. The results shall be presented in the form specified in Appendix X to this Worksection. The results sheets shall also be included in the Final Report and the rebound values given in the slope surface stripping records to be submitted in accordance with GIN.W040.

GIN.T050.9 STANDARD PENETRATION TEST

1. The apparatus and procedure for standard penetration test (SPT) shall comply with BS EN ISO 22476-3:2005, amended by this clause as necessary. The drive hammer shall be a type incorporating an automatic trip mechanism to ensure free fall. The steel anvil of the drive assembly shall have a diameter of 145 ± 5 mm. The guide rod arrangement that permits the hammer to drop with minimal resistance shall have an outer diameter of at least 3 mm smaller than the diameter of the central hole of the hammer;
2. A cone ended adaptor with a 30° half angle shall be available to replace the open-ended driving shoe for use in gravel common ground, or if Instructed;
3. Carry out SPT below the level of the casing. The base of the drillhole shall be fully cleaned before the test starts. Jar samples shall be taken from the split-barrel shoe after each test;
4.
    a. The results shall be reported on daily site records and both preliminary and final drillhole records as the number of blows for the first 150 mm penetration (seating drive), in 75 mm increments, and subsequently the number of blows for each 75 mm penetration for 300 mm;
    b. The number of blows of the drive hammer required to achieve each 75 mm of shoe penetration until a total penetration of 450 mm has been achieved shall be recorded. The 'N' value shall be recorded as the sum of the number of blows of the driving hammer required to achieve the last 300 mm of shoe penetration:

e.g. $\frac{14, 16}{27, 29, 32, 36}$

N=124

c.

i. If the full penetration of the seating drive is not achieved after 50 blows of the drive hammer, the number of blows and the penetration achieved (in mm) shall be recorded and the test continued with the test drive from that point:

e.g.

Seating Drive	Test drive	Summary	Remarks
27, 23/35 mm	35,27,32,31	N = 125	Test drive commenced after completion of 50 blows in the seating drive.
50/20 mm	38, 100/50 mm	138/125 mm	Test drive commenced after completion of 50 blows in the seating drive; test terminated in increment 3.
50/20 mm	100/40 mm	100/40 mm	Test drive commenced after completion of 50 blows in the seating drive; test terminated in increment 2.

ii. During the test drive, if any of the first three increments of 75 mm penetration is not achieved after 100 blows of the drive hammer, or where total number of blows excluding the seating drive, reaching 200, the number of blows and the penetration achieved (in mm) shall be recorded and the test shall be terminated:

e.g.

Seating Drive	Test drive	Summary	Remarks
17, 25	38, 100/50 mm	138/125 mm	Test terminated in increment 4.
17, 25	25, 30, 100/50 mm	155/200 mm	Test terminated in increment 5.
17, 25	65, 90, 45/30 mm	200/180 mm	Test terminated in increment 5.
17, 25	35, 60, 60, 45/30 mm	200/255 mm	Test terminated in increment 6.
17, 25	25, 30, 35, 110/70	200/295 mm	Test terminated in increment 6.

5. The water level in the hole at the time of test shall be recorded and reported. When testing below the groundwater table particular care shall be taken to maintain water level in the drillhole at or above the ambient groundwater level;
6. When Instructed, provide liner samples in conjunction with the Standard Penetration Test as described in GIN.W480;
7. If liner samples have not been instructed, place the sample recovered from the split spoon immediately in a plastic container of minimum diameter of 100 mm, with a screw top. It shall then be arranged securely in the core box with the core, in proper sequence.

GIN.T060.9 PACKER (WATER ABSORPTION) TEST

1. When Instructed, carry out single or double Packer Tests in vertical or inclined drillholes in TNW and T2-101 size. Testing shall follow the method described in Geoguide 2. The general arrangement of the tests shall be as shown in Figure 31 of Geoguide 2;
2. At the commencement of the Contract, and at other times if Instructed, carry out calibration of the equipment for friction head loss by connecting the pressure gauges, flow meter and supply pipe headworks, three or four different lengths of drill rod and the packer with its tailpipe to the water supply. Pump water through the system and record flow rates for several values of back pressure. Establish and submit to the CM a graphical relationship of flow against pressure loss for the number of drill rods used and include it in the Final Fieldwork Report if packer tests are carried out;
3. Carry out a single packer test by expanding a hydraulic or pneumatic packer in the drillhole (not in the casing) to create a seal at the top of the test section. All rods and couplings must be watertight and the threads of drilling rods supplying the water to the test section shall be wrapped with thread sealing tape. The length of test section required shall be Instructed. Fill the drillhole below the packer with water and keep it full at the specified water pressure for 15 minutes immediately before the test commences. The flow meter used shall be capable of measuring flow quantities to the nearest 0.1 litre. Monitor the water levels in the drillhole above the packer at regular intervals during the test, by means of a suitable dipmeter, to check whether leakage is occurring around the packer;
4. The acceptance of water by the test section shall then be measured and recorded at successive pressures as Instructed, the maximum of which will not exceed 75% of the effective overburden pressure at the mid-depth of the test section. A calibrated pressure gauge capable of measuring the required pressure to the following accuracies shall be used:
    a. 0 - 100 kPa Maximum Value (accurate to ± 5 kPa);
    b. 0 - 200 kPa Maximum Value (accurate to ± 10 kPa);
    c. 0 - 500 kPa Maximum Value (accurate to ± 20 kPa); and
    d. 0 - 1000 kPa Maximum Value (accurate to ± 20 kPa).
5. At each pressure, the flow of water into the drillhole shall be measured over three periods, each of 5 minutes duration. If the first two readings do not differ by more than 10%, the third reading is not required. A complete test shall comprise measurement of the flow through the full cycle of pressures and any calibration tests required by the CM;
6. Packer tests using single or double packers may also be required after the drillhole has been completed. The double packer test shall be performed as for a single packer test, except that the water pressure shall be applied to a specified length of drillhole isolated between two packers;

7. Submit preliminary results on the record sheets to the approval of the CM with the corresponding preliminary logs of the hole.

GIN.T070.9 VANE SHEAR TEST

1. When Instructed, carry out the vane shear tests as specified in BS 1377-9:1990 (Test 4.4) unless amended by this clause as necessary;
2. Vanes capable of measuring shear strengths up to approximately 75 kPa shall be available. The area ratio of each vane blade shall be less than 12%. The torque measuring instrument shall be calibrated by a method approved by the CM and a copy of the most recent certified calibration chart shall be submitted with each set of vane test results and be included in the Final Fieldwork Report;
3. The vane shall be advanced to the test depth and the torque applicator assembly shall be carefully connected. After a pause of 5 minutes, the vane shall be rotated at a constant rate of between 0.1 and 0.2 degrees/sec. Readings shall be taken at intervals of each 5° rotation. The maximum torque required to rotate the vane shall be recorded. The vane shall then be rotated rapidly through 12 revolutions without taking any readings. After a further pause of 5 minutes, the test procedure shall then be repeated in order to obtain the remoulded (disturbed) undrained shear strength;
4. Submit preliminary results in a format agreed by the CM with the corresponding preliminary logs of the hole;
5. Submit final results of undrained shear strength, corrected using the torque head calibration curve with the Final Fieldwork Report in a format agreed by the CM. For tests on common ground, report the residual value of undrained shear strength.

GIN.T080.9 FALLING OR RISING HEAD PERMEABILITY TEST

1. When Instructed, carry out falling or rising head permeability tests in a hole. Flush the hole prior to carrying out the test. The installation shown in Figure 27 of Geoguide 2 shall be used unless otherwise Instructed. The graded filter material and sand shall be to the approval of the CM and shall be placed in the hole by tremie pipe. The groundwater level shall be allowed to equalise in the completed installation for at lease one hour before test commences;
2. The method of flushing of the bottom of the hole for field permeability tests shall be as follows:
    a. Clean water shall be introduced to the cased hole through a 38 mm diameter pipe fed from a storage tank. The feed pipe shall contain a perforated section 480 mm in length consisting of 20 rings of holes at 25 mm centres, each containing 4 holes of 6 mm diameter. The end of the perforated section of pipe shall be capped. The complete perforated section shall be positioned such that it is just below the existing ground water level in the hole;
    b. The flushing water shall be withdrawn from the casing through a 38 mm diameter pipe positioned with its open end between 150 mm and 200 mm above the base of the borehole. The discharge shall be by means of a pump of sufficient capacity to extract the flushing water from the base of the borehole. Control of the flow of clean water and discharge water shall be by means of valves positioned on the inflow pipe and the discharge pipe.
3. For a falling head permeability test, raise the water level in the piezometer by adding clean water by a minimum of 3 m, or the maximum practical. Then allow the water level to equalize with the groundwater level. Measure water levels in the piezometer by means of a suitable dipmeter at the following elapsed times in minutes from the start of the test:

0, 0.25, 0.5, 0.75, 1, 1.5, 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 25, 30, 45, 60, 90, 120, 150, 180

Terminate the test at 180 minutes, or earlier if:

a. The water level has returned to its initial level; or

b. A head ratio (the ratio of water head at any time during the test to the initial head at the commencement of test) of 0.3 is achieved; or

c. Instructed by the CM.

4. For a rising head permeability, lower the water level in the piezometer by pumping by a minimum of 3 m, or the maximum practical. Then allow the water level to equalize with the groundwater level. Measure water levels in the piezometer following the same procedure as for a falling head permeability test;

5. Repeat both types of permeability test once to demonstrate that consistent results have been obtained. If the results differ by more than 20% Then repeat the test again;

6. Submit preliminary results of a falling or rising head permeability test on a record sheet to the approval of the CM, together with the corresponding preliminary logs of the hole.

GIN.T090.9 CONSTANT HEAD PERMEABILITY TEST

1. The procedure used for the constant head permeability test for flushing the hole, setting up the installation and allowing the ambient groundwater level to equalise shall be the same as for a falling or rising head permeability test;

2. Feed clean water into the piezometer at a constant rate until a constant water level is established or until the water level is 0.3 m below the top of the piezometer tube. Record the constant rate of inflow to maintain a constant head. Use a flow meter capable of measuring flows down to 0.1 litre;

3. Record cumulative inflow readings, once the constant head has been achieved, in the following sequence:

   a. 4 readings at 15 second intervals;

   b. 9 readings at 1 minute intervals;

   c. 4 readings at 5 minute intervals;

   d. Readings at 10-minute intervals until the inflow values do not differ by more than10% in any 10 minute interval.

4. Submit preliminary results on the record sheet, to the approval of the CM, with the corresponding preliminary logs of the hole.

GIN.T110.9 IN-SITU DENSITY TEST

1. Carry out in-situ density tests in trial pits and trial trenches in accordance with Test Method 11.1 or 11.2 of Geospec 3;

2. Submit preliminary results using a HOKLAS approval worksheet along with the preliminary logs of the trial pit or trial trench in which the test was performed;

3. The Final Field Work Report shall contain the results presented on a HOKLAS endorsed report.

GIN.T120.9 DYNAMIC PROBE TEST

1. The equipment of dynamic probe test shall be generally as shown in Figure 36 of Geoguide 2 and amplified below:

a. The mass of the hammer shall be 10.0 kg (±0.1 kg). The ratio of the length to the diameter of the hammer shall be between 1 and 2. The hammer shall be provided with an axial hole with a diameter which is 2-3 mm larger than the diameter of the guide rod;

b. The anvil shall be rigidly fixed to the extension rods. The mass of the anvil shall be between 1.5 kg and 1.8 kg and the diameter between 60 mm and 70 mm. The combined mass of the anvil, guide rod and upper anvil shall not exceed 5.0 kg;

c. The hammer shall fall freely and not be connected to any object which may influence the acceleration or deceleration of the hammer. The hammer shall be stationary in its upper position prior to release. The fall shall be 300 mm (±5 mm);

d. The diameter of the rods shall be between 11 mm and 13 mm and the length 1000 mm (±10 mm). The rods shall be straight and shall be connected so as to bear against each other over their full area by means of external couplers of maximum diameter 20 mm;

e. The diameter of the point shall be 25 mm (±0.2 mm). The cylindrical portion of the point shall have a length of 25 mm (±1 mm). The point shall have a conical tip with an apex angle of 45° (±2°).

2. Carry out the dynamic probe test as follows:

a. The lower end of the probe shall be rested against the ground at the test location, with the first extension rod and guide rod in a vertical position;

b. The hammer shall be raised to bear against the upper anvil, and shall be allowed to fall freely. It shall not be connected to objects which may influence its acceleration and deceleration, and shall be stationary when released in the upper position. The fall shall be 300 mm ± 5 mm;

c. The hammer shall be used to drive the probe into the ground, with a rate of driving between 20 and 60 blows per minute;

d. Additional extension rods shall be added as necessary. The rods shall be rotated clockwise one full turn each time a rod is added to ensure that screw joints are tight. The blow count for every 100 mm of penetration shall be recorded, or at refusal the penetration distance for 50 blows of the hammer. Interruptions exceeding 5 minutes shall be recorded;

e. If any obstruction to the probe is encountered which cannot be penetrated over 100 mm by 100 blows of the driving hammer, then that probe shall be considered to have reached refusal and the test shall be terminated.

3. Submit test results on a record sheet to the approval of the CM, which shall contain the following details:

a. Blow count for every 100 mm penetration or at refusal the penetration distance for 50 blows of the hammer;

b. Interruptions exceeding 5 minutes;

c. Dynamic probe record (Figure 37 of Geoguide 2);

d. Confirmation that the test was carried out in accordance with this Specification.

4. If refusal is met at a depth of less than 3 m, then carry out a second test at a distance of between 0.3 m and 0.6 m from the first test;

5. Seal all probe holes on completion with cement grout consisting of cement and water in the proportions 0.4:1 by mass, for at least the top 600 mm;

6. For dynamic probing tests that are not related to trial pit or trial trench excavations, submit preliminary results within 3 working days of the date of completion of all dynamic probing testing Instructed.

GIN.T130.9 PUMPING TEST

1. When Instructed, carry out pumping tests in new or existing holes;
2. The tests consist of pumping water from a hole and observing the effect on the water table by measuring water levels in the hole being pumped and in adjacent piezometers and/or observation wells;
3. These tests shall be performed in accordance with the principles and methods outlined in BS 5930:1981: Section 5, or in accordance with BS ISO 14686:2003 if Instructed to determine the hydraulic properties of the aquifer(s) and/or effect of pumping on neighbouring area;
4. All equipment necessary to undertake the tests shall be provided including temporary electricity supply, pumps, instruments, materials, labour and haulage;
5.
    a. Unless otherwise specified, commence the pumping tests in the morning about 8 am on an agreed day;
    b. When Instructed, take water samples in accordance with GIN.W470 or otherwise as directed by the CM for laboratory tests. Complete all preparation works one day before the test;
    c. The pump used for the test shall be capable of pumping 1.5 times the maximum anticipated flow rate or flow-rate directed by the CM and shall have a discharge line connected to an efficient existing drainage system so that ponding and recharge into the ground does not occur;
    d. Measure the pumping rate and pumped water quantities using an Approved flowmeter and check them using an orifice, or similar weir.
6.
    a. Prior to pump testing, clean and flush the hole, and measure the depth of the hole accurately;
    b. When directed by the CM and unless otherwise specified, place a temporary perforated PVC lining and filter pack in the hole and withdraw the driving casing carefully. Develop the hole by using Approved methods such as jetting, surging and over pumping;
    c. Install the pump and pump the hole in accordance with the following test procedures unless otherwise Instructed:
        i. A Step Drawdown Test shall be performed at the following pumping rates:

            Stage 1: 0.25 x flow rate specified;

            Stage 2: 0.50 x flow rate specified;

            Stage 3: 0.75 x flow rate specified;

            Stage 4: 1.00 x flow rate specified;

            Stage 5: 1.25 x flow rate specified;

            Stage 6: Recovery.

Each stage shall have a minimum of 2 hours duration. Pumping shall be carried out at a constant rate for each stage. The test shall be continuous, commencing with the lowest pumping rate. Under no circumstances shall the pumping rate be increased above the rate for the next stage. Water level readings shall be taken in the hole and in the adjacent piezometers and/or observation wells every 15 seconds up to 2 minutes; every 30 seconds between 2 and 5 minutes; every 1 minute between 5 and 15 minutes; every 5 minutes between 15 and 120 minutes. After Stage 5 the pump shall be turned off and water levels monitored for a minimum of 2 hours, but in any event until the water level measured is substantially the same as the standing water level measured at test commencement;

ii. A Constant Rate Pumping Test shall be performed at the flow rate specified for a continuous period of 48 hours. Water level readings shall be taken in the hole and in the adjacent piezometers and/or observation wells every 15 seconds up to 2 minutes; every 30 seconds between 2 and 5 minutes; every 1 minute between 5 and 15 minutes; every 5 minutes between 5 and 120 minutes and subsequently at 30 minutes intervals. Pumping rate shall remain constant and be adjusted as necessary by reference to the flowmeter or orifice weir manometer. The test shall be continuous. In the event of any breakdown the test shall be repeated, with that portion of the test already performed at the Contractor's expense. After 48 hours or such period as the CM determines the pump shall be turned off and the water level monitored until the water level measured is substantially the same as the standing water level at test commencement.

7. Record, plot and calculate the pump test results on the standard sheets shown in Appendix XI to this Worksection or to follow the proforma/graphs shown in BS ISO 14686:2003 if Instructed;

8. Submit a report on the testing to the CM in accordance with GIN.W040. The report shall include a plan showing the general arrangement of the pumping test (the locations of the holes where pumping tests have been performed and piezometers and/or observation wells where water levels have been recorded, a geological log for the hole; records of the pumping tests performed; a drawing (A4 size) showing details of the hole lining; filter pack and pump level; the pump details (which shall include the pump dimensions, construction and characteristics), water level monitoring records of all relevant piezometers and/or observation wells and the results of any water laboratory tests which may have been undertaken.

GIN.T140.9 PRESSUREMETER TEST

1.

a. When Instructed, carry out Pressuremeter Test using a Menard pressuremeter type GB or GC of NX size at locations shown on the Drawings, as detailed in this Worksection or as directed by the CM;

b. The equipment shall have a pressure range and membrane strengths suitable for testing the materials at the test location. For this purpose a pressure range of up to 10,000 kPa shall be available for tests in Grades III to V decomposed rock and up to 4,000 kPa for tests in Grade VI decomposed rock or in other soils. Grades of decomposition shall be as defined in the Geoguide 3.

2.

a. The probe shall comprise essentially a 74 mm diameter measuring cell between two guard cells. The measuring cell shall be pressurised by water and the guard cells by gas;

b. The control unit shall comprise essentially a cylindrical reservoir with a graduated transparent tube called the volumeter which is connected to the measuring cell of the probe;

c. The volumeter shall be capable of being pressurised, the pressures being read on Bourdon type gauges of suitable sensitivity;

d. Coaxial tubing shall connect the probe to the control unit. The length of tubing shall be the minimum necessary to allow the deepest test to be carried out;

e. The equipment shall at all times be protected from direct sunlight. If type GC equipment is used then a separate gauge shall be used to read guard cell pressures.

3. The equipment shall be checked and calibrated when a new probe is used, a probe has been refurbished, any water circuit has been subjected to a vacuum or sudden pressure release or when 10 tests have been completed since the previous calibrations and checks. The checks and calibrations shall include the following:

   a. Integrity and de-aired state of the water circuits and water;

   b. Volume calibration of the measuring cell;

   c. Pressure calibration of the line and volumeter;

   d. Initial volume of the probe;

   e. Pressure calibration of the probe, line and volumeter.

4. Install the probe in a NX size investigation hole. Lower the probe into the hole and apply the first pressure increment within 15 minutes of removal of the core barrel from the test level;

5. Select pressure increments so that the limit pressure is achieved in 7 to 14 increments. Keep the pressure constant for the duration of each increment and take volumeter readings at 15 sec., 30 sec., 1 min., 1.5 min. and 2 min. after the application of the pressure. Take further readings if significant volume change takes place after 2 minutes;

6. Carry out cycles of unloading and reloading as directed by the CM. Consult the CM before any termination of the test;

7. Subject to Approval, the test shall be considered complete when the total volume of water in the volumeter has been injected into the measuring cell or when the pressure capacity of the apparatus is reached or when the limit pressure is reached whichever is the least;

8. Present the results of Pressuremeter Tests in the form of a net volume versus net pressure diagram with pressure indicated on the abscissa and volume on the ordinate. Plot creep volume (volume at 120 sec. minus volume at 30 sec.) for each increment;

9. Report all details of the test including the following:

   a. Site;

   b. Contract number and Works Order number where applicable;

   c. Hole number;

   d. Date of test;

   e. Number of test;

   f. Pressuremeter type and dimensions;

   g. Probe number;

   h. Name of technician;

i. Reduced level and coordinates of hole;

j. Depth below ground level and reduced level of centre of measuring cell;

k. Depth below ground level and reduced level of water / bentonite in the hole;

l. Height of centre of volumeter above ground level at the hole and reduced level;

m. Depth below ground level and reduced level of bottom of the hole;

n. Details of all relevant calibrations;

o. Reason for terminating test;

p. Weather.

10. Report the results including the Limit Pressure, Pressuremeter Modulus, Secant Shear Modulus (initial and for each cycle) and Secant Deformation Modulus (initial and for each cycle) within 7 days of the test being carried out;

11. Carry out Pressuremeter testing using an Approved pressuremeter probe of AX size having a pressure range up to 10,000 kPa at locations shown on the Drawings or as directed by the CM. The procedure for carrying out the tests will be as for the NX size or as directed by the CM and the control unit shall be located at ground level with the probe installed in a hole formed with a hand-held percussive drill of suitable diameter.

GIN.T150.9 POINT LOAD TEST ON ROCK CORE

1. Carry out Point Load Test in accordance with the 'Suggested Method for Determining the Point Load Strength' International Journal of Rock Mechanics, Mining Science and Geomechanics, 1985, Volume 22, No. 2, Pages 51-60;

2.

a. The point load testing machine shall be an Approved type;

b. Make available at least two spare sets of conical testing platens. Platens that are dented or chipped shall be immediately replaced;

c. Tests shall be carried out under air-dry or saturated conditions and to axial or diametrical orientation as directed by the CM.

3. If tests are ordered at regular intervals along the whole length of core obtained from a hole, transport the testing equipment to the Site if required by the CM so that the testing may be undertaken as cores are extracted from the drillhole(s). Reporting shall be in a form to be agreed using a correlation coefficient as agreed by the CM.

GIN.T180.9 GOODMAN JACK TEST

Goodman Jack Tests shall be carried out as directed by the CM to determine the rock mass modulus. The tests shall be carried out according to ASTM D4971-16. The tests shall be carried out by an operator fully conversant with the equipment and the method of test. Submit the results in a format to be approved by the CM within 7 days of the test being carried out.

GIN.T190.9 PLATE LOAD TEST

1. Carry out Plate Load Test at shallow pits or trenches or at other locations when Instructed. The plate load test shall be carried out in accordance with BS 1377-9:1990 (Test 4.1) by a HOKLAS accredited laboratory, except where noted hereunder;

2. The dimensions of the loading plate shall not be less than 300 mm, square or circular as Instructed. The loading plate shall be sufficiently rigid to prevent any distortion or bending at all stage of the loading test. The alignment and direction of the applied load including the load cells and jack shall remain vertical and concentric with the loading plate;
3. Apply the loading by a reaction system provided by means of kentledge system to the approval of the CM. The kentledge shall be capable of providing a reaction force not less than 3 times the test load (W_t) as Instructed by the CM;
4. Measure displacement of the loading plate by four dial gauges located at orthogonal positions. Use a reference beam to aid the measurement of the displacement. The reference beam shall be supported by two rigid foundations positioned outside the influence zones of the loaded area or kentledge reaction area. The dial gauges shall be of sufficient travel to measure the displacement of the plate and to an accuracy of 0.01 mm;
5. The maximum test load adopted shall not be less than $3W_t$, so that the significant stress on soil and settlement can be obtained. W_t is the test load and shall be obtained in accordance with Code of Practice for Foundations or its latest version issued by the Buildings Department;
6. An initial load not exceeding 25% of the initial overburden pressure may be applied to the test plate to reduce the bedding error before conducting the plate load test. Apply the test load in increments of 0.5 W_t up to W_t, release and reapply the test load in increments of 0.5 W_t up to 2 W_t, then release and reapply in increments of 0.5 W_t up to 3 W_t;
7. Maintain the test load at each incremental stage for a period of 10 minutes or longer until the rate of settlement is less than 0.05 mm in 10 minutes;
8. Maintain the maximum test load for at least 72 hours before removal;
9. Report all details of the test including:
    a. Reduced level at the test location and coordinates;
    b. Description of soil stratum where plate load test is conducted;
    c. Details of all calibration and correlation charts;
    d. Description of the method of reaction system used for the application of required loads, including any drawings to assist the presentation of the set-up;
    e. Results and interpretation of the tests in determining the soil modules of the underlying soil;
    f. Temperature and weather at the time of plate loading test;
    g. Date of test.

GIN.T200.9 ACOUSTIC BOREHOLE TELEVIEWER SURVEY

1. The output from the Acoustic Borehole Televiewer shall be such that the following information is provided:
    a. The location of discontinuities in the rock mass relative to ground level;
    b. The width, dip, and dip direction of detected discontinuities.
2. For the calculation of discontinuity dips, use the measured drillhole diameter. Provide the obtained information in graphical, tabulated, text, and digital format, as appropriate;
3. Graphical output shall include:
    a. A legible and orientated travel time log;

b. A legible and orientated amplitude log;

c. An orientated, digitised interpretation in the form of a diagrammatic internal view of the drillhole wall, showing the locations and shapes of discontinuities;

d. A dip/dip direction "tadpole" graphic; and

e. An indicator of the drillhole's deviation from vertical showing both amount and direction of deviation.

4. Adjust the depth scale of the logs to ensure the depth of the discontinuities represented on the log correlate to their corresponding depth in the rock cores or as agreed by the CM;

5. State clearly in the logs that all directions are relative to magnetic north. The declination of magnetic north from Hong Kong Metric Grid System north shall be recorded within the header information for each log. Final copies of these logs shall show the travel time and amplitude plots in colour. Logs shall have a vertical scale of not less than 1/10 unless otherwise Instructed. Provide the discontinuity data for each drillhole surveyed in tabular format and as a contoured stereographic plot, in the form of a lower hemisphere projection on an equal area stereonet;

6. Provide the following data in tabular format:

   a. Depth relative to ground level to the first appearance of each discontinuity;

   b. Depth relative to ground level to the last appearance of each discontinuity;

   c. The drillhole diameter at the mid-depth of each discontinuity;

   d. The calculated dip of each discontinuity feature to within one degree. (Horizontal is 00 degrees, vertical is 90 degrees). Dip is to be reported as a two-digit figure. The value of dip shall be corrected for the angle of the drillhole;

   e. The measured direction of dip relative to magnetic north. Direction is to be reported as a three-digit figure. Any deviation of the direction from vertical shall be taken into account when measuring dip direction;

   f. The deviation of the drillhole from vertical at the mean depth of the discontinuity reported to the nearest 0.1 degrees; and

   g. The direction of deviation of the drillhole at the mean depth of the discontinuity reported to at least the nearest 0.5 degrees relative to magnetic north.

7. The declination of magnetic north from Hong Kong Metric Grid System north shall be clearly stated in a footnote to the tabulated data;

8. Make an assessment of the distribution of material decomposition grades, according to Geoguide 3, based on the Acoustic Borehole Televiewer data as far as possible and include it in the Final Report. The assessment shall be carried out by a qualified geologist/geophysicist with experience in the interpretation of Acoustic Borehole Televiewer data;

9. A graphical differentiation shall be made between tight and open discontinuities and shading shall be used between discontinuity walls to illustrate aperture distances;

10. The tabulated data specified above shall also be supplied in digital form as a comma separated value text file. The file name shall be agreed with the CM. The file shall also contain a header line giving the Contract No., the Works Order number where applicable, the project title, the drillhole identification number, and the date of surveying. Each item in the header line is to be separated by a comma and shall not include commas;

11. Submit the results obtained under this clause in a format to be Approved within 7 days of the survey being carried out.

GIN.T210.9 CONE PENETRATION TEST

1. When Instructed, use an electrical cone capable of measuring the resistance, sleeve friction and pore pressure simultaneously. The cone shall be advanced hydraulically at a steady penetration rate of 20 mm/sec. Records at 20 mm interval of slide friction, tip resistance, and pore water pressure shall be obtained. Carry out the cone penetration test using equipment and methods in accordance with the recommendations of CIRIA Ground Engineering Report: In-situ Testing, Cone Penetration Testing, methods and interpretation by A.C. Meigh (1987);
2. For each test, provide the following information to the approval of the CM:
   a. Plot of cone point resistance, q_c versus depth;
   b. Plot of local sleeve friction f_s versus depth;
   c. Plot of pore pressure (u) versus depth;
   d. Plot of friction ratio, R_f versus depth;
   e. Plot of pore pressure ratio, (u/q_c);
   f. Plot of effective cone point resistance $(q_c - u)$;
   g. Plot of corrected total cone resistance $q_t = q_c + (1 - \beta) \times u$ versus depth where β is the cone correction factor;
   h. Plot net cone resistance $q_{net} = q_t$ – total overburden pressure versus depth;
   i. Plot normalised dissipated record versus time;
   j. Soil profile adjacent to CPT plots;
   k. Copies of all detailed test data including tapes/diskettes on which the data may be stored. All results shall be presented in SI units.
3. All tests and calibration data shall be made available to the CM within 3 days of the completion of the test;
4. The test could be terminated in cases when:
   a. 80% of the cone tip capacity, i.e. tip resistance or local friction are exceeded; or
   b. The pore pressure reaches or exceeds the nominal capacity, i.e. 20 bars or 2000 kPa; or
   c. The total thrust applied is less than the full reaction weight of the seabed frame, i.e. reaching the limitation of the penetrometer/rod string capacity.

LABORATORY TESTS

GIN.T310.9 GENERAL

1. All laboratory testings shall be carried out by an Approved commercial testing laboratory on the Development Bureau's List of Approved Suppliers of Material and Specialist Contractors for Public Works in Soil and Rock Testing. The testing work to be carried out comprises generally of testing of soil, rock and groundwater samples. The testing may be of any of the following types:
   a. Determination of Moisture Content;
   b. Determination of Atterberg Limits;
   c. Determination of Particle Density;
   d. Determination of Particle Size Distribution;

e. Determination of Amount of Chemical Substances and Electro-chemical Properties;

f. Determination of Dry Density/Moisture Content Relationship;

g. Determination of In-situ Bulk Density, In-situ Dry Density and Relative Compaction;

h. Determination of the California Bearing Ratio;

i. Determination of Compressibility Characteristics of Soils;

j. Determination of Shear Strength of Soils using Triaxial Apparatus;

k. Determination of Shear Strength of Soils using Shear Box Apparatus;

l. Direct shear strength tests including tests carried out on rock joints;

m. Any other soil and rock tests as directed by the CM.

2. Carry out all laboratory tests for soils in accordance with the recommended testing methods and procedures stated in 'Geospec 3: Model Specification for Soil Testing', GEO, unless otherwise specified;

3. Provide HOKLAS endorsed test reports for those soil tests that carried out in accordance with the recommended testing methods and procedures stated in 'Geospec 3: Model Specification for Soil Testing', GEO;

4. For those soil and rock tests where HOKLAS endorsed test reports are not available, submit the following to the CM for approval at least two months prior to testing:

   a. Copies of the full test procedures manuals (with equipment details, sample preparation and testing procedures, and recording and reporting specific to the laboratory) to be adopted for each test;

   b. Copies of calibration certificates for major equipment and measuring instruments to be used;

   c. A sample of the work sheets and of the test report;

   d. The name, qualifications and experience in testing of the person who will be supervising the tests full time at the laboratory and certifying the reliability and completeness of the test reports;

   e. Such tests shall be carried out to the test methods and test conditions specified by the CM, under a quality system up to HOKLAS standards. In particular, approved Signatories of Test Certificates and Reports and Senior Laboratory Technicians shall have qualifications and experience as specified in Appendix XIII to this Worksection. Evidence of training provided to personnel shall be available. Calibration shall have traceability to national standards of measurement. The CM may require an audit to be carried out on the testing laboratory at any time by Public Works Laboratories or by a third party. No claims for extension of time or additional payment will be considered by the CM for any action required by the laboratory to correct non-compliance identified in the audit.

5. The CM shall have the right of access to the Contractor's laboratory at all times when testing is being carried out in connection with this Contract;

6. While laboratory testing is in progress, inform the CM without delay of any unusual occurrences during any of the tests ordered, and of any test that is running to excessive time.

GIN.T320.9 LABORATORY TESTING DEFINITIONS

For laboratory testing the following definitions will apply:

1. Laboratory Engineer - a graduate engineer with a minimum of 5 years experience with at least 2 of which have been gained in soil testing in a laboratory, or a Chartered Engineer with a minimum of 2 years experience in soil testing and fully familiar with the soil testing procedures to be used in the Contract;
2. Senior Technician - a person with at least 10 years experience gained in a soil testing laboratory and fully familiar with all soil testing procedures to be used in the Contract;
3. Technician - any of the Contractor's personnel capable and qualified to set up and conduct tests in the laboratory;
4. Laboratory Assistant - any of the Contractor's personnel requiring direct supervision from an engineer, senior technician or technician.

GIN.T340.9 PHOTOGRAPHIC RECORD OF SAMPLES

1. A colour photographic record shall be taken for each triaxial test specimen, splitting of undisturbed sample, uniaxial rock compression test specimen and rock joint shear test specimen as described in GIN.W1240;
2. Immediately after testing, split soil cylindrical specimen longitudinally or otherwise as directed by the CM;
3. Place a reference label, scale and a suitable colour comparator along with the split specimen in the camera's field of view and a photograph taken at a scale agreed with the CM.

GIN.T350.9 RETENTION OF SAMPLES

1. When laboratory tests are carried out on only part of a soil sample, the remainder of the soil in the sampler or container shall be resealed with wax as soon as possible and retained;
2. All soil on which laboratory tests have been carried out, including that wasted during the preparation of test specimens, shall be retained in airtight containers until the presentation of the Final Report;
3. On submission of the Final Report and with the CM's acceptance, samples and specimens may be dumped. In no circumstances are samples and specimens allowed to be dumped without the Approval.

GIN.T360.9 CLASSIFICATION AND CHEMICAL TESTS

1. For all classification and chemical tests, adopt the following tests:
   a. Test procedures as specified in 'Geospec 3: Model Specification for Soil Testing', GEO:

Classification and Chemical Tests	Test Method as specified in 'Geospec 3: Model Specification for Soil Testing', GEO
i. Determination of moisture content	5.1, 5.2 or 5.3
ii. Determination of Atterberg Limits	6.1 or 6.2
iii. Determination of particle density	7.1 or 7.2
iv. Determination of particle size distribution	8.1, 8.2, 8.3, 8.4, 8.5, 8.6 or 8.7
v. Determination of organic matter content	9.1

vi. Determination of total sulphate content of soils and sulphate content of groundwater	9.3
vii. Determination of water-soluble chloride content	9.4
viii. Determination of the pH value	9.5

b. Test procedures as specified in BS:

Classification and Chemical Tests	BS
i. Determination of carbonate content of soils	The method as stated in BS 1377-3:1990, Test 6
ii. Determination of resistivity of soils	The method as stated in BS 1377-3:1990, Test 10.4

2. The particular test method to be employed will be given by the CM.

GIN.T365.9 TRIAXIAL TESTS ON SOIL SAMPLES

1. Carry out the test for determination of shear strength of soils using Triaxial Apparatus (also known as Triaxial Tests) in accordance with Test Method 15.1 or 15.2 or 15.3 of 'Geospec 3: Model Specification for Soil Testing', GEO. The particular test method to be employed will be given by the CM;
2. Triaxial testing shall be either single stage or multistage as Instructed. The size of the specimens to be tested shall generally be either 76 mm or 100 mm nominal diameter;
3. Remoulded triaxial specimens not greater than 100 mm diameter may be required. The specimen shall be prepared in accordance with Clause 13.2 of 'Geospec 3: Model Specification for Soil Testing', GEO;
4. Triaxial specimens not greater than 100 mm diameter may be required from a block sample. These shall be prepared by trimming using a soil lathe, in accordance with the method described in Clause 13.3 of 'Geospec 3: Model Specification for Soil Testing', GEO.

GIN.T367.9 TRIAXIAL TESTS ON LOOSELY COMPACTED FILL MATERIALS

Follow Test Method 15.2 of 'Geospec 3: Model Specification for Soil Testing', GEO (Geospec 3) with modifications on the following stages:

1. Sample preparation
   a. Follow Clause 13.2 of Geospec 3 if the initial target density is dense enough to enable a uniform triaxial specimen to be prepared. (Note 1 of Clause 13.2.2.9 of Geospec 3 recommends the use of static compaction);
   b. Where static compaction is not applicable in preparing a very loose and uniform specimen, slight tamping using a purposely-made apparatus shall be used;
   c. The initial target dry density and moisture content shall be specified by the CM. When the initial moisture content (m.c.) is not specified, the use of a m.c. value close to its optimum m.c. shall be acceptable;
   d. The CM may specify a series of initial relative compaction for the triaxial specimens instead of the initial target dry densities as mentioned in sub-clause (c).
2. Saturation
   a. Before applying back pressure, follow the following steps:

i. Disconnect the tubes at pore pressure and back pressure lines;

ii. Set the pressure of the CO_2 coming out from the cylinder at about 20 kPa;

iii. With the pore pressure and back pressure valves closed, plug in the tube with CO_2 to the pore pressure line;

iv. Immediately open the pore pressure and back pressure valves at the same time;

v. Check the CO_2 pressure via the pore pressure transducer. Adjust the CO_2 cylinder pressure at around 20 kPa;

vi. Allow the CO_2 to percolate through the soil specimen for about 5-10 minutes;

vii. Plug out the CO_2 tube and plug in back the tubes for pore pressure and back pressure. Take care to avoid trapping air bubbles in the tubes; and

viii. Continue with the procedures as set out in clause 15.2.6.2 of Geospec 3.

b. Use more stringent criterion for saturation. To enable correction for volume change during saturation be estimated, a full saturation or nearly full saturation of the specimen is required. The pore pressure coefficient B shall be $\geqq 0.97$ and the back pressure $\geqq$ 200 kPa before proceeding to the consolidation;

c. Follow the recommendation of Geospec 3 if the change in volume during saturation is significant. An estimate of the volume change is required.

3. Shearing

a. Terminate the test only at an axial strain of at least 20%.

4. Unload the specimen and dismantle the test

a. During unloading and dismantling, care must be exercised to minimize the loss of moisture and soil grains from the specimen.

GIN.T380.9 ONE-DIMENSIONAL CONSOLIDATION TEST

Carry out one-dimensional consolidation tests in accordance with Test Method 14.1 of 'Geospec 3: Model Specification for Soil Testing', GEO.

GIN.T390.9 SPLITTING OF UNDISTURBED SAMPLES OBTAINED FROM TRIPLE TUBE RETRACTABLE CORE BARRELS

1. For inspection purposes, tubes containing undisturbed samples obtained from triple tube retractable core barrel may be required to be split longitudinally on Site or in the laboratory for their full length by use of a rotary saw or other suitable means. Saw runs will in general be two in number and diametrically opposite. The tube material will be plastic;

2. Log the split undisturbed samples graphically with detailed description in accordance with Geoguide 3. Include the logs and photographs of the split undisturbed samples in both the Final Fieldworks Report and Laboratory Tests Report.

GIN.T400.9 DIRECT SHEAR BOX TEST

Carry out the test for determination of shear strength of soils using Shear Box Apparatus (also known as Direct Shear Box Tests) in accordance with Test Method 16.1 of 'Geospec 3: Model Specification for Soil Testing', GEO. The particular test method (Method A or Method B) to be employed will be given by the CM.

GIN.T410.9 SOIL COMPACTION TEST

Carry out the test for determination of dry density/moisture content relationship (also known as Soil Compaction Tests) in accordance with Test Method 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, 10.7 or 10.8 of 'Geospec 3: Model Specification for Soil Testing', GEO. The particular method to be employed will be given by the CM. Separate specimens shall be required for each moisture content/dry density determination.

GIN.T420.9 DETERMINATION OF THE CALIFORNIA BEARING RATIO

Carry out the test for determination of California Bearing Ratio in accordance with Test Method 12.1 of 'Geospec 3: Model Specification for Soil Testing', GEO.

GIN.T430.9 ROWE CELL TESTING OF LARGE DIAMETER PISTON SAMPLES

1. Rowe Cell (also known as hydraulic cell) consolidation tests may be required on soil samples with diameters ranging from 75 to 254 mm. Testing may be of "free strain" or "equal strain" type and be carried out under one of the following drainage conditions:
    a. Vertical drainage to the top surface only, with measurement of pore pressure at the centre of the base;
    b. Vertical drainage to both top and bottom surfaces;
    c. Radial drainage outwards to the periphery only, with measurement of pore pressure at the center of the base;
    d. Radial drainage inwards to a central drain with measurement of pore pressure at one or more points off center.
2. Carry out Rowe cell consolidation tests in accordance with BS 1377-6:1990 (incorporating Amendment No. 1) with the following modification:
    a. Carry out all tests in an area free from significant vibrations and other mechanical disturbance. The temperature variation during any test shall not exceed 8℃, and the temperature at any time during a test shall be between 15℃ and 28℃. The apparatus shall be sited away from the effects of local sources of heat, direct sunlight and draught;
    b. Carry out a pre-test assessment of the soil sample before the test. If necessary, inform and request the CM to examine and assess the sample condition and its suitability for test;
    c. The permeability of the porous discs shall be at least one order of magnitude greater than the estimated permeability of the soil specimen. Check the permeability of the porous discs before they are first used and subsequently at a frequency of at least once every year to ensure that they meet the above criterion;
    d. In addition to the calibration of the apparatus as described in Clauses 3.2.5 and 3.2.6 of BS 1377-6:1990, calibration of rim drain shall also be carried out for tests under outward radial drainage condition;
    e. At each stage of loading, plot the compression gauge readings against both logarithm of time and square-root of time and maintain the pressure until such time that the end of primary consolidation is reached. The end of primary consolidation shall be determined using both the log time and the square-root time plots, whichever gives a longer primary consolidation period. When the end of primary consolidation can be identified on only the log time or the square-root time plots, that shall be taken as the end of primary consolidation;

f. Determination of the initial moisture content of the soil sample in clause 3.5.8.1.2 of BS 1377-6:1990 shall be in accordance with Test Method 5.1 or 5.3 of 'Geospec 3: Model Specification for Soil Testing', GEO as Instructed. Drying of the specimen as required in Clause 3.5.6.4 of BS 1377-6:1990 shall be at a temperature which is the same as that adopted in the test method specified for the determination of initial moisture content of the soil specimen;

g. Temperature correction described in Clause 3.5.8.5.5 of BS 1377-6:1990 shall not be carried out;

h. The coefficient of consolidation (cv) shall be calculated using both the log of time plot and the square-root time plot, where possible;

i. Upon completion of the test, break up the specimen for inspection (if necessary, soak the dried soil specimen in water until it is sufficiently soft for breaking up into individual particles). If there are particles of size large than one-fifth of the height of the consolidation ring, determine and record the percentage by weight and the size distribution of these particles within the specimen. Determine the percentage by weight and size distribution of large particles using BS sieves or other equivalent standard sieves;

j. The reporting to test results shall include all information as required in Clause 3.5.9 of BS 1377-6:1990 except that:

   i. A basic description of the specimen shall be carried out;

   ii. The initial void ratio and degree of saturation of the sample shall be reported;

   iii. Plot of percentage vertical compression and void ratio (which correspond to the end of primary consolidation as defined in sub-clause (2)(e) against the logarithm of applied pressure for the complete load-unload cycle shall be provided;

   iv. Plots of compression against time (both log time and square-root time), for each load increment, shall be included;

   v. The daily maximum and minimum temperatures recorded in the vicinity of the test apparatus over the whole period of test shall be reported; and

   vi. The percentage by mass and size distribution of particles larger than that acceptable, if found within the test specimen, shall be reported.

k. For "free strain" tests under outward radial drainage condition, t0.465 plots instead of square root time plots shall be used as referred in sub-clauses (2)(e) and (2)(j)(iv).

3. Report the results on the forms shown in Appendix A of BS 1377-6:1990. Alternative record sheets shall be to the approval of the CM.

GIN.T440.9 UNIAXIAL COMPRESSIVE STRENGTH TEST

1. When Instructed, determine the uniaxial compressive strength (UCS) in accordance with ASTM D7012-07 on intact rock core specimens;

2. At the discretion of the CM, determine also the elastic moduli of the intact rock in accordance with ASTM D7012-07;

3. Report the test results on forms to the approval of the CM.

GIN.T450.9 ROCK JOINT SHEAR TEST

Carry out rock joint shear test in accordance with ASTM D5607-16 and with the following modifications:

1. Unless otherwise Instructed, carry out multi-stage testing;
2. Carry out the following in rock joint shear tests and report on the forms to the approval of the CM:
    a. Determine and record the dimensions of the top and bottom shear surfaces;
    b. Estimate the actual area of contact between the top and bottom surfaces. Calculate the areas of regular shapes. Determine the areas of irregular shapes by tracing the shape onto a tracing paper and measuring the area with a planimeter;
    c. Record the roughness profile, before and after shear, with the aid of the profilometer. Also make a description of the rock joint surfaces with regard to colour, tightness and nature of infilling materials;
    d. Take photographs of top and bottom joint surfaces, before and after shear, in accordance with the requirements of GIN.T340;
    e. Soak the specimen in water for 48 hours before testing unless otherwise Instructed;
    f. Record the horizontal displacements, vertical displacements, shear loads and normal loads during the tests;
    g. Make the following corrections in calculating the stresses:
        i. Hydraulic ram springs - where hydraulic rams have been used, apply a correction to gauge readings to take into account the resistance provided by the ram return springs;
        ii. Cross-sectional areas - take into account the reduction in cross-sectional area during the shearing process;
        iii. Take into account contributions to normal load such as self-weight of loading system, weight of upper box and sample and cementing material.
3. The variations to the above procedures for testing tight joints shall be Approved.

GRO GROUTING FOR GEOTECHNICAL WORKS

MATERIALS

GENERAL

GRO.M010.9 DEFINITIONS

In this Specification:

1. "Ground", for the purpose of grouting for geotechnical works, is fill material, soil and rock and the interfaces between fill material, soil and rock and any structures;
2. "Grout", for the purpose of grouting for geotechnical works, is cement grout, cement-sand grout, cement-bentonite grout and Approved proprietary grout;
3. “Sand” shall be natural sand or crushed natural stone;
4. "Grouting", for the purpose of grouting for geotechnical works, is the mixing and injection of grout through predrilled or preformed holes;
5. "Grouting stage", for the purpose of grouting for geotechnical works, is the discrete length of drillhole into which grout is to be injected in a continuous operation;
6. "Lugeon" is a water loss of 1 litre per minute per metre length of hole tested at an effective pressure of 1 MPa.

GROUT FOR GEOTECHNICAL WORKS

GRO.M110.9 GROUT

1. Materials for grout shall comply with Worksection CON1 except as stated in this Worksection;
2. Cement grout for geotechnical works shall consist of Portland Cement (PC), Pulverised Fuel Ash (PFA), sand and water. Admixtures shall not be used unless permitted by the CM. The use of PFA in cement grout shall follow the same requirements of PFA in concrete as specified in Worksection CON1;
3. Sand for grout shall be clean dry sand complying with BS 1200:1976 and shall have a particle size distribution such that 100 % passes a 2 mm BS test sieve and not more than 30 % passes a 0.2 mm BS test sieve;
4. Water for grout shall be clean fresh water having a temperature not exceeding 30℃ or less than 5℃;
5. Cement grout shall have a minimum crushing strength of 30 MPa at 28 days;
6. The amount of bleeding of grout shall not exceed 0.5 % by volume 3 hours after mixing or 1.0 % maximum when measured at 23 ± 1.7℃ in a covered glass or metal cylinder of 100 mm internal diameter and with a grout depth of approximately 100 mm. In addition, the water shall be reabsorbed by the grout within 24 hours;
7. The flow cone efflux time of grout shall not be less than 15 seconds.

GRO.M120.9 STANDPIPES FOR GROUTING

1. Unless otherwise Approved, standpipes for grouting shall be standard black metal pipe complying with BS 1387:1985 (1990). Unless otherwise permitted by the CM, non-metallic grout pipe may be used for grouting rock dowels, rock bolts and soil nails. Where metallic standpipes are used for grouting rock dowels, rock bolts and soil nails, they shall be extracted from drillholes as grouting proceeds;
2. Submit to the CM for approval of the proposed standpipes for grouting the following particulars at least 14 days prior to installation:
    a. Sample of the proposed standpipes for grouting;
    b. Certificate(s) from the manufacturer confirming compliance of the materials with the requirements of this Specification or as shown on Drawings.

WORKMANSHIP

SUBMISSIONS, RECORDS AND MONITORING

GRO.W010.9 PARTICULARS OF GROUTING FOR GEOTECHNICAL WORKS

The following particulars of the proposed materials and methods of construction for grouting for geotechnical works shall be submitted for Approval at least 28 days before grouting starts:

1. Details of drilling, grouting and testing equipment;
2. Details of grout mix, including admixtures;
3. Methods of storing, mixing and injecting grout;
4. Methods of drilling, cleaning, capping and sealing grout holes;
5. Methods of grouting, including grouting stages, order of working and re-grouting methods;
6. Methods of controlling surface water, groundwater, grout leakage and ground movement, including methods of containing overflow grout, grout spill, monitoring and instrumentation; and
7. Safety and hazard risk control measures, including bursting of high pressure grout pipes.

GRO.W020.9 RECORDS OF GROUTING FOR GEOTECHNICAL WORKS

1. Keep records of grouting for geotechnical works on the Site. The records shall be available for inspection by the CM at all times. Records shall include the following details:
    a. Hole location and reference number;
    b. Depth of hole;
    c. Type of grout and grout mix proportions;
    d. Volume of grout injected;
    e. Grouting pressures; and
    f. Times and details of any interruptions, leakages and equipment malfunctions.
2. Submit a record of grouting for each hole to the CM within 24 hours after completion of grouting of the hole. The record shall contain the following details:
    a. Hole location and reference number;
    b. Grouting stage numbers and lengths;
    c. Collar level and hole inclination;
    d. Details of grout injections including the information stated in sub-clause (1); and
    e. Details of the grouting procedure, including any stoppages, leaks to other holes, surface leaks and ground movement.
3. Submit a record of the testing for each hole, including test results, to the CM within 24 hours after completion of testing of a hole. Records of Packer tests shall contain the following details:

a. Hole location and reference number;

b. Depth of packer in the hole;

c. Date and time of test;

d. Type of gauge or meter and identifying reference number;

e. Test readings for each 5 minutes period;

f. Calculated test results in Lugeons; and

g. Details of any equipment malfunctions, sudden water losses or blockages, surface leakage or other variations in test procedure.

4. Submit a report of grouting for each part of the Works as shown on the Drawings, including record drawings and logs of holes, to the CM within 7 days after completion and testing of grouting for that part of the Works. The form of records, logs and record drawings shall be as agreed by the CM.

GRO.W030.9 MONITORING OF GROUTING OPERATIONS

1. Where as shown on the Drawings or directed by the CM, install instrumentation to monitor heave, bulging, settlement, lateral movement, deformation or fracturing of the ground or structures due to grouting operations. Keep records of monitoring on the Site and submit a copy of the records to the CM at frequencies as shown on the Drawings or as agreed by the CM;
2. Check the accuracy of the instruments before grouting starts and at regular intervals agreed by the CM.

DRILLING FOR GROUTING FOR GEOTECHNICAL WORKS

GRO.W110.9 DRILLING

1. Drill holes in rock for grouting for geotechnical works using rotary or percussion type drills. The tolerances for the holes shall be as stated in Worksection GIN except that for drillholes of soil nails which shall be as stated in Worksection SLO. Do not use grease and other lubricants in the flushing medium or on the rods, except around the threads at the ends of the rods. Do not use drilling methods which result in drill cuttings causing blockages such that grouting cannot be performed satisfactorily;
2. The set-up for drilling plant and ancillary equipment shall be in such a manner that water, dust, fumes and noise generated in the course of drilling and grouting operation shall be sufficiently diverted, controlled, suppressed and muffled. The flushing medium for drilling shall be clean water or air accompanied by the operation of an effective dust extraction and filtering device as agreed by the CM;
3. The minimum size of hole for grouting in rock shall be 40 mm;
4. Drill holes in soil for grouting for geotechnical works by a method which is suitable to the ground conditions and which is Approved;
5. The location of all underground obstructions and utilities shall be determined by the Contractor before drilling starts and the drilling pattern shall take account of the location of obstructions and utilities;
6. Casings required to prevent the collapse of grout holes shall be as stated in Worksection GIN. Remove casings immediately before or simultaneously with the grouting or sleeve grouting operation in such a manner that the grout hole will not collapse and the injection of grout will not be hindered;

7. Flush clean grout holes with water or compressed air introduced at the bottom of the hole after drilling is complete. Protect the holes with capping pipes or standpipes to prevent subsequent collapse or clogging after flushing;
8. Re-flush grout holes, which have been drilled more than one day before grouting of the hole starts, with water or compressed air immediately before grouting is commenced and remove excess flushing water by air jet. Holes drilled in soft ground or in ground other than rock and in which sleeve grouts are proposed as part of the grouting operation shall be sleeve grouted as soon as practicable after drilling.

GRO.W120.9 INSTALLATION OF STANDPIPES AND CAPPING PIPES

1. Unless otherwise permitted by the CM, cap grout holes after drilling and before grouting. Capping shall be by a suitably sealed grout connection, standpipe, packer or other methods agreed by the CM. The cap shall seal the hole to prevent contamination or clogging of the hole until grouting operations start;
2. Install standpipes, if required, in holes after drilling. The pipe shall be sealed into the hole using cement grout consisting of PC and water in the proportions 1:1 by volume.

GROUTING FOR GEOTECHNICAL WORKS

GRO.W130.9 GROUTING EQUIPMENT

1. Grouting equipment for geotechnical works shall be a type, quantity and size suitable for the grouting required. The equipment shall be kept clean and in good working order;
2. Standby grouting equipment shall be available at all times and shall be capable of being brought into operation immediately in the event of breakdowns during grouting operations;
3. Grouts mixers shall be high-speed colloidal mixers having a rotor speed of the least 1000 r/min and capable of producing a colloidal grout mix. Mixers shall be fitted with a water-volume measuring device for batching purposes;
4. Holding tanks shall be fitted with an agitator to provide continuous agitation of the grout at 100 r/min. The tank shall be fitted with a dipstick to allow continuous measurement of the volume of grout in the tank. A 2.36 mm removable screen shall be provided between the tank and the pump or grout lines;
5. Grout pumps shall be a positive displacement type. Pumps shall be fitted with bypass valves to allow a standby pump to be brought into operation;
6. Working pressure gauges shall be accurate to within 3 % and shall be calibrated against a test gauge before grouting starts and at weekly intervals. A test gauge with accompanying calibration certificates shall be kept on the Site for the purpose of calibrating working gauges. Working gauges shall be numbered and a record shall be kept of gauge number, shift worked, calibration dates and repairs undertaken. Keep records on the Site and make the records available for inspection by the CM at all times;
7. Packers shall be such that they seal holes in rock at the specified level and shall be capable of withstanding the maximum grout or water pressure to be used at the level without leakage. Packers may be of the mechanical or inflatable rubber type. A sufficient number of packers of a size to suit the holes shall be available on the Site.

GRO.W140.9 MIXING GROUT

1. Grout for geotechnical works shall be mixed by volume or batched by mass as agreed by the CM. The mix proportions may be adjusted if Approved depending on the results of the trial grouting, water tests in the hole or the results of previously grouted holes;
2. Mix grout by adding approximately two-thirds of the cement to the water, adding any admixture and adding the remaining one-third of cement. Other mixing procedures shall not be used unless permitted by the CM;
3. The time for which grout shall be mixed in high-speed mixers shall be suitable for the type of mixer used. Grout shall be continuously agitated in a holding tank after mixing and shall be screened before being circulated in the grout lines. Mixed grout shall be continuously circulated in such a manner that grout which is not taken in a hole can be returned to the holding tank;
4. Grout to which a retarding agent has not been added, and which is not used within 30 minutes after mixing, shall not be used for grouting.

GRO.W150.9 PRESSURE GROUTING

1. Grout holes in rock in grouting stages not exceeding 3 m. Grouting may be carried out in either an upstage or a downstage sequence;
2. Grout ground other than rock in such a manner that grout can be injected at various points along the grout hole in a multi-stage operation. The grouting method shall employ perforated pipes with rubber sleeve valves unless otherwise permitted by the CM;
3. Grouting pressures shall initially be 100 kPa per 4-metre depth of hole and shall not exceed the overburden pressure unless permitted by the CM;
4. Grout holes in a continuous operation at the grouting stages and pressures as stated in the Drawings. Unless otherwise permitted by the CM, carry out grouting by injecting the grout under pressure into each grouting stage of the hole until the grouting stage refuses to take further grout;
5. If in the opinion of the CM grouting of any hole or grouting stages has not been completed due to excessive grout-takes, low pressures, excessive leakage or other causes, the hole shall be redrilled or flushed out with water and re-injected with grout.

GRO.W160.9 LOSS OR LEAKAGE OF GROUT

1. If during the grouting of any hole, grout is found to flow from adjacent grout holes in quantities, which in the opinion of the CM are sufficient to interfere seriously with the grouting operation or to cause appreciable loss of grout, the holes shall be temporarily capped. If in the opinion of the CM capping is not essential, ungrouted holes shall be left open to allow air and water to escape;
2. If during the grouting of any hole grout is found to flow from joints in the geological formation at the Site or any other location, the leaks shall be plugged or caulked in a manner agreed by the CM;
3. If during the grouting of any hole the grout-take increases suddenly by a significant amount, inform the CM immediately.

GRO.W170.9 MAKING GOOD HOLES

1. Make good grout holes through concrete using concrete agreed by the CM. The concrete shall be firmly compacted and shall be finished to match the adjacent surface;

2. Top up uncapped holes in rock after grouting using cement grout consisting of PC and water in the proportion 1:1 by volume, or 1:3 cement sand mortar.

TESTING

GENERAL

GRO.T010.9 TRIALS FOR GROUTING

Unless otherwise permitted by the CM, carry out a grouting trial. The extent and depth of holes for grouting trials and the tests to be carried out shall be as stated in the Drawings.

GRO.T020.9 BATCH OF GROUT

1. For GRO.T110 and GRO.T210, a batch of grout for geotechnical works is any quantity of grout used for grouting geotechnical works in one continuous operation in one day;
2. For GRO.T310, a batch of grout for geotechnical works is the quantity of grout as stipulated in Clause 1.2 of CS1:2010.

GRO.T030.9 LABORATORY

Unless otherwise Approved, carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.

TESTING FOR BLEEDING OF GROUT

GRO.T110.9 TEST FOR BLEEDING OF GROUT

1. Testing arrangements:
    a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.
2. Testing samples:
    a. Provide one sample of grout from each batch of grout for geotechnical works to determine the amount of bleeding of the grout;
    b. Provide samples not more than 30 minutes after the grout has been mixed and protect samples from moisture content changes before the tests for determining the amount of bleeding are carried out.
3. Testing methods:
    a. Divide each sample of grout into three specimens. Test each specimen to determine the amount of bleeding;
    b. Test each specimen for bleeding in accordance with ASTM C940-98a;
    c. Complete the bleeding tests immediately prior to each application in a day or as directed by the CM.
4. Non-compliance:
    a. If the result of any test does not comply with the specified requirements for amount of bleeding of grout for geotechnical works:
        i. Submit particulars of proposed changes to the materials, grout mix or methods of production to the CM for approval;

ii. Carry out further grouting trials unless otherwise permitted by the CM.

TESTING FLOW CONE EFFLUX TIME OF GROUT

GRO.T210.9 TEST FOR FLOW CONE EFFLUX TIME OF GROUT

1. Testing arrangements:
   a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.
2. Testing samples:
   a. Provide one sample of grout from each batch of grout for geotechnical works to determine the flow cone efflux time of the grout.
3. Testing methods:
   a. Test each sample to determine the flow cone efflux time in accordance with ASTM C939- / C939M-16a.
4. Non-compliance:
   a. If the result of any test does not comply with the specified requirements for flow cone efflux time:
      i. Submit particulars of proposed changes to the materials, grout mix or methods of production to the CM for approval;
      ii. Carry out further grouting trials unless otherwise permitted by the CM.

TESTING CRUSHING STRENGTH OF GROUT

GRO.T310.9 TEST FOR CRUSHING STRENGTH OF GROUT

1. Testing arrangements:
   a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.
2. Testing samples:
   a. Provide one sample of grout for geotechnical works from every 10 m^3 or 10 batches, whichever is the smaller volume, for geotechnical works to determine the crushing strength of the grout. Provide at least one sample from the grout produced on any one day;
   b. Provide samples not more than one hour after the grout has been mixed and protect samples from moisture content changes before test cubes are made.
3. Testing methods:
   a. Make three 100 mm test cubes from each sample of grout taken, mark the test cubes with suffix A1, A2 and B;
   b. Make, cure and test all test cubes for crushing strength at 28 days in accordance with CS1:2010.
4. Acceptance Criteria:
   a. The crushing strength for all individual test cubes with suffix A1, A2 and B shall have the minimum specified crushing strength; and
   b. The test results of the average crushing strength of test cubes with suffix A1 and A2 shall comply with the acceptance criteria set below:

i. The average strength determined from any group of four consecutive test results shall exceed the specified grout strength by 5 MPa. Where there are only two or three test results available, those results shall be treated as if they were four consecutive test results;

ii. If the difference between the crushing strengths of the test cubes with suffix A1 and A2 exceeds 15% but does not exceed 20% of the test result:

- Do not use the test result for that sample to assess compliance as set out in sub-clause (b) (i) above; and
- Review the sampling and testing procedures and propose for improvement.

iii. If the difference between the crushing strengths of the test cubes with suffix A1 and A2 exceeds 20% of the test result:

- Discard the test result for that sample; and
- Propose investigation for Approval to establish if the grout represented by the sample is acceptable or not.

c. If the test result does not comply with the specified requirements for crushing strength of grout:

i. Submit particulars of proposed changes to the materials, grout mix or methods of production to the CM for approval;

ii. Make further trial mixes and carry out further grouting trials unless otherwise permitted by the CM.

5. Reporting:

Option 1

a. Submit test report for test cubes with suffix A1, A2 and B with a statement signed by SQCC confirming that the material complied with sub-clause 4(a) above;

b. Submit a separate test report for test cubes with suffix A1 and A2 with a statement signed by SQCC confirming that the material complied with sub-clause 4(b) above, together with a statistical analysis according to the acceptance criteria given in Building (Construction) Regulation 59 have been complied with;

Option 2

a. Submit test report for test cubes with suffix A1, A2 and B with a statement signed by QCE confirming that the material complied with sub-clause 4(a) above;

b. Submit a separate test report for test cubes with suffix A1 and A2 with a statement signed by QCE confirming that the material complied with sub-clause 4(b) above, together with a statistical analysis according to the acceptance criteria given in Building (Construction) Regulation 59 have been complied with;

c. All reports must be submitted within 7 days after testing.

PACKER TESTS ON DRILLHOLES FOR GROUTING AND GROUTED DRILLHOLES

GRO.T410.9 TESTING

1. The water loss from drillholes for grouting and from grouted and re-grouted drillholes shall be determined by the Packer test;
2. The number of drillholes for grouting to be tested to determine the water loss shall be as Instructed;
3. Unless otherwise Instructed, test every grouted drillhole and every re-grouted drillhole to determine the water loss;
4. Carry out Packer tests in accordance with BS EN ISO 22282-3:2012 and the following sub-clauses (5) to (8);
5. Tests shall be carried out using clean water, in grouting stages not exceeding 3 m in length. Determine the rate of flow of water in the test to an accuracy of 10 % for flows exceeding 1 L/min;
6. The test pressure shall be equal to the overburden pressure and shall not exceed the specified maximum grouting pressure for the grouting stage being tested;
7. Carry out the test between a packer and the base of the hole for grouting stages at the base of a hole and between two packers in other cases;
8. Carry out the test by pumping water at the specified pressure into the grouting stage being tested and measuring with a volume meter the water loss over three consecutive 10 minutes periods. The results shall be calculated in Lugeons for each 10 minutes period.

GRO.T420.9 COMPLIANCE CRITERIA

The water loss determined by the Packer test in the grouted hole shall not exceed 5 Lugeons when measured over a 10 minute period.

GRO.T430.9 NON-COMPLIANCE OF DRILLHOLES

If the result of any Packer test on drillholes for grouting does not comply with the specified requirements for the test, the drillhole shall be grouted, re-drilled and retested. Grouting, re-drilling and retesting shall continue until the result of the Packer test complies with the specified requirements for the test.

GRO.T440.9 NON-COMPLIANCE OF GROUTED AND REGROUTED DRILLHOLES

If the result of any Packer test on grouted drillholes or regrouted drillholes does not comply with the specified requirements for the test, the grout shall be removed and the drillhole shall be regrouted and retested. Removal of grout, regrouting and retesting shall continue until the result of the Packer test complies with the specified requirements for the test.

GWD GROUND WATER DRAINAGE AND CONTROL

MATERIALS

GENERAL

GWD.M010.9 DEFINITIONS

In this Specification:

1. "Caisson drain" is an excavated vertical shaft, with or without raking drains, to provide drainage by intercepting and lowering the groundwater level in the vicinity;
2. "Geotextile filter" is a permeable sheet of synthetic material used like a granular filter for filtration and in-plane drainage;
3. "Filter pipe" is a perforated or non-perforated pipe used for draining groundwater;
4. "Granular filter" is a graded sand or gravel placed against a soil to prevent the migration of fine particles out of the soil caused by water flow, and graded such that free discharge of water flowing into the filter is allowed. Sand shall be natural sand or crushed natural stone;
5. "Prefabricated band drain" is a synthetic drain which, when installed in a soil strata, acts as a drainage medium for dissipation of pore water pressure;
6. "Raking drain" is a drillhole, with or without perforated filter pipes and geotextile filter sheath, installed generally at an upward inclination for groundwater lowering by gravity flow;
7. "Relief drain" is a synthetic drain installed on slope surfaces or in excavations to divert water seepage before applying sprayed concrete, masonry dentition or other construction;
8. "Trench drain" is a trench wholly or partly filled with granular material or clean crushed rock, with or without filter pipes and geotextile filter.

SUBMISSIONS

GWD.M110.9 PARTICULARS OF GRANULAR FILTERS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for granular filters at least 14 days before deposition of granular filter material starts:

1. Whether granular filter material is to be supplied ready mixed or is to be mixed on the Site;
2. Source of supply, including name of supplier of ready mixed material;
3. Quantity of each constituent if the material is to be mixed on the Site;
4. Construction plant and methods of mixing for material mixed on the Site;
5. Method of storage and location of storage areas on the Site;
6. Methods of deposition and compaction of material;

7. Test report(s) for the granular filters showing compliance of the materials with the requirements of this Specification or as shown on the Drawings;
8. Results of three tests for particle size distribution of the fill material against which the granular filter is to be placed;
9. Details of filter design including calculations and grading envelopes.

GWD.M120.9 PARTICULARS OF GEOTEXTILE FILTER

1. Submit to the CM for approval the following particulars, including certificates, of the proposed materials and methods of construction of geotextile filter at least 28 days before the first delivery of the geotextile filter to the Site:
   a. Manufacturer's name and source of supply;
   b. Details of geotextile filter including manufacturer's literature;
   c. A certificate for the geotextile filter showing the manufacturer's name, the date and place of manufacture and showing that the geotextile filter complies with the requirements, including results of tests, stated in this Specification or shown on the Drawings;
   d. Calculations showing that the geotextile filter complies with the filtration characteristics stated in this Specification or shown on the Drawings;
   e. Details of previous uses of the geotextile filter;
   f. Details of quantities to be supplied in each delivery;
   g. Method of storage;
   h. Methods of cutting and jointing geotextile filter;
   i. Method of repairing small batches; and
   j. Methods of laying and holding in position.
2. Submit certificates for each batch of geotextile filter delivered to the Site.

GWD.M130.9 PARTICULARS OF TRENCH DRAINS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for trench drains at least 14 days before installation of trench drains starts:

1. Source of supply, including name of supplier of the fill material for trench drains;
2. Test report(s) for the fill material for trench drains showing compliance of the materials with the requirements of this Specification or as shown on the Drawings;
3. Method of excavation of trench and installation of geotextile filter;
4. Details of granular fill material as stated in GWD.M360;
5. Details of geotextile filter as stated in GWD.M120.

GWD.M140.9 PARTICULARS OF RAKING DRAINS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for raking drains at least 14 days before installation of raking drains starts:

1. Certificate(s) from the manufacturer and the associated test report(s) for the raking drains showing compliance of the materials with the requirements of this Specification or as shown on the Drawings;
2. Method of connecting adjacent sections of pipes;

3. Proportions of sealant mix;
4. Details of geotextile filter sheath.

GWD.M150.9 PARTICULARS OF RELIEF DRAINS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for relief drains at least 14 days before fixing of relief drains starts:

1. Details of relief drains and outlets; and
2. Method of fixing relief drains to the slope face.

GWD.M160.9 PARTICULARS OF CAISSON DRAINS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for caisson drains at least 14 days before construction of caisson drains starts:

1. Methods of excavation and installation and removal of caisson liners;
2. Method of compaction of fill material;
3. Details of granular filter material as stated in GWD.M110; and
4. Details of geotextile filter as stated in GWD.M120.

GWD.M170.9 PARTICULARS OF PREFABRICATED BAND DRAINS

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for prefabricated band drains at least 28 days before installation of prefabricated band drains starts:

1. Details of type of drain, including manufacturer's literature;
2. A certificate showing the manufacturer's name, the date and place of manufacture and showing that the drains comply with the requirements stated in this Specification or shown on the Drawings;
3. Details of previous installations by the Contractor using similar drains;
4. Method of installation; and
5. Details of installation mandrel, drain anchor, method of penetration and method of recording depth of installation.

GWD.M180.9 PARTICULARS OF FILTER PIPES

Submit to the CM for approval the following particulars of the proposed materials and methods of construction for filter pipes at least 28 days before installation of the filter pipes starts:

1. Details of type of pipes, including manufacturer's literature;
2. A certificate showing the manufacturer's name, the date and place of manufacture and showing that the pipes comply with the requirements stated in this Specification or shown on the Drawings;
3. Details of previous installations by the Contractor using similar pipes; and
4. Method of installation.

GWD.M190.9 PARTICULARS OF GROUNDWATER CONTROL, DRAWDOWN AND MONITORING

Submit to the CM for information the following particulars of the proposed materials and methods of construction for groundwater control, drawdown and monitoring at least 14 days before the relevant work starts:

1. Constructional plant and materials for dewatering;
2. Timing and sequence of dewatering operations;
3. Details of silt traps;
4. Methods of monitoring flow rates and volumes of silt, including monitoring intervals; and
5. Methods and locations for discharging groundwater.

GWD.M200.9 SAMPLES OF MATERIALS

Submit samples of the following proposed materials to the CM for approval of the source and type of each material at the same time as particulars of the material are submitted:

1. Granular filter material;
2. Geotextile filter and two pieces of geotextile filter joined in accordance with the manufacturer's recommendations for each type of joint;
3. Relief drains;
4. Filter pipes;
5. Raking drains;
6. Prefabricated band drains.

FILTER AND DRAINAGE MATERIALS

GWD.M310.9 GRANULAR FILTER MATERIAL

Granular filter material for granular filter, trench drains and caisson drains shall consist of durable, inert, natural material free from clay, organic material and other impurities. Granular filter material shall have the particle size distribution stated in this Specification or shown on the Drawings.

GWD.M320.9 GEOTEXTILE FILTER

Geotextile filter shall be an Approved proprietary type and shall have the properties stated in this Specification or as shown on the Drawings.

GWD.M330.9 FILTER PIPES

1. Filter pipes shall comply with the following:
    a. Precast concrete pipes to BS 5911-1:2002+A2:2010 and BS EN 1916:2002;
    b. Vitrified clay pipes to BS EN 295:2013;
    c. DI pipes to BS EN 545:2006;
    d. Steel pipes to BS EN 10224:2002;
    e. Porous concrete pipes to BS 5911-114:1992;
    f. Perforated concrete pipes to BS 5911-1:2002+A2:2010 and BS EN 1916:2002;

g. Pitch fibre pipes to BS 2760:1973;

h. uPVC pipes to BS EN 1401-1:2009 (Fittings also refer to BS 4660:2000 and BS EN 13598-1:2010) or BS 3506:1969;

i. Corrugated polyethylene tubing to AASHTO M252-18.

2. Class O uPVC pipes shall not be used;

3. The perforations in perforated pipes shall be cleanly cut and shall be uniformly spaced along the length and circumference of the pipe;

4. uPVC plastic pipes shall be jointed by couplers.

GWD.M340.9 RAKING DRAINS

1. Type 0 raking drains shall be unlined raking drains. Drain holes shall be at least 40 mm diameter;

2. Type 1 raking drains shall be single pipe raking drains consisting of a single perforated pipe with a non-perforated invert;

3. Type 2 raking drains shall be single pipe raking drains consisting of a single perforated pipe with a non-perforated invert and enclosed within a geotextile filter sheath;

4. Type 3 raking drains shall be double pipe raking drains consisting of an outer permanent pipe and an inner removable pipe enclosed within a geotextile filter sheath. The outer and inner pipes shall be perforated pipes with a non-perforated invert;

5. Pipes for raking drains shall be perforated pipes with non-perforated invert as Approved. The portion of openings in the perforated pipe shall cover between approximately 50 % and 70 % of the circumference of the pipe. The percentage of opening areas to overall surface area of the pipe shall neither be less than 14 % for 40 mm diameter pipe nor less than 8 % for 65 mm or above diameter pipe. The pipe material shall have the following physical properties or having equivalent functions:

   a. Material: non-metallic;

   b. Minimum tensile strength: 21,300 kN/m^2;

   c. Minimum compressive strength: 22,000 kN/m^2;

   d. Minimum flexural strength: 6,800 kN/m^2.

6. Couplers for filter pipes shall also have non-perforated invert and shall be of similar strength and durability of the pipe materials. The lapped length of coupler and each end of the filter pipes shall be at least 100 mm. The elongation at the pipe connection shall be less than 5 mm under a 45 kg pulling force;

7. Geotextile filter sheaths for raking drains shall be formed of non-woven geotextile filter robust enough to prevent tearing and shall have the following physical properties or materials having equivalent functions or performance as Approved:

   a. Material: non-metallic;

   b. Minimum tensile strength: 17 kN/m;

   c. Apparent opening size: 140 μm;

   d. Coefficient of permeability under 2 kN/m^2: 5 x 10-3 m/s;

   e. Flow rate at 100 mm head under 2 kN/m^2: 195 L/m^{2}s.

8. Tying wires for jointing pipes and stitching filter sheath shall be non-metallic wires of minimum breaking load 400 N or equivalent as Approved.

GWD.M345.9 RELIEF DRAINS

Relief drains shall be drain mats with multi-layer porous fabric wrapped in filter fabric and covered with an impermeable fabric or products having equivalent function or performance as Approved. PVC flanges for connecting relief drains to outlet pipes shall be directed by the CM.

GWD.M350.9 PREFABRICATED BAND DRAINS

1. Prefabricated band drains shall consist of a core and a filter. The drains may be manufactured as a single unit or the filter may be wrapped around the core, and overlapped and sealed to contain the core. The drains shall be made from chemically treated paper, polyethylene, polyester, polyolefine or other synthetic material or combination of such materials;
2. Prefabricated band drains shall be provided with an outer casing or mandrel of rhomboidal or rectangular cross section for use during installation. The drains shall also be provided with an anchor to ensure embedment of the drain during extraction of the mandrel;
3. The strength of the materials in prefabricated band drains shall be such that the drains will withstand all forces resulting from handling and installation;
4. The filter jacket for prefabricated band drains shall be a type which:
    a. Has been previously proved effective under similar soil and pressure conditions;
    b. Is in all cases able to prevent excessive migration of soil particles into the core; and
    c. Has a permeability not less than that of the surrounding soil.
5. Prefabricated band drains shall be able to conform to soil deformation without buckling or crimping of the core.

GWD.M360.9 FILL MATERIAL FOR TRENCH DRAINS

1. Fill material to be used with geotextile filter in trench drains shall be clean crushed rock. Type A and Type B fill material shall have the particle size distributions stated in the following table:

Particle size distribution of fill material for trench drains							
Type of fill material	Percentage by mass passing BS test sieve						
	63 mm	37.5 mm	20 mm	10 mm	3.35 mm	600 μm	63 μm
Type A	-	100	-	45-100	25-80	8-25	0-5
Type B	100	85-100	0-20	0-5	-	-	-

2. Fill material passing a 425 μm BS test sieve shall be non-plastic;
3. The D15 particle size of Type A fill material for use with perforated pipes shall be at least 15 % larger than twice the maximum dimension of the perforations, where D15 is the equivalent sieve size in millimetres, interpolated from the particle size distribution curve, through which 15 % of the fill material would pass.

GWD.M370.9 CAISSON LINERS

Caisson liners shall be concrete tapered rings at least 100 mm thick and not exceeding 1 m deep. The liners shall be constructed with well-compacted concrete of Grade 20/20 or greater.

WORKMANSHIP

DELIVERY, HANDLING AND STORAGE

GWD.W010.9 GRANULAR FILTER MATERIAL

1. Granular filter material shall not be handled or stored in a manner which will result in mixing of the different types and sizes or in segregation, contamination, deterioration or erosion of the material;
2. Place stockpiles of granular filter material on well-drained, prepared areas and shall be separated by dividing walls of sufficient height to keep the different materials separate.

GWD.W020.9 GEOTEXTILE FILTER

1. Deliver geotextile filter in secure wrappings to ensure that the geotextile filter is dry and protected from damage, contamination and exposure to conditions that may adversely affect it;
2. Store geotextile filter on a level surface and shall be kept in a secure and dry condition, which will not result in damage to the fabric or in contamination of the fabric.

GWD.W030.9 FILTER PIPES

Store coils of plastic tubing for filter pipes flat.

GWD.W040.9 PREFABRICATED BAND DRAINS

1. Prefabricated band drains shall be supplied in rolls, securely packed in lightproof wrappings;
2. Store prefabricated band drains in a clean, dry environment.

GRANULAR FILTERS

GWD.W110.9 MIXING

Mix granular filter material thoroughly by the method approved by the CM. Material that has been stockpiled shall be remixed before deposition.

GWD.W120.9 DEPOSITION AND COMPACTION

1. Deposit and compact granular filter material as stated in Worksection EAR1;
2. Deposit granular filter material in a manner which will not result in segregation or contamination of the material;
3. Deposit granular filter material in such a manner that a continuous free draining zone is formed. Clean and scarify the surface of each layer before the next layer is deposited unless otherwise permitted by the CM.

GEOTEXTILE FILTER

GWD.W210.9 EXPOSURE AND DAMAGE REPAIR

1. The total period for which geotextile filter is exposed to daylight or other sources of ultra-violet radiation during handling, delivery, storage and installation shall not exceed 7 days;
2. Do not use geotextile filter that has been damaged or exposed to daylight or other sources of ultra-violet radiation for longer than the period stated in sub-clause (1) above in the permanent work unless permitted by the CM;
3. Repair geotextile filter that has been torn or damaged during installation by using a patch of the same material extending at least 300 mm beyond the edge of the damaged area. Do not carry out repairs on geotextile filter that has been damaged during storage prior to installation.

GWD.W220.9 LAYING

1. Install geotextile filter in such a manner that the individual yarns, webs or layers of the fabric retain their intended orientation and relative positions with respect to each another;
2. Install, cut and joint geotextile in accordance with the manufacturer's recommendations;
3. Laps in sheets of fabric reinforcement, which are not stated in the Drawings to be jointed, shall be at least 300 mm.

GWD.W230.9 PROTECTION

Do not operate construction plant and other vehicles on installed geotextile filter unless in the opinion of the CM that the installed geotextile filter is adequately protected by a cover of fill material or other means agreed by the CM.

GWD.W240.9 RECORDS

Keep records of installation of geotextile filter on the Site and submit a copy of the records to the CM each day. Records shall contain the following details:

1. Identification of structures and sections of work where geotextile filter is installed;
2. Type of geotextile filter, including identification of batch;
3. Date of first exposure of geotextile filter to ultra-violet radiation before installation;
4. Type of joint, amount of overlap, method of holding in place and any repairs to geotextile filter carried out during installation;
5. Date of installation of geotextile filter; and
6. Date of final covering of geotextile filter.

RAKING DRAINS

GWD.W310.9 INSTALLATION

1. The length of raking drains assembled before installation shall not exceed 12.5 m. Connections between adjacent pipes shall be secured in such a manner that the cumulative longitudinal extension of a 12.5 m assembled length of pipe does not exceed 5 mm when pulled by hand;

2. Pipes for Type 2 and Type 3 raking drains are to be wrapped in geotextile filter sheath in the following manner prior to installation in order to ensure that the overlap and stitching shall be at the non-perforated invert of the pipe:
    a. The pipe shall be placed onto and along the centre of a strip of geotextile filter with the non-perforated invert at top;
    b. The strip of geotextile filter shall be of sufficient width to allow an overlap of at least 50 mm, and shall be drawn around the pipe and stitched together tightly with non-metallic wires;
    c. The stitching shall be tied off onto the pipe and the fabric at every 300 mm to prevent dislocation during installation;
    d. The filter sheath shall be marked to ensure that the non-perforated invert is correctly positioned during installation.
3. During delivery and installation of raking drains, take care to ensure that the pipe and geotextile filter sheath are not damaged. Submit the method of installation of raking drains to the CM for approval prior to installation;
4. Before installation of drain pipes, check the drillholes for cleanliness. Whenever any obstruction is encountered inside a drillhole during pipe insertion, withdraw the pipe and clear the obstruction before re-insertion. No jacking or hammering of pipes shall be carried out during the whole process of pipe insertion.

GWD.W320.9 DRILLING

1. Do not use drilling lubricants other than clean air or fresh water for drilling holes for raking drains. Use casings to prevent collapse of the hole and to permit unobstructed insertion of the pipes and geotextile filter sheath;
2. Position the drillhole entry point within the tolerance specified. Deviation in alignment and from straight shall not exceed the tolerance specified. Maintain a positive gradient throughout the complete length of the hole. Measure the inclination of holes by a method agreed by the CM;
3. Drilling and sampling for undisturbed soil samples and rock cores instructed by the CM to be recovered from drillholes shall be as stated in Worksection GIN;
4. Drillholes shall be temporarily plugged or otherwise protected to prevent entry of deleterious material after drilling.

GWD.W330.9 RECORDS

Keep records of drillholes for raking drains on the Site and submit a drillhole log for each drillhole to the CM before installation of the raking drain starts. The borehole log shall contain the following details:

1. Drain reference number;
2. Location, inclination, bearings, diameter and length of hole;
3. Details of drilling progress;
4. Details of water seepage related to drilling progress; and
5. Details of samples taken.

TRENCH DRAINS

GWD.W410.9 EXCAVATION

The width of trench drains:

1. Shall be at least 450 mm;
2. With filter pipes not exceeding 150 mm diameter shall be at least four times the nominal diameter of the pipe;
3. For pipes exceeding 150 mm diameter shall be at least the same as the external diameter of the pipe plus 450 mm.

GWD.W420.9 GEOTEXTILE FILTER SURROUND

Install geotextile filter surround for trench drains as stated in GWD.W220.

GWD.W430.9 BED FOR TRENCH DRAINS

1. Concrete bed for filter pipes in trench drains shall be at least 75 mm thick and shall be Grade 20/20 concrete;
2. Granular bed for filter pipes for trench drains shall have a thickness at least the same as the diameter of the pipe or 150 mm, whichever is greater.

GWD.W440.9 DEPOSITION AND COMPACTION OF FILL MATERIAL

1. Deposit the material for granular bed for trench drains in the trench in layers not exceeding 150 mm thick and for the complete width of the trench. Compact each layer with six passes of a plate vibrator or by other methods agreed by the CM;
2. Deposit and compact fill materials around filter pipes in trench drains as stated in Worksection EAR1. Obtain the permission of the CM before depositing fill material around filter pipes.

RELIEF DRAINS

GWD.W510.9 TRIALS

Construct a trial length of relief drains of at least 2 m.

GWD.W520.9 FIXING

Fix relief drains in position before surface protection or remedial measures are applied. Carry out the fixing in a manner that will not affect the serviceability of the relief drains or outlets. Discharge water collected in relief drains to outlets agreed by the CM.

CAISSON DRAINS

GWD.W610.9 CONSTRUCTION

1. Carry out excavation for caisson drains by manual methods in stages not exceeding 1.0 m depth unless otherwise permitted by the CM. Dewater excavation below the groundwater level so that work may be carried out, as near as may be practicable in the circumstances, in dry conditions. Carry out the dewatering as stated in GWD.W810 and GWD.W820;
2. Unless otherwise permitted by the CM, support the caisson drain shaft at all times during construction using concrete liners. Fill voids between liners and excavated faces with no fines concrete. Install caisson liners for each 1.0 m stage on the same day as that stage is excavated;
3. Remove softened and loose material from the base of the caisson drain immediately before depositing granular filter material in the caisson drain;

4. Remove part or all of the concrete liner adjacent to the granular filter layer before depositing the granular filter material or fill material. Remove debris arising from the concrete liner from the caisson drain;
5. Deposit granular filter material in layers not exceeding 500 mm and compact the granular filter material by methods approved by the CM.

GWD.W620.9 DISCHARGE OF WATER

Discharge water collected in caisson drains to the outlets stated in this Specification or shown on the Drawings.

GWD.W630.9 RECORDS

1. Keep records of caisson drains on the Site and submit a copy of the records to the CM within 14 days after completion of construction of caisson drains. The records shall contain the following details:
   a. Record of work carried out each day; and
   b. Drawings showing the exact locations of caisson drains and the final depths relative to Principal Datum.
2. Keep detailed face logs of caisson drains on the Site and make available for inspection by the CM at all times. The logs shall contain the following information and the format shall be as shown in Figure 10 of 'GEOGUIDE 2: Guide to Site Investigation', GEO:
   a. Details of depths and rate of groundwater seepage;
   b. Details of water levels, including dates and details of fluctuation; and
   c. Four colour prints and one negative for each of the photographs or composite photographs taken during excavation. Each excavation stage shall be photographed using a reference board with maximum dimensions of 300 mm (width) by 450 mm (length). The photographs shall cover all the excavated faces before the placing of caisson liners. Where more than one photograph is required to cover the full excavated depth or length of a face, the overlap between adjacent photographs shall be between 10 % and 20 %. Each photograph shall identify the face of the excavation and shall contain a natural scale and a colour comparison chart placed alongside the excavated face. The minimum size of colour prints shall be 125 mm x 175 mm.

PREFABRICATED BAND DRAINS

GWD.W710.9 INSTALLATION

1. The installed location of prefabricated band drains shall be within 300 mm of the specified location in plan on the ground surface and the drain shall be within 2 % of the installed length to the vertical;
2. Install each prefabricated band drain in one continuous length without joints;
3. The depth of penetration of prefabricated band drains shall be as stated in this Specification or shown on the Drawings. Modify the depth as instructed by the CM during installation based on the resistance of the soil to penetration. Notify the CM immediately of any sudden change in the penetration resistance to the mandrel.

GROUNDWATER CONTROL AND DRAWDOWN

GWD.W810.9 DRAWDOWN OF GROUNDWATER TABLE

Do not draw down the groundwater table to more than 2 m below the earthwork final surface as defined in Worksection EAR1 for excavation.

GWD.W820.9 DEWATERING

1. Carry out dewatering in such a manner that no loss of fines from the ground occurs;
2. Silt traps shall be provided and shall be regularly maintained. All dewatering pumps shall discharge into silt traps;
3. Do not discharge pumped groundwater onto roads, footpaths, kerb channels or adjacent land. Make all arrangements with and obtain the necessary approvals from the relevant authorities for discharging water to drainage systems, watercourses or the sea. Do not start dewatering until the arrangements for disposal of the water have been approved by relevant authorities and implemented. Water entering the Site shall not be discharged into the same silt traps as are used for dewatering;
4. The total capacity of pumps available on the Site for dewatering shall be at least equal to twice the rate of flow measured through the silt traps at any time when the groundwater table is maintained at maximum drawdown;
5. Half of the total pump capacity shall be equipped with a secondary motive power source in addition to the primary motive power. The secondary motive power source shall commence operation automatically in the event of failure of the primary motive power source or an effective alarm system shall be set up which will warn of failure of the primary motive power source. The maximum allowable delay between failure of the primary motive power source and full operation of the secondary motive power source shall not exceed 15 minutes;
6. A full-time attendant shall be available on the Site at all times to execute the changeover if manual operation of equipment is required to bring the secondary motive power into operation;
7. The operation of the changeover of motive power equipment shall be demonstrated to the satisfaction of the CM before the relevant work starts unless otherwise permitted by the CM.

GWD.W830.9 GROUNDWATER RECHARGE

1. If groundwater recharge is to be carried out to maintain the specified groundwater levels at any location, the groundwater recharge system shall have the means to regulate and measure the rate of recharge and to provide an adequate continuous supply of water for recharge. Only clean water shall be used;
2. The capacity of pumps and the power sources which are to be used for groundwater recharge shall be as stated in GWD.W820 (4) except that the rate of flow shall refer to the maximum rate of groundwater recharge required;
3. The groundwater table at any location shall not be raised above the background groundwater table measured before the relevant work starts.

GWD.W840.9 MONITORING

1. Monitor groundwater levels at locations stated in this Specification or shown on the Drawings or as instructed by the CM at all times when groundwater control and drawdown is carried out. Make arrangements for installing instruments and taking measurements both inside and outside the Site;

2. The survey marks for monitoring shall be located in position and level to the Hong Kong standard survey grid and to Principal Datum to within 10 mm in every direction;
3. Monitoring stations and monitoring shall be as stated in Worksection GIN;
4. Groundwater levels shall be measured to an accuracy of 20 mm. Settlements shall be measured to an accuracy of 3 mm;
5. Notify the CM immediately if any incremental settlement reading exceeds 5 mm or if the accumulated settlement exceeds the maximum allowable settlement stated in this Specification or shown on the Drawings.

GWD.W850.9 RECORDS

Keep records of monitoring of settlement, groundwater control and drawdown on the Site and submit a copy of the records to the CM within 24 hours of taking readings.

GWD.W860.9 TOLERANCES

Refer to Appendix H "Schedule of Tolerances" to this Specification.

TESTING

GRANULAR FILTER MATERIAL

GWD.T010.9 GRANULAR FILTER MATERIAL

1. Testing arrangements:
    a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.
2. Testing samples:
    a. A batch of granular filter material is any quantity of granular filter material of the same type and grading delivered to the Site at any one time;
    b. Provide one sample of granular filter material from each 500 m^3 or part thereof of the material delivered to the Site;
    c. Unless otherwise permitted by the CM, provide one sample of granular filter material from each 500 m^3 or part thereof of granular filter material that has been deposited and compacted;
    d. The size of each sample taken as stated in sub-clause (2)(b) above shall be 10 kg. The method of sampling shall be in accordance with CS3:2013;
    e. Samples taken as stated in sub-clause (2)(c) above, shall consist of material excavated from the compacted layer to form a flat bottomed, steep sided hole of approximately 0.13 m^2 to the complete depth of the compacted layer. A template shall be used to fix the edges of the hole if necessary. The sides and bottom of the hole shall be at least 50 mm from other types of fill material.
3. Testing methods:
    a. Test each sample of granular filter material to determine the particle size distribution in accordance with Test Method 8.2 of Geospec 3: Model Specification for Soil Testing, GEO.
4. Non-compliance:
    a. If the result of any test for particle size distribution on a sample of granular filter material taken as stated in sub-clause (2)(b) does not comply with the specified requirements for particle size distribution, provide additional samples from the same batch and carry out additional tests for particle size distribution;
    b. If the result of any test for particle size distribution on a sample of granular filter material taken as stated in sub-clause (2)(c) does not comply with the specified requirements for particle size distribution, provide additional samples from the same batch and carry out additional tests for particle size distribution;
    c. The batch shall be considered as not complying with the specified requirements for particle size distribution if the result of any additional test as stated in sub-clauses (4)(a) or (4)(b) above for particle size distribution does not comply with the specified requirements for particle size distribution.

FILL MATERIAL FOR TRENCH DRAINS

GWD.T110.9 FILL MATERIAL FOR TRENCH DRAINS

1. Testing arrangements:

a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.

2. Testing samples:

   a. A batch of fill material for trench drains is any quantity of fill material for trench drains of the same type delivered to the Site at any one time;

   b. Unless otherwise permitted by the CM, provide one sample of fill material for trench drains from each batch of fill material for trench drains delivered to the Site;

   c. The size of each sample taken as stated in sub-clause (2)(b) above shall be 10 kg. The method of sampling shall be in accordance with CS3:2013.

3. Testing methods:

   a. Test each sample of fill material for trench drains to determine the particle size distribution in accordance with Test Method 8.2 of Geospec 3: Model Specification for Soil Testing, GEO;

   b. Test fill material passing a 425 μm BS test sieve to determine the plasticity index in accordance with Test Method 6.1 of Geospec 3: Model Specification for Soil Testing, GEO.

SLO SLOPE TREATMENT WORKS

MATERIALS

GENERAL INFILLING, BEDDING AND SURFACING MATERIALS ETC

SLO.M010.9 CEMENT MORTAR

1. Cement mortar for in-filling joints in rock faces, for bedding rock for masonry infilling and for surfacing slopes shall consist of Portland cement (PC) and sand in the proportions 1:3 by mass;
2. PC shall comply with BS EN197:2000;
3. Sand shall be natural sand or crushed natural stone complying with BS 1200:1976.

SLO.M020.9 ROCK FOR MASONRY INFILLING

Rock for masonry infilling shall not exceed 300 mm in size and shall be obtained from an Approved source.

SLO.M030.9 SOIL-CEMENT

1. Soil-cement shall consist of PC, sand and inorganic soil in the proportions 1:3:12 by mass unless otherwise stated. The mix proportion of soil-cement is 1:3:40 by mass when it is applied to the top layer (maximum 300 mm thick) or other areas as directed or agreed by the CM;
2. PC shall comply with BS EN197:2000;
3. Sand shall be natural sand or crushed natural stone complying with BS 1200:1976;
4. Inorganic soil shall be free from organic matter and shall contain not more than 30% of soil particles passing a 63 μm BS test sieve;
5. Submit to the CM for approval of the proposed soil-cement the following particulars at least 14 days before the first delivery of the material to the Site:
    a. Source of supply and type of the inorganic soil for the soil-cement;
    b. Test report(s) for the inorganic soil showing compliance of the materials with the requirements of this Specification or as shown on the Drawings.

SLO.M040.9 GROUT FOR GEOTECHNICAL WORKS

As Worksection GRO.

SLO.M070.9 WEEPHOLES

1. Unless otherwise as shown on the Drawings, weepholes shall be 50 mm nominal diameter uPVC pipes;
2. Submit samples of the proposed weepholes to the CM for approval at least 14 days prior to installation.

SPRAYED CONCRETE MATERIALS

SLO.M110.9 CONCRETE

As Worksection CON1.

SLO.M120.9 AGGREGATE

The nominal maximum aggregate size of aggregates for sprayed concrete shall not exceed 10 mm.

SLO.M130.9 REINFORCEMENT

Unless otherwise Approved, fabric reinforcement including A393 and A252 for sprayed concrete shall comply with Worksection CON3 except that the 50 mm x 50 mm x 2.7 mm (wire diameter) hot dip galvanized steel welded mesh shall have tensile strength not less than 275 N/mm^2.

SLO.M140.9 COLOURING

The pigment shall comply with ASTM C979/C979M and shall have the characterization of light fast, lime proof, weather resistance and durable like concrete. The pigment shall also comply with the requirements stipulated in FIN1.M820.

PROTECTIVE SCREEN FOR SLOPE WORKS

SLO.M210.9 PROTECTIVE MESH AND FIXINGS

1. Protective mesh for slopes shall be PVC coated galvanized steel wire woven into a double twisted hexagonal mesh. Each hexagon shall be 80 mm x 60 mm. The steel wire shall be at least 2.2 mm diameter and the PVC coating shall be at least 0.4 mm thick. PVC coating on steel wire shall comply with BS 1722-16:2009 or equivalent. The colour of PVC coating is to be approved by the CM. Wire for protective mesh shall comply with BS 1052:1980 (1999). Galvanized coating on wires shall comply with BS EN 10244-2:2006. The tolerance on the opening of mesh shall comply with BS EN 10223-3:2013;
2. Tying wire for protective mesh shall be 2.2 mm diameter PVC coated galvanized soft annealed steel wire;
3. Bolts for fastening protective mesh to rock or structure shall be galvanized mild steel hooks as shown on the Drawings;
4. Stainless steel anchor bolts and accessories for fastening protective mesh to soil nail heads shall be as shown on the Drawings;
5. Hooks, fixing pins, steel plates and washers for fixing the protective mesh to slope face shall be as shown on the Drawings and shall be galvanized to BS EN ISO 1461:2009;
6. Galvanizing shall comply with BS EN ISO 1461:2009;
7. Submit to the CM for approval of the proposed protective mesh and fixings the following particulars at least 14 days prior to installation:
    a. Samples of the proposed protective mesh and its fixings;
    b. Certificate(s) from the manufacturer and the associated test report(s) showing compliance of the materials with the requirements of this Specification or as shown on the Drawings.

ROCK BOLTS AND GROUT

SLO.M310.9 ROCK BOLTS

1. Rock bolts shall be an Approved proprietary type. Rock bolt shall comply with CS2:2012 and shall be mild steel or high yield deformed steel as shown on the Drawings. The rock bolt reinforcement shall also comply with Worksection CON3;
2. The rated working load of rock bolts shall not exceed 50 % of the ultimate tensile strength. A reduction of 4 mm in the diameter of the bolt shall be taken into account for corrosion when calculating the ultimate tensile strength;
3. Nuts for rock bolts shall be of grade 4 steel and comply with BS 4190:2001. Connectors shall comply with Worksection STW. Bearing plates shall be of grade S275JR steel plate and comply with BS EN 10025-2:2004. Holes in steel plates for rock bolt heads shall be drilled perpendicular to the face of the steel plate and the centre of the hole shall be at a position of within 2 mm from the centroid of the plate. The clearance between the steel bar and the hole of the steel plate shall not be more than 2 mm. All nuts, connectors and bearing plates shall be galvanized to BS EN ISO 1461:2009. Rock bolts shall have non-corrodible centralizers capable of ensuring an even annulus of grout as Approved. Grease shall comply with Table 1 of Geospec 1: Model Specification for Prestressed Ground Anchors, GEO;
4. Rock bolts shall be galvanized in accordance with BS EN ISO 1461:2009.

SLO.M320.9 GROUT FOR ROCK BOLTS

Grout for rock bolts shall be as stated in GRO.M010 to GRO.M110 except that the water cement ratio shall not exceed 0.45. The use of admixtures (e.g. PFA) shall be subject to Approval.

ROCK DOWELS

SLO.M410.9 ROCK DOWELS

1. Rock dowels shall consist of untensioned straight or L-shaped deformed high yield steel or mild steel bars complying with CS2:2012 and Worksection CON3 and shall be galvanized to BS EN ISO 1461:2009;
2. Rock dowels shall have non-corrodible centralizers capable of ensuring an even annulus of grout around the steel bar as Approved;
3. Submit to the CM for approval of the proposed rock dowels the following particulars at least 14 days prior to installation:
   a. Samples of the proposed rock dowels;
   b. Certificate(s) from the manufacturer and the associated test report(s) showing compliance of the materials with the requirements of this Specification or as shown on the Drawings.

SLO.M420.9 GROUT FOR ROCK DOWELS

Grout for rock dowels shall be as stated in GRO.M010 to GRO.M110 except that the water cement ratio shall not exceed 0.45. The use of admixtures (e.g. PFA) shall be subject to Approval.

SOIL NAILS

SLO.M510.9 GENERAL

A soil nail shall consist of a steel bar, cement grout, centralizers, head assembly and all other associated components as shown on the Drawings.

SLO.M520.9 SOIL NAILS

1. Soil nail bars shall be of high yield deformed bars and comply with CS2:2012 and Worksection CON3. Dimensions, mass per metre and permissible deviation of soil nail bars shall refer to Clause 1.4 of CS2:2012. Chemical composition of soil nail bars shall refer to Clause 1.5 of CS2:2012 and mechanical properties shall refer to Clause 1.6 of CS2:2012. Definition of relevant terms such as stocklist, manufacturer, etc. in the clauses in relation to soil nails shall be referred to Clause 1.2 of CS2:2012;
2. Nuts shall be of grade 4 steel and comply with BS 4190:2001;
3. Connectors shall comply with Worksection STW and shall be:
    a. A proprietary type approved by the CM;
    b. For tension joints, a cold swaged or threaded type. The connectors shall be capable of developing the full tensile strength of the parent bar and shall comprise high tensile steel studs and seamless steel tubes fitted with protective plastic caps;
    c. For compression joints, a wedge locking or bolted sleeve type.
4. Bearing plates shall be of grade S275JR steel plate and comply with BS EN 10025-2:2004;
5. Permanent casings shall comply with BS 4019-3:1993;
6. All steel components for soil nails shall be galvanized to BS EN ISO 1461:2009. Materials for repair to hot dip galvanized coating shall comply with BS EN ISO 1461:2009;
7. Soil nails shall have non-corrodible centralizers capable of ensuring an even annulus of grout around the soil nail bars. The nominal diameter of the centralizers shall not differ from the specified diameter of the drillhole by more than 10 mm;
8. Conducting wires for length checking shall be solid wires of specified diameter with insulation;
9. Wires and ties for fixing and anchoring packers, centralizers, grout pipes and conducting wires etc. shall be made of non-corrodible materials;
10. For soil nails using threaded type connectors but without galvanized coating on either the threads inside the connectors or the threads at the ends of soil nail bars, heat-shrinkable sleeve of a proprietary type as approved by the CM shall be used as an alternative to galvanization as a corrosion protection measure to the connections. Any rust on the threads of soil nail bars and connectors shall be thoroughly cleaned before being connected together;
11. Unless otherwise specified by the manufacturer and approved by the CM, the heat-shrinkable sleeve for soil nail bars connectors shall be made of a layer of radiation cross-linked polyethylene and a layer of anti-corrosion mastic sealant material. The properties of polyethylene and mastic sealant materials shall comply with the following requirements:

Property	Test Method	Unit	Acceptance
Properties of polyethylene			
Tensile strength at 23℃ (Cross head speed: 50 mm/min.)	BS EN ISO 527-1:2019	MPa	≥ 17
Ultimate elongation at 23℃ (Cross head speed: 50 mm/min.)	BS EN ISO 527-1:2019	%	≥ 350
Impact brittleness	BS ISO 974:2000	℃	≤ -40
Water absorption at 23℃, 24 hours	BS EN ISO 62:2008	% increase in weight	≤ 0.1
Properties of mastic sealant material			
Corrosion effect	ASTM D2671-13 (Procedure A)		No corrosion
Peel strength to steel at 23℃ (Cross head speed: 100 mm/min.)	DIN 30672	N/cm	≥ 4
Shear strength at 23℃ (Cross head speed: 50 mm/min.)	BS ISO 4587:2003	N/cm²	≥ 10
Softening point	ASTM E28	℃	≥ 70

SLO.M525.9 SOIL NAILS WITH DOUBLE-CORROSION PROTECTION

Materials for soil nails with double-corrosion protection shall comply with SLO.M520 unless otherwise specified in the following sub-clauses:

1. Corrugated sheathing for the double corrosion protection shall be a proprietary type approved by the CM and shall be made of high density thermoplastic materials which shall be homogeneous, thermally stable, chemically inert and resistant to chemical, bacterial and fungal attack. The wall thickness of the sheathing shall be at least 1.0 mm. Plastic sheathing and all associated components shall comply with the requirements as stipulated in Table 2 of Geospec 1: the Model Specification for Prestressed Ground Anchors, GEO;
2. Finished internal and external surfaces of the sheathing shall be smooth, clean and free from flaws, pin-holes, bubbles, cracks and other defects. Sheathing and all associated components shall be used in accordance with the manufacturer's instructions;
3. Sheathing and other plastic protective components shall:
    a. Not contain any substances that will promote corrosion;
    b. Be covered to prevent exposure to ultra-violet light from direct or indirect sunlight;
    c. Be resistant to slip; and
    d. Be capable of withstanding the applied handling stresses, the hydrostatic and grouting pressures.

SLO.M526.9 GROUT FOR SOIL NAILS

Grout for soil nails shall be as stated in GRO.M010 to GRO.M110 except that the water cement ratio shall not exceed 0.45. The use of admixtures (e.g. PFA) shall be subject to Approval.

SLO.M527.9 SOIL-NAIL HEAD

1. Steel reinforcement for soil-nail heads shall be of grade 500 steel and comply with CS2:2012 and Worksection CON3;
2. Concrete for soil-nail heads shall be Grade 30/20 concrete or 30 MPa sprayed concrete and comply with Worksection CON1.

SLO.M540.9 NON-BIODEGRADABLE MATS FOR EROSION CONTROL

1. Non-biodegradable mats for erosion control shall be woven and ultraviolet stabilized mats. The mats shall have the material properties as shown on the Drawings;
2. The mats must be produced by proprietary manufacturers and specifically designed for the erosion control of sloping ground;
3. The colour of the mats shall be black or dark green or other colour as directed or Approved.

SLO.M550.9 BIODEGRADABLE MATS FOR EROSION CONTROL

1. Biodegradable mats for erosion control shall be woven coir mesh mats or woven jute mats. The mats shall have the material properties as shown on the Drawings;
2. The mats must be produced by proprietary manufacturers and specifically designed for the erosion control of sloping ground.

SLO.M560.9 WIRE MESH FOR EROSION CONTROL

1. Wire mesh for erosion control shall comply with SLO.M210 (1);
2. Unless otherwise specified in the Drawings, fix the wire mesh onto the slope surface by means of anchor bolts and/or fixing pins. The fixing pins, steel plates and washers for fixing the wire mesh to slope face shall comply with SLO.M210;
3. Galvanized costing on wires shall comply with BS EN 10244-2:2009. The anchor bolts nuts and washers for fixing the wire mesh to soil nail heads shall be stainless steel complying with Worksection DRA. Submit details of anchor bolts and fixing pins to CM for approval;
4. Anchor bolts and accessories shall have the following properties:
    a. The minimum size of the anchor bolts shall be M8;
    b. The components of the anchor bolts shall include the following:
        i Hexagonal bolt or threaded rod with hexagonal nut;
        ii. Washer with minimum diameter of 20 mm.
    c. The length and diameter of the drillholes and the minimum size and embedment depth of the anchor bolts shall be as shown on the Drawings or otherwise Approved;
    d. The mean ultimate tensile resistance and mean ultimate shear resistance of the anchor bolts shall be 31 kN and 47 kN respectively in non-crack concrete with concrete strength at 30 N/mm².

BUTTRESSES

SLO.M610.9 CONCRETE

Buttresses may be either mass concrete or reinforced concrete as directed by the CM. Concrete for buttresses shall be of Grade 20/20 concrete and shall comply with Worksection CON1 unless otherwise as shown on the Drawings.

SLO.M620.9 REINFORCEMENT

As shown on the Drawings.

SLO.M630.9 DRAINS

Drainage which is required behind buttresses shall consist of relief drains connected to 50 mm diameter uPVC outlet pipes.

ROCK JOINT RELIEF DRAINS

SLO.M710.9 DRAINS

1. The drain must be produced by proprietary manufacturers and specifically designed for use as rock joint relief drain;
2. Submit sample of proposed rock joint relief drains to the CM for approval at least 14 days prior to installation.

BOULDER BARRIER MATERIAL

SLO.M810.9 GABION

The barrier shall consist of mesh gabions or equivalent. The gabion shall be a box-shaped container made of triple-twist hexagonal steel wire mesh strengthened by selvedges of heavier wire and by mesh diaphragms which divide it into 1 m compartments. The steel wire mesh for the gabion shall be 2.7 mm diameter with a plastic coating giving an outer diameter of 3.8 mm. The mesh shall conform to BS EN 10223-3:2013.

SLO.M815.9 FABRICATED SOIL

Fabricated soil shall comply with Worksection EXT12 in respect of the requirements for fabricated soil and consist of a mixture of 3 parts by volume Decomposed Granite and 1 part by volume Soil Conditioner as follows:

1. Decomposed Granite shall consist of evenly textured, granular soil taken from the top 300 mm of land previously supporting vegetation growth. It shall be free from weeds, deleterious matter and stones larger than 50 mm in any dimension;
2. Soil Conditioner shall consist of moist peat; or fully matured animal manure as supplied by Agriculture and Fisheries Department; or equal and approved by the CM. No material shall give off toxic nor obnoxious fumes;
3. Submit information on the source and type of decomposed granite to the CM for approval at least 14 days prior to application.

SUBMISSIONS

SLO.M910.9 PARTICULARS OF ACCESS

Particulars of the proposed means of access for slope treatment works, including access structures and reinstatement, shall be submitted to the CM for approval at least 14 days before the slope treatment works start.

SLO.M920.9 PARTICULARS OF SPRAYED CONCRETE

1. Submit to the CM for approval the following particulars of the proposed materials and methods of construction of sprayed concrete at least 14 days before sprayed concrete is used:
    a. Type and performance of mixing and spraying plant;
    b. Details of water sprays and associated pumps for surface spraying;
    c. Method of curing;
    d. Details of trial panels and test panels;
    e. Methods of measuring surface temperature and moisture content of the soil;
    f. Methods of achieving the specified thickness of sprayed concrete and the specified cover to reinforcement and methods of measuring the thickness and cover after spraying;
    g. Method of fixing reinforcement;
    h. Details of materials and mix design;
    i. Details of dry mix process and/or wet mix process for applying sprayed concrete;
    j. Name and details of the experience of the shotcretors;
    k. Details of working platform;
    l. Method of forming expansion joints; and
    m. Sequence of spraying on slope surfaces.
2. Keep records of sprayed concrete operations on the Site and submit to the CM daily. The records shall contain details of the quantities of all materials used at each location.

SLO.M930.9 PARTICULARS OF ROCK BOLTS

1. Submit to CM for approval on the source and type of rock bolts and a sample of a complete rock bolt at the same time when particulars of rock bolts are submitted;
2. Submit to the CM for approval the following particulars of materials and methods of construction for rock bolts at least 28 days before pull-out trials start and before any rock bolts are installed in the permanent works:
    a. Details of rock bolts, nuts, washers, bearing plates, connectors, sleeves, grease and centralizers;
    b. Methods of tensioning and grouting;
    c. Proposed working loads;
    d. Previous performance records;
    e. Details of equipment for testing rock bolts, including test and calibration certificates;

f. Details of working platform and drilling equipment, including method of drilling and size of drillholes;

g. Details of equipment for Packer tests in drillholes including test and calibration certificates;

h. Grout mix details and grouting equipment.

3. All equipment for testing rock bolts shall be tested and calibrated by laboratories approved by the CM not more than 6 months prior to the date of carrying out the tests.

SLO.M950.9 PARTICULARS OF SOIL NAILS

1. Submit to the CM for approval the following particulars of materials and methods of construction for soil nails at least 28 days before pull out tests commence and before any soil nails are installed in the permanent works:

   a. For soil nail bars, a certificate from the quality assured stocklist and a copy of the manufacturer's certificate/document of the original steel bars in accordance with Clause 4.1 of CS2:2012;

   b. Details of the proposed materials and methods of installation for soil nail bars connectors, including manufacturer's literature;

   c. Details of and assembled component samples comprising of soil nails bars, coupling sleeves, nuts, washers, plates, connectors, centralizers, grout pipes, conducting wires, corrugated sheathing, packers for isolating the bond length and plugs capable of sealing the drillholes and withstanding the pressure head maintained on the grout during grouting;

   d. Details of galvanizer, including name and location of the coating factory, to be employed for galvanizing the steel components and method of making good any damaged galvanized coating. Original certificate from the manufacturer showing the date and place of application of the coating and showing that the galvanized coatings comply with the requirements stated in the Drawings and including results of tests carried out by methods as recommended in BS EN ISO 1461:2009 for thickness of coating. A document prepared by the manufacturing factory for the galvanized soil nail bars with threads and couplers, certifying each batch of steel with certificates from quality assured stocklist, mill and hot dip galvanizer are properly stored, handled, processed and supplied to a purchaser;

   e. Details of heat-shrinkable sleeve for protecting the connections between soil nail bars if galvanized coating to either the threads inside connectors or at the ends of soil nail bars is not applied, together with details of the heat application equipment for shrinking the sleeves; risk assessment for using the heat application equipment and safety measures in connection with the use of the heat application equipment;

   f. Method of repairing damaged heat shrinkable sleeves during heat application or other installation process of soil nails;

   g. Details of corrosion protection for the threaded portion of the steel bar at soil nail head;

   h. Details of working platform;

   i. Details of temporary support to drillholes;

   j. Details of permanent casing;

   k. Method of storing materials;

   l. Method of drilling and details of drilling equipment;

m. Method of assembling soil nail bars;

n. Method of installing soil nail bars into drillholes;

o. Method of grouting and details of grouting equipment;

p. Details of equipment for measuring the volume of grout injected into each drillhole together with the accuracy and method of calibrating the equipment;

q. Details of equipment for testing soil nails, including test and calibration certificates;

r. Details of testing assembly including details of datum for deformation measurement and bearing pad;

s. Method of constructing soil nail-heads;

t. Certificate(s) from the manufacturer and the associated test report(s) of all components for soil nail showing compliance of the materials with the requirements of this Specification or as shown on the Drawings.

SLO.M955.9 PARTICULARS OF MATS FOR EROSION CONTROL

Submit to the CM for approval the following particulars of materials and methods of construction for the mats for erosion control at least 14 days prior to installation:

1. Details and samples of materials;
2. Manufacturer's literature including recommended sequence of mat installation and hydroseeding;
3. Methods of drilling holes, lapping, fixing and anchoring;
4. Method of placing and tamping soil into the mats, if required;
5. Details of equipment; and
6. Certificates from the manufacturer on the compliance of the materials with the requirements as shown on the Drawings.

SLO.M957.9 PARTICULARS OF WIRE MESH FOR EROSION CONTROL

Submit to the CM for approval the following particulars of materials of wire mesh, anchor bolts and methods of construction at least 14 days prior to installation:

1. Details and samples of wire mesh and anchor bolts;
2. Method of drilling holes for the bolts and details of drilling equipment; and
3. Certificates from the manufacturer on the compliance of the materials with the requirements as shown on the Drawings.

SLO.M960.9 DETAILS OF ROCK ANCHORS

1. When required by the CM submit, prior to the commencement of fabrication and installation, details of rock anchors which the Contractor proposes to use in the Works. The details shall include, inter alia, working drawings showing all relevant anchor dimensions, corrosion protection, head details, stages of installation, etc, together with a method statement including all relevant data on installation, grouting, stressing and monitoring procedures. All relevant test certificates and manufacturer's literature shall also be submitted. Do not commence the installation of anchors until the CM has indicated that he has no further comment on these drawings and procedures. The CM's acceptance of the proposals for anchors will be contingent upon their acceptance by the Geotechnical Engineering Office, Civil Engineering Development Department;

2. Maintain detailed comprehensive records of all activities relating to the installation of rock anchors on the Site. Such records shall be compiled on Approved record sheets. Records shall be submitted to the CM for his verification not more than 24 hours after completion of each anchor.

SLO.M970.9 PARTICULARS OF GABIONS

Submit to the CM for approval the following particulars of materials of gabions and the methods of construction at least 14 days prior to installation:

1. Details and samples of materials;
2. Manufacturer's literature including recommended sequence of gabion installation; and
3. Certificates from the manufacturer on the compliance of the materials with the requirements as shown on the Drawings.

SLO.M980.9 METHOD STATEMENT FOR REMOVAL OF UNSTABLE BOULDERS

Submit to the CM for approval a method statement for the removal of unstable boulders, including the safety precautions to be taken, before the commencement of works.

WORKMANSHIP

GENERAL REQUIREMENTS AND PRELIMINARY WORK

SLO.W010.9 SCOPE OF WORK

1. Rock stabilization works on final excavated rock slopes shall include, but shall not be limited to breaking up and removing loose or overhanging rocks, supporting loose rocks with dowels or bolts, providing masonry infill, buttresses or reinforced concrete supports, securing loose areas with sprayed concrete (reinforced with mesh or plain), infilling joints with mortar, removing soft material and backfilling with concrete and providing adequate drainage measures. Typical details of these items are shown on the Drawings;
2. The quantities of various stabilization measures given in the Bill of Quantities are all provisional. A detailed examination of the final rock slope may result in significant variation in the actual quantity of work required. The Contractor shall be deemed to have made allowance in his rates for this variation in quantities;
3. Blasting is not permitted for the works unless Approved;
4. If, in the CM's opinion, the rock stabilization works are required principally as a result of the Contractor's standard of workmanship (for example poorly aligned presplit drillholes) the Contractor shall bear the cost of such stabilization measures as are required by the CM;
5. The CM will inform the Contractor of the extent and nature of rock stabilization work required for any slope, or portion of slope, within two weeks of access being provided to that slope or portion of slope. The CM will also inform the Contractor which of these items, if any, he considers to be necessary as a result of the Contractor's standard of workmanship;
6. For rock slopes with multiple benches, rock stabilization works shall be installed progressively as the benches are excavated. Blasting of each lower bench shall not be carried out unless the upper bench has been inspected by the CM and the Instructed stabilization measures installed to the CM's satisfaction.

SLO.W020.9 ACCESS TO SLOPES

1. Means of access consisting of scaffolding constructed of sound bamboo, metal or other materials agreed by the CM shall be installed to enable the CM to examine slope treatment works. The scaffolding shall allow access to within 0.8 m of the slope face. Hand and foot holds for climbing shall be provided by bamboo or metal members at centres not exceeding 0.5 m vertically and 0.8 m horizontally;
2. Where the slope stabilization details include the removal of rock from the slope or other materials the CM may wish to carry out an additional inspection of that area of the slope from which rock or other materials have been removed. If required by the CM, re-erect or repair the access to enable such additional inspection to take place;
3. Install a system of safety ropes on the scaffolding. Safety ropes shall be 12 mm diameter and shall have a breaking force of at least 18 kN. The system of safety ropes shall consist of:
    a. Vertical ropes at not more than 3 m centres horizontally securely anchored to the crest of the slope; and

b. Horizontal ropes at not more than 3 m centres vertically.

The system of safety ropes shall be constructed in such a manner that the ropes are tied at not more than 3 m spacings in both directions to form a net.

4. Provide scaffolding for CM to carry out inspection to the slope. Do not use the scaffolding for carrying out site operations without the permission of the CM;
5. Where rock slope works are included in the Contract, allow sufficient time in the programme for the CM to inspect the rock slope, check the stability, design slope treatment works and determine the extent of works required, taking into account of any specified time stated in the Contract that the CM may require for inspection and design of slope treatment works;
6. Additional payment for repairing or re-erecting access for the purpose of inspection in accordance with sub-clause (2) shall not be made. The rate to provide and maintain access shall be deemed to include the cost of complying with this sub-clause.

SLO.W030.9 PROTECTION FENCES AND BARRIERS

1. Construct protection fences and barriers for slope treatment works as shown on the Drawings before slope treatment works start;
2. Repair damaged protection fences and barriers immediately. Obtain CM's permission before protection fences and barriers are dismantled.

SLO.W040.9 PREPARATION FOR SLOPE TREATMENT WORKS

1. Clear vegetation and remove existing impermeable surfaces and topsoil from existing soil slopes before slope treatment works start;
2. Trim and scarify surface of slopes before slope treatment works start. On completion of trimming and scarifying, remove any loose materials from the surface of slopes by means of water jet coupled with compressed air for rock slopes or other hard surfaces and by means of air jet for soil slopes, unless otherwise directed by the CM;
3. Clean rock faces and joints, and the surface and joints of retaining walls of moss, vegetation and loose material, immediately before slope treatment works start. Remove surplus water by an air jet. Divert water flowing from or across the rock face by relief drains or by other methods agreed by the CM before the application of impermeable surfaces;
4. Reinstate any slope surface that has been stripped for inspection by the CM without any further slope work to its original condition.

BOULDER STABILISATION, REMOVAL AND CONSTRUCTION OF BOULDER BARRIERS

SLO.W110.9 GENERAL

1. Where shown on the Drawings or as directed by the CM, carry out boulder stabilization/removal works. Carry out the boulder stabilization/removal works in such a manner as to prevent damage to other parts of the ground surface, slope drainage channels or pipes, road surfaces, fencing and any other temporary or permanent features;
2. Take all necessary precautions to ensure public safety within the area of boulder stabilization/removal works to prevent fires, and to avoid erosion or the slippage or wash of loose materials within, or into areas beyond, the limits of the Site;

3. On the completion of the works the area shall be left clean and tidy. Reinstate all works areas, including backfilling of any excavations, re-establishing vegetation by hydroseeding or planting, making good of any erosion and damage to roads, tracks or paths to the satisfaction of the CM.

SLO.W120.9 REMOVAL OF BOULDERS

1. Where directed by the CM, remove boulders from slopes by means of line drilling, expansive grouts, rock breakers or other methods agreed by the CM. For the purpose of this clause, a boulder to be removed from rock slopes shall qualify as "boulder" only if it exceeds 0.2 m^3 in volume before excavation and it cannot be removed without the use of powered mechanical equipment;
2. Under no circumstances will blasting be permitted. Take all materials removed off the slope and clean the slope surface. Devoid of any loose fragments;
3. Carry out such removal so as to prevent boulders, rock fragments or other materials from falling down the slope. The broken up boulders, rock fragments or other materials from boulder removal shall not be allowed to remain or be scattered on the slope. Removal shall also be carried out in such a manner as to prevent damage to other parts of the ground surface, slope drainage channels or pipes, road surfaces, fencing and any other temporary or permanent features.

SLO.W130.9 CONSTRUCTION OF BOULDER BARRIERS

1. Where shown on the Drawings or as directed by the CM, construct boulder barriers as protection against potentially hazardous boulders or rock falls. Conduct a joint initial record survey to determine the actual barrier location for agreement before construction. Details of boulder barriers shall be issued within 2 weeks after the survey. Vegetation clearance at the tentative barrier location is to be completed to the satisfaction of the CM prior to the survey;
2. Excavate the foundation for the barrier in accordance with Worksection EAR1 and to depths as directed by the CM;
3. Construct drainage pipes, headwalls, baffle blocks and watercourse paving associated with the boulder barrier in accordance with the Drawings to intercept water and to carry the water flow through the pipes under boulder barriers;
4. The barrier shall consist of mesh gabions or equivalent in accordance with SLO.M810. Join the gabions securely by looping binding wire through the mesh and twisting it together. The binding wire shall be coated with PVC. The strength of connections shall be not less than the strength of the steel wire mesh. Sprayed concrete shall be applied on the gabions surface for fire protection if required by the CM;
5. Where shown on the Drawings or as directed by the CM, place additional steel wire mesh on the face of the gabions. The wire mesh sheeting shall be fastened to the gabions by binding wire;
6. Fill the gabions to one-third height with hard durable stones of sizes between 125 mm to 200 mm. The stones shall be adequately hand-packed to ensure that it is tightly packed and has minimum voids. Horizontal bracing wires with plastic coating shall be fixed in the gabions directly above the level of the stone to keep the face of the gabion even and free from bulging. Continue filling and repeat the process until the stones reach to the top level of the gabion;

7. Where shown on the Drawings or as directed by the CM, place a layer of galvanized steel wire mesh with openings less than 1.5 mm at one-third height of the gabions. Fill and compact stones until they reach the top level of the gabion. Fill all voids within the rockfill above the mesh with fabricated soil as specified in SLO.M815. The top surface of the barrier shall be hydroseeded or planted as directed by the CM.

ROCK SLOPE TREATMENT WORKS

SLO.W210.9 SCALING AND TRIMMING OF ROCK SLOPES

1. Carry out rock scaling on areas as directed by the CM. Rock scaling shall include the removal of all loose blocks of any size using hand tools, or boulders not exceeding 0.2 m^3 in volume using powered mechanical equipment;
2. Carry out scaling and trimming of rock slopes in such a manner that soil and rock is removed from the slope face without affecting the stability and integrity of the slope;
3. Take measures to prevent uncontrolled falls of debris arising from scaling and trimming works. Carry out scaling and trimming of rock slopes using hand-held tools;
4. Remove all material excavated by scaling and trimming and loose fragments of soil and rock off the slope;
5. Clean rock faces using a water jet coupled to compressed air after scaling and trimming is complete.

SLO.W220.9 ROCK SPLITTING

Carry out rock splitting using percussive hammers, drills, hydraulic splitters, chemical expanding agents, hand-tools or other methods agreed by the CM.

SLO.W230.9 SEALING AND INFILLING OF ROCK JOINTS

Seal joints in rock faces with Grade 20/20 concrete, cement mortar or masonry as shown on the Drawings or directed by the CM. Rock for masonry infilling shall be bedded in cement mortar. Where shown on the Drawings or as Instructed, install relief drains before rock joints are sealed or infilled.

SLO.W240.9 CONCRETE BUTTRESSES

1. General requirements:
    a. Where directed by the CM, construct buttresses to support rock or rock faces at the locations and to the dimensions as directed by the CM and in accordance with the details shown on the Drawings;
    b. Construction of buttresses may incorporate some or all of the following activities and features: scaling of loose rock, trimming, installation of rock dowels, rock bolts, no-fines concrete, sandbag filters, raking drains, drainage holes and channels;
    c. At each buttress location, scale off loose blocks and trim the slope to lines and levels as directed by the CM. For buttresses located at the base of the slope, trim and excavate the bottom area to an Approved alignment;
    d. Unless otherwise specified, form all exposed concrete faces in accordance with Worksection CON1;
    e. Construct drainage behind buttresses as SLO.W260 with a gradient of at least 1 in 50. Fix the uPVC pipes securely to the formwork before concreting starts.

2. Special requirements for concrete buttressing to unstable rock:

   a. Where shown on the Drawings or directed by the CM, construct buttresses to support a boulder, groups of boulders or other rock masses;

   b. Excavate the foundation for the buttress in accordance with Worksection EAR1 to depths directed by the CM. Do not place any formwork until the CM is satisfied that a suitable founding level has been achieved;

   c. The buttress shall be anchored by 32 mm diameter rock dowels embedded 500 mm into the ground and projected at least 300 mm into the buttress, or as shown on the Drawings or as directed by the CM;

   d. Prior to concreting, scarify the rock surface thoroughly;

   e. Where shown on the Drawings or as directed by the CM, construct drains to intercept water and to carry it past the boulder, groups of boulders, rock masses or the strata influencing their stability.

SLO.W250.9 CONSTRUCTION OF REINFORCED CONCRETE PADS

Reinforced concrete pads may be used in conjunction with one or more rock bolts. Dimensions of the pads and details of the reinforcement required shall be given to the Contractor within two weeks of access being provided for the CM's examination of the rock slope. Where possible the shape of the concrete pads will be chosen so that support during construction can be provided by natural irregularities in the rock slope. Where such irregularities do not exist, the Contractor may, where Approved, install dowel bars to provide temporary support.

SLO.W260.9 DRAINAGE HOLES IN BUTTRESSES AND PADS

1. Where ordered by the CM, 50 mm diameter uPVC pipes shall be built into buttresses or reinforced concrete pads to act as drainage holes. The buried end of the pipe shall be mortared in place on a joint or fissure and the exposed end fixed firmly to the formwork before concreting commences;

2. Where directed by the CM, a pocket of coarse filter material or no-fines concrete shall be placed at the buried end of the pipe.

SOIL-CEMENT FILL

SLO.W310.9 MIXING SOIL-CEMENT

Mix soil-cement thoroughly in a concrete mixer. Small quantities of soil-cement shall not be hand mixed unless permitted by the CM. The method of mixing soil-cement shall be agreed by the CM.

SLO.W320.9 DEPOSITION AND COMPACTION OF SOIL-CEMENT FILL

1. Deposit soil-cement fill in its final position and compact within 30 minutes after the cement has been added to the mix;

2. Compact soil-cement fill in accordance with Worksection EAR1 to obtain a relative compaction of at least 95 % throughout. Soil-cement fill shall be at optimum moisture content during compaction. The tolerance on the optimum moisture content percentage shall be ± 3.

SPRAYED CONCRETE

SLO.W410.9 RECORD

Before sprayed concrete is applied to any slope, keep records of the slope in terms of photographs/mapping, format of which shall be as agreed with the CM.

SLO.W420.9 MIX DESIGN AND PROCESS

Before sprayed concrete is used, submit the mix design to the CM for approval. Where required by the CM, construct trial panels for different types of spraying equipments or different shotcretors. Make test panels to establish the suitability of sprayed concrete mix, spraying equipment and shotcretors and test in accordance with SLO.T110.

SLO.W430.9 TRIAL PANEL

1. Construct a trial panel at least 50 mm thick and at least 3 m x 3 m in area for sprayed concrete on the surface to be treated. The average percentage rebound shall be estimated for each trial panel and shall be used in the calculations of the cement content of the applied concrete. Cores shall be taken and tested in accordance with the requirements of the testing section in this Worksection;
2. Trial panel for coloured sprayed concrete:
    a. Carry out a trial panel for coloured sprayed concrete of an area not less than 2 m x 2 m at least 2 months before any permanent coloured sprayed concrete is to be constructed;
    b. The trial panel shall be used to demonstrate the methods and the finishes of the proposed coloured spayed concrete construction;
    c. Should the panel not present the required finishes, carry out further trial panels until acceptable finishes are produced. No permanent coloured sprayed concrete construction shall be allowed until the trial panel is Approved.

SLO.W440.9 PREPARATION OF SLOPE SURFACES

1. Remove weak material along joints or seams in slope surfaces to which sprayed concrete will be applied to a depth equal to the width of the weak zone;
2. If the soil surface temperature exceeds 25℃ or the moisture content is less than 10 %, water the surface to be sprayed using sprays unless otherwise Instructed. Hoses without sprays shall not be used. Spraying of water onto the slope surface shall be carried out not more than 1 hour before spraying of concrete starts;
3. Before sprayed concrete is applied, protect all tree trunks, railings, channels, utilities, pipes, structures, street furniture or other facilities adjacent to or within the sprayed concrete area from being contaminated by sprayed concrete or rebound particles with an Approved means. Clean and make good all contaminated surfaces to the satisfaction of the CM.

SLO.W450.9 FIXING REINFORCEMENT

Fix and lay fabric reinforcement for sprayed concrete securely to the slope by steel nails or rawl bolts, or as shown on the Drawings, without sharp bends or creases. The cover to the reinforcement shall be at least 20 mm and laps between adjacent sheets shall be at least 150 mm, or as shown on the Drawings. Place the fabric reinforcement centrally in the sprayed concrete. The fabric reinforcement shall be supported clear of the ground and away from any surface irregularities with adequate numbers of cover blocks.

SLO.W455.9 WEEPHOLES, STUD DRAINS AND JOINTS IN SPRAYED CONCRETE

1. Construct 50 mm diameter weepholes as follows:
   a. On slope surfaces at 1.5 m staggered centres in each direction; and
   b. On rock faces, on rock joints and at locations/spacings as directed by the CM.
2. Extend all weepholes through the full thickness of the sprayed concrete and lay with an outward inclination of 1 in 10;
3. When directed by the CM, form stub drains and rock joint relief drains as shown on the Drawings. Stub drains shall be formed with perforated uPVC pipes installed in 75 mm diameter drillholes of 500 mm minimum length. The spacing of the drains shall be as directed by the CM;
4. On soil slopes, construct expansion joints in sprayed concrete in line with the expansion joint s of adjacent channels, berm slabs and concrete structures etc, or at 15 m intervals maximum in case there is no channels, berm slabs or concrete structures;
5. Construction joints in sprayed concrete shall comply with Worksection CON1.

SLO.W460.9 EQUIPMENT FOR SPRAYING CONCRETE

1. Sprayed concrete shall be applied using the dry process in which water and admixtures shall be added at the nozzle. Alternatively, sprayed concrete shall be applied using wet process in which wet ready-mixed concrete shall be supplied at the nozzle;
2. Equipment for dry-mix process shall be capable of projecting a mixture of cement, fine and coarse aggregate and water at high velocity on to the surface of the slope to produce a dense homogeneous cover. The equipment shall be fitted with weight-batching facilities;
3. Equipment for wet-mix process shall be capable of projecting a mixture of wet ready-mixed concrete at high velocity on to the surface of the slope to produce a dense homogeneous cover;
4. Only skilled operators experienced in the use of sprayed concrete shall be employed as shotcretors. Submit the names and details of the experience of the shotcretors who will be employed on the Works for Approval at least 14 days before sprayed concrete works start.

SLO.W470.9 SPRAYING CONCRETE

1. Measure the surface temperature and moisture content of the soil and submit the results to the CM immediately before sprayed concrete is applied;
2. For dry-mix process, the aggregates and sand for sprayed concrete shall be kept dry before mixing. Sand shall be natural sand or crushed natural stone. The water shall be added at the nozzle at the instant of application. The air and water supply, the rate of application and all other factors affecting the quality of the work shall be adjusted to produce dense concrete with no sloughing. For wet-mix process, the ready-mixed concrete shall comply with Worksection CON1 unless otherwise Approved. For both the dry-mix process and wet-mix process, rebound material shall not be reused and shall be removed within 8 hours after spraying;
3. Apply sprayed concrete in layers not exceeding 50 mm thick to the total thickness as shown on the Drawings or as directed by the CM. Sprayed concrete shall be applied perpendicular to the surface to be sprayed and the nozzle shall not be positioned farther than 1.5 m from the surface during spraying. Submit details of the methodology to be used to achieve the required thickness. The maximum panel dimension shall not exceed 15 m^2;

4. Colour pigment approved by the CM shall be mixed thoroughly with the sprayed concrete mix. A layer of 25 mm thick of coloured sprayed concrete shall be applied to form the total thickness of sprayed concrete as shown on the Drawings;
5. Submit details of colour pigments including specification and colour samples and the method statement to the CM for approval prior to application. Colour to be employed shall be directed by the CM.

SLO.W490.9 CURING SPRAYED CONCRETE

Cure sprayed concrete for at least 4 days after application by one of the following:

1. Applying a liquid curing compound to the sprayed concrete surface by a low-pressure spray until a continuous visible covering is achieved. The application rate shall be applied as recommended by the manufacturer. For textured surfaces and fluted surfaces, the application rate shall be adjusted to ensure that full covering is achieved. Covering the adjoining reinforcement or formwork shall be avoided; or
2. Covering the sprayed concrete surface with hessian, sacking, canvas or other absorbent material as agreed by the CM or with a layer of fine aggregate at least 25 mm thick. The hessian, sacking, canvas, absorbent material or fine aggregates shall be kept constantly wet; or
3. Covering the sprayed concrete surface with polyethylene sheeting. Sprayed concrete surfaces which have become dry shall be thoroughly wetted before the sheeting is placed.

SLO.W500.9 INSPECTION OF SPRAYED CONCRETE

1. Completed areas of sprayed concrete shall be sounded using a wooden mallet;
2. Take cores of 75 mm diameter from the completed sprayed concrete area at the rate of 1 no. per every 150 m^2 of sprayed surface or part thereof at locations determined by the CM for checking the quality and thickness of the sprayed concrete as well as cover to reinforcement;
3. Whenever any defect is found or the test result of any of the concrete cores from test panels as detailed in SLO.T110 does not comply with specified requirements, carry out further investigation to locate the extent of the defect;
4. Remove and re-spray areas which in the opinion of the CM are substandard or hollow;
5. Reinstate the surface with core holes with cement mortar of colour matching the adjacent surface.

SLO.W510.9 RECORDS OF SPRAYED CONCRETE

Keep records of sprayed concrete operations on Site and submit them to CM daily. The records shall contain details of the quantities of all materials used at each location. The records could be either a hard copy or soft copy as agreed by the CM.

PROTECTIVE MESH FOR SLOPES

SLO.W750.9 FIXING PROTECTIVE MESH

1. Unless otherwise shown on the Drawings, orientate, lace, suspend down and fix protective mesh onto the slope face with dowels or steel hooks at intervals not exceeding 3 m;
2. The diameter of the drillholes for dowels or steel hooks shall be at least 20 mm larger than the diameter of the dowels or steel hooks;

3. The method of drilling and cleaning of drillholes shall be as stated in sub-clauses (1) and (2) of SLO.W830;
4. Position the last column and row of dowels or steel hooks fixing the edge and base of the protective mesh at not more than 300 mm from the respective edges/base of the mesh;
5. Laps in mesh sheets in vertical direction shall be avoided as far as possible. Where necessary, the laps shall be at least 300 mm minimum wide and lapping sheets shall be laced with 2.2 mm nominal diameter galvanized and PVC-coated binding wire at the centre of the lap in the same way as adjacent vertical sheets.

INSTALLATION OF ROCK BOLTS

SLO.W810.9 GENERAL

1. Where directed by the CM, install rock bolts to support large blocks or boulders, to reinforce masses of unstable jointed rock, or, in conjunction with reinforced concrete pads and beams, or steel support, to support zones of loose fragmented rock or rock masses resting on weak seams, as shown on the Drawings;
2. Provide and install all flat washers, tapered washers, steel bearing plates, and cement mortar patching, to ensure uniform bearing of the rock bolt on the surface of the rock, concrete pad, beam, or support, as shown on the Drawings and as directed by the CM;
3. The permission of the CM shall be obtained before installation of rock bolts starts.

SLO.W820.9 STORAGE AND PROTECTION OF ROCK BOLTS

The rock bolts shall be stored in clean dry conditions, and at the time of installation shall be undamaged, straight and free from rust, pitting, grease or other deleterious matter.

SLO.W830.9 DRILLING AND PREPARING ROCK BOLT HOLES

1. Drill holes for rock bolts at the locations as Instructed. The diameter of the hole shall be at least 20 mm larger than the diameter of the rock bolt or the outer diameter of the connectors, if used, whichever is larger. The method of drilling shall be rotary or rotary percussive with water flush or air flush accompanied by the operation of an effective dust extraction and filtering device. Holes shall be drilled to provide 50 mm cover to the end of bolts for which cement grout is used to form the bond length;
2. Flush holes for rock bolts with clean fresh water before rock bolt installation starts and until the return water runs clear. Blow out standing water from the hole using compressed air after flushing. Seal hole to prevent ingress of foreign matter;
3. Test holes for rock bolts by the Packer test as stated in SLO.T220 and submit the test results to the CM for approval before commencing the installation of the rock bolts.

SLO.W840.9 FIXING ROCK BOLTS

1. The location, direction, inclination, length and diameter of each rock bolt drillhole shall be in accordance with the Drawings or as directed by the CM;
2. Obtain CM's permission before commencing the installation of the rock bolts;

3. All rock bolts shall first be fixed centrally in the drillhole by permanent centralizers or other Approved means to prevent displacement of the bolt during injection and setting of grout. When Instructed, provide double corrosion protection of approved type to rock bolts. All bolts (other than trial bolts for load testing) shall be finally grouted within 8 hours of being tensioned to their installed working load;
4. Install rock bolts in accordance with the manufacturer's recommendations;
5. Rock bolts shall be fully grouted after stressing. Heat-shrinkage plastic sleeves approved by the CM shall be provided to the free length of rock bolts;
6. Installation of rock bolts, including grouting of the free length and installation of head protection, shall be completed as soon as practicable and not more than 14 days after completion of the drillhole;
7. Rock bolt with a grouted anchorage shall not be stressed until the grout crushing strength has attained a value of 21 MPa when tested in accordance with Worksection GRO;
8. Where as shown on the Drawings or as Instructed, cover all rock bolts determined as permanent by the CM by concrete of Grade 20/20 which shall be 250 mm square in size and of 150 mm minimum thickness. A unique identification number shall be marked on the concrete surface. Temporary rock bolts shall have their unique identification numbers marked on a concrete pad of 150 mm square in size and of 30 mm minimum thickness. Depth of marking of all rock bolts shall not be less than 5 mm.

SLO.W850.9 GROUTING ROCK BOLTS

1. Grouting for rock bolts shall be in accordance with Worksection GRO except as stated in sub-clauses (2) and (3) below;
2. Grout shall be introduced at the lower end of drillholes with downward inclinations and shall displace all air and water through the top of the drillhole;
3. Packers and return ducts which maintain a head on the grout until the grout has set shall be used for drillholes with upward inclinations or with inadequate downward inclinations. The packers and ducts shall be such that separate grouting of the anchorage zone and free-length zone of the drillhole can be carried out. The head to be maintained on the grout shall be as Approved.

SLO.W860.9 PROVING ROCK BOLTS

Each installed rock bolt shall be proved as stated in SLO.T230. Rock bolts shall be locked off at 1.1 times the working load after proving. The complete bolt head assembly shall be encased by a concrete block after locking off.

SLO.W870.9 RECORDS OF ROCK BOLTS

1. Keep records of installation of each rock bolts on the Site and submit a copy to the CM not more than 7 days after each installation operation. The records could be either a hard copy or soft copy as agreed by the CM. The hard-copy report shall use re-cycled papers and double side printed. The soft copy shall be in read-only format. Format and content of the records shall be as Approved;
2. The records shall contain the following information:
    a. Rock bolt location and identification number;
    b. Drilling details, including:
        i. Date and time drilling started and finished;
        ii. Machine and operator identification;

iii. Location, level, inclination, bearing, length and diameter of drillhole;

iv. Rate of penetration at 0.5 m intervals.

c. Water tightness of drillhole, including:

i. Date and time water test started and finished;

ii. Details of any pre-grouting and redrilling;

iii. Length of test zone;

iv. Water pressure applied;

v. Duration of test;

vi. Measured water absorption rate.

d. Details of steel bolts, including:

i. Type and diameter;

ii. Bond length;

iii. Overall length;

iv. Number and type of centralizers;

v. Stressing record and lock-off load; and

vi. Details of Manufacturer and supplier.

e. Corrosion protection details;

f. Test details and results;

g. Details of grouting, including:

i. Date and time grouting started and finished;

ii. Details of any packers used and length of grouted zones;

iii. Head maintained on grout during setting;

iv. Volume of grout accepted;

v. Identification marks of grout cubes.

INSTALLATION OF ROCK DOWELS

SLO.W910.9 GENERAL

Obtain CM's permission before commencing the installation of the rock dowels.

SLO.W920.9 STORAGE AND PROTECTION OF DOWELS

The bars shall be stored in clean dry conditions and at the time of installation shall be undamaged and free from rust, pitting, grease, or any other deleterious matter.

SLO.W930.9 DRILLING AND PREPARATION OF ROCK DOWEL HOLES

The drilling and preparation of holes for rock dowels shall be as stated in sub-clauses (1) and (2) of SLO.W830.

SLO.W940.9 FIXING ROCK DOWELS

1. The location, length, direction, inclination and diameter of each dowel shall be as directed by the CM;
2. The bar shall be fixed centrally in the drillhole by permanent centralizers or other Approved means which will prevent displacement of the bar during injection and setting of the grout.

SLO.W950.9 GROUTING ROCK DOWELS

1. Grouting for rock dowels shall be in accordance with Worksection GRO except as stated in sub-clause (2) below;
2. Rock dowels shall be grouted over the complete length of the drillhole in which the dowel is installed. Centralizers shall be fitted to rock dowels before grouting to ensure an even annulus of grout. No jacking or hammering of the dowels shall be carried out during the whole process of insertion of dowels into drillholes. Grout shall be introduced at the lower end of drillholes with downward inclinations and shall displace all air and water through the top of the drillhole.

SLO.W960.9 RECORDS OF ROCK DOWELS

Keep records of installation of each rock dowels on the Site and submit a copy to the CM not more than 7 days after each installation operation. The records could be either a hard copy or soft copy as agreed by the CM. The hard-copy report shall use re-cycled papers and double side printed. The soft copy shall be in read-only format. Format and content of the records shall be as Approved. The records shall contain details of the reference number, date of installation, location, length, inclination and level of each rock dowel installed.

INSTALLATION OF ROCK ANCHORS

SLO.W1010.9 DESIGN, INSTALLATION AND TESTING

Design, install, test and subsequently monitor rock anchors to comply with all the requirements in Geospec 1: Model Specification for Prestressed Ground Anchors, GEO.

INSTALLATION OF SOIL NAILS

SLO.W1110.9 GENERAL

1. The dimensions of soil nail heads and the orientation of soil nails shall be as shown on the Drawings or as directed by the CM;
2. The diameter of drillholes shall be the minimum diameter as specified. The grout cover to the lower end of soil nail bar shall be at least 50 mm;
3. Holes in steel plates for soil nail heads shall be drilled perpendicularly to the face of the steel plate and the centre of the hole shall be at a position of within 2 mm from the centroid of the plate. The clearance between the soil nail bar and the hole of the steel plate shall not be more than 2 mm;

4. The spacing of the centralizers and the suitability of the method of fixing the centralizers, grout pipes, conducting wires and corrugated sheathing where required shall be determined by carrying out trials on Site until no damage, deformation and displacement of the centralizers, grout pipes, conducting wires and corrugated sheathing are observed on completion of assembling all components, during inserting and withdrawing the soil nails. Once Approval is given, no change to the type, method and arrangement of fixing of the centralizers, grout pipe, conducting wires and corrugated sheathing shall be made without the prior approval of the CM;
5. For soil nails with double corrosion protection, centralizers shall be provided on the soil nail bar and the sheathing at suitable intervals to meet the following requirements:
    a. The soil nail bar shall be positioned in the sheathing so that a minimum grout cover to the bar of 10 mm is maintained;
    b. There shall be minimum clearance of 15 mm between the sheathing and the sides of the drillholes or casing.
6. For soil nails with double corrosion protection, corrugated sheathing shall be embedded at least 50 mm into soil nail head.

SLO.W1112.9 HANDLING OF SOIL NAIL BARS

1. Soil nail bars shall not be subject to rough handling, shock loading or dropping from a height;
2. Use nylon, rope or padded slings for lifting galvanized soil nail bars. Bundles shall be lifted with a strong back or with multiple supports to prevent abrasion.

SLO.W1114.9 STORAGE OF SOIL NAIL BARS

1. Store soil nail bars off a levelled, well drained and maintained hard-standing ground on level supports and in a manner, which will not result in damage or deformation to the soil nail bars, or in contamination of the soil nail bars. Submit proposal/measures to protect the soil nail bars from wetting and rusting caused by weather to the CM for approval;
2. Store soil nail bars horizontally;
3. Store different types and sizes of soil nail bars separately;
4. Do not store soil nail bars on or adjacent to concrete surfaces that form part of the permanent works;
5. Store galvanized soil nail bars on wooden or padded cribbing.

SLO.W1116.9 CUTTING SOIL NAIL BARS

1. Cut soil nail bars in accordance with BS 8666:2005 to the specified shapes and dimensions;
2. Comply with Table 5 of BS 8666:2005 for tolerances on cutting soil nail bars.

SLO.W1118.9 SURFACE CONDITION OF SOIL NAIL BARS

1. Soil nail bars shall be clean at the time of assembling and shall be free of loose mill scale, loose rust or any substance that, in the opinion of the CM, is likely to reduce the bond or affect the bars or grout chemically. Maintain the soil nail bars in this condition until insertion of soil nail bars;
2. If the surface condition of the soil nail bars deteriorates such that it does not comply with the requirements stated in sub-clause (1) of this clause, the soil nail bars shall be cleaned or dealt with by other methods agreed by the CM.

SLO.W1119.9 REPAIRS TO GALVANIZED COATING

1. If the coating to galvanized soil nail bars is damaged,

   a. At any point by an amount exceeding 25mm^2 in area or 50mm in length; or

   b. At more than three points in a 1m length by amounts each even not exceeding 25mm^2 in area or 50mm in length;

   that part of the soil nail bars shall not be used in the permanent works. If the coating to galvanized soil nail bars is damaged at more than six points in the cut length of a bar by amounts each even not exceeding 25mm^2 in area or 50mm in length, that length of bar shall not be used in the permanent works.

2. Except as stated in sub-clause (1) of this clause, all damaged areas and cut ends of galvanized soil nail bars shall be repaired by materials to be approved by the CM. Sufficient material shall be applied to provide a coating of at least the same thickness as the galvanized coating. The Contractor shall refer to Section 6.3 and Annex C of BS EN ISO 1461:2009 for information on repair of damaged areas;

3. Carry out repairs to galvanized coatings within 8 hours of cutting or identifying damage. Remove traces of rust from the surface of the soil nail bars before the repair is carried out.

SLO.W1120.9 DRILLING FOR SOIL NAILS

1. Comply with sub-clauses (4) and (5) of GRO.W110, and the following sub-clauses of this clause;

2. The set up of drilling plant and ancillary equipment shall be in such a manner that water, dust, fumes and noise generated during the drilling operation shall be sufficiently diverted, controlled, suppressed and muffled;

3. Carry out drilling for soil nails using rotary or percussive type drills with air as the flushing medium unless otherwise agreed by the CM. Provide temporary support, including but not limited to the use of temporary casing, to drillholes to prevent the collapse of drillholes until the completion of grouting. Clear drillholes of all debris and standing water immediately before installation of soil nails. Before soil nails are installed, provide the CM all necessary equipment and assistance to check the inclination, diameter, bearing, cleanliness and length of all drillholes;

4. Where as shown on the Drawings or required by the CM, submit drilling records including reference numbers of soil nails, date and time of drilling, penetration rate, description of strata of materials penetrated and any special observations during drilling such as underground voids encountered, collapse of hole, groundwater encountered, appropriate depth to groundwater and depth of zone of no air return etc. to the CM not more than 2 working days after completion of drilling in a format agreed by the CM;

5. Where as shown on the Drawings or ordered by the CM, install and leave in place with soil nails permanent steel casing of appropriate internal diameter and of 6.3 mm minimum thick. Unless otherwise specified by the CM, the bottom 2 m length of drillhole should be left unsupported by permanent casing;

6. Do not carry out drilling at a place within 10 meters radius of any freshly grouted soil nails, including soil nails for pull-out tests, grouted less than 12 hours previously.

SLO.W1130.9 INSTALLATION AND GROUTING FOR SOIL NAILS

1. Do not install soil nail bars and connectors from each batch until testing of the batch has been completed. Install and grout soil nails as soon as possible after drilling. In any case, each drillhole shall not be left unsupported for more than 3 days. Check all drillholes for cleanliness prior to installation of soil nails. Fix connectors for soil nail bars in accordance with manufacturer's recommendation and using equipment recommended by the manufacturer. Soil nail bars shall not be welded unless approved by the CM. For soil nail bars with threaded type connectors, each length of the soil nail bars shall be tightened by means of an appropriately sized wrench. During the whole process of installation, do not carry out any jacking or hammering of the soil nails. Grouting for soil nails shall comply with Worksection GRO and the following sub-clauses of this clause;

2. Calculate and record the gross volume of the drillholes, discounting the volume of all cast-in components of each of the soil nails to be grouted on the request forms for inspection of soil nail installation;

3. Terminate the grout pipe at a point within 150 mm above the lower end of the soil nail bars and no side cut hole shall be made on the grout pipe except that the cut is made within 150 mm above the lower end. Fix grout pipe onto the soil nail bars or corrugated sheathing (in case of double corrosion protection soil nails) by non-corrodible ties at spacing of not more than 2 m. Grout pipes shall not be removed from drillholes after insertion and the part protruding from drillholes after grouting shall be trimmed down to the base of soil nail head;

4. Where heat-shrinkable sleeve is used, the heat-shrinkable sleeve shall be heat-shrunk by means of an apparatus approved by the CM, and it shall be used in accordance with the manufacturer's instructions. The sleeve shall have sufficient length and shall be positioned such that a minimum 100 mm length of soil nail bars beyond the connector is protected by the sleeve after completion of heat-shrinking. No lapping of the sleeve shall be allowed. The sleeve thickness shall not be less than 1.0 mm after heat-shrinking. Finished surface of the sleeve shall be smooth, free of trapped air pockets, flaws, holes, cracks, burn marks and other defects. Any defects or damage found on the sleeve shall be made good to the satisfaction of the CM;

5. Install a pair of conducting wires in each permanent soil nail in accordance with the Drawings. For the shorter wire, the insulation of the wire at the lower end (25 mm length) shall be removed and the exposed end of the wire shall be in contact with the soil nail bars and securely tied to the soil nail bars by adhesive tape. The lower end of the longer wire shall be sealed in such a manner to achieve electrical insulation;

6. After insertion of soil nail bars into the drillhole, seal the top end of the drillhole with an appropriate plug capable of withstanding a grout pressure head, which is maintained during the first hour after completion of grouting as described in sub-clause (8) of this Clause. Install an outlet pipe extending above the slope surface through the plug to allow discharge of air, water and grout from the upper end of the drillhole during grouting. Submit details of the arrangement of outlet pipe and sealing plug for the CM's agreement and carry out a site trial to demonstrate that the set up performs satisfactorily;

7. Grout soil nails on the same day when the soil nail bars are inserted into drillholes. Soil nails which are not grouted after insertion and are left in drillhole overnight shall be withdrawn from the drillhole and the drillhole shall be checked for cleanliness and obstructions prior to re-insertion;

8. Grout soil nails over their entire length of soil nail bars in one single operation. Inject grout into drillhole through the grout pipe to the lower end of drillhole such that air and water are displaced from the drillhole as grouting proceeds. When the consistency of the grout flowing out of the outlet pipe is the same as the injecting grout, the grouting operation shall be stopped and the inlet grout pipe sealed. A pressure head of at least 300 mm of grout measured from the top of drillhole shall be maintained in the outlet pipe during the first hour after completion of grouting. Any settlement of the grout level inside the outlet pipe observed shall be replenished with fresh grout immediately;
9. The set up of grouting plant and ancillary equipment shall be in such a manner that water, spillage of grout, dust, fumes and noise generated in the course of grouting operation shall be sufficiently diverted, controlled, suppressed and muffled;
10. Record the volume of grout used for grouting each drillhole and the volume used for refilling each drillhole after grout settlement. Submit the records to the CM not more than 3 days after each grouting operation. The records shall include all details as required in GRO.W020 (1) and the following:
    a. Volume of grout spilled from the drillhole;
    b. Volume of grout added to outlet pipe after grout settlement.
11. Report to the CM any excessive grout loss immediately. If a drillhole cannot be fully filled with grout after injecting a volume of grout equal to 10 times the calculated gross volume of the drillhole, discounting the volume of all cast-in components, cease immediately the grouting operation for that drillhole unless otherwise agreed by the CM. Report the grouted length of the drillhole to the CM and submit proposals for completing the grouting for that drillhole to the CM for approval as soon as possible;
12. Unless otherwise agreed by the CM, for soil nails with double corrosion protection, grout firstly over the annular space between the wall of drillhole and corrugated sheathing in a continuous operation. Grout the annular space between corrugated sheathing and soil nail bars immediate afterwards in a continuous operation.

SLO.W1140.9 SOIL-NAIL HEAD

1. Construct soil-nail heads in accordance with the details as shown on the Drawings. Submit for the CM's agreement a method statement for the construction of soil-nail heads;
2. The threads at the top end of soil nail bars shall be thoroughly cleaned, properly treated with galvanized coating or protected with approved zinc-rich paint prior to construction of soil-nail heads;
3. Carry out concreting of soil-nail heads in a manner which ensures that the placed concrete is adequately compacted. Unless agreed otherwise by the CM, concreting of soil-nail heads using sprayed concrete shall be applied in two stages, allowing the bearing plate to be positioned firmly against the first stage concrete. The method statement as referred to in sub-clause (1) of this clause shall include proposal for the construction sequence of 2-stage sprayed concrete soil-nail heads. Conduct trial runs to demonstrate to the CM that the proposed method statement will produce satisfactory results and the rebound of sprayed concrete material is minimal;
4. Backfill any temporary excavation for constructing soil-nail heads, including overbreaks, with Grade 30/20 concrete, 30 MPa sprayed concrete or other material as agreed by the CM;

5. Where Insttructed, uncover a maximum of 3 concreted soil-nail heads from the batch of soil-nail heads constructed on any one day for examination of the quality of soil-nail heads. If defective workmanship is identified in any one of the uncovered soil-nail heads, the whole batch of soil-nail heads constructed on the same day shall be deemed to be defective. Break up all the remaining soil-nail heads constructed on the same day for the CM's examination. Re-construct and re-examine the soil-nail heads to the satisfaction of the CM.

MATS FOR SLOPE EROSION CONTROL

SLO.W1150.9 PREPARATION OF SURFACES

Clear areas to be applied with mats of all rubbish, debris and loose soils. All local irregular spots and areas shall be trimmed or filled with compacted fill material or compacted soil-cement to provide smooth surface unless otherwise Instructed. The finished slope surfaces shall be inspected by the CM prior to installation of mats.

SLO.W1160.9 LAYING AND FIXING OF MATS FOR EROSION CONTROL

Lay and fix mats for erosion control onto sloping ground in accordance with the manufacturers' recommended procedures and in compliance with the following requirements:

1. The mats except biodegradable types shall be anchored along the slope crest and each berm level with at least 200 mm length embedded into the ground or underneath the concrete berm slabs. The mats shall also be embedded at least 200 mm into any adjacent structures to be constructed. The mat shall be rolled out from top down the slope surfaces. Sufficient galvanized anchorage pins at a maximum spacing of 1 m centre to centre shall be provided to ensure the mats are in complete and total contact with the ground at every place. In areas of irregularities due to exposed rocks or existing structures, additional anchorage pins shall be provided to prevent any gap or void forming underneath the mats. Lapping between mats shall be at least 150 mm and shall be formed with the upslope mat over the downslope mat. No lapping shall be formed within 1 m of any intersection of two slope surfaces which have a sharp difference in slope gradient or strike direction;
2. The biodegradable erosion control mats shall be anchored along the crest of slope and each berm with at least 2 rows of bamboo sticks or wooden pegs at a maximum horizontal spacing of 550mm on 300mm length mat lapping. The mats shall be rolled out from top down the slope surfaces. Sufficient bamboo sticks or wooden pegs at a maximum spacing of 1m centre to centre shall be provided to ensure the mats are in complete and total contact with the ground at every place;
3. In areas of irregularities due to exposed rocks or existing structures, additional anchorage pins shall be provided to prevent any gap or void forming underneath the mats. Lapping between mats shall be at least 150 mm and shall be formed with the upslope mat over the downslope mat. No lapping shall be formed within 1 m of any intersection of two slope surfaces which have a sharp difference in slope gradient or strike direction;
4. Where recommended by the manufacturer of the mats for erosion control, on completion of laying and anchoring of the mats, place and tamp soil into the mats in accordance with the Drawings or as directed by the CM. All voids shall be completely filled to form an integral composite structure;
5. The sequence of hydroseeding and laying of mats shall be in accordance with the manufacturer's recommended sequence, or as directed by the CM. The protective material for hydroseeding shall be laid on top of the erosion mat, if specified.

INSTALLATION OF ROCK JOINT RELIEF DRAINS

SLO.W1210.9 GENERAL

Where as shown on the Drawings or directed by the CM, install rock joint relief drains on the slope surface before applying sprayed concrete, buttresses or other constructions. Install the drains along weathered seams or at joints where water seepage is evident.

SLO.W1220.9 WEEPHOLES FOR ROCK JOINT RELIEF DRAINS

Weepholes shall be provided from the relief drain through the sprayed concrete or buttresses at intervals not greater than 1200 mm in each direction, or as directed by the CM.

SLO.W1230.9 FIXING ROCK JOINT RELIEF DRAINS

1. Fix the relief drain in place immediately prior to applying sprayed concrete, buttresses or other constructions;
2. Before the first length of permanent drain is installed, fix a trial length in place to demonstrate the method of fixing for Approval;
3. No permanent relief drains shall be installed until the CM has given his Approval to the method of fixing.

APPLICATION OF NO-FINES CONCRETE

SLO.W1310.9 USE AND APPLICATION

1. Where as shown on the Drawings or directed by the CM, apply no-fines concrete as Worksection CON1 to form drainage layers between the rock slopes and the sprayed concrete, buttresses, or other structures, or on its own;
2. Where as shown on the Drawings or directed by the CM, fill rock slopes that have voids behind the trim line or undercut points, resulting from face treatment and stabilization work or scaling and trimming, with no-fines concrete as Worksection CON1.

GROUT STRENGTHENING OF JOINTED ROCK

SLO.W1410.9 TECHNIQUE AND APPLICATION

1. Cement grouting shall be carried out in holes not less than 50 mm diameter drilled at locations, spacings, depth, inclinations, and directions, all as directed by the CM and as shown on the Drawings;
2. At the collar of each grout hole, reamed out if necessary, a stand-pipe shall be cemented not less than 1000 mm into the rock, and extend not more than 500 mm out of the rock, and shall be attached to a Tee manifold to facilitate injection of grout. The bore of the standpipe shall be not less than 50 mm;
3. The manifold shall consist of inlet and outlet connections for the delivery hose from the grout pump and the return hose to the grout holding tank, respectively; a valve in the stem of Tee to control bleed off of grout from the pumping circuit into the grout hole; a valve in the branch to the delivery hose; a valve in the branch to the return hose; and a pressure gauge (0 to 250 kPa), located not more than 200 mm above the connection to the standpipe, to measure the injection pressure of the grout, all as shown on the Drawings;

4. The grout pump and delivery and return hoses shall be of sufficient capacity to allow a pressure of not less than 250 kPa to be maintained at the standpipe of the grout hole being injected;
5. The grout pump shall be of the positive displacement type and, together with its motive power, shall permit small variations (not more than 25 kPa) in output pressure to be effected over the whole range from zero pressure to maximum delivery pressure. A suitable pressure gauge shall be fitted to the delivery line;
6. Grout shall be mixed in accordance with Worksection GRO;
7. During grout injection, a manifold operator shall be in continuous attendance at the grout injection manifold and a pump operator shall be in continuous attendance at the grout pump, for the whole duration of the work. The manifold operator shall be in continuous radio or telephone communication with the pump operator during this time;
8. The injection pressure to be maintained at the manifold gauge; the water:cement ratio of the grout mix; the duration of the injection, the number of injection periods, and the sequence in which holes are to be injected or re-injected, shall be as directed by the CM one day in advance of the work for every grout hole. No grouting shall be commenced or resumed unless Instructed;
9. The manifold operator, with the aid of the pump operator, shall ensure that the specified injection pressure is maintained at all times within a tolerance of 10 kPa at the manifold gauge. He shall record the gauge pressure and the times of commencement and cessation of grout injection, against each hole number. He shall also keep a record of any grout leakage at the ground surface or other holes by means of a dimensioned sketch plan. Fair copies of these records shall be forwarded to the CM at the end of each working day;
10. If grout leakage through natural rock joints at the surface occurs during grouting of a hole, then grouting shall immediately cease and shall not be resumed until the leaking joints are caulked using oakum, lead wool, or other caulking materials, all to the satisfaction of CM, who may direct grouting to continue at other holes until caulking is completed. If grout leaks into another hole near that being grouted, the former hole shall be flushed clean of grout after grouting is completed and before the grout has set;
11. If grout leakage occurs from the collar of the hole, grouting of the hole shall cease until the leak is stopped by caulking or cementing or other methods;
12. If the manifold operator observes lift or heave of surface rock during grouting, he shall immediately close the manifold valve, and advise the CM. No further grouting shall be attempted at the general locality until Instructed;
13. The pump operator shall, for each hole grouted, dip the grout tank and record the total volume of grout injected to an accuracy of 0.02 m^3 (Note: this will not include the grout in the delivery and return pipes), the strength of the grout mix, the pressure in the delivery line, and the times of commencement and termination of pumping. Fair copies of these records shall be conveyed to the CM at the end of each working day;
14. At the commencement of grouting operations each day, and before the grout hoses are connected to the standpipe manifold at the hole, a grout tank and delivery and return hoses shall be flushed with clean water for not less than 5 minutes at a velocity sufficient to remove all dirt, cement flakes, sand and foreign matter;

15. Before grouting commences at a hole, the hole shall be cleaned out by means of a probe or lance consisting of a 25 mm bore pipe of suitable length, fitted with a cap at one end and connectors for compressed air and water at the other, and perforated by 5 mm diameter holes at 25 mm centres in staggered rows every 90° for a distance of not less than 300 mm from the cap. The lance shall be passed up and down the hole for not less than five minutes and all drill cuttings and rock particles and foreign matter shall be removed from the hole by the compressed air and water jets before grouting is attempted;
16. On connection of the grout injection manifold to the standpipe and commencement of grouting, injection pressures shall be continuously maintained within tolerance of the pressure specified by the CM for the full period of injection, except in the event of grout leakage or rock movement as noted in sub-clauses (10), (11), and (12) above;
17. On completion of grouting at a hole, and after a suitable period of time has elapsed (as specified by the CM) for the grout to achieve an initial set, all grout in the hole itself shall be flushed out using the air-water lance. The standpipe shall then be temporarily capped. If the hole is not required for further grouting, the standpipe shall, on the CM's Instructions, be cut off flush with the rock surface and the hole filled with grout;
18. No oils, water soluble oils, greases, or other lubricants, shall be used on drill rods or drill bits or in drilling water during the drilling of grout holes;
19. The CM may require tell-tales, uplift gauges, or other means of detecting rock movement, to be installed before grouting commences;
20. The CM may require additives to be used in the grout to hasten or delay setting times or to achieve other characteristics in the grout;
21. The CM may require holes that have already been grouted to be deepened by further drilling through the standpipe and additional grouting carried out;
22. The CM may require type of grout other than cement grout to be used in the grouting operations;
23. On completion of grouting of a hole, the grout injection manifold shall not be removed from the standpipe until the grout pressure on the gauge has fallen to zero. Care shall be exercised by the manifold operator when disconnecting the manifold from the standpipe and moving it to another hole not to spill grout on the ground.

TREATMENT OF DECOMPOSED ZONES

SLO.W1510.9 TECHNIQUE AND APPLICATION

1. Where directed by the CM, decomposed zones shall be stabilized and protected in accordance with the measures shown on the Drawings;
2. For steeply dipping or sub-vertical decomposed zones, the work shall consist of:
    a. Removing weak or loose material from the seam to a depth equal to 100 mm plus the width of the zone if the latter is less than or equal to 300 mm or to a depth of 400 mm otherwise;
    b. Installing a drainage layer and longitudinal continuous drain if so Instructed;
    c. Placing a Grade 20/20 mass concrete plug flush to the rock surface;
3. The CM may direct raking drains to be installed to intersect and drain the weathered zone below its outcrop;
4. For gently dipping or sub-horizontal decomposed zones, the work shall consist of:

a. Removing weak and loose material from the zone as described above;

b. Placing a drainage layer of sandbags not less than 100 mm thick and a continuous longitudinal drain next to the decomposed material;

c. Installing a reinforced concrete plug, inclined outward to its foot, and keyed and dowelled into the rock on the lower side of the seam; and

d. Installing outlet drain pipes through the concrete plug from the longitudinal drain, as directed by the CM.

REINSTATEMENT OF ROCK BERMS

SLO.W1610.9 MAKING GOOD

Where directed by the CM, make good the shoulder of rock berms by means of mass concrete (Grade 20/20) placed flush with the berm surface and rock face and securely held to the rock by means of rock dowels as shown on the Drawings.

EXTENSOMETERS

SLO.W1710.9 PROVISION, INSTALLATION, TESTING AND RECORDING

1. Where directed by the CM provide, install and test rod extensometers of an Approved proprietary type;
2. The extensometers shall have either five (5) rods and a maximum length of 25 metres, or three (3) rods and a maximum length of 15 metres;
3. The extensometers shall be installed and tested in drillholes of a suitable size according to the manufacturer's instructions and shall be completed with all necessary components such as reference heads and protective caps;
4. A dial gauge of suitable accuracy and its accessories (including calibration accessories) shall be provided by the Contractor and shall be available on the Site in a serviceable condition at all times;
5. Take readings from all installed extensometers at a frequency to be directed by the CM from time to time, and convey the recorded data to the CM within 2 days of the readings being taken.

TELL-TALES AND REFERENCE POINTS

SLO.W1810.9 PROVISION AND INSTALLATION

1. Where directed by the CM, provide and install tell-tales and reference points for the purpose of measuring rock or soil movement. The tell-tales shall consist of mortar patches or glass strips affixed to the rock, or of such other similar means as the CM may direct;
2. The reference points shall be of an Approved proprietary type consisting of demountable stainless steel eyebolts affixed to corrosion protected steel bolts grouted not less than 200 mm into rock. Provide the necessary accessories and protective caps for the reference points. Install the reference points strictly in accordance with the manufacturer's installation instructions.

TOLERANCES

SLO.W1910.9 SOIL NAILING

Refer to Appendix H "Schedule of Tolerance" to this Specification.

TESTING

TESTING FOR THE OPTIMUM MOISTURE CONTENT AND MAXIMUM DRY DENSITY OF SOIL-CEMENT FILL

SLO.T010.9 OPTIMUM MOISTURE CONTENT AND MAXIMUM DRY DENSITY OF SOIL-CEMENT FILL

The maximum dry density and optimum moisture content of soil-cement fill shall be as Worksection EAR1 except that the method of testing shall be the Vibrating Hammer Test Method in accordance with BS 1924-2:2018.

TESTING CONCRETE CORES FROM SPRAYED CONCRETE

SLO.T110.9 TESTING CONCRETE CORES FROM SPRAYED CONCRETE

1. Testing arrangements:
    a. Carry out tests by employing a laboratory that complies with the requirements stated in the Preliminaries Worksection.
2. Testing samples
    a. The strength of sprayed concrete shall be determined from the concrete cores cut from a test panel constructed at the same time as sprayed concrete is applied;
    b. Construct one test panel for each application in a day or as directed by the CM;
    c. The test panel shall be 250 mm thick and shall be at least 1000 mm x 1000 mm in size. Fix securely the mould in position at the same height and inclination as the surface being sprayed. Construct the panel by spraying concrete into the mould at the same time as the concrete to be tested is applied. Cure the test panel by the same method as the sprayed concrete;
    d. Provide three concrete cores from each test panel. Cores shall not be taken within 125 mm from the edges of the panel;
    e. Concrete cores shall be 100 mm diameter and shall be the full depth of the test panel;
    f. The method of taking concrete cores shall be in accordance with CS1:2010.
3. Testing methods
    a. Test each concrete core to determine the compressive strength and density;
    b. Prepare and test the concrete cores to determine the compressive strength in accordance with CS1:2010;
    c. Test the concrete cores to determine the density in accordance with CS1:2010;
    d. Three concrete cores shall be tested at 28 days;
    e. Interpret the results of tests for compressive strength of concrete cores in accordance with CS1:2010;
    f. Do not make adjustments to the measured strength in respect of the age of the core when tested unless permitted by the CM;

g. The minimum compressive strength of concrete cores, converted to estimate in-situ cube strength in accordance with CS1:2010 shall be the specified grade strength at 28 days.

4. Non-compliance

   a. If the result of any test does not comply with the specified requirements for compressive strength or density of concrete cores from sprayed concrete:

      i. Submit particulars of proposed changes to the materials, mix design, methods of production or methods of construction to the CM for approval;

      ii. Make further trial mixes and construct further trial panels unless otherwise permitted by the CM.

TESTING ROCK BOLTS

SLO.T210.9 TRIALS FOR ROCK BOLTS

1. The design bond length of rock bolts with bonded anchorages shall be determined for each rock type by a pull-out trial;
2. The proof load of the pull-out trial shall be twice the working load;
3. Pull-out trials shall be carried out on two bolts for each combination of rock bolt and rock type;
4. Unless otherwise permitted by the CM the bolts used in trials shall be discarded and shall not form part of the permanent works, and the hole shall be sealed by grouting.

SLO.T220.9 PACKER TESTS ON DRILLHOLES FOR ROCK BOLTS

Holes for rock bolts shall be tested by the Packer test as follows and the results of the tests shall be submitted for Approval, before installation of rock bolts starts:

1. The water loss from drillholes for rock bolts shall be determined by the Packer test. The number of drillholes to be tested shall be as Instructed;
2. The Packer test shall be carried out on the bond length of the drillhole at a test pressure of 100 kPa. The method of testing shall be as stated in Worksection GRO;
3. The water loss determined by the Packer test in the grouted hole shall not exceed 5 Lugeons when measured over a 10 minute period;
4. If the result of any Packer test on drillholes for rock bolts does not comply with the specified requirements for the test, the drillhole shall be grouted, re-drilled and retested. Grouting, re-drilling and retesting shall be continued until the result of the Packer test complies with the specified requirement for the test.

SLO.T230.9 TESTS ON INSTALLED ROCK BOLTS

1. Test each installed rock bolt to determine the loss in stress by applying a test load of 1.5 times the working load for 5 minutes;
2. The loss in stress in installed rock bolts shall not exceed 5% of the test load in 5 minutes;
3. If the result of any test for loss in stress of installed rock bolts does not comply with the specified requirements for the test, an additional test for loss of stress shall be carried out on the rock bolt;
4. If the result of any additional test for loss of stress of installed rock bolts does not comply with the specified requirements for the test, the rock bolt shall be replaced.

TESTING SOIL NAILS

SLO.T310.9 GENERAL

1. Soil nails for pull-out tests shall be installed and tested prior to the installation of permanent soil nails as directed by the CM. The number of pull-out tests shall be as shown on the Drawings or as Instructed. Soil nails subjected to pull-out tests shall not form part of the permanent works. Submit the details of the testing arrangement including the set-up and support for the testing apparatus to the CM for approval. Drilling records of holes selected for pull-out tests shall be provided to the CM within 24 hours after drilling;
2. Where Instructed, carry out non-destructive testing of soil nails by either Time Domain Reflectometry (TDR) test or magnetometer test to verify the length of the installed soil nails. The frequency of non-destructive testing shall be at least 1% of soil nails with a minimum of 2 nails per slope (including wall).

SLO.T315.9 MEASURING APPARATUS FOR PULL-OUT TEST

1. The apparatus for measuring loads and deformations shall have an accuracy of 5 kN and 0.05 mm respectively. The apparatus for measuring deformation shall be capable of measuring a displacement of up to 50 mm;
2. The apparatus shall be tested and calibrated by laboratories approved by the CM not more than 6 months prior to the date of carrying out the tests;
3. Submit the test and calibration certificates to the CM at least one week before the test.

SLO.T320.9 PULL-OUT TEST FOR SOIL NAILS

Unless otherwise directed by the CM, adopt the following procedures of the pull-out tests for soil nails:

1. The loading apparatus shall be set up in such a way that no loading, other than the pull-out load, acts on the soil nail bars at the nail head. The reaction of the pull-out load from the loading apparatus shall act on a sufficiently sized rigid bearing plate placed against a temporary cut face at normal to the alignment of the soil nail bars to ensure adequate load spreading and to avoid eccentric loading. Monitoring instruments shall be carefully positioned and independently supported to record the extension of the soil nail steel bar and any movement of the steel baring plate;
2. Grout the soil nail over the length as specified in the Drawings or as directed by the CM. The length to be grouted shall be isolated by means of a packer that can prevent grout from leaking through to the free-length section during grouting and that can ensure that the proposed bonded section is effectively grouted to the required length as shown on the Drawings. Subject to the CM's approval, alternative means to form the required bond length may be adopted by the Contractor. The entire free length of the soil nail bars shall be properly debonded or capped to ensure that the test load can be directly transferred to the bonded zone in case of grout leak through the packer. The pull-out test shall not be carried out until the grout has reached a cube strength of 21 MPa;
3. The maximum test load shall be either 90 % of the yield load of the soil nail bars of the test nail (T_p) or the ultimate soil/grout bond load (T_{ult});

4. The test nail shall be loaded in stages: from the initial load (T_a) via two intermediate test loads (T_{DL1} and T_{DL2}) to the maximum test load. T_{DL1} and T_{DL2} are the loads that result in the bonded zone tested to the design working bond strength and 2 times the working bond strength respectively. T_a shall not be greater than T_{DL1} or 5 % of T_p. All loadings including T_a, T_{DL1}, T_{DL2} and T_p shall be specified in the Drawings or as directed by the CM;
5. During the first two loading cycles, the intermediate loads, T_{DL1}, and T_{DL2}, shall be maintained for 60 minutes for deformation measurement. After the measurement has been completed, the load shall be reduced to T_a and the residual deformation shall be recorded. In the last cycle, the test load shall be increased gradually from T_a straight to maximum test load and then maintained for deformation measurement. The measurement at each of the cycles shall be taken at time intervals of 1, 3, 6, 10, 20, 30, 40, 50 and 60 minutes. The test nail is considered to be able to sustain the test load if the difference of nail movements at 6 and 60 minutes does not exceed 2 mm or 0.1 % of the grouted length of the test nail. In this case, the test shall proceed to the next loading cycle or be terminated if the test nail is subject to T_p;
6. If the nail fails to sustain the test load T_{DL1}, T_{DL2} or T_p, the test shall be terminated and the nail movement against residual load with time shall be recorded. The measurements shall be taken at time intervals of 1, 3, 6, 10 and every 10 minutes thereafter over a period for at least two hours. Where required, the measurements shall be continued and at intervals as directed by the CM;
7. Throughout the test, the soil nail movement versus the applied load shall be measured, plotted on a graph and recorded along with all other relevant information, on forms agreed by the CM or as shown on the Drawings. All the results shall be submitted to the CM within 3 days of completion of the test;
8. Where required, the whole soil nail shall be pulled out from the drillhole for the CM's inspection. Where the soil nail bar remains in-situ after the pull-out test, the bar shall be cut-off flush with the finished ground and remaining part of the drillhole grouted.

SLO.T325.9 CREEP TEST

Where Instructed, carry out a creep test as part of a pull-out test as stated in SLO.T320. During a creep test, monitor movement of the test nail at a prescribed load as detailed below:

1. The test nail shall be loaded in stages in accordance with the loading cycles specified for a pull-out test;
2. The test load in one of the loading cycles shall correspond to two times the allowable design bond strength;
3. The creep period shall start as soon as the test load of two times the allowable design bond strength is applied. The load shall be maintained for 60 minutes. During this period, readings of the nail head movement shall be taken at time intervals of 1, 2, 3, 5, 6, 10, 20, 30, 50 and 60 minutes;
4. A test nail shall be considered acceptable when:
    a. A total creep movement between the 6-minute and 60-minute readings during creep testing is less than 2 mm; and
    b. The overall trend of creep rate (i.e. creep movement/log time) is linear or decreasing throughout the creep test load hold period.

SLO.T360.9 TIME DOMAIN REFLECTOMETRY (TDR) TEST

Adopt the following procedures for the TDR test:

1. Select some nails of known length for calibration of pulse propagation velocity;
2. Remove concrete nail head to provide access to steel nail head;
3. The head of the steel soil nail shall electrically be accessible. All loose materials shall be removed from the bar head;
4. Connect the TDR instrument to the steel soil nail head and the electric wire;
5. Send a short pulse into the steel soil nail and record the time of reflection (if the wire is electrically in contact with the steel soil nail end, the return signal from the nail end should go down and vice versa);
6. Send a long pulse into the steel soil nail and record the time of reflection (if the wire is electrically in contact with the steel soil nail end, the return signal from the nail end should go down and vice versa);
7. Determine the average propagation velocity of the pulse from the results obtained in sub-clauses (5) and (6);
8. Repeat steps described in sub-clauses (4) to (7) for steel soil nail to be tested and estimate its length by using the calibrated propagation velocity;
9. Submit a test report with the test results and their interpretations to the CM within 3 days of completion of the test;
10. Re-cast the concrete nail head after the test as directed by the CM.

SLO.T370.9 MAGNETOMETRY TEST

Adopt the following procedures for the magnetometry test:

1. Drill a hole parallel and in the vicinity of the test nail. The separation between the drillhole and the test nail should be about 300 mm to 500 mm, and the length of drillhole should be longer than the anticipated length of the soil nail by at least 1 m. The size of the drillhole should be large enough to accommodate a PVC pipe of minimum 55 mm internal diameter;
2. Insert the magnetometer into the PVC pipe. Measure and record the Earth's magnetic field as the magnetometer moves along the pipe until it reaches the end of the pipe;
3. Repeat the measurement and recording process as the magnetometer moves away from the pipe end until it reaches the top of the pipe;
4. Analysing the fluctuation of the measured Earth's magnetic field to determine the locations of couplers and the end of steel soil nails;
5. Submit a test report with the test results and their interpretations to the CM within 3 days of completion of the test;
6. Grout the drillhole after the test as directed by the CM.

SLO.T380.9 BATCH OF SOIL NAIL BARS AND CONNECTORS

1. For the purpose of testing, subdivide the soil nail bars delivered to the Site into batches in accordance with Clause 1.2.1 of CS2:2012;
2. A batch of connectors is any quantity of connectors of the same type, size and grade, manufactured by the same mill, covered by the same mill and testing certificates and delivered to the Site at any one time.
3. In addition, for a batch of galvanized soil nail bars, the coating shall have been applied at the same coating factory and shall be covered by the same original test certificates with original signatures and official authorization chop.

SLO.T390.9 SAMPLE OF SOIL NAIL BARS AND CONNECTORS

1. Provide samples of soil nail bars and connectors from each batch of the materials delivered to the Site and at least 14 days before insertion of the soil nail starts. The number of samples to be provided from each batch shall be as stated in the following Table:

Description	Size of batch	No. of samples per batch
Soil nail bars	All size	1
Connectors	less than 100 no.	1
	100 – 500 no.	2
	Exceeding 500 no.	3

2. The number of specimens in each sample shall be as follows:

Category	Number of specimens
Soil nail bars	In accordance with Table 10 of CS2:2012 for Class 2 steel
Thickness of galvanized coating for soil nail bars/connectors	In accordance with Table 1 of BS EN ISO 1461:2009
Connectors for tension joint	3

3. Each specimen of bar shall be at least 1m long. Each specimen of connectors shall consist of one connector joined to two lengths of bar each at least 500mm long. The bars shall be of the same type, size and grade as the bars to which the connector will be fixed in the permanent work;

4. Each specimen of soil nail bars shall be taken from different bars in the batch. The ends of specimen shall be cut square before delivery to the laboratory.

SLO.T400.9 TESTS FOR SOIL NAIL BARS AND CONNECTORS

1. Each sample of soil nail bars shall be tested in accordance with Clause 5.1.1 of CS2:2012 except no test for bond property shall be carried out;

2. Test each specimen as required in sub-clause (2) of SLO.T390 of galvanized soil nail bars/connectors to determine the thickness of coating in accordance with BS EN ISO 1461:2009 for compliance;

3. Test each sample of connectors to determine the tensile properties in accordance with SLO.T420;

4. The number of tests on each sample shall be as stated in the following Table:

	Type and number of tests				
	Tensile properties	**Bend performance**	**Mass per metre**	**Chemical composition (product analysis)**	**Thickness and uniformity**
Soil nail bars	In accordance with Clause 5.1.1 of CS2:2012 for Class 2 Steel				-

Galvanized coating	-	-	-	-	In accordance with Table 2 of BS EN ISO 1461:2009
Connectors	3	-	-	-	-

SLO.T410.9 COMPLIANCE CRITERIA FOR SOIL NAIL BARS

1. If the results of the tests performed on the test specimens of soil nail bars meet the requirements specified in Clause 5.1.2 of CS2:2012, the batch shall be deemed to comply with the requirements.

SLO.T420.9 COMPLIANCE CRITERIA FOR CONNECTORS

1. The results of tensile properties tests on specimens of connectors shall comply with the following requirements:
   a. The tensile strength shall exceed 287.5 MPa for grade 250, 540 MPa for grade 500B and 575 MPa for grade 500C soil nail bars;
   b. When a test is made of a representative gauge length assembly comprising soil nail bars of the size, grade and profile to be used and a connector of the precise type to be used, the permanent elongation after loading to 0.6 times of the specified characteristic strength and unloading shall not exceed 0.1mm. The gauge length shall span over the connector.

SLO.T430.9 NON-COMPLIANCE OF SOIL NAIL BARS

1. If the result of any test on soil nail bars fails, the acceptance of retests shall be considered in accordance with Clause 5.1.4 of CS2:2012.

SLO.T440.9 NON-COMPLIANCE OF GALVANIZED COATING

1. If the result of any test for thickness of galvanized coating to soil nail bars or connectors does not comply with the specified requirements for the property, additional samples shall be provided from the same batch and additional tests for the property shall be carried out. The number of additional samples shall be as stated in the Table under sub-clause (1) of SLO.T390;
2. The number of specimens in each additional sample shall be as follows:
   a. Galvanized soil nail bars: 4;
   b. Galvanized connectors: 4.
3. The number of tests on each additional sample shall be four;
4. The batch shall be considered as not complying with the specified requirements for the property if the result of any additional test does not comply with the specified requirements for the property.

SLO.T450.9 NON-COMPLIANCE OF CONNECTORS

1. If the result of any test for tensile properties of connectors does not comply with the specified requirements as stated in SLO.T420, provide additional samples from the same batch and carry out additional tests as stated in SLO.T420. The number of additional samples shall be as stated in the Table under sub-clause (1) of SLO.T390;
2. The number of specimens in each additional sample shall be six;

3. The number of tests on each additional sample shall be six;
4. The batch shall be considered as not complying with the specified requirements for tensile properties if the result of any additional test does not comply with the specified requirements as stated in SLO.T420.
